arches, above which are large semi-circular arches in recessed rings pierced with windows. The domes are on octagonal drums with semi-circular arched openings, many of which have been filled up in order to keep out the eastern sun. The plan is small but beautifully arranged, having an outer narthex with three domes on high drums, an inner narthex with one flat dome, and a central dome measuring only thirteen feet across on a high drum. The apse is semi-circular internally and polygonal externally. The domes externally present a melon-shaped treatment which was frequently used in Constantinople.

The church which was formerly attached to the monastery of the Chora was rebuilt in the eleventh and twelfth centuries. It has an outer and an inner narthex; the interior is beautifully decorated with mosaics, and the building is known as the Mosaic Mosque. The inner narthex has two domes on high drums, and the square nave is covered with a dome also on a high drum measuring eighteen feet in diameter. The whole of the walls, vaults, and ceilings are entirely covered with mosaic. The outer circle was added in after years. The inner narthex is covered with a melon-shaped dome. A Saracenic minaret was added in later years when the church was turned into a mosque.

The original basilican church of S. Mark's, Venice, built in the year 830, resembled that at Torcello, and was constructed to receive the body of S. Mark, the evangelist, from Alexandria. This church was partially burnt in 976 A.D., and reconstructed as we now find it between the years 1043 and 1071. It resembles the church of the Holy Apostles at Constantinople, which was destroyed by one of the Sultans. The interior was altered from the basilican to the Byzantine plan, a Greek cross with domes. In the twelfth century the marble facing and the columns to the façade were added, and before this the mosaic to the domes. The timber domes were added in the thirteenth century, and further Gothic alterations took place in the fifteenth century. Columns were brought from Rome and from all parts of the East, from Constantinople, Greece, Arabia, and Persia, and early Christian buildings in Asia Minor and Syria were despoiled for this purpose. The church is a Greek cross on plan, having a narthex along the three sides of the western arm, a nave covered by a dome at the crossing forty feet in diameter, and domes over the two arms. The aisles are twenty feet wide, and pass through the piers which support the dome. These piers measure twenty-eight feet by twenty-one feet. The narthex is divided into square bays having pointed arches and covered by low domes ornamented with mosaic. Each side of the central entrance the arch springs from two pairs of columns, with small Ionic capitals crowned by deep dossier blocks. The broad transverse arch is left plain to be treated with mosaic. The mosaics of the domes of the narthex date from the fourteenth century, and represent the Creation.

The nave, which is forty feet wide, has high columns, probably taken from old basilican churches. These support stilted semi-circular arches, over which are bridges three feet wide which run round the whole church and lead to the women's gallery. Galleries, however, are not so usual in the Western Church as in the East.

The wide spaces of uninterrupted walling are covered with glass mosaic. No mouldings are used in order not to interfere with the treatment of the mosaic, the angles of which are rounded off. The uneven surface of the pavement is due probably to shifting foundations, though it has been suggested that the undulation is intentional, the idea being to represent the waves of the sea.

The cancelli of marble panels were erected in 1393. These support a screen of columns and a crucifix with statues of the Holy Virgin and S. Mark on either side; a small arcade encloses the lower part leading to the crypt belonging to the old church, which is below the sea level, and was formerly under water. The body of S. Mark was placed here originally, but is now enshrined in the upper church. Many of the capitals are convex in shape and the carving undercut, and beneath the surface of the outline the leaves are V-shaped, and the deep drilling between the lobes shows the Greek craftsmanship of the Byzantine style so strongly in contrast with Roman work.

The central dome is of solid brickwork covered with timber. These timber domes are of unusual shape and are covered with lead; they have no prototypes in the Byzantine style. The walls externally are of brick, which is still visible on the north and side façades.

Doge Domenico Selvo in the twelfth century instructed all Venetians, ambassadors, officers of the army, navy, captains of the trading ships, &c., to assist in obtaining all

THE CASTLE GATEWAY, LEWES

the material possible for the façade of the church. In consequence Venetian colonies, especially Constantinople, were unsacked, and an enormous number of columns were produced, thus accounting for the quantity used and for their being crowded one above the other. They were of all shapes and descriptions, polygonal, square, fluted, unfluted, and of every kind of marble. Old Corinthian capitals from Roman buildings were used and placed next to the convex Byzantine capital in many instances.

The façade presents a series of five arched openings, the central opening being semi-circular and admitting light to the nave. The original bronze doors of the central doorway are still in existence; the arch is 30 feet in diameter, the outer carving measuring 3 feet 6 inches. The windows in the façade are small and grouped together; they are filled with lattice-work of translucent marble and coloured glass. The square billet moulding is used and is to be found in all periods of Venetian art.

The font in the baptistery dates from 1545; it is beautiful in design and proportion; the lid is crowned with a figure of St. John the Baptist. The four bronze horses on the façade are the only existing specimens of a Roman quadriga; they date from the time of Nero and originally belonged to the quadriga which crowned his arch, and later that of Trajan. Constantine sent them to Constantinople when he removed his capital. In 1204 Doge Dandolo brought them to Venice. They were taken to Paris by Napoleon in 1797 to crown the Arc de Triomphe, and in 1815 they were placed in their present position by the Emperor Francis.

YORK MINSTER.

In 1898 the Dean of York issued a special appeal for funds for the preservation of York Minster. After an expenditure of more than 50,000*l.* the work is almost complete. From time to time there has been issued to subscribers a report on the restoration work. The twelfth of these "Occasional Papers" by the Dean has now appeared. In the course of it he says:—

"The stone and glass of the nave clerestory windows have now been put into a condition of thorough repair. The subjects on the latter are entirely heraldic shields, and in order that they may be duly appreciated it is well to remember the purpose and significance. Mediæval heraldry

was no matter of mere caprice or ornament. Armorial bearings could only be assumed or displayed by the distinct authority of the Heralds' College, and as such they express the family and name of those to whom they had been granted, or of their legitimate descendants, and thus the preservation thereof in the nave of the Minster indicates that members of certain families were here at the building, or had contributed towards the expense thereof, but as there are no marks of cadency on the several coats it is impossible to say what members of the families are personally represented thereby. I can therefore only mention the names of those recorded as living during the period of the building of the nave, and likely to have been present here, and give short historical memoirs of them, but while indicating this it is impossible to guarantee the individual personality of any of them. Nevertheless, these shields enable us to idealise what manner of men supported the three Plantagenet kings in their attempt to subjugate the people and land of Scotland, and, however we may disapprove of the object which they had in view, we cannot but recognise the motives which animated them, their loyalty to the Crown, their courage in the face of a powerful enemy, their self-sacrifice in leaving the enjoyment of wealth and home at the call of duty, and their patience in bearing hardships and suffering even to death itself. We need such qualities still for the more reasonable and peaceable dealing with the circumstances of the day in which we live, and herein is an encouragement to those who have eyes to see and ears to hear, for though there is neither speech nor language, yet their voices may be heard amongst us, and their bright example should stimulate us to follow their good example, and do our duty in that state of life unto which it has pleased God to call us.

"The repairs to the stone and glass of the east window of the south choir aisle is another work which has been accomplished. The former had deteriorated so as to be scarcely equal to support the latter against the violent gusts of the east wind, and the glass itself had become so encrusted with soot and dirt as to lose in a great measure its brightness and beauty. It is difficult to say how much of the painted glass in this window includes portions of the original window, but there is evidently much which has been inserted from other windows, though all, save the fragments of a modern coat-of-arms at the top, is mediæval. And the golden eagle, one of the supporters of the Scrope family, together with the tuft of white feathers, their badge, and the golden lion sejant, their crest, which may be noticed here, seem to indicate that it was probably erected by Thomas le Scrope, of Masham, 1459, who established a chantry here for himself and the members of his house.

"There are still many windows requiring careful attention, and our purpose is to carry on the good work as rapidly as the means at our disposal will allow, so as to preserve as far as possible the unrivalled wealth of exquisite mediæval painted glass with which our Minster is enriched.

"The condition of the Choir Fund is now causing us some little anxiety. It seems only right that the music of the services in such a building as York Minster should be in harmony with the dignity and beauty of the building, and we should therefore very much regret if we are compelled to reduce the members of our choir. During the last two years the annual amount received has depreciated by nearly 200*l.* During my tenure of office the necessary funds for the fabric and services of the Minster have been munificently augmented by substantial personal donations, and also by the active efforts of those who have in various ways endeavoured to enlist the liberality of others therein. . . . The munificent bequests of the three Miss Duncombes, who had a life-long devotion to the Minster, are materially assisting us to carry on the many details in the needful work of restoration, which is still incomplete. But the Choir Fund languishes, and while so many participate from time to time in the services of their Cathedral Church, I feel confident that they will not leave them to be solely maintained by the residents in the Cathedral City.

"Suggestions have been made to me that a memorial statue to the late King Edward VII. should be placed in the Minster, but I have purposely refrained from taking any action therein lest I should seem to be forestalling those who had a stronger claim to take the initiative. The year of mourning is, however, now fast passing away, and if anything is to be done it should be done at once. After due consultation, therefore, I venture to say that if the necessary funds can be subscribed—100*l.* to 120*l.*—a statue of the late King shall be placed on the bracket at the south-east end of the choir, immediately opposite the statue of King Edwin. It would be an appropriate position. For they were both

MODERN EUROPEAN ARCHITECTURE.
GERMANY.

STREET FRONT OF HOUSE AT DAHLEM-GRÜNEWALD, BERLIN.—Herren PAULUS & LILLOE, Architects. [From *Berliner Architekturwelt*.]

"peacemakers," though necessarily differing in their action according to the times in which they lived. King Edwin endeavoured to secure the peace of faithful Christian people of his kingdom by defending them with his life from the aggressive violence of the heathen Penda, King of Mercia. King Edward sought to promote peace amongst the nationalities at home and abroad by active and incessant efforts of mutual conciliation, which by God's blessing maintained harmony and good feeling amongst the nations of Europe."

Mr. R. C. Green, clerk of works at the Minster, reports to the Dean as follows, under date February 13, 1911:—

"Since the issue of your last occasional report the nave clerestory windows have been under repair. On the south side five windows were taken in hand; the lead work of these windows was in a very bad state, and much of the glass broken. The whole of the glass was carefully removed to the stone yard, where in one of the sheds, specially arranged for this purpose, it was carefully repaired by glaziers accustomed to this particular work and under my inspection. None of the glass was removed from the premises, no attempt being made at restoration, plain glass being put in where glass was missing. Where the glass was simply cracked strengthening leads were added, but in some cases it was found necessary to re-lead whole panels. The mullions to these windows were in a very bad state. Owing to the corrosion of the very large saddle-bars the mullions in many instances were split from sill to springing. In addition to this, they were considerably decayed and unsafe, considering the amount of heavy tracery which they had to support. The stone work in the tracery was also in a bad state and had to be partially renewed. Great care was taken with the old stone, and every piece possible was saved. All the old saddle-bars were re-used, but shortened, and copper ends were attached to them, as so much damage had been done by the iron bars being let into the stone. After the completion of the five windows on the south side, six windows were taken in hand on the north clerestory. The glass in these windows was in a similar condition to that on the south, but the stone work was not in such a bad condition; the mullions of the windows were, practically speaking,

renewed, but it was not necessary to remove the whole of the tracery as had been the case with regard to the south side windows.

"The south side windows were taken in hand in May 1908, and finished in November 1909. The windows on the north side were commenced in July 1909, and finished in September 1910. The total sum expended on the eleven windows amounted to 2,593*l.* 7*s.* 1½*d.*; this works out at about 235*l.* 15*s.* 2*d.* per window.

"In September 1910 the east window of the south choir aisle was taken in hand and treated in a similar way to those in the clerestory. The stone work generally was found to be fairly sound, but the glazing was in a very bad state, and in need of urgent repair. This window was completed on December 30, at a cost of 201*l.* 12*s.*"

GUILD OF ARCHITECTS' ASSISTANTS.

At a meeting held at Prince Henry's Rooms, Fleet Street, on April 10, Mr. T. H. B. Scott took the chair. The Hon. Secretary reported that two further suggestions of the Guild to the Registration Bill Committees of the R.I.B.A. and the Society of Architects had been duly acknowledged by those bodies. They were as follows:—A clause to legalise a scale of salaries for assistants, subject to approval of qualification by the Registration or other agreed authority. That the general provisions of the Bill should offer greater security to the pupil by surveillance of his progress, on request, and ease of appeal to the Registration or other agreed authority, by his parents or guardians when necessity demands. Also, that the present position of the assistant in relation to open competitions be retained. These, combined with the two previous proposals of the Guild—(1) registered practitioners to employ only registered men as assistants; (2) restriction of the number of pupils and unpaid assistants in the office of a registered practitioner—represented the first concerted attempt to put forward the claims of the assistant to the two premier architectural societies.

MODERN EUROPEAN ARCHITECTURE.

GERMANY.

[From *Berliner Architekturwelt*.]

GARDEN FRONT OF HOUSE AT DAHLEM-GRUNEWALD, BERLIN.—Herren PAULUS & LILLOE, Architects.

It was agreed to open a special fund to bring the proposals of the Guild to the notice of assistants generally, and circular letters to all sympathisers were being drawn up to that effect. The Hon. Secretary then dealt with the present position of the Guild and the various objections which had been raised against it. He pointed out that every object of the Guild had its corresponding item in current architectural politics. The trade union objection to the Guild had an equal bearing on the policy of the R.I.B.A. and the Society of Architects. He thought that objection merely a matter of prejudice rather than reasoned analysis, and that the slightest actual acquaintance with the trade-union movement would suffice to show the absurdity of it. A letter he had addressed to the *R.I.B.A. Journal* of April 1 on this subject was then read. That letter dealt conclusively with the current objections to trade unionism, and, at the same time, indicated some measures of a trade-union character which were being adopted by the profession and others which could be adopted with equal success. In reference to the registration proposals of the Guild, the first two had been said to unduly interfere with the liberty of both the assistant and the principal; but this undue interference was believed by the Guild to be necessary for the future welfare of the profession. A well-known member of the R.I.B.A. Council had confessed to having spent 25 years as an assistant, and every member of the profession had to spend a shorter or longer period as such, and many, an increasing number, never attained the position of principal. This being so, it appeared only reasonable that the framers of a Registration Bill should pay some attention to the probationary period passed as a commonplace grub, as well as that of the imago and final stage of professional success, to which the general principles of the proposed Bill were exclusively directed. The first proposal of the Guild—"That registered practitioners should employ only registered assistants"—was put forward with the object of preventing a state of affairs which had arisen in the legal profession, namely, that of creating a crowd of un-

registered assistants, that is, unarticled students not training to acquire the registration qualification, who would come into keen competition with the articled student, and necessarily reduce his market value. The influx of students to the towns, and especially to London, for the purpose of study and examination would aggravate this result. The second proposal, that the number of pupils and unpaid assistants in a registered practitioner's office should be restricted was prompted by the same object. It was clear that a practitioner with a certain amount of work in his office could only superintend the studies and experience of a certain number of pupils, and if that number was exceeded it would be to the detriment of the pupil. The latter proposal of the Guild, relating to the pupil, would automatically fix the number of pupils satisfactorily manageable in an office. The unpaid assistant was to be apologised for by inexperience and the necessity of extending the period of early study as improver, but after that time he was in serious competition with the assistant who depended upon his salary largely, if not entirely, to exist, thus becoming a serious stumbling-block. The Guild holds it to be criminal on the part of the principal and the unpaid assistant to continue their relationship when it is evidently detrimental to the mass of assistants. Again, the third proposal of the Guild, to legalise a scale of salaries for assistants would, if adopted without the two first or their equivalent, become quite artificial and independent of the current market value of the assistant.

A discussion followed, in which Mr. J. V. Hibbert, F.S.I., pointed out that the object of the Guild dealing with the formation of a Federal Council of all Architectural Societies had now come about in spite of the derision with which it was met two years ago. The Chairman pointed out the strength and usefulness of the National Union of Teachers in reference to school work and how many improvements in school planning had their origin in that body. At the conclusion of the meeting Mr. J. E. Winfield was elected a member of the Council of the Guild.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *New York Architect* (New York) contains a number of beautiful illustrations as well as plans of the Hotel Rector, a sixteen-storey building on New York Broadway, opened at the close of last year, from the designs of Messrs. D. H. Burnham & Co. Another skyscraper illustrated is the New Whitehall Building, of which Messrs. Clinton & Russell are the architects.

The *Western Architect* (Minneapolis) is this month practically a monograph of the Capitol of South Dakota, of which Mr. C. E. Bell is the architect, and which is illustrated by a full series of photographs, as well as geometrical drawings.

La Construction Moderne (Paris) illustrates the new Palace of Justice at Rome, of which Signor G. Calderini is the architect, which has been in course of construction since the year 1888.

Der Architekt (Vienna) is occupied chiefly with domestic architecture from examples in Austria and Hungary, an exception being a new theatre in Budapest of ultra "new-art" treatment.

Construction (Toronto), apropos of the death of Mr. John M. Carrère, illustrates the New Public Library of New York, which was recently opened for the first time to permit the public to view the remains of its designer. Canadian buildings illustrated are the Head Office of the Royal Bank of Canada at Montreal and the Bank of Commerce at Winnipeg.

Engineering Record (New York) describes how an eighteen-storey building, 220 feet high above the street level, was built in 69 days, chiefly during December and January. This is known as the Underwood Building at the north-east corner of Vesey and Church Street, New York.

COMPETITION NEWS.

COVENTRY.—Mr. E. Guy Dawber, F.R.I.B.A., the assessor in the Coventry Municipal Buildings and proposed Town Hall competition, has delivered his award to the Council, and has selected the following as the three premiated designs:—(1) Messrs. Garratt, Simister, Buckland & Farmer, Norwich Union Chambers, Congreve Street, Birmingham; (2) Messrs. Couch & Barnard, 82 Victoria Street, Westminster, S.W.; (3) Mr. Herbert J. Rowse, Great Crosby, Liverpool.

LIVERPOOL.—The Finance Committee of the City Council last week, after considering plans prepared by the City Surveyor, Mr. Shelmerdine, and the Baths Superintendent and Engineer, for proposed baths on a portion of the old George's Dock site, decided to invite designs from architects for the elevations. Three premiums of one hundred, fifty and twenty-five guineas will be offered for the designs adjudged to be first, second and third in the order of merit. It is understood that the estimated cost of the scheme is about 70,000l.

LONDON.—Mr. J. W. Winter, architect, Sheffield, has been successful in a competitive scheme for the proposed St. Mary's Hall and Institute, Osterly Park, London, to cost 3,000l.

ST. AUSTELL.—The local cottage hospital committee recently invited architects practising in the county of Cornwall to submit designs for a cottage hospital, to be erected on the Trewoon Road at a cost of not more than 1,500l. Three premiums, viz., 12l. 12s., 8l. 8s., and 5l. 5s., were offered. Mr. H. L. Thornely, F.R.I.B.A., the assessor, has now selected the designs submitted by Messrs. R. F. Wheatley, F.R.I.B.A., & E. H. Sedding, F.R.I.B.A., of Plymouth.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Undeveloped Land Duty.—A Warning.

SIR,—Demands are now being made upon owners in all parts of the country for the new annual land tax of one halfpenny in the pound on the capital value of all land possessing any value over and above its value for agricultural purposes.

As the operation of the Budget land taxes is so uncertain, and so little understood, may I draw attention to the following important points:—

1. That no undeveloped land duty can be charged on any agricultural land let on a tenancy created before April 30, 1909, until the determination of such tenancy.

2. That, where under the terms of the lease or agreement the owner has power to take the whole or any part of such land for building or other purposes, the duty cannot be charged until the earliest date, after the commencement of the Act, upon which the tenancy could be determined.

The commencement of the Act was April 29, 1910.

It is therefore clear that where land was let even on only a yearly tenancy (and there was no power to determine the tenancy under any special arrangement) no duty can be charged until after Michaelmas 1911, as this would be the earliest date on which the tenancy could be determined by notice, and in the case of a Lady Day tenancy no duty can be charged until Lady Day 1912.

Already several of our members have been served with demands for this tax for the years ending March 31, 1910 and 1911 respectively, but, acting on advice, have objected and been discharged from the liability. It is safe to say that very little undeveloped land duty becomes payable until after 1912, and owners are urged to carefully investigate the demands made upon them.—I am, sir, yours faithfully,

C. H. KENDERDINE,

Secretary of the Land Union.

St. Stephen's House, Westminster, London, S.W.:
April 12, 1911.

Licentiates.

SIR,—I shall be very much obliged if you will kindly call the attention of your readers to the fact that by a resolution of a special general meeting on March 20, confirmed at a subsequent general meeting on April 10, the Council was authorised to continue to elect Licentiates until the end of June 1912. I may mention, however, that although the last date on which Licentiates can be elected is June 30, 1912, all application forms, drawings, &c., must be received here before May 31, 1912, at the very latest.—Faithfully yours,

IAN MACALISTER,

Secretary, Royal Institute of British Architects.

April 12, 1911.

The Decorator in Ancient Times.

SIR,—In reading the report of Mr. Noel Heaton's paper in your current publication, there is a point mentioned on page 233, in the first column, which is apparently contradictory.

Dealing with the analysis of the plasters, the author states "that it is composed of pure lime without any additions," following this up with an analysis giving calcium oxide 51.93 per cent., which, being combined up with CO₂, gives practically the figure of 41 per cent. found by analysis. The author further states that the analysis given is not inconsistent with the possibility of marble dust (CaCO₃), but the contradiction is seen in the closing paragraph: "Two years (of experiments) has failed to reveal any other material in the original plaster than caustic lime"—after giving a characteristic analysis of carbonate of lime.

Trusting that the answer to the above will interest others, as it will yours respectfully,

GEO. H. ROWE.

THE death occurred suddenly last Sunday at Woodhall Spa of Mr. George Hastings Fowler Jones, architect, of Chestnut House, York. Mr. Jones was associated in business originally with his father, an ecclesiastical architect of some eminence. He had been employed in the design of several important public buildings. He was for some years secretary to the York School of Design, which was founded by William Etty, R.A., and he took a deep interest in all matters pertaining to art in the city.

THE late Mr. James Ogden gave 4,378l. to the Rochdale Corporation in 1901 to be spent on pictures for the Art Gallery, on condition that the interest should be allowed to accumulate for ten years. The principal now amounts to about 6,400l., and the Art Gallery Committee have just made their first purchase under the endowment. The picture is by Mr. Edward Stott, A.R.A., and is entitled "There was no Room at the Inn," representing the Nativity. It was exhibited at the Academy last year.

FORTHCOMING EVENTS.

Monday, May 1.

Royal Institute of British Architects : Annual General Meeting. Concrete Institute : Visit to the Building Trades Exhibition at Olympia. Lecture by Mr. R. W. Vawdrey on "Reinforced Concrete."

Society of Engineers : Paper by Mr. H. C. H. Shenton on "The Protection of Water Supplies," to be read at the Institution of Electrical Engineers, Victoria Embankment, W.C.

Tuesday, May 2.

Royal Society of Antiquaries of Ireland : General Meeting at Kilkenny, May 2-3.

Building Trades Exhibition : Institute of Clayworkers.

Wednesday, May 3.

Royal Archaeological Institute : Miss E. K. Prideaux on "The Sculptured Figures on the West Front of Exeter Cathedral Church," to be read in the apartments of the Society of Antiquaries, Burlington House, W.

Royal Society of Arts : Mr. A. W. Gattie on "The Improvement of London Transport."

Building Trades Exhibition : Visit of the Society of Architects.

COVENTRY MUNICIPAL BUILDINGS COMPETITION.

THIS is not one of those competitions in which the first premiated design is markedly superior to all others; indeed, we fail to see that as regards the plan it is superior or even equal to some that are not premiated, whilst it contains what seem to us to be serious faults, and we cannot agree entirely with the laudatory description given of it by the Assessor.

Mr. DAWBER says in his report: "The problem was not an easy one to solve, and as a consequence it has produced a series of designs greatly varying in merit." He might have added with truth "and in solution." Of the 130 designs submitted no two closely approximate, though there are some easily recognisable types, and the three premiated designs though widely differing are alike in the adoption of one principle which we must assume to have found favour with the Assessor and to be the cause of his preference.

The site, which is restricted in area for the accommodation required, is, although irregular in form, rectangular in its lines except for the principal frontage to Earl Street, a continuation of the old High Street of Coventry. This takes with the lines of the other boundaries, and is itself an irregular curve. The three premiated designs all show a symmetrical front to Earl Street, with a range of rooms and a corridor behind following its line more or less closely and having the principal entrance in the centre. All the other lines in these plans follow the rectangular boundaries of the site. This, then, appears to be the principle that alone commended itself to the Assessor, being the only characteristic, as far as we can see, that the three premiated designs have in common.

One of the most important points that has to be determined at an early stage by the designer of municipal buildings is the treatment of the corridors, whether they are to have rooms on one side only or on both sides. In this case the restricted area of the site has rendered it difficult to adopt the former method, which is undoubtedly preferable when space and funds permit, but very few competitors have boldly adopted the second method throughout. In the first premiated design a compromise has been effected; most of the corridors have rooms on one side, but some on both. Like most compromises, this is illogical. If some corridors can be lighted with rooms on both sides, why cannot all? The use of corridors, with rooms on one side only, leads, in a restricted and awkward site, to small internal areas, and the lighting of some of the rooms in the first premiated design appears to us to be deplorable. What sort of light can be expected from a well hole that is a right-angled triangle on plan 28 feet on the base and 10 feet vertical height? Can a committee room be adequately lighted with a high wall 10 feet in front of its principal windows? Even the Waterworks

Department does not seem to be properly treated with a high wall 16 feet in front of its windows. The Assessor's report says that the plan "is most economical." We fancy it will cost a good deal in white glazed brick and electric current.

Certain positions were suggested for some of the departments in the instructions to competitors, but it was made clear that these suggestions were not binding. MESSRS. GARRATT, SIMISTER, BUCKLAND & FARMER in the first premiated design have placed on the ground floor the Gas, Electrical, Rates and City Treasurer's departments; on the first floor, the Council Chamber, Committee rooms, &c., and the departments of the Town Clerk, the City Engineer and the Waterworks; on the second floor, the Medical Officer, the Education Department and the caretaker. In the basement they have located the Weights and Measures Department, and the stores, sample and testing room of the City Engineer. The Assessor's report says of this plan that "each department has been kept distinct and self-contained." We fail to understand this when the provision for the City Engineer is partly on the first floor and partly in the basement, which latter, by the way, is below the level of St. Mary's Street, the lowest part of the site, with windows whose sills are on the pavement level and on the street frontage, so that the windows could not be opened without the probability of the City Engineer's stores being gratuitously increased by passing boys.

It was clear from the instructions that Mr. DAWBER would attach importance to the relative amounts of corridor and room space, as the colouring of the plans was directed to show this and this alone. The report says of the first premiated plan that "the corridors are few and short." There is not a great amount of red, it is true, but there are several internal corridors and thoroughfare rooms that are coloured yellow, and as to there being "no wasted space" we cannot see the economy of two corridors side by side and communicating even if one is tinted red and the other yellow.

A good point in the planning of the Council Chamber, Committee rooms and Mayor's Parlour is their arrangement *en suite* so that they are admirably adapted for civic receptions, but against this the ante rooms are all corridors, and the Mayor and councillors cannot reach their rooms without passing through the ante rooms in which deputations may be waiting. In the case of hostile deputations the worthy councillors would be in a state of siege.

We were amused with the planning of the sanitary tower. It is religiously cut off, hospital fashion, by a cross ventilated lobby, but one w.c. has no external wall, and is merely an inside cupboard opening out of the lavatory.

Most of the competitors have found that the space required for the Municipal Buildings did not leave room for

EDINGTON CHURCH, WILTS, FROM SOUTH

a well arranged Town Hall of the area demanded, with 1,200 seats on the ground floor and 300 in the gallery, and have availed themselves of the permission to put 500 in a gallery and 1,000 on the main floor. In the first premiated design this is professedly done, but we can only count about 850 seats instead of the 1,000. Hence the plan looks very nice, and crush rooms, side corridors and other adjuncts are provided, including an assembly hall of good size which seems to be entirely innocent of daylight.

The elevations of the first premiated design are very satisfactory, and the Assessor's description is quite accurate, the symmetry of the Earl Street front and a good tower at the lowest point of the site giving a truly monumental character. We are inclined to suppose that Mr. DAWBER has been caught by the design of the elevations and rather cleverly spoofed by the plan.

The second premiated design, by Messrs. COUCH & BARNARD, places on the ground floor the Gas, Electric Light, Rates and Town Clerk's departments; on the first floor, the Council's accommodation, the City Treasurer and the City Engineer; on the second floor, the Medical Officer and Education departments and the caretaker; and in the basement the Waterworks and the Weights and Measures. Although there is apparently more red colour on this plan than on the first premiated, we consider that value has been obtained both in convenience and effect, and that the plan, in actual working, would be better than the successful one, even though the lighting of some of the rooms is not perfect as, for instance, when a room 25 feet deep is supposed to be properly lighted from an area 16 feet wide with a four-storey building in front of the windows. As we have said above, this plan follows the principle adopted in the plan of the first premiated design, but it does not do so in elevation by any means. Messrs. COUCH & BARNARD consider that the Roman Doric order treated in the French manner even to the inclusion of the Imperial eagle will "harmonise with the character of the old" buildings, St. Mary's Hall and

St. Michael's Church. Apart from the harmony the design of the elevations is dignified and good.

Mr. HERBERT J. ROWSE, the author of the third premiated design, has located on the ground floor the Town Clerk, the City Treasurer, the Gas and Rates departments; on the first floor, the Council, the City Engineer and the Waterworks departments; on the second floor the Medical Officer and the Education departments; and in the basement the Weights and Measures and the Electric Light departments. Mr. ROWSE has regulated his Earl Street front to a continuous circular curve of large radius and, as in the other premiated designs, produced a symmetrical elevation. Certainly this plan has too much corridor, some of it distinctly wasteful, as there are no rooms opening from a considerable portion. This third premiated design also presumes the Roman Doric order to be in harmony with St. Mary's Hall and St. Michael's Church, though it is here treated in an English and somewhat modern manner.

Of the 127 designs that have been unfortunate, the majority have adopted corridors with rooms on one side only, and although this has usually led to a multiplicity of internal areas and light wells, in some instances all the rooms are fairly well lighted. The few who have placed rooms on both sides of the corridors have thereby produced compact plans with well lighted rooms as, for example, No. 14. It is difficult to understand wherein lies the wisdom of the Assessor's judgment in selecting for the first place a plan which embraces the disadvantages of both methods of corridor treatment, when there are plans which give all the advantages of each respectively. In the majority of cases it is true that "each department has been kept distinct and self-contained" to a greater degree than in the first premiated plan, so here we fail to recognise its superiority.

The modern vogue of axial planning has obsessed many of the competitors, who have gone out of their way to

EDINGTON CHURCH, WILTS, FROM NORTH-WEST.

evolve axes and thereby manufactured difficulties for themselves, which, however, have often been surmounted very cleverly. With the peculiar shape of site in this instance, we think axes are not worth striving to attain.

There are so many of the unfortunate designs possessing merit in a greater or lesser degree that we can find space for only a few words of criticism. No. 11 has a good plan, which is rather extravagant in length of corridor, some of which does not do its fair share of work. No. 13 is axial and cleverly symmetrical, but some of the rooms are lighted from small areas.

No. 14, as we have already noted, has adopted the principle of placing rooms on both sides of the corridors, and is one of the best plans of the type. After all, is it not better in municipal buildings to have well lighted rooms and borrowed light to corridors than brilliant corridors and dull rooms? No. 26 has a simply laid out plan, but with the faults of drawing office and Medical Officer's laboratory looking south into an area. This design has good elevations of the modern competition type of Renaissance. No. 39 has a fairly good plan with a commendable modern Gothic treatment of elevations. No. 43 shows great ingenuity in struggling with eccentrically-shaped rooms, which are good in effect. The elevations here also are of the modern competition Renaissance type.

No. 55 has excellent elevations, and in plan has adopted a device common to several others of top-lighted rooms on the ground floor. No. 57 is an example of a fair plan of axial type, following the most favoured line bisecting the angle between the rear of the site and Earl Street. This design has a good detail drawing. No. 64 has a quite unusual type of plan with a grand staircase leading to an assembly room. No. 66 has made a bold attempt at a symmetrical plan which has many good points. The elevations are well treated in a Renaissance manner. No. 69 has endeavoured to get over the awkward line of Earl Street and arrange a symmetrical

plan by a recessed hollow on the front line. The one-sided corridor is adopted, but the Gas Showroom seems to be rather dark.

No. 72 is one of those adopting the direct lighted corridor, who has produced a good plan. The elevations have a decidedly sturdy character combined with fairly good Gothic detail. No. 79 is one of the pronounced axial type, resulting in a quite decent plan. No. 81 is another axial plan of simple arrangement, with the Council Chamber next Earl Street, a position avoided by most competitors. No. 87 has an implicit belief in the capabilities of modern steel construction and reinforced concrete, and has arranged his plan on various floors with a sublime disregard of walls below. The internal areas are scarcely satisfactory. The elevation and detail show a Gothic treatment that is neither too aggressively modern nor too strictly archaeological. No. 93 is a good plan, thoroughly architectural in conception, with an ante room to the Council Chamber 1,200 square feet in area. One room is lit from a court 14 feet wide. The elevations are good. No. 105 is a good plan, with rooms both sides of corridors. The elevations are decidedly twentieth-century Gothic, but of excellent character. No. 113 has a plan free from small areas and with a short length of corridor. The detail is quite good. No. 118 has a rather good plan with Renaissance elevations well detailed.

We append Mr. GUY DAWBER's report on this competition:

I have most carefully examined the 130 designs submitted in competition for the Municipal Offices and Town Hall, and after a long and exhaustive comparison have placed first that numbered 31.

The problem was not an easy one to solve, and as a consequence it has produced a series of designs greatly varying in merit.

The instruction to competitors that "the Council felt strongly that the new building should harmonise with the character of the old" somewhat hampered the independent

EDINGTON CHURCH, WILTS, FROM SOUTH-EAST.

treatment of the subject, and competitors have either dealt with it in a so-called Gothic spirit, or have thrown this aside and designed their buildings in the freer Classic style of the day.

The site is a somewhat difficult one to deal with, as the Municipal Offices, having to occupy the entire frontage to Earl Street, necessitated the buildings being spread out, and tended to the multiplication of corridors leading to the various departments.

The number and variety of these departments, and their grouping and relationship to each other, all constituted an important factor in any decision upon the merits of the respective plans.

The author of design marked 31 submits an extremely well-thought out scheme for both the Municipal Offices and the Town Hall. The plan is admirably arranged and is most economical, the corridors are few and short, and there is no wasted space; each department has been kept distinct and self-contained, and the Municipal Offices can be erected quite independently of the Town Hall, and do not encroach unduly upon the Hay Lane frontage.

The elevations have been broadly treated with a certain amount of Gothic feeling, simple yet monumental in character, which would harmonise well with the style of the old buildings in the city, and, in my opinion, the whole scheme is by far the best one submitted in the competition.

I further consider that the second best design is that numbered 104, and the third that numbered 76.

Messrs. Stoner & Sons, quantity surveyors, of London, have checked the cubical contents of all three designs, and whilst they are of opinion that the scheme submitted for the Municipal Offices numbered 31 could be built for the sum stipulated, yet they think a somewhat too sanguine view has been taken of the cost of the Town Hall, but this would depend upon the character of the building as worked out in detail.

I therefore advise, subject to the fulfilment of the conditions and instructions to competing architects, that the author of design No. 31 be appointed architect to the new buildings and receive, in addition, the sum of 150*l.*, that the author of design No. 104 be paid a premium of 175*l.*, and the author of design No. 76 receive a premium of 125*l.*

EDINGTON AND ITS MONASTIC CHURCH.

THAT noble pile of masonry, Edington Church, nestling amongst the trees in the valley of the Wiltshire Downs, was dedicated in the year 1361 by Robert Wyville, Bishop of Sarum, to the honour of St. Mary, St. Katherine, and All Saints. If not wholly built by William de Edington, the celebrated Bishop of Winchester, there can be but little doubt that the chancel was erected by him when other parts of the building were adorned and renewed. It is considered the only perfect monastic church remaining in the county.

William de Edington, a native of this place, founded a chantry or college here for a dean and twelve secular priests about the year 1347, but this college, by desire of Edward the Black Prince, was converted in 1358 to a monastery of the Augustinian order of "Bon-hommes," which was governed by a rector.

The rectory of Edington belonged to the Abbey of Romsey, of which the rector was a resident prebendary, and the parochial duties, with the services in the church, were discharged by a vicar.

In the reign of Henry VIII. the establishment was dissolved, and the site and buildings granted to Sir Thomas Seymour.

It is a large, cruciform edifice of stone, in the Transition style from Decorated to Perpendicular, and consists of a chancel, clerestoried nave, transepts, and south porch with parvise, and a fine embattled tower rising from the intersection containing six bells. The windows, niches, buttresses, pinnacles, &c., of the chancel are very fine examples of the Christian architecture of the age when the Bishop lived, and will be found to afford satisfactory evidence of being coeval with, and analogous to, the west front of Winchester Cathedral.

There is a window containing glass of the fourteenth century; the windows of the north aisle also retain a great deal of the original stained glass. A piscina and rood screen still exist. The nave contains a richly-carved octagonal Jacobean pulpit. In the chancel is placed a large, carved

INTERIOR OF EDINGTON CHURCH, WILTS.

monument, consisting of two statues larger than life, by Chantrey, to commemorate Sir Simon Taylor, Bart. Amongst others there are two canopied tombs of the fourteenth and fifteenth centuries.

Bishop Edington, as stated above, was born in the village of his name, but neither the year of his birth nor the condition of his relatives appear to have been recorded. His early life is equally obscure. Whilst a student at Oxford he appears to have attained a proficiency in all the scholastic learning of the age. Having acquired the acquaintance and favour of Edward III., who highly regarded him for his distinguished talents, he was, in April 1345, made treasurer of England, and in the following year consecrated Bishop of Winchester. This latter promotion was bestowed by monks who had previously elected John le Devenith, one of their own body, to fill the vacant see. But by way of compromise he was made Abbot of Canterbury.

In 1350, on the institution of the Order of the Garter, Bishop Edington was appointed the first Prelate, or Chancellor of the Order, a dignity which was to descend to all his successors, Bishops of Winchester.

In 1357 he was constituted Chancellor of England. He

died in the year 1366, after a very distinguished career, and was buried in the nave of Winchester Cathedral, which he had begun to re-build at his own expense, and he also bequeathed a considerable sum of money for the work to proceed.

The domestic buildings of the monastery at Edington were on the north side of the church, and of which there remains the Prior's house, now a farm-house. This contains some modelled plaster ceilings and some very fine oak panelling. The north aisle formed one side of the cloister garth, the windows of the aisle being shorter than on the south side, and the lower part of the side window of the transept built solid to admit of the cloister roof coming below them. It may be mentioned that the weather mould over the roof still exists.

The entrance to the church from the monastery was by the doorway into the north aisle at the south-east angle of the cloister, and the arch of the doorway is unlike any other throughout the building, enriched with carving.

The church was built for the double purpose of a monastery and a parish church—its plan has been arranged for this, and the details of the separate parts have been designed to emphasise their use.

SCREEN IN EDINGTON CHURCH, WILTS.

It will be seen that the chancel (the monks' choir) and the transepts, which were used as chapels, have a distinctly different treatment to the nave and aisles, which formed the parish church. The windows of the monastic church have a distinct type of tracery; their mouldings are richer and more varied; plinths on the outside and string courses both inside and outside are carried round this part only; the buttresses here are terminated by pinnacles, and the gargoyles are carved, whilst those of the parish church are plain. The chancel being the church of the monastery, the parish altar was placed under the western arch of the tower, the way to the chancel from the cloister being behind it.

The chancel is divided from the nave by a beautifully-carved wooden screen, standing on a plinth of stone. The screen itself is filled with plain panels below the middle horizontal rail, and the grooves in the mullions of the upper part indicate that there were solid panels here also, behind the existing traceried heads. Thus with the exception of the open framing of the upper half of the doors, the screen entirely shuts out a view of the chancel from the nave. The doorway has a four-centred arch supported by shafts with carved capitals on the joints. The loft over is seven feet wide, the eastern face being supported by a carved beam.

A noticeable feature in the design of the church is that effect is produced by good proportions, solid construction, and rich mouldings rather than by carving. The leading principle in the construction of the groups of mouldings at Edington is that which is a special characteristic of Perpendicular work—that all lie on the splay or chamfer plane, and the projections of the various members all touch the line of that plane. The splays, whether sunk, or not, are all parallel to this line, so that the mouldings are, as it were, sunk from the surface represented by it. This applies not only to jamb and arch mouldings, but also to the undersides of string courses and cornices.

The church was restored in 1889-92 at a cost of about 8,000*l.*, and the strict and laudable attention paid to the chancel during the renovation by Mr. Watson Taylor, the lord of the manor, has resulted in this once beautiful and interesting part of the edifice being restored to its pristine character.

YORK AS AN ART CENTRE.

MR. C. F. BELL, the Curator of the Department of Fine Art, Ashmolean Museum, Oxford, who recently visited York in order to see the Etty collection of pictures, has written an interesting letter to the Chairman of the Etty Exhibition and Statue Committee, in the course of which he says:—

The impression which a stranger interested in museums and art galleries gets from a visit to York is one of magnificent opportunities awaiting development. The city is endowed with a beautiful and extensive site—the ancient precinct of St. Mary's Abbey—devoted to scientific and artistic purposes, and upon this site is a group of architectural remains of matchless interest and several carefully-planned modern buildings, ideally capable of adaptation into a series of museums. The whole may be said without fear of contradiction to afford material for a scientific, archaeological, and artistic park of quite unique character, interest, and charm.

As for the collections, the library and scientific collections of the Yorkshire Philosophical Society have long been famous; the series of local Roman antiquities is not only of the highest archaeological order in itself, but makes that poignant appeal to the imagination which only antiquities exhibited upon what is practically the actual spot of discovery can make.

The contents of the cases of mediæval pottery are certainly not surpassed, if, indeed, they are equalled, except, perhaps, by those of similar wares in the British and Guildhall Museums; and contain numbers of specimens not to be matched anywhere. It is not too much to say that nobody can pretend to a knowledge of mediæval pottery who has not studied the York collection. Yet the whole effect is so sadly marred by crowding and lack of arrangements that nobody but the special student can realise the extent and meaning of the collection.

The manner in which the priceless Roman antiquities are displayed is mean and unworthy, the impossibility of controlling the temperature and humidity of the atmosphere in the old hostel—picturesque and appropriate as it is in many ways for its purpose—is becoming increasingly evident from the condition of the specimens and the mounts. Many of the bronze objects are beginning to decay in an alarming manner.

Not less precarious is the condition of the famous tapestry maps in the Lecture Hall, which are in a deplorable state of decay and dirt, and require immediate attention.

Turning to review the condition of things upon the northern side of the wall, which at present divides the Abbey precinct, a state of affairs almost the counterpart of that hitherto indicated presented itself. There are extensive modern buildings in excellent repair erected in anticipation of collections which have not yet arrived to fill them. The vast block of buildings, containing the Corporation Art Gallery, with the School of Art and attached halls, exists, so far as museum purposes are concerned, to enshrine the Burton collection, a few isolated pictures, and two or three cases of loans from the Victoria and Albert Museum, in one of its smaller apartments. The collection contains many pictures of interest and charm, which with sympathetic hanging might be made even more effective than at present.

In France it has long been the excellent custom of the State Ministry of Fine Arts to concentrate the interest of provincial museums on the productions of the artists to whom the towns where such museums are located have given birth, thereby stimulating patriotism and encouraging talent in local centres. In England this duty has fallen to private patrons, and has latterly been accepted as part of the duty of municipal bodies. It is only necessary to instance as fruits of this policy the admirable collections of the works of David Cox in the Birmingham and of W. J. Muller in the Bristol Corporation Galleries.

York has always been fertile in artistic genius, the only city in Europe which can boast of a school of glass-painters of the highest order, which flourished continuously for above five hundred years. She has in latter days given birth to a galaxy of painters, Etty, Albert and Henry Moore, and many others, dead and living, of scarcely less eminence. The capital of the largest county in the kingdom, a county not willingly consenting to stand second to any other in wealth and patriotism, endowed with the materials of a perfect museum and the incentive of local pride in her great men to urge her to combine these materials, it would seem that all that is required is some concentrated effort and a little contagious enthusiasm amongst the citizens. The existence of these qualifications, if only amongst a few individuals, has manifested itself in the recent Etty Exhibition; an admirable display and an excellent example of what the organised determination of a handful of enthusiasts can do. May it mark the beginning of a brighter era for the arts in this city! In the first place, by enriching the permanent collection with a group of characteristic paintings by this great master. In the second, by leading to the formation of similar exhibitions of the works of Albert and Henry Moore and of other York artists which may also be expected to leave behind them some permanent residuum in the Corporation Gallery. In the third, by awaking the civic consciousness to the fact that everything is not for the best in the present distribution of the buildings and collections which the city is to be envied and congratulated for possessing.

COMPETITION NEWS.

COVENTRY.—Coventry City Council on Tuesday accepted the award of the Assessor in the competition for designs for proposed Municipal Buildings and Town Hall, and decided to take the necessary steps to proceed with the Municipal Buildings portion of the scheme at an estimated cost of 49,469*l*. The City Council accordingly appointed Messrs. Garratt, Simister, Buckland & Farmer, architects for the new buildings, leaving the Town Hall portion of the scheme to be proceeded with at some future date, the estimate for this portion of the work being placed at 15,072*l*.

ILFRACOMBE.—The Urban District Council has decided to invite competitive plans for a free library.

NEWTON ABBOT.—In response to the invitation for competitive plans for the proposed Seale-Hayne College some 60 or 70 applications have been received for particulars. Prizes of 100*l*., 50*l*., and 30*l*. are being offered by the Governors for the best set of plans, and the Assessor, Mr. Smith, J.P., of Reading, has provided block plans on which the competitors have to base their work. The competitors have to design a building the cost of which will not exceed 20,000*l*., but at the same time they must provide for extensions to be carried out at some future date, in character with the main building, at an estimated cost of 10,000*l*. Mr. Smith will judge the competitive plans, and it will be open

to the Governors to adopt any set they please. The College will be erected on the Houghton Barton Estate, situate about a mile from Newton Abbot on the main road to Ashburton, and in the parish of Highweek. The competitive plans have to be submitted to the Assessor by the end of June.

SOUTHAMPTON.—Twenty-six sets of designs were sent in for the competition in connection with the new buildings proposed to be erected for Hartley University College. The award of the assessor, Mr. H. T. Hare, F.R.I.B.A., is as follows: 1st, Messrs. Clyde Young & H. S. East, 6 Lancaster Place, London, W.C.; 2nd (value 100*l*.), Mr. Edwin Cooper, 12 Gray's Inn Square, London; 3rd (50*l*.), Messrs. J. H. Hickton & Farmer, Birmingham.

SOUTH MOOR.—Out of 40 plans submitted for a parochial hall and church institute to be erected at St. George's Church, South Moor, that of Mr. James Garry, West Hartlepool, has been accepted.

WORCESTER COLLEGE, OXFORD.

By the Rev. S. H. W. HUGHES-GAMES, M.A. (formerly Scholar of Worcester College).

EVERY old building or group of buildings is like a palimpsest or corrected manuscript of some ancient tragedy or comedy—as to which of the two depends partly on the building and partly on the point of view. The elements of tragedy and comedy blend largely in the history of a college, and also not a little in its buildings.

In the library of Worcester College are some manuscript copies of forgotten plays; they are much corrected, they are brown with age, and they are bound together in a grey old cover, stained and marked in the lapse of years. The plays are not all of the same date or by the same hand; some are hardly legible, and the authors of some are unknown. It is much the same with the College buildings. To make the simile more complete we must imagine many of the pages of the plays torn out and others substituted in their places, and, indeed, some without substitutes at all.

Though in one sense "Worcester" is one of the youngest of Oxford colleges, in another it is among the oldest. Under its present name the College dates only from the year 1714, but for the real origin of the foundation we must go back as far as 1275, to the reign of EDWARD I. While the King was endeavouring to consolidate British rule by placing Wales and Scotland, with England, under one common Government, and nearer at home was using all means in his power to curtail the rights of the Church and the barons, Benedictine monks were considering how best they could secure proper supervision and accommodation for their students sent to Oxford for purposes of study. A meeting of the members of the Order in the province of Canterbury was held at Abingdon, and there it was decided to erect buildings at which the "brethren of our order, who are to be sent from the various monasteries to study, may live properly." Before this decision was carried into effect St. Peter's, Gloucester, one of the Benedictine houses, determined independently to build a college at Oxford. In 1283 JOHN GIFFARDE, of Brimsfield, founded a cell for thirteen monks of St. Peter's at Oxford "for the health of his soul," and that of his wife, MAUD LONGESPEE, who had been widow of the Earl of SALISBURY's son, and whom he had carried off by force, as she alleged, to his Castle of Brimsfield. Seven years later, with the consent of JOHN GIFFARDE, Gloucester College became part of a larger college—really a collection of cameræ or cells—for all the Benedictine Order in the province of Canterbury. From 1283 to 1541 these continued, under the name of Gloucester College, to minister to the educational needs of the Canterbury Benedictines. The following, according to Antony Wood, were the abbeys which furnished students—Gloucester, Glastonbury, St. Albans, Tavistock, Burton, Chertsey, Coventry, Evesham, Eynsham, St. Edmondsbury, Winchcombe, Abbotsbury, Michelney, Malmesbury, Rochester, Norwich.

To a visitor, who enters on a winter's afternoon, when the sun is setting the great gate of Worcester, the small

cottage-like buildings, part of those erected for the accommodation of the students, present a singularly picturesque and beautiful appearance. They stand on the south side of the modern quadrangle, and they still are aptly described in A. Wood's words: "Divided (though all for the most part adjoining to each other) by particular roofs, partitions and various forms of structure, and known from each other, like so many colonies and tribes (though one at once inhabited by several abbies), by arms and rebuses that are depicted and cut in stone over each door." Beginning at the east, or the nearest side to the gate, over the door of the first set of lodgings is a "griffin sergeant"; over the next a plain cross; further on a shield bears three cups surmounted by a ducal coronet; while at the extreme west end, nearest to the garden gate, is another shield bearing a mitre over a comb and a tun with the letter W. This letter may be either the rebus of WALTER COMPTON, or it may refer to Winchcombe Abbey. The chambers in the centre of the five blocks of buildings were "partly for Ramsey and Winchcombe Abbays"; and those adjoining them on the west side have been traditionally assigned to Westminster Abbey. In the small quadrangle, where are the modern buttery and kitchen, is another plain shield.

On the north side, hidden now behind the chapel, is a similar group of buildings to that on the south side. The first of these was allotted to the monks of Abingdon; the second to the monks of Gloucester. Here now are the senior common-room, a lecture-room, and some small sets of undergraduates' rooms.

In 1420 a chapel was erected on the site occupied by the present chapel. Previous to this date, doubtless, the parish church was frequented by the students; but they possessed a license also for a portable altar. So far we find no mention of a refectory. A library, however, was added at the same date as the chapel by JOHN WHETHANSTAL, Abbot of St. Albans, on the south side of the chapel, and at right angles with it. The Abbot himself, and by his influence HUMPHREY, DUKE OF GLOUCESTER, contributed many books—now lost—to the newly formed library.

For a century the College continued in uneventful prosperity; but with the Dissolution of the Monasteries there came inevitably a break in the continuity of its history. The College passed into the hands of King HENRY, and in 1542 it became the residence of the first Bishop of Oxford—Bishop KING—who had been the last Abbot of Osney. In 1559 Queen ELIZABETH gave over the College to WILLIAM DODDINGTON. From him it passed to the College of St. John the Baptist. In 1604 the then Bishop of Oxford tried vainly to recover it; and "made an entry by night, and by water, and did drive away the horse depasturing on the land belonging to the said Hall."

By this time the College had become a Hall. In 1560, under the presidency of its first Principal, a Fellow of St. John's College, on St. John the Baptist's Day, a hundred scholars dined for the first time in the monks' refectory, erected some time during the previous century.

A hundred years later these scholars had sadly dwindled in numbers. In 1675 and the three following years there were no matriculations at all; the paths were "grown over with grass, and the way into the chapel and hall made up with boards."

A view taken by LOGAN in 1675 presents a sad picture of ruin and desolation; it bears the motto: "Quare fecit Dominus sic domui huic?" ("Why has God dealt thus with our house?")

An interesting episode in the history of the College was the introduction in 1698 of five young Greeks, brought over from Smyrna. The experiment of maintaining a Greek college did not, however, prove a success, and in the year 1705 was finally abandoned.

About that time Dr. WOODROFFE, the then Principal of Gloucester Hall, a man evidently of energy and determination, though somewhat unscrupulous, was in negotiation with Sir THOMAS COOKES, a Worcestershire baronet, who had expressed his desire to found or enlarge some Oxford college with the sum of 10,000*l.*

There was a good deal of competition for the prize. Balliol, St. Edmund Hall, Magdalen Hall—all hoped to secure it. At one period it looked as if the money would go to establish workhouses in Worcestershire. Dr. WOODROFFE died in 1711; and it was a Fellow of St. John's, Dr. RICHARD BLECHYNDEN, who ultimately became first provost of the newly-founded College.

In 1720 building began, the funds for this supplied out of the "remnant of a disputed bequest." In 1746 the library was completed; in 1784 the hall; the chapel in 1786 was still unfinished.

Dr. CLARKE, Fellow of All Souls', and member of the University, and Mrs. SARAH EATON, daughter of a former principal, had left benefactions—the one to endow six fellowships and three scholarships, the other seven fellowships and five scholarships to be held by sons of clergymen. These foundations were incorporated by charter in 1744. Between 1753 and 1759 Dr. CLARKE's trustees erected nine sets of rooms to lodge his foundation; in 1773 the remaining part of the north side of the quadrangle was demolished to make provision for twelve sets of rooms for Mrs. EATON's foundation. Simultaneously with these the present provost's lodgings were built.

Previously, in 1741 and 1744, the College had purchased from St. John's College the ground now forming the gardens and meadows to the south and north and west of the College. In 1801, by purchasing the "King's Head," then in front of the College, and clearing away "Woodroffe's Folly" in 1806, an open frontage was secured. About the year 1827 the then Bursar, Mr. CRESSWELL, laid out the gardens very much as they now appear. In 1820 Beaumont Street was opened up; before that time the College could only be approached by George Street, Stockwell Street, or Friars' Entry. In 1821 three additional sets of rooms were added; and in 1824 the roof of part of the old building was raised to make six new sets of rooms. In 1844 a new and commodious kitchen was built and seven additional sets of rooms constructed.

Such briefly is the history of the buildings as they now stand; their ornamentation and further details may be left for a second paper.

ILLUSTRATIONS.

OXFORD COLLEGE SERIES.—WORCESTER.

A HISTORICAL account of Worcester College appears above, and we this week present the first of our series of illustrations.

ORIGINAL SKETCHES BY THE LATE HERBERT RAILTON.

THE modus operandi of a great draughtsman has always a peculiar interest, and these sketches by Herbert Railton show the kind of preliminary studies that formed the personal memoranda from which he afterwards made finished drawings.

PUGIN STUDENTSHIP DRAWINGS.

THIS week we reproduce some of the drawings submitted for the Pugin Studentship this year by Mr. F. J. Lenton and Mr. S. Clough.

At a trustee meeting at Stenalees, it was decided to proceed with the erection of a Wesleyan Church and school at a cost of 3,300*l.*

SIR ROWAND ANDERSON recently examined the condition of the external stonework of the new portion of Dunfermline Abbey, and has informed the heritors that the cost of repair would probably be about 1,000*l.*

THE Dudley Education Committee have invited architects practising within eight miles of Dudley (including the area of the city of Birmingham) to send in their names as competing architects for a school to be erected at a cost of about 5,000*l.* A selection from the applicants is to be made to-day, the 28th inst.

THE ARCHITECTURAL ASSOCIATION.

N Ordinary General Meeting of the Association was held on Monday, April 24, at 18 Tufton Street, S.W., Mr. A. Keen, President, presided.

The President read the report of the scrutineers in connection with the election of officers for the session 1911-12, which stated that there were 311 voting papers, or a decrease of sixty-three in the number of those voting last year. Of these two were rejected as invalid. The voting had resulted in the following elections:—President, Mr. Gerald C. Horsley; vice-presidents, Messrs. W. Curtis Green and W. J. Upper; members of the Council, Messrs. C. C. Brewer, G. Leonard Elkington, C. Wontner Smith, A. T. Bolton, Percy May, Sir A. Brumwell Thomas, G. Lucas, P. W. Lovell, George Field, Stanley Hamp, and A. G. Horsnell; hon. treasurer, Mr. A. Keen; hon. editor of the Journal, Mr. P. de Lafontaine; librarian, Mr. W. H. Ward; hon. secretary, Mr. H. A. Hall.

The Chairman proposed a vote of thanks to the scrutineers, whose work he said had been long and arduous.

The motion was carried.

Mr. Gunn announced the sixth spring visit to the Town Planning and Modern House and Cottage Exhibition, Gidea Park, Squirrels Heath, Romford Garden Suburb, on May 6, by kind permission of the committee of the Town Planning and House and Cottage Exhibition, and the directors Gidea Park, Limited. Members will travel by the 3.30 P.M. train from Liverpool Street station, and are requested to obtain their own tickets at the booking office. Tea will be provided by the directors of Gidea Park, Limited.

The President proposed a hearty vote of thanks to Mr. H. Reville Montgomery for arranging the visit to the Building Trades Exhibition on the previous Saturday, and for his hospitality on that occasion, and this was carried.

A vote of thanks was also proposed by the Chairman to the visitors in the School of Design. He said that Messrs. Ambler, Hare, May and Dawber had been to the rooms from time to time to inspect the drawings, and they were under great obligation to them. The motion was carried unanimously.

The President announced that the Association's play could be given in the long gallery of the Royal Institute of British Architects on May 30 and 31 and June 1 and 2. They were under great obligation to the Royal Institute for allowing them the use of the gallery, and he hoped they could show their appreciation by turning up in good numbers.

Mr. Horsley moved a vote of thanks to the Chairman, Mr. A. Keen, and retiring members of the Council, Messrs. J. Dare Clapham, Allen Foxley, Edwin Gunn, F. Winton Newman, and Henry Tanner; and Mr. Wornum, librarian. He said it was his privilege to welcome Mr. Keen to the chair a year ago, and he then ventured to say he would be a very good president. He was sure they would agree that he was a good prophet on that occasion, and they were greatly indebted to him for all he had done.

The motion having been carried, the President briefly replied, and also asked the meeting to accord a vote of thanks to the Professional Press.

Professor Beresford Pite then read the following paper

Alberti and Bramante: Architecture a Profession or an Art in the Cinque-Cento?

A rough generalisation may describe Brunelleschi, the sculptor, of Florence, as the discoverer of the interest and value of ancient Roman buildings, from whose enthusiasm and ability the whole course of architectural progress received that new direction in the first quarter of the fifteenth century which we know as the Renaissance, and upon the yet unexpanded tide of which we are still floating down the stream of time. Similarly, a century later, we may summarise in Michelangelo's career the realisation of that unity of art—entirely unique executively in his single personality—which reveals that sculptor, painter, and architect alike fulfil one mission and serve one mistress, not three. This unity, whether a truth or a doctrine we must each feel for ourselves, has found some verbal re-expression in our own day, though but little concrete exemplification if we except the work of that rare genius, Alfred Stevens, whom it is well-nigh impossible to claim as the product of the Italian national school, as he was truly English. The archaeological impetus of Brunelleschi also can be easily recognised as reproduced in our own antiquarianism, as well as his struggles with the competition system, and the registered trades unionism of the master builders of Florence. These influences gradually

create that personality in connection with the monuments of the Early Renaissance that had been lacking in the great Gothic buildings, and we are conscious of fellow-feeling and sympathy with colleagues who thus become our professional forefathers. The building arts are becoming individualised, the general march of tradition is being arrested, something more than apprenticeship to the craft and mystery of masonry is entering into the practice. Architecture, in short, the shadow of the architect himself, is emerging from those of the forest, and with the greater movement of thought and the revelation of the past as an operative force upon the present, he magnetises in his person the numberless details which formerly grew or grasped themselves naturally, and compels them to an obedience which is according to the law of his own thought and ideal.

In the century between the completion of Brunelleschi's struggle with the guildsmen over the construction of the dome of St. Mary of the Flowers at Florence, and Michelangelo's crown of an heroic artist's career in St. Peter's at Rome, we may hope to find further illustrations of the development of our own type of architect, student, enthusiast, and practitioner, for we, too, may have monuments to erect—even though no larger than Bramante's miniature temple—without the assistance of active building tradition other than that of the almost hopeless artistic ideals of the modern stone or brick worker and his trade society.

Two Italian architects in this period will afford these illustrations, each greatly differing in circumstance, character, and achievement, but both contributing impulses which are familiar and potent to-day alike to students and practitioners. These two men are respectively aristocratic and plebeian, one having the advantages of birth, wealth, and education, the other of the converse disadvantages. They are but partly contemporary, so we will proceed chronologically, but before entering into detail will generalise that the first represents the influences of literature, and the second those of successful practice in the constant struggle to get work and carry it out well and promptly. But in both we find the light of a clear and sweet architectural result in graceful buildings and grand design.

The mid cinque-cento was dominated by one architectural writer, just as the mid-nineteenth has been, but more completely and ultimately. The earlier was the dead hand of Vitruvius, revived by the ten books of Leon Battista Alberti, and the other by the stones of Venice, temporarily illuminated by the seven lamps of John Ruskin. The architect in both centuries had learnt to read and to write, and as an inevitable consequence forsook the limitations of a workshop education for the fairy lands of antiquity with extraordinary and often impractical distension of his imaginative faculty—that is, of that part of his brain action which differentiates him and makes him a specialist.

The widening view of the Renaissance epoch seems to have developed, out of a narrow embryo, that receptivity of idea which imagines and ultimately thirsts for originality. Vitruvius was, then, a fresh spring; the apparently intellectual basis, the philosophical connections, and the historical and mythological allusions with which his book, entitled "Architecture," abounds, all offered relief from the bondage of the craftsmen's traditions, and the narrowness of the ecclesiastical limits of art. How strange that after some four centuries of freedom the mediæval narrowness should again flow with the ideal light of a golden age of revealed perfection to the imaginations of such Victorians as Pugin, Ruskin, Street, and, shall we add, Morris.

It is claimed, I think most uncertainly, by Swift, upon the ground of certain proportional systems, that Vitruvius was not unknown to mediæval architects, but his work was practically without effect until the break up of the Eastern Roman Empire, early in the cinque-cento, directed scholars to the wealth of literary tradition and manuscripts which it embodied. Professor Aitchison, in his Royal Academy lectures in 1905, describes the discovery of the manuscript of Vitruvius by Poggio in 1414. It was not printed till, it is supposed, 1486, at Rome, but the book is without date.

Three editions were published before the end of the century—Rome, 1486; Florence, 1496; and Venice, 1497. Fra Giocondo published his illustrated edition at Venice in 1511, rapidly followed by others. Within a century of its discovery twenty distinct editions were published, thirteen in Latin and seven in Italian, the first of the latter being in 1526.

Professor Aitchison says that all the civilised nations of Europe began in the sixteenth century to issue illustrated editions; and according to the Codex, Vitruvius's original

book was illustrated, but that has disappeared without leaving any trace.

Alberti absorbed Vitruvius, reincarnated him, gave currency in practical application to his orders; but in liberality architecture, from mediævalism, enslaved it to his new classicism, and you and I by it live and suffer, for Alberti practically rules us to-day with orders, and thereby substance for examination questions, diplomas, registration, and licences, as well as excommunications and threatened deprivation of any liberty to assume the title of architect. To imagine architecture delivered from the pedantry of commentators, proportionalists, systematising ordinance creators, and all the supposed education which arises thereupon, you have only to transpose yourself into that first half of the cinque-cento before Alberti wrote his ten books on building, and rejoice that where ignorance is bliss art gains affectation only by wisdom.

Leon Battista Alberti was born in 1404 at Venice, where his father, Lorenzo, was living in exile. The Alberti family was one of the noblest of the Florentine aristocracy, seeming to Machiavelli to be "rather princes than a private family." The democratic party at Florence was directed by the Alberti, the Ricci, and the Medici families; they were deprived of power and exiled by the rivals, the Albizzi, in 1381, who directed the affairs of the city for well-nigh half a century. This was the most prosperous epoch of the Republic, during which the Renaissance budded into flower, the period of Brunelleschi, Ghiberti, and Donatello. The Pope, Martin V., in 1424, directed the Florentine magistrates to recall Alberti. His successor, Eugenius IV., made Alberti's uncle a cardinal at the Council of Florence in 1440. The Albizzi men succeeded by the Medici, Cosimo dei Medici, born in 1389, managed to return to Florence in 1428, and having opulence and European reputation as the head of a great commercial establishment, used his wealth and influence to effect a personal political ascendancy. In 1434, the year when Brunelleschi's cupola closed over the central space of the Duomo, he exiled the Albizzi and recalled the party of his friends. The political ambitions of the Medici family and their great wealth were combined with literary and artistic culture. Their sumptuous palace in Florence was the centre of intellectual life, and the Platonic philosophy was studied, discussed, and applied in the discussions of the academy garden.

The Albertis were not a negligible factor even in their exile, a heavy price lying upon their heads until Cosimo dei Medici's action put an end to the threatened assassinations.

Leon Battista grew up, therefore, in a strange atmosphere to that of a modern architectural student, and without much experience or promise of the restful conditions sometimes deemed so necessary to artistic work. He was early put to study law at the celebrated University of Bologna, amidst much promise of extraordinary gifts and determined character. We are told that as a boy of fifteen he solaced himself during a severe operation on his foot with his cithara and singing, and conquered a natural disgust for onions by steady perseverance in fighting nausea. He joined the hatless brigade of his day, to accustom himself to variety of temperature, and of this the hair on his medallion portrait seems to offer evidence.

The self-control of the stoic, indifference to wealth, ignorance of fame, but with abounding impetuosity and vivacity of character, combine to make him a singularly fascinating character. Versatility scarcely describes a young man who magnetised vicious horses, was unsurpassed in wrestling, javelin-throwing, and running and jumping—with an almost fabulous certainty of aim—and a then remarkable zest for mountaineering. His skill in and love of music has been mentioned, but he was also a reputable painter, a medallist, and a sculptor, and possessed equally with a burning enthusiasm for scientific study, as then understood, a dominating love of classical literature. He used to say that books at times were as brilliant jewels or sweet flowers in the delights they gave him. And when he felt these raptures to be alternated with disgust he fled to sports, arms, and wild nature for relief.

He was gifted with a gentle temper and a conversational charm that was never commonplace. His friends and biographers are as enthusiastic about his person and gifts as those of Michel Angelo later were about his art. He was silent, with a tendency to solitariness, and of a thoughtful cast of countenance; his friends delighted in his quiet humour, and repeated his moral dicta.

He was as thoroughly bitten with antiquarian fever as any modern student, and he designed and executed by way of recreation an antique comedy, which for years was attributed

to Lepidus, the comic poet. In achieving execution as well as design, the literary Chatterton has the advantage over his architectural imitator, who cannot enlist the decaying teeth of time so imitatively. But Alberti's literary antiquarianism found a practical sphere in the study and emulation of Vitruvius, and the revivification of Roman architectural law, and practice thenceforward became a vital element in the progress of the Renaissance.

The study of ancient architectural principles proceeded through literature by Alberti as though buildings by Brunelleschi; truth tintured by distance and matured like wine in oblivion, rediscovered with the flavour of the essays of a bygone age, was at the service of the student. Alberti's great work, "*De Re Edificatoria*," which consists of ten books like Vitruvius's "*De Architectura*," was finished in 1452 but not printed till 1485, thirteen years after his death.

It is to be observed, therefore, that Alberti's work was printed and published a year before the first printed Vitruvius, both being in Latin. Alberti's book is thus the first printed embodiment of architecture as an art and science in a system, and it indeed as such remains effective to-day. He, a student, impartially thus created the architect as an entity entitled to honour, and he says in his preface:—

"Our ancestors have left us many and various arts tending to the pleasure and convenience of life, acquired with the greatest industry and diligence; which arts, though they all pretend, with a kind of emulation, to have in view the great end of being serviceable to mankind; yet we know that each of them in particular has something in it that seems to promise a distinct and separate fruit: some arts we follow for necessity, some we approve for their usefulness, and some we esteem because they lead us to the knowledge of things that are delightful. What these arts are it is not necessary for me to enumerate, for they are obvious. But if you take a view of the whole circle of arts you shall hardly find one but what, despising all others, regards and seeks only its own particular ends; or if you do meet with any of such a nature that you can in no wise do without it, and yet which brings along with it profit at the same time conjoined with pleasure and honour, you will, I believe, be convinced that architecture is not to be excluded from that number. For it is certain if you examine the matter carefully it is inexpressibly delightful and of the greatest service to mankind in all respects, both public and private; and in dignity not inferior to the most excellent. But before I proceed further it will not be improper to explain what he is that I allow to be an architect, for it is not a carpenter or a joiner that I thus rank with the greatest masters in other sciences, the manual operator being no more than an instrument to the architect. Him I call an architect who, by a sure and wonderful art and method, is able, both with thought and invention to devise and with execution to complete all those works which by means of the movement of great weights and the conjunction and amassment of bodies can with the greatest beauty be adapted to the uses of mankind; and to be able to do this he must have a thorough insight into the noblest and most curious sciences. Such must be the architect."

"The conclusion is, that for the service, security, honour and ornament of the public we are exceedingly obliged to the architect, to whom in time of leisure we are indebted for tranquility, pleasure, and health, in time of business for assistance and profit, and in both for security and dignity. Let us not therefore deny that he ought to be praised and esteemed, and to be allowed a place both for the wonderful and ravishing beauty of his works and for the necessity, serviceableness, and strength of the things which he has invented among the chief of those who have deserved honour and rewards from mankind."

Our nearly modern Gwilt describes this book as deserving careful perusal by everyone who studies for the purpose of practice. I would recommend, for the mere interest of it, a refreshing practical view of Renaissance building practice the perusal of the eighteenth century English edition by Giacomo Leone—the architect of Moor Park, Rickmansworth among other Georgian residences.

The first book deals with site, soil, and climate; the second with materials; the third with construction; the fourth with the civic politics of building; the fifth with palaces, castles, academies, and religious buildings; the sixth with architectural proportions and ornaments; the seventh with columns, pilasters, and ornaments; the eighth with roads, pyramids, tombs, cities, streets, and public buildings; the ninth continues this, and also deals with decorations by paintings and sculpture; and the tenth and last deals with water supply and the assistance that architecture affords to domestic economy.

Vasari tells us that at the time when Nicholas V. (Tomaso Sforza), who was the first energetic and great Pope of the Renaissance, had thrown the city of Rome into utter confusion "with his peculiar manner of building," Alberti lived, and on account of his position at once received the Pope's confidence. Bernardo Rossellino, of Florence, was at that time acting as the Pope's architect, and great schemes were in hand for an enormous Vatican palace, and for fortification at the castle of S. Angelo, and new streets.

The Pope appears to have adopted Alberti's suggestions to spare the ancient imperial monuments which were being ruthlessly dealt with, and Rossellino is stated by Vasari to have executed the advice given by Alberti. The association of these two men is interesting in view of the similarity between the design of the Piccolomini Palace at Piacenza by Rossellino, and the Rucellai Palace at Florence by Alberti. We shall note three novel treatments at least connected with Alberti's name, the originality of which, based upon classical knowledge, would indicate their source in the mind of a scholar such as Alberti rather than from the ideals of the sculptor, Bernardo Rossellino. The carrying out executively by an architect of the work would probably be the work of the latter, and ascription to him ensue.

These three new motives are—first, the employment upon the façade of superimposed orders, as in Roman work; second, recourse to Roman examples for pedimental treatment for a gable end; and, thirdly, the use of the order of a triumphal arch for an internal arcade. These three methods are employed successively at the Rucellai Palace, where the now traditional Florentine method of a great cornice, of the proportion of a mediæval machicolated parapet, is employed to crown the undivided height of the elevation, is abandoned, and the Roman tier of three superimposed orders delicately applied with regular and delicate rustications. A new idea for the purpose of applied architectural features to impart interest into a composition is first attempted here since mediæval methods ceased. It is obviously the idea of a close student of ancient Roman ideas and buildings, and with the discovery of Vitruvius only just behind us how interesting is this deliberate experiment with his doctrine!

The return in this example to the decorative application of the orders to the front of a building preceding the work of practical architects like Bramante and San Gallo—a dilettante student reveals itself characteristically as the imposition of a revolutionary factor in design by a powerful mind.

The second treatment which we identify with Alberti is that of a pedimental treatment, for the gable elevation has special interest in its first employment at Rimini. This small city lies on the Adriatic between Ancona and Ravenna, and, like them, breathes the atmosphere given by Imperial Roman monuments. The triumphal arch, erected to honour Augustus still remains at the beginning of the Flaminian Way, rivalling the later and more showy one of Trajan at Ancona.

From this Augustan arch Alberti derived the direct motive for the façade of the Cathedral Church of St. Francis, which he clothed in a complete Roman garb.

The ideal is manifestly the re-creation of the forms of the Imperial past; the treatment of the flanks with arched recesses for external sarcophagi is as pedantic as those beneath the caryatid vestry porticoes of St. Pancras Church in the London Road.

The corpus of the church is mediæval, and the pointed arches and vaults remain of the chapels of the wide basilican nave. The front, however, frankly neglects all this, and the independent treatment of gable end with a screen was customary to Italian Gothic builders. The entire detachment of idea and originality of style manifested by Alberti here sets him again apart from all the traditional methods, his idea springing directly from the Roman monument of the town. The attached order, the wider arches, the roundels, the continuous base, the detached impost to the enclosed arches are faithful to their arch type; while the gracefulness of the proportions and the ease with which the order attaches itself to the front are instances of sound architectural judgment. The superimposition of a second order tentatively completes the composition. The side elevation is as great simplicity and power. The entire freshness of such design in the middle of the fifteenth century must be borne in mind; there was nothing up to this point comparable for breadth and dignity with this composition. Brunelleschi and Michelozzo are each characterised by great but different qualities from this work. We can trace the measures by which they advance, and as the cortiles of the Pazzi Chapel and Certosa at Florence by Brunelleschi and

of the Palazzo Vecchio by Michelozzo are to all that had gone before in their delicate graciousness, so is this next and immediately subsequent flanking arcade, with its now entirely Roman sense of power. There is withal place for the current Florentine refinement of decorative carving in the beautifully-detailed enrichments.

The interior of the church is a curiously fascinating medley, illustrating perhaps how the mind that has become dependent on antique precedents fails in adaptability to peculiar conditions. But the problem seems simply to have been to enrich with inscriptions and luscious emblems the interior of the church, which was practically a family temple rather than a Christian cathedral. The internal sculpture has provided modern critics with much interesting discussion, as Vasari is absurdly incorrect in citing Ghiberti, who was in Rimini fifty years before; Donatello's brother, who never existed; and Luca della Robbia, in 1414, as taking part in the work, which was begun in 1446 and completed in 1450. M. Yriarte probably is correct in showing that Matteo de' Pasti and the celebrated Agostino d'Antonio di Duccio were responsible respectively for distributing the decoration and executing most of the sculpture.

We may agree, too, with M. Eug. Müntz in refusing to credit Alberti with the confused effect of the interior; but in any case the problem was a difficult one, and the employer, Sigismondo Pandolfo Malatesta, certainly the most extraordinary of clients.

Mr. Addington Symonds's sketch of him is broad and fascinating. He says: "No one with any tincture of literary knowledge is ignorant of the fame, at least, of the great Malatesta family—the house of Wrongheads, as they were rightly called by some prevision of their future part in Lombard history. So far as Rimini is concerned, the house of Malatesta culminated in Sigismondo Pandolfo, son of Gian Galeazzo Visconti, known as the perfidious Pandolfo. It was he who built the Rocca, or castle for the despots, which stands a little way outside the town, and who remodelled the Cathedral of S. Francis on a plan suggested by the greatest genius of the age. S. P. Malatesta was one of the strangest products of the earlier Renaissance. To enumerate the crimes which he committed within the sphere of his own family, mysterious and inhuman outrages which render the tale of the Cenci credible, would violate the decencies of literature. Dissolute, treacherous, and inhuman as he was, the tyrant of Rimini always encouraged literature, and delighted in the society of artists. He who would brook no contradiction from a prince or a soldier allowed the pedantic scholars of the sixteenth century to dictate to him in matters of taste, and sat with exemplary humility at the feet of Latinists like Porcellio, Basinio, and Trebanio. Valturio, the engineer, and Alberti, the architect, were his familiar friends, and the best hours of his life were spent in conversation with these men. It is here that all the Malatesti lie. Here, too, is the chapel consecrated to Isotta, 'Divæ Isottæ Sacrum,' and the tombs of the Malatesta ladies, 'Malatestorum domus heroidum sepulchrum,' and Sigismondo's own grave, with the cuckold's horns and scornful epitaph. Nothing but the fact that the church is duly dedicated to S. Francis, and that its outer shell of classic marble encases an old Gothic edifice, remains to remind us that it is a Christian place of worship. It has no sanctity, no spirit of piety. The pride of the tyrant, whose legend occupies every arch and string-course of the architecture, and whose coat of arms and portrait in medallion, with his cypher and his emblems of an elephant and a rose, are wrought in every piece of sculptured work throughout the building, seems so to fill this house of prayer that there is no room left for God.

"Yet the Cathedral of Rimini remains a monument of first-rate importance for all students who seek to penetrate the revived paganism of the fifteenth century."

The façades of two churches of importance also remain to illustrate the application of the pediment motive by Alberti, namely, Sta Maria Novella at Florence, and Sant Andrea at Mantua. Though very different from one another, as from Rimini, the elements of the arrangement are similar. The struggle with the aisle roofs below the clerestory have caused the introduction of the curved truss-like wings at Sta Maria Novella, the façade of which was erected by Alberti's friends, the Rucellai, in 1470. There is no great departure here from the usual type as seen at S. Miniato, but gently the whole mediæval scheme is brought into classical character by an element of harmonious proportion introduced by the applied orders; the absence of such designed proportions is obvious in the mere arrangement in the earlier system of marble penellings.

But the façade of Sant Andrea at Mantua presents another classical scheme. An enclosed portico is erected in front of the great body of the church, and treated by a combination of Florentine and Roman motives. The central arch resembles the accepted early Renaissance type of Brunelleschi. A following example is the sanctuary from Sta Chiara, Florence, at South Kensington, by Cronaca. The front of the Pazzi Chapel shows how originality was desiderated, but the scheme of entablature, pilasters, and intermediate stones with a great pediment, free of the main roof slope, which rises beyond and behind, is a definite composition of classic features employed as in a Roman triumphal arch with studied proportions and arrangement. If the result appears somewhat commonplace to us, it could not have been so when it stood as the pioneer of the method afterwards hackneyed by Palladio. The interior of this great church at Mantua affords us the typical example of the third classic motive which Alberti introduced into Renaissance architecture by employing the arch enclosed by an order for the internal arcades. Brunelleschi's very beautiful and picturesque treatment of St. Lorenzo and St. Spirito at Florence merely employs the columns and returned entablature below the arch; the wall is free above from vertical emphasis. The main pilasters at the crossing and at the terminations of external loggias seemed to be difficult to him, and no simple prescription seemed at hand to help. Alberti's plan is masterly in its simplicity, and the key obviously is the pair of pilasters to each arch, which space out the bays and give strength and simplicity to the lines of the plan. There is a naturalness about the supports of the dome at the crossing produced by this system that is quite masterly. The internal elevation of the nave is entirely simple in scheme, though it is covered with the overrich ornament of the epoch. The simplification of the treatment around the apse is equally natural and facile. The simply-coffered vault brought right down on to the main cornice is very fine in effect. It proved convincing enough, for St. Peter's is this and little more, except greatly increased scale. The simple apse, the complete form of the pendentives, and the simple large panels of the piers and spandrels seem more to be the results of a long-developed style than the innovations of a dilettante student. If we afterwards contemplate the movement imparted by Bramante or Michel Angelo we must expect little to compare for direct power and practical usefulness than this system, at St. Andrea exhibited in proportions which have not lost their vigour and charm, and with a refinement which seems to echo the great character of Alberti.

Donato Bramante da Urbino, or Donato Lazzari called Bramante (Bramante means desiring), was born, according to Geymüller, who thought that he had identified the family house, in a small house outside Fermignano, near Urbino, the birth town of Raphael, in the year 1444, exactly forty years after Alberti. There are no reliable particulars of his early life, but we know the famous ducal palace at Urbino, the architect of which, Luciano da Lovrana, evidently exercised a considerable influence over his style, as possibly did Alberti also, before whose death, when Bramante was twenty-eight, he had worked under Andrea Mantegna at Mantua while St. Andrea was building.

For the ensuing quarter of a century Bramante practised at Milan, gaining reputation by the erection of the peculiarly-planned church of San Satiro, consisting of a transept and a nave, with a chancel built in perspective upon a flat wall—a curious exercise of talent in that newly-discovered and much-practised and valued art. Let us moralise upon the persistence of the perspective draughtsmen since then, and of his highly respectable antecedents. Perspective offers just that flavour of practical science in combination with artistic effect that in light and air cases optics and angles do with brigandage—enough to render the mixture attractive. Bramante practised perspective nobly, providing careful designs for the architectural backgrounds of his accomplished young friend and fellow-townsmen Raphael. Sanzio's frescoes in the Vatican later on, when honour and distinguished patronage were not lacking.

The queer chancel of San Satiro is a *tour de force*, and, one might almost confess, worth the effort. The principal achievement, however, is the octagonal sacristy with a polygonal cupola. This building is small and complete, and illustrates some interesting developments of domical design, upon which we cannot stay to dwell. It evidences, however, that Bramante had studied well the work of his contemporaries, the great Giuliano da Sangallo and his garrulous confrère, Simone Pollajuolo, at Florence, and had sought to improve upon their treatment of the pilasters of the internal angles of the octagonal. The building has a

beautifully-modelled frieze by Caradossa of terra-cotta. Geymüller has recounted with great industry of research various works at Milan which can be imputed to Bramante during his long residence of about twenty-eight years in city; these researches are easily accessible to us, as they embodied in his paper in the *R.I.B.A. Transactions* for 1898. The comparatively recent death of Baron Heinrich von Geymüller is a great loss to all students of Renaissance architecture.

The remarkable front of the church of Abbiate Grasso near Milan is an inspiring experimental design of great boldness; it seems to have an element of pure adventure about it, and to be taking obvious risks successfully. It illustrates Bramante's earnest and constant adoption of Alberti's Romanism of the superimposed orders, and the great arched recess remained in his mind as a motive to again experiment with when the opportunity offered. That he made for himself courageously many years after in the great open-air apse of the Belvedere of the Vatican. It is a respect element in St. Andrea at Mantua which provoked the venture. There is always, perhaps, an element of wonder risk in an arch which increased almost disproportionately with its size. How the arches of great bridges really excite us! Waterloo does the Thames in seven, London Bridge five, the new St. Paul's is to be three, and the day may come when we shall do it in one! Bramante's cupolas and domes grew similarly in his hand and mind with both purity and power. Sta Maria delle Grazie, the picturesque terra-cotta melange of whose exterior is so well known to us, is a brisk development of Bramante's power of drawing beautifully delicate details. There is no attempt to classicise the exterior; the external walls are panelled out in search of proportion and enriched. There is probability in the conclusion that the upper parts were not executed by Bramante as they evidence a relapse to earlier methods, as a comparison with the exterior of the San Satiro group shows.

There are interesting evidences of Bramante's hand in Como Cathedral; a comparison of his south door with Rodari's northern one very instructively reveals the work of a broader mind and stronger sense of design. The ornamental genius of the early Florentine Renaissance did not become coarse in a hurry, but had a tendency, in spite of its drawing, to tire the eye with the wealth of its delicate enrichment. The Certosa at Pavia is the culmination erected just at this time of the era of the ornamentalists. Geymüller's suggestion that the treatment of the walls of the nave of Como Cathedral, and possibly the pinnacles to the buttresses, may be by Bramante does not seem unlikely. We do not realise that he was always dependent upon the northern Roman methods, but enjoyed what we may call that local freedom which so often characterises the provincial office.

Though it was not until the fall of Ludovico Sforza, called the Moor, the Duke of Milan, in 1500 that Bramante settled in Rome, it seems that he was there in 1495, and Vasari mentions a commission to paint the arms of the Borgias for Alexander VI., now destroyed, over the holy door of the Lateran Church before the beginning of the holy year 1500. Geymüller states that he was first engaged upon a commission for the Cardinal Riario in building the magnificent palace known now as the Cancelleria. This great palace entirely designed in the scholarly manner of Alberti, with an air of Florentine dignity and refinement that one feels instinctively to be gentlemanly. The quietness of the details has occasioned doubt as to whether the authorship is consistent with what we know of Bramante's other work, but he was now in high repute, about the age of fifty, the centre of a group of able and active artists, with abundance of commissions.

In 1502 he is engaged upon the cloister of San Pietro in Montorio, a small sort of rival to the greater basilica not far off. Here he planned with fine imagination a great circular cloister surrounding a small circular temple over the sacred central spot. This tempietto alone was built, but even in its solitariness, without its harmonious circumference, is a work of singular grace and charm. The purity of the forms and delicate adjustment of the proportions make this simple exercise in peristylar design almost as fascinating as a Greek temple. It appears so natural in its absolute completeness and one marvels that such simple and relatively small work have not achieved similar success again and again, but this indeed, has not been so. Like St. Stephen's, Walbrook, it is sufficient, if properly estimated, to secure the reputation of its architect apart from claims of other greater and later work.

The evidence of a new and careful scholarship in this work is important to note in a man well advanced in

iddle life, and Vasari, probably somewhat poetically, says
t "he had brought some money with him from Lombardy
al had gained other sums in Rome by certain works which
had executed there; these funds he husbanded with care,
ending them with extreme frugality, because he desired
live for a time on his means, and not to be distracted by
er occupations from the labours which he proposed to
dertake among the ancient buildings of Rome, all of
ich he was anxious to study, wishing to obtain accurate
asurements of them, entirely at his leisure."
(To be continued.)

ILLUMINATING ENGINEERING SOCIETY.

MEETING of the above Society was held on Monday,
the 24th inst., at the premises of the Royal Society
Arts. Papers by Mr. Haydn T. Harrison, M.I.E.E., and
r. P. J. Waldram were read. Mr. Harrison's paper on
The Ratio of Light to Illumination" was as follows:—

Only within the last few years has artificial illumination
en dealt with as a separate science; therefore it is not
prising that some of the terms connected with it are often
ed with different meanings, thus leading to confusion.

The very title of this paper would confuse many who are
the habit of looking upon light and illumination as the
me thing; but I prefer to treat the definition of light as
at which causes illumination, whether that illumination is
sible or not.

I agree, for instance, with Mr. Trotter's definition of
llumination as depending simply on the quantity of light
lling upon a surface, and that it has nothing to do with
e colour or reflecting value of that surface. Therefore, it
ould be, strictly speaking, inaccurate to state that an instru-
ment (such as the Holophane Lumeter used by Mr. Waldram
or the valuable tests of which the results will be put before us
y him to-night) indicated the illumination except when it
as pointed at a white screen of similar material to the screen
n the instrument itself, and which is illuminated to a pre-
etermined degree.

In order to demonstrate my point I carried out the follow-
ng experiments with my "Universal" photometer as made
y Elliott Bros. As you are aware, this instrument consists
f a screen capable of angular displacement, thus varying
he degree to which it is illuminated by a standard lamp.
his screen in used in conjunction with the Whitman sector
licker disc, and thus indicates the degree of illumination
derived from a source of which the candle-power value can
be calculated. The advantage of using this instrument was
hat, by replacing the standard comparison screen by the
various tinted wall-papers which Mr. Waldram used in his
experiments, I could ascertain very accurately the increased
illumination necessary in order that the rays reflected from
such wall-papers should have the same effect on the eye as
when a white paper of similar surface to the photometer
screen was used.

As the results of my experiment may be interesting I
give them below:

Screen No.	Colour.	Increased Illumination Necessary.
1	Bright red	3.5 times
2	Dull cardinal red	6.5 "
3	Medium blue	4.8 "
4	Light blue	3.2 "
5	Dark green	7.0 "
6	Light green	2.2 "

Another interesting point that these tests proved was that
the angle of incidence of the light rays closely followed
the cosine law over the greater part of the angular movement,
despite the fact that the surface of these wall-papers was far
from a plain one.

My next experiment was to ascertain the value of the
light reflected from the area of these papers compared with
that of white blotting paper, and I found that, though these
tests were made under very different conditions and very
roughly, owing to the short time available, they to all intents
and purposes corroborated the figures given above, thus
proving that an instrument of the Holophane Lumeter class
measures correctly the irregular reflecting value of a surface.

Mr. Dow and Mr. Mackinney, when describing their
"Holophane Lumeter" instrument in the *Illuminating En-
gineer* (May, 1910), stated that it could be used to measure
either intrinsic brilliancy expressed in terms of candles per
square centimetre, or illumination expressed as Lux or foot-
candles "which a truly white surface would have to receive
in order to have an equivalent brightness."

This description is quite correct, except that it might be
taken to mean that the instrument indicates either intrinsic
brilliancy or foot-candles, thus making it appear that they

were one and the same thing. This, of course, is not so,
therefore it must be clearly understood that it only measures
foot-candles when a special screen is used.

It is interesting to note here a remark of Mr. Trotter's,
viz.: "Such terms as illumination, brilliancy, brightness,
intensity, and luminosity are generally employed by different
writers to express different ideas, and are often used in a
confused, vague way." This, unfortunately, is as true to-day
as when it was written, therefore it is not surprising that it
is difficult to fix definitely a unit which accurately describes
reflecting value, and I doubt whether a better word than
"Luminosity" could be chosen. Sir William Abney de-
scribes luminosity as brightness resulting from illumination,
which is exactly what the Holophane Lumeter measures.
But in this case are we to regard "luminosity" as denoting
luminous flux per unit area, so that it would be expressed,
say, in lumens per square inch? Or as denoting C.P. per
unit of area?

With regard to the other terms, personally I use them in
the following sense:—

1. *Light*.—The emanations from a light source.
2. *Illumination*.—The extent to which anything is illu-
minated; foot-candles.
3. *Brilliancy*.—Refers to primary light source and is
candle-power divided by area.
4. *Intrinsic Brilliancy*.—Candle-power per unit surface
(square centimetre).
5. *Brightness and Intrinsic Brightness*.—Same as
brilliancy.
6. *Luminosity or Luminous Intensity*.—Same as bril-
liancy, but applied to secondary sources of light.

I only put the above table forward as suggestive, and
would like to see the terms "brilliancy" and "brightness"
always applied to primary light sources, as considerable con-
fusion, which is now caused by their indiscriminate use,
would be obviated.

For example, many people talk about a bright light, and
this under the above classification would be correct; but for
an artist to talk about a bright colour would be incorrect.
But, on the other hand, an artist and a colourman think on
different planes: a colour is bright to an artist under one
condition, and dull under another; whereas to a draper or
a colourman a colour is *ipso facto* a colour describing some-
thing when viewed under normal light, and he would not
grant that the colour is changed when viewed under an
abnormal light, but that the light is changed. Therefore,
the luminosity is changed, whereas illumination is not
changed by the fact that it falls and is reflected to the eye
in a varying degree dependent on its colour.

If luminosity or luminous intensity is used as applied to
indirect or secondary sources of light, the value of these
sources could be stated in lumens instead of candle-power,
which would simplify matters considerably. For example, if
we could state that any given area in a room was illuminated
to a certain degree in foot-candles by direct light from a
source plus so many lumens in the form of indirect illumina-
ation, we should know at once the relative reflecting value of
the surroundings of the light source, and also the likely
density of the shadows. This would not be a difficult thing
to measure, as, by shading the direct light from the measur-
ing surface, we get the illumination due to the lumens (in-
direct lighting) only.

Louis Bell points out that altering the position of the
primary source of light in a room does not affect the illumina-
ation seriously if the walls and ceiling diffuse strongly (*i.e.*,
have a high degree of luminosity), while, if they are dark,
the change is decidedly unfavourable. I will go further than
this, and say that if the walls and ceiling have a 100 per
cent. luminous efficiency and the light, though invisible, is
placed so as to illuminate them, the resulting illumination
will have a maximum efficiency. On the other hand, if the
walls and ceiling have no luminous efficiency, and no direct
illumination is derived from the source of light, the illumina-
ation will be zero. The various stages between these two limits
will be inversely proportionate to a table similar to that
given in the early part of this paper. If this theory is
correct, the illumination at any part of the room will be pro-
portionate to the direct illumination plus the illumination
due to light reflected from the surfaces visible from the point
of measurement.

The measurement of the illumination derived from all
sources is, of course, an easy matter, such instruments as
the Trotter photometer, Holophane Lumeter, with subsidiary
screen, and several others, being available for the purpose;
but to ascertain the light value of the original source of such
illumination is a very different thing.

The importance of ascertaining this light value arises

MODERN EUROPEAN ARCHITECTURE.
AUSTRIA.

A SUBURBAN HOUSE IN VIENNA.—Herr OTTO A. GIELOW, Architect.

[From *Der Architekt*.]

when a question of cost and efficiency is under consideration, and the only satisfactory method is either to eliminate all reflecting sources or to remove the lamps to the test-room. In either case the question presents itself as to what is the light source—is it the lamp only, or the lamp plus the globes and reflectors, which may considerably enhance its value as an illuminating agent?

It must be borne in mind that globes and reflectors only enhance the lamp's value as a light source for the purpose of giving direct illumination, and often depreciate its value from the point of view of the reflected illumination derived from the surrounding objects. Therefore, the value of the naked lamp alone must be known, and this is, of course, easy to ascertain by the usual photometric methods. The value of such a lamp plus globes or reflectors is a more complicated matter, owing to the area of the light source being increased, and thus interfering with the square law of photometry. Under these circumstances, unless means are available for obtaining the profile curve of lighting, the only way to ascertain the illuminating value of a light source, including reflector, &c., is by ascertaining the illuminating results.

For this reason I would suggest that all makers of lamps who wish the apparatus supplied by them to be used to the best advantage should accurately state the candle-power derived at various angles, and should not be content with stating either the maximum, horizontal, or mean spherical or hemispherical candle-power. If makers would do this, the lamps or combinations of lamps with globes and reflectors would be divided into classes, which would not only greatly assist illuminating engineers, but would result in the goods supplied being used to the satisfaction of the public.

This naturally leads to the consideration of the relative merits of lights with reflectors or globes which increase the illumination in the direction required, versus unprotected lights from which good illumination is obtained by using the walls or ceiling as reflectors.

It is obvious that as regards efficiency the use of reflectors will generally have the advantage. Take, for example, a room with white ceiling and walls. The upper hemispherical rays are reflected back into the room and usefully increase the illumination, but, on the other hand, a reflector placed directly over the lamp, provided it receives all the upper

hemispherical rays, will even more efficiently direct them on to the remainder of the room where illumination is required, but will leave the upper part of the room in comparative darkness. In the case of a room which has not a white ceiling and wall-paper the efficiency of a reflector will be comparatively higher, and, what is even more important, will remain constant owing to the fact that it can be cleaned more often than it is convenient to whitewash the ceiling and walls of a room. But the physiological (light sensation) effect is different, because the illumination is derived from a single source, while in the other case it emanates from all directions.

I am prepared to grant that a person entering a room with light coloured ceiling and walls will often state that it is better illuminated than a similar room where the surroundings are dark coloured. Nevertheless, the illumination in the latter case may be better than in the former, and possibly the physiological effect would eventually prove more generally satisfactory as the high luminosity of the surroundings would tend to close the iris, thus producing a trying effect on the optic nerve if an attempt to work is made under those conditions.

This is where the province of an illuminating engineer becomes very similar to that of a physician. The latter cannot always tell the effect of the drugs he prescribes on various people, and often has to use the trial and error method; so the illuminating engineer will have to learn the effects which are most likely to please his clients.

For example, very few men would like to work in a study or dine in a dining-room where the light emanates from all directions and where the iris of the eye is kept constantly contracted by the high luminosity of the surroundings. On the other hand, many of the opposite sex would prefer it, owing, I fancy, to their desire to exhibit themselves and their costumes. Nature, however, tones down the luminosity of surroundings as the brilliancy of the sunlight increases, by providing them with a covering of green which is restful to the eye.

Artists have learnt that in order to depict the high illumination they must have strong contrasts, such as the deep shadows provided by nature, and I think in this respect they teach illuminating engineers a lesson. Shadowless illumina-

[From *Der Architekt*.]

tion is always depressing, just as a day when the sun is obscured by clouds is depressing; and I think it would be wise to deliberate carefully before any system of shadowless illumination is adopted, and to remember that the object of all illumination is to produce an effect by which the outline of objects is easily seen, which result is greatly assisted by the effect of light and shade.

In conclusion, I must apologise if this paper is not what the title and synopsis in your Journal led you to suppose it would be. I am afraid it comes to little more than the stringing together of a few matters that interest us all. Nevertheless, if it provides food for thought and eventually results in some of the ambiguities I have touched upon being cleared up either by subsequent papers or discussions, I am sure you will forgive me for having placed before you these few remarks, not on the score of their merit, but on account of what they may produce.

a vaulted recess, and the opening in the wall through which the beam was pushed to strengthen the gates when the portcullis (the first line of defence) was captured. The interior of the rooms in the firelight, with the fires in the braziers reflecting on the old stone walls, appeals strongly to the imagination, and has quite an old-world look, and Mr. Jackson is to be congratulated upon the careful manner in which he has carried out the alterations, retaining everything of an antiquarian interest.

The Roman and ancient British objects found at Margidunum on the Fosse Road, near Bingham, were described by Mr. Wallis. Everything discovered is now being carefully examined and catalogued by Dr. Oswald and a small committee. Attention was drawn to the similarity of design of various objects, such as pottery, ornaments, and even the pattern of horse-shoe nails, with those found in Rome, proving conclusively that Margidunum was one of the important Roman military stations between Leicester and Newark.

The party then inspected the exhibition of water-colours lent by the Birmingham Art Gallery, more particularly the architectural subjects by Mr. T. M. Rook. These are unique as records alone, and from an artistic point of view are very beautiful. The amount of detail shown, the quality and texture of the colouring are remarkable, and the extraordinarily delicate lighting and brightness of the pictures cannot but impress everyone who sees them.

Mr. Bromley on behalf of those present tendered the thanks of the Society to Mr. Ball and Mr. Wallis for arranging the visit and for the interesting information they had given.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has illustrated some buildings at Minneapolis by Messrs. Hewitt & Brown, viz., St. Mark's Church, a quasi-Perpendicular design; the Thomas Memorial Hospital for Consumptives, whose planning is quite opposed to English ideas; and Christ Church Parish House. We have also examples of the work of Messrs. Rankin, Kellogg & Crane, distinctly influenced by modern French design. A special country and suburban house number is an excellent exposition of the high character of modern

NOTTINGHAM ARCHITECTURAL SOCIETY.

ON the invitation of Mr. F. Ball, the Chairman of the Castle Museum Committee, and Mr. G. H. Wallis, the curator, the Nottingham Architectural Society visited the Castle on Friday evening, April 7. The party numbered 16, and included Messrs. A. N. Bromley, F.R.I.B.A., H. G. Watkins, A.R.I.B.A., S. G. Walker, and the Hon. Sec., Mr. F. M. Royle.

Mr. Ball and Mr. Wallis received the visitors at the entrance gateway, and showed them the interiors of the rooms in the bastions, which have been restored under the direction of Mr. T. G. Jackson, the well-known architect.

Mr. Wallis informed the party that the whole of the interior of the old rooms previous to restoration were lined with modern brickwork. This had been removed and the stonework of the earliest gateway—some of it dating back to the thirteenth and fourteenth centuries—had been exposed. It is interesting to see that some of the blocks have been formed from the rock upon which the Castle itself stands. The room on the right-hand side (till recently occupied as a residence) contains some interesting features. The private doorway from the Castle grounds has been discovered, also

domestic architecture in America, showing a remarkable variety of treatment from the purely picturesque to the sumptuously stately.

La Construction Moderne (Paris) reproduces some designs of Mr. Maxwell Ayrton, which were exhibited last year at the Salon. Other illustrations are devoted to the first and second successful competitors for the Rougevin prize, Mons. Haffner and Mons. Dupré. There is also a private house of reinforced concrete in the Rue Boileau, Paris, which is rather fearsome.

Moderne Bauformen (Stuttgart) is this month largely devoted to the work of Albert Gessner, of Charlottenburg, including some of his studies in town-planning. Some of Herr Gessner's interiors are very charming. Several examples of interior design by Professor Otto Prutscher, of Vienna, are also illustrated.

Stone (New York) illustrates the Chautauqua County Bank, Jamestown, New York, a refined piece of design with French feeling. The failure of a reinforced concrete building in Cleveland is described with the report of the Commission on the causes of the collapse, which caused the death of eight persons. As frequently happens, the design was all right, but the execution all wrong. Another failure in New York City is mentioned, which during the past month killed four workmen.

Engineering Record (New York) contains an excellent and learned paper on the design of reinforced concrete chimneys by Mr. E. Parry, B.S., A.M.I.C.E., M.I.E.E., of London, England. An illustrated description is given of the self-supporting marble stairs at the New York Public Library.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Registration of Architects.

SIR,—In your note *re* Registration in your issue of April 14 you say: "Of course, those *soi-disant* 'architects' who unite with their artistic efforts the more lucrative callings of auctioneers and undertakers need not trouble to apply." Why not? The Council have already, to my own knowledge, admitted to the Licentiate'ship a Government Clerk of Works (by trade a painter), and another (whose trade I do not know) has been nominated—if not, by this time, admitted—his papers being signed by Associates who, being engaged in the same Government department as himself, must be perfectly aware that he is *not* an architect. If such as these (very estimable men, no doubt, but without any claim to be regarded as architects) are to be admitted, why discourage auctioneers, or even undertakers?

The Council are, naturally, anxious to get as much support as possible for their Bill, therefore cannot be expected to inquire too curiously into the evidence of qualification, but it does not argue well for their cause if, in order to pass a Registration Bill, they have first to obtain the support of the very class which it is the object of that Bill to exclude from practice in the architectural profession. Let them only carry this policy far enough, and the need for the Bill ceases to exist, when the unqualified practitioners are all brought within the charmed circle, including the gentleman who, not content with combining the practice of architecture with the business of undertaker, added that of "coal merchant."

I have passed the Intermediate Examination, but feel no encouragement to proceed with the "Final" to qualify for the Associateship, and I know others who feel as I do—disgusted, after the time and money spent.

I enclose my card, but would subscribe myself

A HUMBLE MEMBER OF A NOBLE (!) PROFESSION.

Lightning Conductors at St. Paul's and Westminster Abbey.

SIR,—In *The Architect* of February 12, 1909, you drew attention to fire risks. I now write on the question of possible injury to these national buildings if they were struck by lightning.

The conductors at St. Paul's Cathedral were rearranged according to my specification in 1898, and inspected by me each year until 1909, when I reported that certain repairs were required, and advised an examination of those joints

which were inaccessible without special scaffolding was erected; as my report was not acted on I resigned my appointment as consulting engineer for this work last year.

Westminster Abbey was fitted with a somewhat similar system in 1901, but the conductors on one of the towers, which my predecessors had some years ago reported on as insufficient, were not altered, although I believe it was the intention of the surveyor, the late Mr. Micklethwaite, to have the work completed, and I believe they still remain in an unsatisfactory condition.

My object in bringing this into notice is to draw attention to the fact that even a modern system of lightning conductors, such as are installed in both these buildings, cannot be relied on without it is kept in order, and the shelving by the authorities of the recommendations of their consulting engineer, whose name would probably be quoted should any damage occur, is an unwise policy. Structural repairs are always in progress, and workmen are apt to treat the small cables which extend over the roofs with little consideration; for instance, after the last Coronation I found at the Abbey that one of the down conductors had been cut, possibly because it was in the way of some scaffolding; and I remember another case at the Guildhall, where the two principal down conductors were actually removed by the workmen who erected a temporary room for some city function.

In conclusion, I should like to refer architects and others to the Phoenix Fire Office rules for the erection of lightning conductors, which were drawn up in 1910 by Sir Oliver Lodge and myself after consultation with the electrical adviser to the company. Rule 6: "A test and examination of earth connections should be made once annually by a competent expert."

KILLINGWORTH HEDGES, M.Inst.C.E.

Hon. Secretary to the Lightning Research Committee (1905 Report).

10 Cranley Place, South Kensington: April 22, 1911.

Licentiate'ship R.I.B.A.

SIR,—Now that this season guinea-sale of the Royal Institute of British Architects is over, please allow me a little space to express the disappointment of the Indians in obtaining a Licentiate'ship, if not a Fellowship, to be less ambitious, in spite of the encouraging clauses of the Royal Charter. So far as we can see not a single Indian has been enrolled as a Licentiate, even though Indians as a class have been considered to be not very far behind the times in the matter of architecture.

My application for Licentiate'ship has been most awkwardly handled by the authorities concerned, and I am collecting information as regards similar unfortunate cases, for placing them before the public and the Fellows of the Institute through the medium of your valuable Journal if you could kindly allow me the privilege of a little more space next time.

AN INDIAN.

Madras: March 6, 1911.

[Our correspondent has been a little too hasty. The latest list of Licentiates elected contains the names of some of his compatriots, showing that if properly accredited native-born Indians are elected as readily as anyone else.—ED.]

Surveying for Dilapidations.

SIR,—It would be of some interest to reventilate the following problem, which, in solution, may admit of varying interpretations. My own view is that the lessor's surveyor can only estimate a sum for clearance of such items, as against a late lessee:—

In surveying for dilapidations, it is necessary to discriminate between removable and irremovable fixtures, &c.; but a difficulty is sometimes involved, e.g. if the schedule is prepared prior to the determination of the lease, dilapidations to tenant's fixtures cannot, of course, be included; but should the tenant leave on the premises, say, Venetian blinds, matched-boarded partitions, brass finger-plates, &c., supplied by him, all such become part of the freehold. Can repairs, painting, re-lacquering, &c., be scheduled for such against the very person who (a few weeks previously) would not have been liable?

The problem occurred through a lessee's surveyor stating that he would remove certain fixtures, rather than repair; but, being subsequent to the determination of the lease, removal did not lie within the discretion of the late lessee.—Faithfully yours,

SURVEYOR.

FORTHCOMING EVENTS.

<i>Saturday, May 6.</i>
Edinburgh Architectural Association: Visit to Hopetoun and Neighbourhood.
Architectural Association: Spring Visit to the Town Planning and Modern House and Cottage Exhibition, Gidea Park, Squirrels Heath, Romford Garden Suburb.
<i>Monday, May 8.</i>
Surveyors' Institution: Mr. J. J. Done on "Development of Building Land."
<i>Thursday, May 11.</i>
Society of Architects: Mr. A. Saxon Snell on "Hospitals."
Concrete Institute: Annual General Meeting.
<i>Friday, May 12.</i>
National Housing and Town Planning Council: Conference at Manchester for Lancashire, Cheshire and North-Western Counties.
<i>Saturday, May 13.</i>
Royal Institute of British Architects: Final date of application for the Final and Special Examination to be held June 29—July 7.

THE ROYAL ACADEMY EXHIBITION.

AS we enter the Architectural Room at the Royal Academy Exhibition we have in front of us five fine drawings of church architecture on the line. In the centre, an exterior view of the Church of St. Ninian, Douglas, Isle of Man, of which Mr. W. D. CARÖE, F.S.A., F.R.I.B.A., is the architect; flanking this, on either side, are a drawing of Mr. CARÖE's new Chapel for the North-Eastern County School, Barnard Castle, and another of the Church and College of St. Ignatius, Stamford Hill, of which Messrs. B. WILLIAMSON & J. H. B. FOSS are the architects. These three drawings are all similar in treatment, brush work in black and white, by Mr. MACDONALD. On either side of these three are two beautiful water-colour drawings by Mr. CHARLES GASCOYNE, of the interior and exterior—from the west—of the Church of The Holy Spirit, Clapham Common, a memorial church to the late Canon GREENE, the design for which, by Mr. H. P. BURKE DOWNING, F.R.I.B.A., was selected in a limited competition.

The symmetrical grouping of these five drawings forms an excellent basis for pattern making, and pattern making appears to have been the chief aim in the arrangement of the architectural drawings in this year's Academy. Water colour is balanced by water colour, monochrome by monochrome, as if the underlying thought were—well, if the Philistine will not come to look at architecture, let us see if we can attract him by pretty patterns of wall decoration.

As regards their architecture, the five drawings to which we have above referred possess the common characteristics of breadth and dignity. It is refreshing to find that Mr. CARÖE is maturing in this direction; the excessive fussiness and fidget of much of his past work is mellowed into a greater restraint that still has sufficient piquancy to prevent it from being wearisomely tame, and imparts a far higher quality to his architecture than was ever possessed by the restless superabundance of imagination of which we have seen so much in the past. The design by Messrs. WILLIAMSON & FOSS is dignified and able, but we fancy its good position on the wall is to some extent the result of the happy accident that it fits in well with the decorative scheme of hanging. Mr. DOWNING's drawings well merit their position, as the design is eminently dignified and the water-colour rendering of a very high order.

A striking drawing is No. 1,591, reminding one irresistibly of WILLIAM BURGESS. This is a design by Mr. WILLIAM HAYWOOD for a flèche in steel covered with cast lead for South Church, New York, of which Messrs. CRAM, GOODHUE & FERGUSON were the architects.

Mr. TEMPLE MOORE has in one frame (1,608) a group of three coloured drawings showing parts of the new Church of St. Anne, Royton, Oldham, the Lady chapel,

the interior from the raised narthex, and an external view of the north-east angle. Picturesque and piquant are these drawings of an apparently small, or at least moderate-priced, church. Mr. MOORE's Interior of new Church, Skirbeck, Boston (1,621), shows what is apparently a close-boarded screen or tympanum behind the rood, which stands on a beam separate from the screen, an arrangement that has ancient precedent, but is scarcely suitable for the congregational form of worship that now obtains in the English Church. Our present-day choirs do not sing the offices by themselves, they lead the congregation.

The Interior of the new Church of St. Mary, Dorchester (1,623), by Mr. CHARLES E. PONTING, is a simple line perspective, in contrast with the many carefully coloured drawings on the walls, and shows a fine dignified church with an elaborate screen, above which is a rood on one of the roof tie beams. Messrs. H. R. & B. A. POULTER's design for St. Tarcisius' Church, Camberley, and clergy house connected, is evidently inspired by the work of Mr. J. OLDRID SCOTT and Mr. LEONARD STOKES, but suffers from the intrusion of an apparently meaningless flying shore in the form of a stone arch between the two buildings, which, though possibly intended to "tie them together," really keeps them apart, like its prototype.

Generally speaking, the interiors of the church designs exhibited are more satisfactory than the exteriors, which are too frequently overwhelmed with frantic strivings after picturesqueness and an entire absence of repose, as for example in Mr. J. HAROLD GIBBONS' design for the completion of the west end of St. Augustine's Church, Highgate (1,628), a perfect orgie of buttresses and projections, very different from the stately design of Mr. HENRY WILSON some years ago, a fine conception that we regret was never carried out. Mr. GIBBONS' design is quaint and picturesque, but this church of SEDDING's does not want picturesque quaintness for its completion. Another design that would be vastly improved by the judicious use of sponge or indiarubber is Mr. ROBERT H. CUNLIFFE's for St. Andrew's Church, Accrington (1,627), which is spoilt by too much striving after effect.

An excellent study for coloured decoration on mediæval lines is the proposed reredos and decoration of sanctuary, St. Chad's Church, Far Headingley, Leeds (1,587), of which Messrs. JOHN GIBBONS & SON are the architects, and in the drawing of which we recognise the hand of Mr. J. HAROLD GIBBONS. For effectiveness in the picture, the actual colouring is somewhat, in the drawing, disguised by accidentals, but there is sufficient to show an architect the nature of the colour scheme, though it is not quite clear how much is colour and how much form. Certainly the colour, so far as evident, is superior to the form in the reredos.

MESSRS. BROMET & THORMAN are responsible for a couple of truly weird pieces of design in the reredos of

By the kind permission of the Worshipful Company of Founders we are enabled to illustrate the design for a medal to be issued by the Company, the present design being the one approved at a recent competition in which Mr. A. Stanley Young was the successful sculptor. The model is now on view at the Royal Academy Exhibition.

Otley Parish Church (1,586) and "A Sanctuary" (1,604). These gentlemen have evidently an idea that the mediæval designers of our own country, of France, of Spain, and of Germany, even in their most extravagant fancies, have not exhausted the possibilities of tracery design. The reredos is a maze of new forms in tracery, surmounted by a pergola, constructed in we know not what material. Certainly wood or stone, the usual materials of a reredos, would be inadequate for the realisation of the amazing growth of crimson rambler, or whatever may be the creeper on which the design is based. We admire the ingenuity and the originality of these gentlemen, but cannot summon up any respect for their taste. The reredos in the Sanctuary is a curious combination of diptych and baldachino.

Very different to this is Mr. CECIL G. HARE's Interior view of the restoration of Ashley Church, Staffordshire (1,613), where a genuine rood screen, original in design but not eccentric, is the salient feature of an interior where the stonework is warm in colour and the wall surfaces are plain plaster.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

THE drawings sent in for last month's subject are a very creditable set and show a remarkable degree of improvement compared with earlier efforts of the same students. We find considerable difficulty in deciding the

relative superiority of the work sent in. Some drawings are better in one direction, some in another, but there is a generally satisfactory standard throughout.

"Sans Peur" has selected one of the best extant examples of mediæval chimneys—from the Vicar's Close, Wells, and has accompanied his perspective with sketch elevation, plans and details. Thus, his drawing is a good and useful architectural study, though purely as a pen and ink drawing his perspective is a little wanting in values and gradation.

Mr. E. H. GIBSON sends two drawings, both of chimney-stacks from Haddon Hall. The chimneys in themselves are simple, and Mr. GIBSON has justifiably included in his drawings some of the surroundings with which they group in composition. Although clearly expository of the forms, the drawings are too diagrammatic for pen and ink and do not convey an adequate idea of the light and shade values. Some of the perspective is a little faulty, whilst the monotony of the pen shading in the ball-room chimney-stack is particularly unfortunate.

Mr. T. OWEN THIRTLE has drawn a chimney-stack from Blickling Hall, Norfolk, composed of three octagonal shafts grouped together. The effect would have been better if Mr. THIRTLE had mustered up courage to attempt a drawing in other than parallel perspective. His work is too much like a geometrical elevation to scale and does not hold sufficient of the character of a pen and ink drawing, largely owing to the hard outlines and absence of values. A sketch elevation of the house front fails to

show clearly the attachment of the chimney-stacks to the main building.

"Plato" has contributed a nice sheet of sketches containing five examples of different treatments of brick chimneys, from Hampton Court, Westerham, Penshurst, Salisbury and Bruges. Whilst maintaining sufficient definition to make useful architectural studies, "Plato" has produced some very effective pen and ink drawings.

"Spes" has sent two sheets of drawings, one of a stone chimney-stack from Kirby Hall, Northants, the other a brick stack from Guilledge Farm, East Grinstead. Both examples were worth study and the sketches are useful and effective, though not of the highest calibre as pen and ink drawings.

"Le Quayt" sends a study of a chimney from an early sixteenth century house at Masham, Yorkshire, comprising a perspective sketch, showing the connection of the chimney and the house, elevations, plan and details, altogether a satisfactory study of an effective piece of chimney design in stone.

We have decided to award a prize of one guinea to "Plato," and half-a-guinea each to "Sans Peur," "Spes," and "Le Quayt."

NOTES AND COMMENTS.

THE inclusion of architecture amongst the arts of production in the Copyright Bill had a rather narrow escape when the Bill was before the Standing Committee of the House of Commons. Mr. JOYNSON HICKS, who has been a consistent opponent of architecture as a legitimate subject of copyright, led the opposition, and his amendment to exempt architecture was only defeated by nineteen votes against fifteen. There would, therefore, appear

now to be an excellent chance of the Bill passing this session with the inclusion of architecture as one of the mental callings that shall receive the benefits of copyright.

IN the consideration by a Parliamentary Committee of the proposal of the Corporation of London to construct the new bridge, generally called St. Paul's Bridge, over the Thames, the petition of the Royal Institute of British Architects was not supported by counsel, and the reason for this abstention has been explained by Mr. LEONARD STOKES in a letter to the *Times*, that the Royal Institute is not in a position to fight a costly Parliamentary battle against the Corporation, but has done its duty in directing the attention of the public and the Corporation to the unsatisfactory nature of the Corporation's scheme and the inadequacy of the Court of Common Council to come to a right decision without the best advice.

NATURALLY, the Corporation want to know what is proposed in lieu of their own scheme. The Royal Institute has proposed nothing, but some of its members have suggested a straight line of road from the south porch of the Cathedral, and this has been fastened upon as the view of the Institute and of the architectural profession, and the whole force of the Corporation's case has been directed to show that this idea is more costly and less practically advantageous for traffic than their own scheme. In discussing the traffic question, it is assumed that there is only one method of dealing with crossing lines of traffic, the right-angled junction with four policemen checking alternately one or the other stream. This method has grown up of late years in the metropolis; the police have been accustomed to it, and, of course, support it. There

is no conception on the part of the public that the waste of time, the strain on horses and motors of stopping and restarting, the danger to pedestrians who get caught in a tidal wave of suddenly-released traffic, can be obviated by any of the systems to which the town planning experts of the Continent have given so much careful attention.

It is not an easy matter, but an expensive one, to prepare a scheme for a bridge over the Thames, and the best arrangement of road to make that bridge of the highest value, either for practical convenience or for æsthetic amenity. It is easy enough to draw parallel straight lines from the south porch of St. Paul's to some point in South London, but that is not preparing a scheme, and it would certainly be more dignified and more reasonable for the Corporation to promote an open international competition, not only for the design of the bridge itself, but for the whole scheme of connecting North and South London, than to stick to their own little pet project.

THERE are many alternatives to the present plan of the Corporation, some of which Mr. STOKES has mentioned, and others of which occur to us; but they are at present merely ideas, which might or might not on development prove better or worse than the Corporation's plan now before Parliament. The gist of the whole matter is that the Court of Common Council has pinned its faith to somebody's idea without having had or sought an opportunity of examining exhaustively all the possible ideas. This is the only way of arriving at the best scheme—to examine every possible idea, and by a process of elimination reduce the number until only one remains superior. Simply to take one crude idea and set it up as an Aunt Sally in order to prove the superiority of their own scheme is a fatuitous course for the Corporation to adopt. They have made a laughing-stock of themselves with regard to the Tower Bridge. Why should they repeat the performance with St. Paul's Bridge?

It is no wonder there were only twenty-six competitors for the Hartley University College, and the winners are not at all to be unduly congratulated. Having made a design for a 100,000*l.* building with the expectation that only 35,000*l.* or 40,000*l.* would be spent at present, they now find, as we learn from the report of the last meeting of the Council, that they have to prepare plans for 25,000*l.* worth of building, for the erection of which the Council have promises of 16,000*l.*, and hopes of the rest.

RATHER a novelty, and somewhat amusing at that, was the effort of a builder to make the architect pay for "extras" in a small case at the Bodmin County Court. His Honour the County Court Judge said the action had been entirely misconceived. He had never heard of such a case. There must be some "extras" in every contract, and the idea of making the architect responsible was absurd. If the "extras" were necessary through the architect's mistake, and the owners were fortunate enough to find it out, well and good, but it was a difficult thing to prove.

By the recent decision of the House of Lords in an appeal case by the Caledonian Railway Company against the Glenboig Union Fireclay Company, fireclay may be a "mineral" within the meaning of section 70 of the Railways Clauses Act, 1845. The essence of the judgment was that in this particular case the clay was of an exceptional character as to its properties and value.

THE SOCIETY OF ARCHITECTS.

THE twenty-seventh annual dinner of the Society of Architects, held at the Holborn Restaurant on April 28, was one of unusual interest and importance, owing to the announcements which were made relating to Registration and the absorption of the Society by the R.I.B.A.

The chair was occupied by the President, Mr. George E. Bond, who has held that position for the last three years. He was supported by a number of distinguished

guests and by a very large gathering of members and their friends, numbering upwards of 200. Among those present were Mr. Leonard Stokes, P.R.I.B.A., L. A. Atherley-Jones, K.C., M.P., Edward White, J.P. (Chairman of the L.C.C.), Sir G. Lawrence Gomme (Clerk to the L.C.C.), Major H. P. Tavener Dickins, V.D. (Master of the Tylers' and Brickmakers' Company), Horatio Porter, M.A., A.R.I.B.A. (Mayor of Holborn), A. A. Hudson, K.C. (President of the Tribunal of Appeal), Sir George Riddell, G. E. Hohler, K.C., M.P., Edwin T. Hall, F.R.I.B.A., Henry T. Hare, F.R.I.B.A. (Hon. Secretary, R.I.B.A.), A. W. S. Cross, M.A., F.R.I.B.A. (Vice-President, R.I.B.A.), Geo. Hubbard, F.R.I.B.A., J. S. Gibson, F.R.I.B.A., Ian MacAlister, B.A. (Secretary, R.I.B.A.), Arthur Keen, F.R.I.B.A. (President of the Architectural Association), D. G. Driver, F.C.I.S. (Secretary, A.A.), G. Bird Godson (President of the Master Builders' Association), J. S. Holliday (President of the Institute of Builders), Leslie Vigers, F.S.I. (President of the Surveyors' Institution), W. J. Hardcastle, F.R.I.B.A. (President of the District Surveyors' Association), Percy B. Tubbs, F.R.I.B.A. (Vice-President, S.A.), G. A. T. Middleton, A.R.I.B.A. (past Vice-President), Col. F. S. Leslie, R.E. (Hon. Secretary), E. C. P. Monson, F.R.I.B.A., Prof. Henry Adams (Chairman of the Examination Committee), E. J. Partridge, F.S.I., Ellis Marsland (Hon. Auditor), R. A. Jack, H. Cartwright Reid (Superintending C.E., H.M. Dockyard, Chatham), C. Day (Borough Surveyor, Chatham), W. Banks, A.M.Inst.C.E. (City Surveyor, Rochester), Matt. Garbutt, F.R.I.B.A., Max Clarke, F.R.I.B.A., W. S. Frith, W. H. May (President, Devon and Exeter S.A.), A. W. Moore, F.R.I.B.A., H. Shepherd, A.R.I.B.A., Fred Fenning, Walter W. Thomas, J.P. (past President), E. J. Sadgrove, F.R.I.B.A. (Hon. Treasurer), A. E. Pridmore, F.S.I. (past President), R. Willock, F.R.I.B.A., E. J. Hamilton (past President), H. V. Milnes Emerson, A.R.I.B.A., C. McArthur Butler, F.C.I.S. (Secretary), T. S. Inglis, R. G. Lovell.

After the toast of "His Majesty the King," and then the toast of "Her Majesty the Queen and the other members of the Royal Family" had been proposed by Mr. George E. Bond, and honoured,

His Honour Judge Rentoul proposed "The Houses of Parliament." He said he felt his position to be one of great responsibility and great difficulty. Therefore he wanted to be extremely cautious in anything he might say. It was known that there were 500 new peers to be created, and he had been hinting that he might possibly be included among that number, especially as by virtue of his position he was more or less a lord already, being always one in the Old Bailey. But the House he knew most about was the House of Commons. This consisted of a body of men whom some were in the habit of abusing. But the House of Commons, whatever its political aspect might be, constituted the best House of Commons they had. The House of Lords was at the present moment threatened by the Commons. He himself was not as much frightened by that step as some men might be. He remembered the election of 1892 when on a hundred platforms the promise was that the House of Lords should be abolished, and a hundred members got in through it. Yet the first thing the party did on their return and the first money they spent was to recushion the House of Lords in morocco leather, as this material lasted longer than any other. The very next thing they did was to create two peers. The House of Lords will probably again survive for a very long time, though in what conditions or with what modifications it was hard to tell. In conclusion, Judge Rentoul made an eloquent appeal for a still closer union between England, Ireland and Scotland.

Mr. L. Atherley-Jones, K.C., M.P., in replying, remarked that there was some touch of irony in the fact that a humble Radical member like himself should be called upon to respond to a toast which wished prolongation and health to an institution which he was nightly engaged in attempting to destroy. He was consoled by the reflection that his party would be credited with being animated by high principles. It was recognised that the Government of this country must be democratic, and they had to be careful lest in destroying the present second chamber they did not get in its place something more dangerous to the institutions of democracy. The progress of civilisation and the spread of knowledge has made every human being in this country take a more or less responsible part in the administration. Although there was a great cleavage between the parties, they were all animated by a desire to serve the general interest. There had been many changes

THOMAS BOKKINGTON'S TOMB, EDINGTON CHURCH, WILTS.

in the type of men sent there even in his time; but generally speaking, the members had one common object in view, and that was to serve that interest and to be free and independent representatives of the people. That night the shadow of approaching dissolution rested over the Society of Architects. There was always a tinge of melancholy in the idea of submerging one's own personality in that of another. Those who represented the older body will gather new force, strength and vitality from the addition of the younger body. Though one could not help shedding a tear over the transition, the members might look to it as an assurance that the great art and science of which they were the trustees would be carefully guarded, preserved and stimulated in their new character, and that they would look back with pride and satisfaction to the work and organisation of the Society of Architects.

Mr. ARTHUR KEEN, in proposing "The Society of Archi-

tects," said he had been wondering why he should be singled out to propose that toast. He was, of course, very conscious of the honour; but at the same time he was placed in a very difficult position from more sides than one. In the first place how was it possible to wish long life and prosperity to a society that is shortly to terminate its career? That very evening was its swan song before it went to the shadow land. In the second place, the Society of Architects was formed for the purpose of giving practical effect to registration—a policy with which he was unable to agree. He personally could not see how the best interests of architecture were to be served by registration, for he feared that it would give recognition to some who were not entitled to it. Consequently he stood in the opposite camp. But Great Britain was essentially a democratic country, and the wishes of the great majority of architects in it were that a Bill should be brought in to give effect to this policy of registra-

tion. As representative of a society existing for educational purposes anything that tended to further that end appealed to him very strongly. By this movement the Institute would add enormously to their number, strength, and position. At the same time the Institute was very wisely attending to educational questions, and he looked forward to the time when all education would be carried out under its strong support. In the order of nature nothing ever dies. So the vitality and force which distinguishes the Society of Architects will be incorporated into the Institute. The increase will be most valuable to it in every way. He hoped the cause of education would be very much benefited and the new movement would help in raising the art of architecture.

Mr. GEORGE E. BOND, J.P., the President, in his reply said:—The year which had elapsed since the last annual dinner had been the most successful one in the Society's history, for no fewer than 140 new members had been elected. It had in other ways been most eventful, for in September last they took possession of new premises in Bedford Square, upon which was expended a large sum of money in adapting them to suit their special requirements, but by an irony of fate just at the moment when they had established themselves in a home of their own, and quite probably as a direct consequence thereof, a scheme was initiated which will, if successfully carried through, effect a great and historic change not only with regard to the Society, but the profession generally. For more than a quarter of a century the Society had been devoting its best energies to the task of educating the general body of the profession to a just appreciation of the great benefits which would necessarily accrue, not only to themselves, but to the general public, as a result of a successful passage through the Houses of Parliament of "The Architects' Registration Bill," and now for the first time there appears to be a reasonable prospect of an agreement between all sections of the profession as to the form in which the Bill shall be presented. The Society had consistently, during the whole period of its existence, expressed the opinion that it was the duty of the R.I.B.A. to take up the question and to promote such a Bill, and it now afforded him the greatest possible pleasure to be able to announce that an arrangement has been arrived at whereby the Royal Institute will in future take the lead in this movement, and that in its efforts it will be earnestly and loyally supported by the present members of the Society. The members of the Registration Sub-Committee, who have been responsible for the conduct of the negotiations with the Royal Institute, knowing that in the present congested state of public business the ultimate success of their aims and objects could only be secured by the presentation of a Bill backed by the unanimous voice of every section of the profession, entered upon their task in a spirit of sweet reasonableness fully determined to do everything in their power to facilitate an amicable and honourable settlement. It was a pleasure to be able to state that they were met in the same reasonable spirit by the representatives of the Royal Institute, the result being the general principles of a satisfactory Bill have been mutually agreed. And, as is usually the case when contending forces agree to meet in fair and reasonable discussion, difficulties and differences, which had previously appeared to be mountains, when viewed at closer quarters turned out to be merely mole hills. Their previous conceptions of each other, as autocratic, bureaucratic, or democratic bogey men, could not stand the test of a first meeting; and as mutual illusions were gradually dissipated, it was to both parties a great pleasure to find that seven fair and reasonable human beings on one side were faced by seven equally fair and reasonable beings on the other, all without exception actuated by the highest and best motives, and each anxious to promote to the utmost of his ability the honour and interests of their noble profession. Under these favourable conditions the inevitable occurred. The question then arose why should two distinct and separate associations continue to exist, having exactly the same aims and objects and covering exactly the same ground, that is to say every part of the great Empire? So the possibility of unity was discussed, and as it was at once recognised that with the Royal Institute fully committed to the promotion of a Registration Bill, the *raison d'être* of the Society's separate existence had disappeared, and also that the grand ideal of a united profession could be the better attained under one powerful and representative institution; the question almost immediately resolved itself into one of terms and conditions, the chief difficulty being, how was it possible for a society whose membership is based upon an equality of status to enter bodily into another association composed of three distinct classes? Various suggestions were made and fully discussed, and ultimately a fair and reason-

able scheme was agreed to by both parties, subject, of course, to the approval of the Councils and members of the respective associations. Such approval has been obtained, and the scheme provisionally ratified. This will be consummated when the general principles of a Bill have been drafted and signed by both parties, so that after many years there now appears to be every prospect of differences being settled to the satisfaction of all concerned. But assuming for the moment that all these internal differences are settled, and that from the architect's point of view a reasonable Bill is prepared for submission to Parliament, public interests have still to be considered, for it should be remembered that it is only in so far as it will be to the general welfare of the community at large as well as themselves that such a Bill can be justified, or that they could reasonably expect any Parliament to approve it. Under existing conditions the public suffers enormously from ignorant and unqualified practitioners. As a result of their employment lives may be sacrificed and health injured. It suffers inconveniences and discomforts in badly arranged, insanitary, and badly built habitations, and pecuniary loss in paying again the cost of many alterations and amendments necessary to rectify errors in planning and construction, such things as a sensible and qualified architect would have satisfactorily arranged in the first instance, and frequently as a result clients are involved in costly litigation. Further, our senses are offended by the erection of ugly abortions in streets and public places. This refers not only to the nondescripts who combine the practice of architecture with sundry other trades and callings, but also to the scores of irresponsible and thoughtless young men who have duly served their three or four years' articles in the offices of qualified architects, performing all their routine duties as part of the day's work, but who have never interfered with their sports or pleasures by seriously applying themselves for one hour to the task of acquiring a practical knowledge of the multifarious duties pertaining to the practice of this most exacting profession, and who as a consequence bring upon it great discredit in the eyes of the public. These young men without practical qualifications, and with no real sense of responsibility, but simply on the strength of their ability to produce smart, sketchy elevations in the particular style dictated by the latest caprice of ephemeral fashion are the very persons who, with the arrogance of ignorance, put on a lot of side and dictate to their clients or ignore their instructions, and who by their errors in planning and construction have led a large section of the public to seriously doubt the practical qualifications of the profession as a whole. As a check upon gross incompetence compulsory test examinations were suggested as the only possible remedy. But they might be told such examinations are open to the objection that unless carried out on practical lines they place a premium on flashy smartness and spurious efficiency, and that the more intrinsically valuable qualities of personality are ignored; that under them in every profession, orthodoxy, and intellectual conventionalism are assessed at too high a value, and it frequently happens that as preliminaries costly and difficult conditions of dubious value for their purposes are imposed. But in spite of this he maintained that the examination system was the only satisfactory method yet evolved for the discovery of reliable ability and knowledge in a candidate. Therefore in the interests of the public compulsory test examinations on sound practical lines must be applied to all future candidates for admission to the ranks of the profession. Each must show that he is in possession of a sound practical knowledge of the science of construction and of the nature, qualities, and capabilities of all kinds of building materials. As a draftsman he must be able so to express his ideas with pencil and paper that they may be readily understood by any reasonable workman. He must be able to draft a clear, definite, and thoroughly intelligible specification. His legal knowledge must be sufficient to enable him to frame proper terms and conditions of contract, and to safeguard his clients' interests with regard to rights of light and other easements, building lines, party walls, rights of support, rights of adjoining owners and others, and a score of other items which, if neglected, may involve his client in expensive litigation, these are all practical qualifications closely associated with the interests of the public and which can and must be made the subjects of severe examination tests. But a person may possess all these qualifications and still be without an atom of real claim to the title architect, for there is another absolutely essential qualification, he must be an artist, actuated by an artist's motives, and in possession of an artist's ideals, having a due sense of proportion and of harmony, and a mind fully tuned to a conception of the true and the beautiful. And it is in connection with this art qualification that

First Floor

Ground Floor

COTTAGE, ROMFORD GARDEN SUBURB.

THIS cottage has been built with hollow red brick walls and roof covered with tiles. The joists over ground floor are arranged to form beamed ceilings. The windows open as casement and are divided by lead bars. The fittings include bath, lavatory basin, w.c., sink, dresser, flap table, cupboards, stores, range, and gas-piping. The cost price, including fencing, was 400l. Mr. T. Gerard Davidson, M.S.A., was the architect.

the real difficulty occurs with regard to compulsory test examinations in architecture. These ought to be perfectly simple and to the point, for necessarily the early art education of an architect must be on conventional lines. They could assume if a candidate possessed a sound knowledge of the first principles of art and of the distinguishing characteristics of the orthodox orders and styles, that, although he may not have any original ideas, his subsequent work will be of a reasonably artistic character, and such as will satisfy requirements in nine out of ten cases; and in fairness to the candidate this is as far as an art examination test ought to go. His ability to design cathedrals or monumental work of any kind was not being tested, but simply his capability of performing the ordinary duties of an average architect in a reasonably satisfactory manner. Large and important works were not given out to unknown architects indiscriminately, but either to men of experience, or they are made the subjects of competition, in which case if the promoters are wise the adjudication will be placed in the hands of an able and experienced expert. And as works usually acknowledged to be within the scope of architectural practice are endless in their variety and of all shades of importance, every candidate after proving his qualifications up to this point may safely be left to find his own level. In a profession which demands of its followers such wide and varied attainments, a young man cannot be efficient in every branch, therefore he should be encouraged to concentrate his attention in the first place on essentials, and among these should be included practical experience upon an actual building during

the course of its erection; for, from the point of view of the client, it is of far greater importance that his architect should be able to distinguish by practical handling or simple tests between different kinds and qualities of stone in block or between different kinds and qualities of building timbers than that he should be able to give the approximate date of erection, say, of the Temple of Diana at Ephesus, nor will the ability to recite in chronological order the names and chief works of the great classical architects from the time of Rhœcus and Theodorus down to Michel Angelo compensate in any way for any lack of knowledge with regard to the latest developments in sanitary science. But once having earned the right to practise architecture, he may then add to his other qualifications the trimmings and embroideries of pure culture with advantage to himself and to all those with whom he may come in contact; and although he will now be relieved from further compulsory examinations his student days are not over, but instead of the subjects of study being arbitrarily dictated by examining boards he will be free to follow his own tastes and develop along lines most congenial to himself. He may look upon architecture as an archaeological study and be content for the rest of his life to dig and rake among historic dust to find a precedent for every part of his work, very useful training to a man who is going to specialise in restoration. Or, on the other hand, he may at once determine that the cold, dead hand of the past shall not chill his brain, that he will treat architecture as a living art, which, like all other living things, has followed certain definite lines of evolution, de-

terminated generally by environment, and which is still capable of further progress and development, and there are new problems to be solved every day. A difficult task was before them in educating a large section of the public to an appreciation of its own responsibilities and interest in the question, as at the present moment it seems to have some extraordinary ideas as to the duties and responsibilities of an architect. Instead of looking for ability, all sorts of absurdities are considered sufficient grounds for his selection and appointment—that he belongs to the same club and plays a good game of “bridge,” or that he attends the same church, or that his uncle was an old school fellow and so on. Was there a more insane proceeding than that a client should practically place the spending of a very large sum of money in the hands of a man simply because he calls himself an architect without in the first place securing some guarantee as to his qualifications and bona fides? But the height of insanity is reached when the client puts men into competition as to the fees, and selects one who is prepared to accept the lowest rate of commission, ignoring the very obvious fact that a fully qualified man at 5 per cent. may carry out the work for 20 per cent. less cost than a less qualified man at 2½ per cent. Proceeding on such lines, he might find many persons who would be prepared to undertake the work without charging him one penny, but who would nevertheless, by a dexterous manipulation of provisional sums under the contract, manage to secure 10 or 15 per cent. for themselves. Therefore let there be compulsory examinations to prove a man's qualifications, and a powerful central professional authority, to which all shall be amenable, to check dishonourable practices. Both these factors will be to the benefit of the community, and neither to the disadvantage of the individual architect, for true architectural art must be based upon construction, and construction upon practice and scientific knowledge. A modern architect is not born, but made, and further he requires a very great deal of making, and even presuming he possesses all the artistic and practical qualifications previously referred to, he will still be unable to take a top place unless in all his transactions he is guided by sound practical commonsense and keen business instincts. There must always be sounded a note of sadness when one is speaking of the imminent dissolution of old associations, the severing of old ties, the abandonment of old-established habits and customs, and the burying of old idols. As a member of the Society for some twenty-three years, and during the last thirteen or fourteen years more or less closely associated with its management, he could speak of the harmonious relations which have at all times existed. As the end appears in sight they must inevitably ask themselves whether the change is going to be for better or for worse, were they going forward into the light or dropping back to obscurity? Personally he was full of hope, for, having perfect faith in the wisdom of the suggested new arrangement, he was confident when they ceased to exist as a society an immediate resurrection would follow to a new life in the parent Institute, where they would have full scope for their individual energies and where he was sure they would continue to do good and useful work in the cause of registration.

Mr. E. J. HAMILTON, P.P.S.A., in proposing “The Royal Institute of British Architects,” remarked that it was the first time they had had officially the pleasure of entertaining the Royal Institute. Yet the interests and aims of the Society of Architects and of the Institute had always been kindred, and they united from time to time on such matters as competitions, ancient lights, the Metropolitan Building Act, and the Copyright Act. From the time of the initiation of the Society its main aim had been the placing of the architectural profession on the same footing as the legal, medical professions, &c. Architecture was an art certainly, but it was the art of practical building or the art of building beautifully and appropriately; that being so, it stood in a very different position to the work of the painter or the sculptor. The work of the architect does not sink into oblivion, but stands for many years, and since people have to live in or otherwise occupy the creations of that art it is in the public interest that architects should be efficiently trained in the history and in the science of their profession. It may be agreed that the general public do not care so very much about art. This can be fully assured by means of compulsory education and registration of all architects, which will show that the profession respects itself. But they do care about the comfort and sanitary conditions of buildings, and these can only be assured by the principles of registration. The principles of registration have been admitted from the very early days of the Royal Institute. In the session of 1859-60

they passed a resolution recommending “the initiation of a scheme to be cautiously and gradually developed and brought into working order, in which too much should not be attempted at the outset, but which, in accordance with the rule now established in other professions, the ultimate result should, in their opinion, be the establishment of a system of compulsory examination extended to all architects whether members or not of this Institute.” Without making invidious comparisons between the personnel of the Council of half a century ago and of the present, one must admit that the bump of caution must have been very largely developed. It is scarcely surprising that after watching for twenty-four years the very cautious and gradual development of the principle adopted by the Institute some younger bloods should wish to accelerate the pace. The great object with which the Society started and which they have always maintained has been the great theme of registration; it was their *raison d'être*. If in these earlier days there had been more men of the character of Mr. Leonard Stokes and other leading men on the Council of the Institute there never would have been a Society of Architects. Some four years ago the Institute definitely decided upon a registration scheme and Bill. It is only by mutually working together that architects can hope to secure the ear of Parliament or of the public. The Society of Architects had to thank their President and the Committee to whom the matter was entrusted, and they must feel that on both sides there has been great skill shown in getting over difficulties. There appears to have been some criticism as to phraseology, and the word “absorption” is now employed. It is not the first experience of the Institute in this connection, for in 1842 (seven years after its formation) that body absorbed an older body known as “The Architectural Society.” In conclusion, he trusted and believed that the union would be to the best interests of both bodies and of the public at large.

Mr. LEONARD STOKES, P.R.I.B.A., said it had already been pointed out that that was the first occasion of the President of the Royal Institute being present at their annual dinner. He only wished they could have a series of them. The next best thing was for all present to come and join in one big dinner. Mr. Bond might certainly throw his fears to the wind, for if there was any honour in the Institute it would be shown now.

Mr. G. A. T. MIDDLETON, past V.P.S.A., proposed “The Visitors.” Mr. Edward White, Chairman of the London County Council, and Mr. Leslie Vigers, President of the Surveyors' Institution, responded.

During the evening a musical programme was gone through.

ILLUSTRATIONS.

OXFORD COLLEGE SERIES.—ELY.—NORTH CHOIR AISLE.

WE continue this week our supplementary series of photographs from Ely Cathedral, which will be completed in subsequent issues.

TRAVELLING STUDENT'S SKETCHES.

DURING his tour last year Mr. Walsh visited Ely, and we now publish two of the drawings he made of that cathedral.

PUGIN STUDENTSHIP DRAWINGS.

THIS week we complete our series of illustrations of drawings submitted in competition for this year's Pugin Studentship with a selection from the work of Mr. T. H. Whittaker.

At a meeting of the Manchester Society of Architects held on the 26th ult., the report and accounts were approved and adopted, and the following officers and members of Council were elected:—*President*.—Mr. Edgar Wood, F.R.I.B.A. *Vice-Presidents*.—Mr. John Brooke, F.R.I.B.A., and Professor S. H. Capper, M.A., A.R.I.B.A. *Hon. Secretary*.—Mr. Isaac Taylor, F.R.I.B.A. *Assistant Hon. Secretary*.—Mr. J. T. Halliday, A.R.I.B.A. *Members of Council*.—Messrs. A. E. Corbett, John Ely, W. C. Hardisty, F. E. L. Harris, Francis Jones, jun., P. D. Lodge, Paul Ogden, Claude Paterson, J. H. Sellers, Gerald Sanville, J. H. Woodhouse, and P. S. Worthington.

THE ARCHITECTURAL ASSOCIATION.

LIBERTI AND BRAMANTE: ARCHITECTURE A PROFESSION OR AN ART IN THE CINQUE-CENTO?

By Professor BERESFORD PITE.

(Concluded from last week.)

THE difference in building materials between Florence, Milan, and Rome should not be forgotten as influencing the respective schools of architecture. Bramante had worked brickwork in Lombardy all his life, and the travertine and perino stone were unfamiliar to him. M. Müntz acutely marks of Bramante's move to Rome that "if he wished an edifice he must now build grandly, not gracefully; the Pantheon, the Colosseum, the Baths of Diocletian, these were the overwhelming examples of which he must needs take count."

The cloister of Sta Maria della Pace at Rome was added to Bramante to the church erected by his contemporary,accio Pontelli, who had died in 1500. This was a commission from the Neapolitan cardinal Oliviero Caroffa, whose intention, Vasari says, was attracted to Bramante when on sketching expedition at Naples. This design is one of angular simplicity and grace. It is almost nervously restrained in the employment of detail, but what is used is not tacky or over-refined. The simple proportions and direct subdivision of two bays over one, of a trabeated order over a arched storey, are, like the ease with which St. Pietro in Vincoli was achieved, convincingly natural and masterly.

When Pope Julius II. (Della Rovere) succeeded after the short reign of Pius III. (Piccolomini), Bramante was in high reputation and large practice. Julius, as we know, was a man of great political and architectural ambitions; his was to have been the great tomb by Michel Angelo on which so much artistic history has turned. Vasari may be our guide for a genial description of Bramante's work for the Pope, though we must remark that probably no architect has ever had his work form the substance of research and enthusiasm so remarkable as that which Baron von Geymüller has bestowed on Bramante. Vasari describes the project formed in the mind of the Pontiff for extending the buildings of the Vatican Palace, erected by Innocent VIII., to connect with the Belvedere Villa in the gardens, forming a quadrangular centre, and enclosing a valley. The vision of Nicholas V. at the papal palace should become the resort of all the courts of Christendom bred a largeness of idea with regard to the palace buildings and their purposes that certainly was not cloistral. Julius wished to have two loggias, one on each side of the valley, to pass to the Belvedere, ascending from the valley by a flight of steps. Bramante, who, as Vasari says, "had great judgment and a most ingenious fancy in such matters," devised an arrangement of superimposed pillars represented by pilasters, which solved the levels progressively, beginning with the Doric for the part at the lowest level, then a second range of the Ionic, which became continuous from the first floor of the Palace to the ground floor of the Belvedere. A loggia of four hundred paces long was thus obtained. The water of the whole enclosure was to be conducted to a magnificent fountain in the lower court.

The great niche above the Roman bronze pine cone which formerly stood in the atrium of old St. Peter's is one of the magnificences of which architecture may boast; not only so, but stimulatingly useful, and suggestive as a practical sign, solving by appropriating to architectural purposes the differences of the levels.

The death of Julius interrupted the work, that of the architect occurring before he had completed more than one of the connections with the Palace.

Vasari tells us that "Bramante when not impeded by the parsimony of those with whom he had to act conducted his various undertakings with extraordinary promptitude; in this case such was the zeal with which he seconded the generosity of the Pope, who would have had the edifice receive birth at a wish rather than await the slow process of execution"—and we note and sympathise—"that the men who were labouring at the foundations carried away at night the mud and earth which they had dug out in the presence of Bramante during the day, and he then without further preparations permitted the foundations to be laid. The result of this inadvertence on the part of the master has been that his work has cracked in various parts and is now in danger of ruin. A portion to the extent of eighty braccia fell to the ground during the Pontificate of Clement VII. (de Medici), and was afterwards rebuilt by Paul III. (Farnese), who caused the foundations of the whole to be repaired and strengthened."

The winding colonnaded staircases by Bramante are important and interesting, and seem to be the originals of the subsequent developments at the Barberini Palace by Bernini in the next century.

We cannot now take up the story of Bramante's connection with St. Peter's; that is a chapter entirely by itself, and covered absolutely by Geymüller's great book. Vasari's somewhat imaginative sketch must suffice. He says: "Seeing the resolution with which the Pope accomplished important undertakings, and finding the desire of the latter to coincide with his own purpose and wishes, that, hearing his Holiness express the intention of demolishing the Church of S. Pietro to construct it anew, he made numberless designs to that end, and among these there was one which astonished all who beheld it, and was indeed of extraordinary magnificence and beauty."

"Nor would it be possible to display more consummate art or a more perfect judgment than were evinced by Bramante in this work: the design shows two towers, in the centre of which is the principal front of the building, as we see it on the medals afterwards struck for Julius II. and Leo X. by Caradosso (the sculptor of the frieze in S. Satiro, Milan), a most excellent goldsmith of that time, who had no equal in the execution of dies; the same thing may be seen in the medals of Bramante himself, which are also extremely beautiful. The Pope, being thus determined to undertake the commencement of that stupendous building the church of St. Peter, caused one-half of the older fabric to be demolished, and set hand to the reconstruction, with the firm resolve that in art, invention, arrangement, and beauty, as well as in extent, magnificence, and splendour of decoration, that edifice should surpass all the buildings ever erected in that city by the whole power of the republic, aided as this was by the genius of many able masters whose works had illustrated the States of the Church. With his accustomed promptitude, the architect laid the foundations of his work, and before the death of the Pope, continuing his labours to the close of his own life, which followed soon after that of the Pontiff; he raised the building to the height of the cornice, which is over the arches of the four piers, and of this part he also completed the vaulting, effecting the whole with extraordinary rapidity, as well as consummate art. He likewise conducted the vaulting of the principal chapel, that wherein is the great tribune namely, causing the chapel, called that of the King of France, to be also put in progress at the same time."

"Bramante was a person of most cheerful and amiable disposition, delighting to do everything whereby he could bring benefit to his neighbour. He was the assured friend of all men distinguished by their talents, and favoured them to the utmost of his power, as was manifest in his conduct towards the graceful Raffaello da Urbino, a most celebrated painter, who was induced to settle in Rome by his means."

"This master always lived in the most splendid and honourable manner, and in the station to which he had attained all that he possessed was as nothing to what he might and would have expended. He delighted greatly in poetry, and took much pleasure in music, hearing as well as practising improvisations on the lyre with infinite enjoyment; he would also occasionally compose a sonnet, if not in so polished a manner as we are now wont to expect, yet always giving evidence of an earnest purpose, and entirely free from errors of style. Bramante was highly esteemed by the prelates, and received various proofs of respect and admiration from different nobles, who were acquainted with his excellences. He enjoyed very great renown during his life, and this was still farther increased and extended after his death, seeing that this event caused the erection of St. Peter's to be suspended during several years. Bramante lived to the age of seventy, and when he died was borne to his grave with the most honourable solemnities, and attended by the Papal Court, as well as by all sculptors, architects, and painters at that time in Rome. He was entombed in San Pietro, in the year 1514."

More accurately, on March 11, and was entombed in the Vatican Grotto.

Bramante designated Raphael as his successor in the architectural direction of the works at St. Peter's. He had been his townsman at Urbino, and his intimate pupil and friend; there seems to be proof lacking as to a closer relationship. As also for the suggested attempt to elbow out the gigantic Michel Angelo from either the entire painting of the Sistine chapel or other works.

Bramante's office staff included great names like Antonio da San Gallo the younger, who afterwards continued the work at St. Peter's, and gradually the impression comes upon us

that architecture in the Cinque-cento had begun to take the individual habit which we know now, and that with the dawn of the following century the professional was as well recognised as the enthusiastic, gifted scientist, who combined the management of men with that of materials, and whose mental equipment was founded upon a reverence for the assured successes of antiquity, which, enlightened by true æsthetic sympathy with painting and sculpture, guided his knowledge with taste in the pursuit and achievement of beauty.

In the pursuit of a high professional and artistic ideal, it will be found that study of the architectural monuments of the Italian Renaissance, rather as expressing the individuality of the wonderful men who achieved them, will not prove unfruitful in emulation, and the attainment of even practical wisdom in dealing with such problems as peculiar and impetuous clients, and to a lofty imagination even such difficulties like the valley between the Vatican and the Belvedere may become the foundation of a triumphal architectural scheme.

The PRESIDENT said that Professor Pite had given a most interesting paper, into which he had compressed a most extraordinary amount of scholarly knowledge and information.

Mr. HARRISON TOWNSEND in moving a vote of thanks to Professor Pite, said he would like to express a sense of their indebtedness to him for the charming, scholarly and literary paper they had listened to. He had pointed out with regard to both of the subjects of his address that one need not shut oneself out from other things and confine oneself to the cold rigidity of the limits of one's own vocation. It was almost impossible to recapitulate the greatness and attributes of Alberti. He was an architect, a poet, a philosopher, a painter, a musician, a playwright and an athlete, but throughout the whole of his life he was first and foremost an architect. It was encouraging to them to see that one could work hard at one's art and still be what Alberti distinctly was—an all-round sportsman. With regard to Bramante, he was not sure that Professor Pite mentioned one of his most beautiful works—the cathedral at Saronno, about twelve miles from Milan, which had very much of what the lecturer called the simple grace of Santa della Maria. It was a very beautiful work, with the dome which they associated with several of his works. He did not know also whether they quite took in what they were shown of the relief of Agostino d'Antonio di Duccio, and how reminiscent it was of the Greek stele in design, and particularly in the half leaning pose of the figure and the treatment of the drapery. The allusions to Baron Geymüller naturally came from any one who had studied Bramante's works, and had studied much of the work of the Renaissance as it was set forth in literature, and his recent death had robbed them of one of the most learned writers of that period.

Mr. GERALD HORSLEY seconded the motion, and said that Professor Pite had given them the history of these great men in a way particularly interesting to them, because he had pointed out certain conditions existing in their time which they also found existing in these times. As Professor Pite had told them, they must study these works of the past before they could begin to design at all. He thought, however, that Professor Pite was inclined to be more humorous than exactly accurate when he suggested that all their conditions had been brought about by the actions of these two men. They had, it was true, imposed the orders upon them; they had obliged them to study the works of the past, but he did not think they were responsible for the movement for registration of the present day. At any rate, their brother architects abroad, who were equally influenced by these great architects, had not found it necessary to register. He was reminded by seeing the photograph of the interior of San Satiro, that Mr. Stannus used to say that Alfred Stevens was very greatly influenced by that particular building, and he thought there was a great similarity in some of the works of Alfred Stevens to the little octagonal building, and particularly to the frieze which ran round the arches. The combination there of bronze and marble or bronze and stone, was one which Alfred Stevens was particularly fond of. He happened a few weeks ago to have been again reading Vasari's account of Bramante's life, of which Professor Pite had given a few interesting extracts, and he remembered that Vasari said that Bramante invented a form of timber roofing. He would like to ask Mr. Pite if he could explain what Vasari meant by that. Vasari was in the habit of making wild statements, but it occurred to him at the time that perhaps Bramante, if he did not really invent, yet was one of the first of the Renaissance architects to con-

struct some of his roofs in a particular way. If it was the case, he was sure that Professor Pite, with his great knowledge of the Renaissance, would be able to tell them. It occurred to him that there might be a roof of a novel kind in a building like the Villa Madama, outside Rome, which Bramante designed. There they had wide corridors which were roofed over with vaults, and these vaults had plaster decoration inside which they knew of, for there was a beautiful model in the South Kensington Museum. He would like to know if these vaults were constructed in the usual Italian way, with brick and concrete, or whether they were constructed of timber, because it occurred to him that the reference of Vasari might apply perhaps to a building of this kind, which was a country house, and which would have been built very quickly.

Mr. BOLTON congratulated Professor Pite on the extremely interesting paper, but said he had considerable doubt himself as to the lesson he wished them to draw from it, because he was not at all sure that there was that contrast between the two men which Mr. Pite seemed inclined to make. They must remember in considering this subject that the Italians, in all epochs, had been very weak on the constructive side. In the construction of vaults and foundations, and so on, that had never been understood in Italy in the way it had been understood elsewhere, and these little incidents which happened to Bramante's buildings were common in Italy, even at a much later period. He did not feel sure that the analogy Professor Pite had attempted to draw of the difference between the two men, the one being a dilettante and the other a professional architect, was altogether borne out. If they took the Church of St. Andrea at Mantua, they had a building constructed with more total disregard of material than any building he had seen. He remembered going over the building, and being told that the crown of the vault was nine feet thick. He put a rod down and ascertained that the vault roof was of that enormous thickness. St. Andrea at Mantua was not only Roman in building and disposition, but also Roman in construction. If a plan had been shown they would have seen that the construction of the church was really that of niches hollowed out of the walls of enormous thickness. He thought in scheming out that church, Alberti had in his mind, not only to use the details of Roman architecture but also the actual construction, and if they added to that that he undertook this great work of architecture and carried through the constructional as well as what they might call the artistic side of it, then he did not think they could look on him as a dilettante architect. No doubt he was a man of too many occupations to be able to complete his buildings as they would like, but he could not himself see that there was that real contrast between the two men that Professor Pite would have liked to have made the moral of his paper. However, that did not detract in the least from the great interest of the paper. The great church of Alberti at Mantua was one he wished they could all see, because from illustrations it was difficult to understand the grandeur of it. There was no doubt, that on the whole, it was the first of the Renaissance churches. Of course Alberti would have spent enormous sums on its heavy construction and was not able to get so far as could be wished, and the dome was built by an inferior architect later, and so they had not the satisfaction of seeing the church with the dome as he would have planned it. Many of the illustrations of the building were very inaccurate. The west end of the church would have been very interesting if it had been finished, but unfortunately it remained very imperfect. He thought that the great church at Rimini was undoubtedly of singular interest; it was an extraordinary idea of a sort of sepulchral edifice. The great Belvedere scheme of Bramante was unfortunately ruined by the construction of the Vatican Library right across the centre. It was impossible, however, to suggest the removal of the building, which was a fine building in itself, but had entirely ruined the conception. The great pine cone he always understood came from the dome of the Pantheon. There was no doubt that the church of San Pietro was a building of extreme perfection. The working out of the Doric order was marvellous. There was a crypt underneath, and below was a hole from which sand was taken out which the pious carried away. It was traditionally said that this was where St. Peter was crucified. When they came to St. Peter's the work led to enormous troubles. The foundations of the great piers were extremely badly done, and the masonry was so bad that it cracked. The piers, as they saw them, were cased. They had to be cased, and their size was thus enormously increased. There was a great deal of controversy about this, but there could be no doubt that a great deal of time was

pent in strengthening the structure before the work went on. All authorities did not accept the view of Geymüller with regard to Bramante, and he himself thought that Geymüller was a little carried away by his subject, and would have liked to make out that Bramante anticipated a good deal of the Renaissance to an extent which the drawings in front of him did not justify. The subject was a very difficult one, but there was no doubt that the Renaissance gradually solidified, and it was impossible to draw an exact line. It went on through Peruzzi, and afterwards Palladio took it up, and in his hands it got settled. He did not think they were justified in looking back at the work of Bramante, and attributing to him ideas which really took time to develop. It was very easy to look at some of his sketches of Bramante, and in the light of what we now know, read into them rather more than could be carried out at that time. Not only was there a continued development of the application of Roman architecture, but the Renaissance was carried on by many men. They must guard themselves against looking at sketches and reading into them more than the actual knowledge of the time justified. Of course, of all the students in the school of Bramante, undoubtedly the cleverest was Peruzzi, but he, unfortunately, died very young. The few buildings he left showed extraordinary sense of architectural design. The sack of Rome broke up the school of architecture and painting, and the artists were scattered to different parts. The very promising school which might have led to so much was undoubtedly disastrously affected by the great event.

Mr. T. FYFE thought that Bramante ought to be characterised as a man of a very illusive personality. His personality was very difficult to find, and he thought it was quite a sound view to characterise him as the great practical practising architect of the fifteenth century, because the man was really lost in his work. He was sorry Mr. Bolton did not refer to Saronno, because Mr. Bolton first put him on it, and he thought very likely that some of the work at that church there was by Bramante. As for Alberti, he thought he was one of the most engaging personalities of the Renaissance. He remembered going to Rimini and the effect the church had on him. Alberti had dressed a Gothic building with classical detail. He could not help feeling that Alberti must have had a great deal to do with the inside, although the decoration might have been done by Duccio.

Mr. POTTER hoped the lecture would not be the last of the kind they would have. It was one of the most interesting periods of Renaissance which had been dealt with, and one of the most critical, because in Alberti they had an intense student of Roman work, and the results were shown, if he might so express it, as "copying the Roman system of design." It was interesting to note how, when Bramante came to Rome he was influenced by Roman work, and yet in his palaces he used the orders. Bramante's work was always influenced by the neighbourhood. His work in the north of Italy had a character suitable to Lombardy, and his work in Rome had the classical feeling one would expect there, but in both cases one saw the true designer and the true architect. Although everyone might not agree with the system of design which these Renaissance architects revived, one thing stood out which they should all try and study, and that was their ability to design in whatever style they might happen to have adopted. All their work should have a studiousness and a knowledge of design. Their design was a composition in which one idea of feeling was predominant, and the details were truly subsidiary portions, which was what they did not get in a great deal of the later Renaissance work, and a great deal of modern work.

The PRESIDENT said that as he had not visited the buildings which had been dealt with, he was not prepared to add anything to the discussion. They had, however, to thank Mr. Gamble for lending a very interesting drawing by Alfred Stevens. Following the papers on these Italian masters of the Renaissance, he thought it would be very interesting to have a paper on the English representative of the time, Alfred Stevens. It has been said of Stevens that had he not been the greatest English sculptor, he would have been known as the greatest English painter.

Professor PITE, in reply, said he must apologise for not having been able to write his paper in time for copies to have been sent to some of the speakers. He had, however, had to prepare the paper since Easter, and in this connection Mr. Horsley had unfortunately enquired as to Vasari's meaning about Bramante's roofing. It was an interesting passage, but he had not worked it out. He must look it up. The discussion had been an extremely interesting one, and showed how vastly interesting these lives of the Renaissance practising

architects were to students. They had paid compliments to the dead in regard to Geymüller, but he ought to have complimented Mr. Bolton whose paper some time ago on the Italian churches was of great practical value. Mr. Bolton had a quickness of thought accompanied by a quickness of hand in drawing, which made his paper a valuable addition to their knowledge on this subject. At the same time, he thought Mr. Bolton's remarks rather justified his suggestion that Alberti was a dilettante. With all deference to Mr. Harrison Townsend, he was not an architect first. He was an antiquary first. He was a sort of classical philosopher. His main interest in life was the classics, and it was that side which he ventured to suggest as the dilettante side. It was only by way of contrast. It was by putting the two men side by side that he suggested the moral in the paper could be drawn. It was an interesting analogy, if they wanted one, but he would say, "Don't push it too far." He was interested in the pine cone suggested by Mr. Bolton. The real point was whether the dome of the Pantheon could have supported the pine cone, and he had his doubts. The most interesting point about the pine cone was that Wren was so enamoured of it that he constructed two on the west towers of St. Paul's. He knew that Geymüller praised the school of Bramante unduly. He was like all dilettante scholars; he had Bramante in his mind, and saw him everywhere. Mr. Potter seemed to be distinctly pedantic about the wisdom of applying orders, and all the rest of it. In these matters they, as a rule, invented the principles after the facts. They had the facts, and looked for the principles, and he thought the principle was obvious here; viz., that it was the work of the antiquarian. As to the President's suggestion of the paper on Alfred Stevens, he thought they were living too near his time to write about him yet. Stevens was in Italy fifteen years, and during that time he studied and absorbed detail in the most extraordinary way. He never lost that Italian love of his, but he was a little doubtful as to his being the next link. The real link that they had with Michel Angelo was Inigo Jones, and what Jones saw and learned in Italy he built in England. It was to be borne in mind that Wren never visited Italy at all. Their direct and immediate link began with Jones, who went to Italy just after the death of Palladio.

ARBITRATIONS.*

IT is with pleasure that I address you on the question of arbitrations, a subject, to the lawyer's mind, of great interest, and which ought also to be of more than ordinary interest to the layman, as a quasi-legal subject with which many men dabble, with more or less success, and with more or less, and often less rather than more, knowledge. Last November I delivered a lecture to the members of the Auctioneers' Institute in Russell Square on a branch of the same subject. I then stated that I chose the subject because I thought that in all probability many members of your Institute would most certainly be engaged somewhat frequently in the near future, not only in connection with arbitrations in the ordinary sense of the word, but with questions of the value of land, under the Finance Act, and the proceedings connected therewith, which proceedings, although called valuations, will, in my opinion, really be arbitrations and not valuations. The rules for procedure before the referees and the method of obtaining the opinion of the High Court are all much more on a par with arbitrations and "judicial inquiry," which we shall consider later on to-day.

As years go on, arbitrations are undoubtedly very considerably on the increase, for in most local Acts of Parliament, in tramway, gas or electric light, and municipal improvement Bills, besides numerous agreements and mercantile documents, clauses are inserted providing for the reference of all disputes between the different authorities, companies, and persons to arbitration (frequently giving some Government Department, such as the Board of Trade, power to nominate the arbitrator); consequently it behoves everyone to be in possession of some knowledge of the subject, and more especially the members of your Institute and kindred societies, the members of whom to a very large extent are engaged in advising persons respecting that class of property usually thereby affected. The lecture I delivered in London on "Arbitration Procedure" was printed and sent round by

* A lecture delivered by Mr. George Phillips, J.P., of the Inner Temple, barrister-at-law, at Birmingham, on Thursday, April 27, to the Birmingham and District Branch of the Auctioneers' Institute of the United Kingdom.

the Institute to all its members. I believe, therefore, you should have all received a copy, though I presume some of you deposited it in the waste-paper basket with those friendly letters marked "private" which some of us receive offering kindly and financial help by way of loan of any sum of money without any cost or security and at a moderate rate of interest; perhaps suggesting just a small preliminary fee. Others of you may have read it.

I will endeavour therefore not to travel over the same ground again to-day, but rather to somewhat enlarge one or two of the topics which I then only touched lightly upon and which seem to me capable of being advantageously dealt with in somewhat more detail.

I shall be very glad, if any gentleman wishes to put any questions to me, to give an answer to the best of my ability so far as an opinion can be given to a general question.

We will consider what an arbitration is, then distinguish arbitrations from valuations or certificates given by valuers, architects, or engineers, and what appeal if any there may be; lastly consider who should be arbitrators and their qualifications.

An arbitration is a determination made by one or more persons at the request of at least two parties for or upon some dispute or controversy between those parties. The term arbitration is not defined in the Arbitration Act.

For there to be an arbitration there must be:—

(1) A dispute or disagreement, and

(2) A dispute or disagreement which it has been agreed is to be settled, although by a judicial inquiry, yet not by any ordinary Court of Law, whose jurisdiction is therefore ousted, as explained later.

If there is no dispute there cannot be an arbitration, but there may be a dispute and yet there may not be an arbitration, for if the dispute is one which is to be settled by some person by the exercise of his own skill, knowledge and (or) judgment, without a judicial inquiry, then that is not an arbitration in the proper sense. I do not mean that an arbitrator must not use his own skill or judgment in trying a particular dispute, because that is the very thing he is expected to do, but as an arbitrator he must decide in a judicial manner and not merely on his own knowledge.

This question of the existence of a dispute or difference is most important to keep in mind, having regard to the next question we are to consider, namely, the distinction between an arbitration and a valuation.

Two valuers are appointed to settle the question on sale of the value of some particular thing or object or property, and if they differ an umpire is to settle the matter; the umpire is appointed, then the valuers act. "At the time when the umpire is appointed it cannot be pretended that any dispute has arisen. The vendor and purchaser have respectively agreed to sell and to purchase the particular thing at a price to be fixed by valuation, and the price not yet being fixed there was nothing in dispute between them. If the valuers could not agree as to the price an umpire was to be appointed, but nothing need be known to the vendor or purchaser about the matter."

Think of the numerous cases of this kind where there is no dispute in which therefore there is no arbitration but a valuation.

The distinction between a valuation and an arbitration is one of some little interest, especially it seems to me to members of your Institute, and in the lecture I gave in London I gave extracts from two judgments which will quite well bear repetition.

The distinction is important to the lawyer because—whether the matter is one of valuation or arbitration—it settles the question of whether the Arbitration Act 1889 applies or not and whether the arbitrator should proceed judicially.

A valuer can, of course, be an arbitrator the same as anyone else, but where a valuer or valuers have to decide value only that is not an arbitration. The result of such work is a valuation, not an award. On another occasion I hope to be able to consider the opposite side of the question as to what is a valuation, what form it should take, and the liability the valuer incurs, for I feel myself that in future the valuing of property will become more and more necessary and important, having regard to the Finance Act for purposes of probate and mortgages, for valuers will, in the future, have to use more skill than they may have done in some cases in the past. That statute will undoubtedly make it much more necessary for the rising generation to be *au fait* with these legal questions than has been the case.

If it is the intention of the parties and "if you find by the agreement that the parties desire to have their case decided by some one who is to hear evidence and have the

matter argued before him, then that is a judicial inquiry to be conducted by an arbitrator. There is no doubt about that. On the other hand, if you have a person appointed to prevent any dispute arising such person is not an arbitrator. There is perhaps a third case where a person is to decide after a dispute has arisen but without hearing evidence. Such a case is much more difficult to decide, but it must be decided upon the same principle, namely, whether there is to be something in the nature of a judicial inquiry or not. Valuations for probate, for purposes of assessment or for mortgage we are not considering to-day. The valuations we are considering are those for ascertaining questions of value between vendor and purchaser, incoming and outgoing tenants, transfer of business, question of goodwill, the passing of benefices, and such like proceedings.

Again the matter may not be an arbitration but the right to enforce a claim may be dependent on a valuer's certificate.

Take a building contract, for example, where the parties have mutually agreed to abide by the decision of the valuer, architect, or surveyor (we will call him to-day the valuer to save repetition); the builder having no claim for any money payable under the contract and the building owner no claim for damages or penalties or liquidated damages until the valuer has issued his certificate.

The valuer has to issue his certificate that certain work has been carried out in accordance with particular specifications and conditions, and that certain sums of money are payable therefor, either by instalments or in a lump sum or according to a price list and quantities schedule, as the case may be; further, possibly the building owner may be entitled to certain deductions or allowances for non-performance of certain work or for badly executed work.

In such cases the person granting the certificate may be the agent of one of the parties or may be a quasi-arbitrator or possibly an arbitrator in the full sense of the word. It is clear that in most cases this power in favour of some one standing between the builder and the building owner is very desirable, if not absolutely necessary, for if he was not there directly the architect condemned materials the builder might stop work and claim arbitration, thus putting the building owner to great loss by reason of long delay, loss of interest on capital, &c.; in fact, the owner might be in a sorry plight.

As to the law two cases on this question of certifying have been decided; in one where the matter was left by two parties to the judgment of a third to determine their rights, and the task of so doing was not a mere matter of arithmetic, but involved skill and knowledge, it was held he was in the position of a quasi-arbitrator and no action would lie against him for what he did in the exercise of his functions as such except in the case of fraud or collusion; the other was one where the architect acted as a paid agent for the building owner, he was held liable to his employer in damages for passing bad work; this decision was subsequently upheld by the Court of Appeal. In the second case the point does not appear to have been taken that the architect was acting as a quasi-arbitrator, and the Court decided that the architect's certificate, although final as between the contractor and the employer, was not so for the purposes of a claim for damages between the employer and the architect.

In one text book on this subject the author, while drawing attention to these cases as above and saying they are difficult to reconcile, thinks the first is right. I don't like to differ, but I must say there seems to me to be better arguments in favour of the second.

In connection with this matter one very important fact to note is that the certificate is more frequently than not a condition precedent to any claim being made. Contracts of this kind often provide that no payment is to be made except on the certificate of the valuer, and in such event the position of the valuer is one of considerable importance. He has a duty to perform towards both parties, and must be careful to act fairly. A case came under my cognisance not very long ago. A contractor had agreed to execute certain work to the value of 50,000*l.*, to be paid as to 5,000*l.* on the foundations being completed and twelve bills to be given to the contractor for the balance of 45,000*l.*, whereby such balance was payable by equal quarterly payments with interest at five per cent., such bill to be dated when the purchaser's engineer had certified that the work had been completed to his reasonable satisfaction, the contractor giving full guarantees for any bad workmanship for a period of twelve months. The work was completed, but one small piece of machinery worth about 250*l.*, which was supplied by a sub-contractor, was not of such quality as to satisfy the contractor, who pointed the defects out to the engineer of the purchaser and undertook to replace the same. The engineer himself appeared to be

satisfied, and the contractor asked for the certificate of completion, and sent the bills to the purchasers for acceptance. The contractor heard nothing, but on pressing for the bills some time after the engineer wrote and said that he "was instructed by his directors not to issue his certificate until this small piece of machinery was replaced." This meant a delay of several weeks, whereas the plant could have been worked as it was. The contractor found out that the owners did not want to start using the buildings and plant, and it looked as if they were delaying the matter so as to avoid paying interest on the 45,000*l.* and defer the payment of the instalments. The contractor consulted his lawyers, and was advised to take proceedings against the purchasers on the ground that the engineer had ceased to act under the contract, and by acting on the instructions of his directors as he said he was doing and not on his own skill and discretion, had taken upon himself to act simply as the agent of his employers, and that his refusal to grant a certificate was unreasonable. The matter was never fought out. I do not know whether the purchasers took any legal advice, but directly the contractor gave notice of his intention to commence legal proceedings the purchasers accepted the bills without even asking for their engineer's certificate.

(To be continued.)

THE ILLUMINATING ENGINEERING SOCIETY.

(Report of meeting held April 24, continued from p. 275.)

MR. P. J. WALDRAM entitled his paper "Some Notes on the Effect of Wall Papers on Illumination." It was as follows:—

When one considers the enormous development of gas and electric lighting industries throughout the world, it seems strange that few exact rules should exist which would enable any given degree of illumination to be pre-determined from illuminating units of given candle-power distribution.

Still more strange does this appear in view of the large army of consulting electrical experts whose chief business it is to specify the number and candle-power of illuminants which will give satisfactory illumination under given conditions.

The problem is one which comes constantly—almost daily—before every one connected with the huge modern industry of artificial lighting, from the officials of the great supply companies down to the small builder or the village gasfitter. But it would be difficult to find any one who could say what illumination on a table or desk could be expected from illuminating units of given candle-power distribution in the presence of walls and ceilings of given colours. The architect, whose efforts will to a large extent be made or marred by the results of the lighting installation, and the householder who has not only to endure the results of any mistakes but to pay for them, both have the doubtful pleasure of knowing that the knowledge upon which they are forced to rely is still largely guesswork.

A large amount of labour and research has been devoted to determining with great exactness what flux of light is emitted in different planes by different units of illumination; but it is difficult to apply such knowledge to practical problems of illumination because the important factor of reflection and counter reflection from walls and ceilings has been neglected or shirked on account of its real or supposed difficulty. It is no exaggeration to say very few experts could say whether this factor in any given case will increase the total illumination by 10 per cent., by 50 per cent., or by 100 per cent.

A not unusual way out of the difficulty is to calculate the direct flux only, leaving any increase due to reflection to make up for subsequent deterioration in lamps. This would be reasonable if one had even an approximate idea of the relative values of the two. As an excuse for almost complete ignorance it is apt to appear to the architect or his client a trifle thin.

It is moreover a direct temptation in cases where economy is of importance, to specify those shades which tend to concentrate the rays of light into a given specified working plane, leaving the walls and ceilings objectionably dark, and leaving the working plane under the disadvantage of a strong undiffused light, very liable to cause shadows and glare from glazed surfaces. The secret of all successful artificial illumination is to approximate as closely as we can to those conditions of daylight under which our eyes have developed; and the property which all artificial illuminants lack is diffusion.

Our eyes accept without protest huge differences in range

of daylight because it is so perfectly diffused by the enormous depth of atmosphere through which it must pass; but a difference of even two or three foot-candles in artificial illumination will cause considerable inconvenience.

As Mr. Harrison has pointed out, shadows, which are distinctly restful to the eye in daylight, are similarly beneficial in artificial lighting. But shadows, or rather differences in the intensity of an otherwise objectionably uniform light, can be obtained by providing surfaces within the range of vision which reflect different proportions of light.

Optically, therefore, it would appear that the correct policy is to utilise as fully as possible the reflecting and diffusing properties of walls and ceilings, and to afford relief from trying uniformity by the use of coloured surfaces, in positions where they will catch the eye without unduly reducing the efficiency of the installation.

A successful scheme of artificial illumination would seem to demand collaboration between the architect and the lighting expert at an early stage in the design. But architects are by way of being fairly shrewd (popular ideas notwithstanding), and they are not likely to vary their designs or their schemes of decoration unless the lighting expert can base his requisitions upon exact knowledge, and can answer pertinent questions thereon. The more, therefore, we can ascertain about the subject and the less we have to trust to guesswork the better.

What is expected of any scheme of artificial illumination is as follows:—

1. That the working or table plane of the room shall receive an equable light, as much diffused as possible, sufficient for the purposes for which the room is to be used without being excessive.

2. That the walls and ceilings should receive and reflect such an amount of light that they appear to be neither too glaring nor too dull, with all essential architectural features brought into sufficient prominence.

Up to the present it has been customary to more or less neglect the wall and ceiling illumination and to consider the working plane illumination as being a criterion of the whole. This is not only wrong, it is injudicious. An interior may have an excellent illumination on the table, but not one person in a hundred would give it credit for being a well-lit room on that account. The walls are what practically everyone unconsciously judges by. According as they are bright or dull, warm in tint or cold, so, rightly or wrongly, the illumination of the room is popularly classed. The light reflected by the walls and ceilings has a psychological effect upon those who use, judge, and pay for it which neither the architect nor the lighting expert can afford to disregard.

Commercially, too, the reflected light from the walls and ceilings is important. Gas or electricity is sold and bought in order that a certain amount of light shall be reflected into our eyes from objects which must be viewed under artificial light, but lamps and mantles emit light in all directions, and users ought to understand that a large proportion of light which falls upon walls and ceilings of poor reflecting capacity is absorbed permanently, and represents money thrown away without any result.

It is also in the best interests of those who sell illuminating energy or the means by which it is utilised to be in a position to point out to their customers that buying light in order to feed the capacious appetite of, say, dark red or olive-green papers with that expensive commodity is hardly conducive to satisfactory results. The best and cheapest advertisement is a satisfied customer. A dark-walled room with a dull ceiling will not only always look dull, but also will actually be decidedly more expensive to light than a similar interior possessed of better reflecting surfaces. Light walls not only impress the user, they also assist very materially to actually illuminate the ceiling, the table planes, and themselves. Considering that rooms can be lit entirely by reflected light from the ceiling and walls, with an almost entire absence of shadow, it is obvious that ignorance of the value of such an important factor is almost inexcusable. There is a need for recognised standards of surface brightness which will be satisfactory for different classes of interiors, and the author ventures to suggest that the Council should take steps to establish such standards.

The predetermination of interior illumination is at first sight by no means an easy problem. The proportion of light thrown upon walls, table, and floor is subject to variation with every alteration of shade and height of lamp. Then the ceiling reflects not only on to the table and floor, but also on to the walls, which, in turn, reflect partly on to the floor and partly back to the ceiling; and all these incidents of re-

MODERN EUROPEAN ARCHITECTURE.

HOUSE AT WACHWITZ.—Professor WILHELM KREIS, Architect.

[From *Moderne Bauformen*.]

flected light are reflected again and again until the mind refuses to grasp further complications.

But however complicated reflection may be, its total effect at any point can be ascertained by simply screening off any direct rays previously incident on that point from the light source. If such results were obtained, averaged, and recorded for a sufficiently large number of interiors and conditions, there would be little difficulty in determining, at least approximately, what reflected illumination might be expected from any given flux of direct light on walls and ceilings of different colours and textures.

If for any situation the direct flux were calculated from the candle-power distribution curve, the indirect or reflected flux deduced from results obtained under similar conditions, and the surface brightness of the wall surfaces ascertained by multiplying the flux direct and indirect incident upon them by the coefficient of reflection of their colour and texture, then the essential conditions of interior lighting could be satisfactorily predetermined.

Reflection-coefficients.—A very exhaustive table of the reflection coefficients of various wall-papers has been prepared by Dr. Louis Bell, and will be found in a paper read by Mr. Leon Gaster before the Association of Engineers in Charge (London), on December 11, 1907.

The author is not quite clear as to how these coefficients were arrived at, but he suggests that the reflection coefficient for any paper, colour, or texture can be ascertained with sufficient accuracy for all practical purposes by measuring its apparent surface brightness in a direction normal to its surface as compared with that of white blotting paper, a Holograph Lumeter standard card, or any other suitable standard under the same illumination. The reflection coefficient of some papers appears to vary with the angle of reflection, but this is a case where half a loaf is preferable to starvation, and it is better to start with data which may require subsequent refinement as our knowledge increases than not to start at all.

C.P. Distribution Curves.—Candle-power curves of lamps and shades are not used at the present time to anything like the extent which they ought to be, and to which they would be were it possible for the lighting expert to obtain them readily for any combination of lamp and shade. It is from the c.p.

curve, and from it alone, that he can determine what direct flux of light will fall upon any given position even if he neglect the enhancing effect of walls and ceilings.

It is, however, no small matter to place a lamp and its shade upon a photometer bench and test it at all angles; and if it were possible to obtain a fully accurate curve from a lamp and shade either in actual use or fixed temporarily to a point, doubtless they would be used more largely. The author suggests the following method as being simple and sufficiently accurate for practical purposes.

To one end of a light wood lath is fixed a vertical bent plate of tin blackened and marked in degrees and carrying a plumb bob so that the angle with the horizon at which the rod is being held can be at once read off. Part of the tin plate is bent at right angles to the direction of the lath, and a plate of known whiteness—white blotting paper or a Lumeter test-plate—is attached by means of a rubber band. A blackened brown paper screen is held or hung behind the lamp and shade to be tested, the lath is held with the point just touching the lamp. The illumination in foot-candles produced on the test-plate is then read, with the lath held at different angles. This illumination (except in a blackened room) is produced partly by the lamp and partly by reflection from surroundings, or even by other lamps. The rays coming from the lamp alone are isolated from the extraneous light as follows. A small black screen of such a size as to just screen all the rays from the lamp and shade, but nothing else, is held in a notch in the lath, and a reading taken under these conditions represents the extraneous light only. The difference between the two represents the direct rays from the lamp and shade only. The net foot-candle readings divided by the square of the length of the lath used to give the required candle-power at various angles. The method seems somewhat rough, but it is very handy, and gives curves which approximate very closely to those obtained in the laboratory. It also enables curves to be measured for gas mantles, oil lamps, wax candles, &c., which are very difficult to obtain in any other way. By its means the difference caused by various patterns of shades can be quickly tested; and it should not be forgotten that many people who are only confused by figures and technical terms will readily grasp the meaning of a curve.

Equipped with the distribution curve of the particular light unit or units which it is proposed to adopt, and the re-

DETAIL FROM HOUSE AT WACHWITZ.—Professor WILHELM KREIS, Architect.

reflection coefficient of the wall and ceiling papers or colours the installing engineer can say what direct flux of light will fall upon the walls, ceiling, and table plane of any room, and what will be the surface brightness due to that flux. All he requires to know is what increase in the flux will be due to reflection.

A very exhaustive series of tests on this point was carried out by Drs. Sharp and Millar, in America last year in a room about 12 ft. by 12 ft. by 10 ft. high, but with a powerful pendant lamp near the ceiling. The walls were "greyish-white," the ceiling white, and the floor brown linoleum. The results obtained will well repay study. (See Trans. American Soc. Ill. Eng., May, 1910.) Briefly summarised they are as follows: the lamp used directed an average flux of 1.20 foot-candles on to the ceiling, 2.50 foot-candles on to the walls, and 1.25 foot-candles on to a table plane 3 ft. from the floor.

It was found that the total effect of reflection and counter reflection from walls and ceilings under these conditions was equivalent to an average secondary flux of 1.90 foot-candles on the walls, 0.65 foot-candles on the ceiling, whilst the illumination on the table plane was doubled to 2.5 foot-candles.

This test, excellent as it is, gives only the results for one size of room, one scheme of colour, and one scheme of lighting. What we require are more numerous (if less detailed) results obtained in a number of rooms of different sizes with different schemes of colour and with varying proportions of light thrown upon walls, ceilings, and floor respectively by means of light units at varying heights with various shades.

Tests of Effects of Wall Papers in a given Interior.—The author hoped to have been in a position to submit to the Society the results of a number of such tests of different rooms. Although, owing to illness, he has been unable to complete them, a description of their scope might possibly induce others to collect data on the same or better lines.

The method adopted was to divide the floor, walls, and ceilings into a number of equal rectangles. The c.p. distribution curves of the lamps having been measured as before described, readings were then taken with an illumination photometer of the illumination received by a detached test-plate placed in the centre of each rectangle. Then another series of readings was taken with a small black screen placed about halfway between the test-plate and each lamp, so as to

just cut out the direct lamp rays whilst obliterating as little as possible of the light reflected from the ceiling. This second set of readings isolates the increase due to all reflections and counter reflections for that size of room and colour of wall and ceiling surfaces, and the difference between the sets of readings should equal the direct flux as calculated from the c.p. curves.

A room about 19 ft. by 12 ft. 3 in. by 10 ft., papered with very dull red paper possessing a coefficient of reflection of only about 11½ per cent. was temporarily fitted with two 35 Watt Mazda pendant lamps and tested with different Holophane shades varying the incidence of the light rays. The walls were then altered from such an approximately worst condition to an approximately best by covering them temporarily with white lining paper with a coefficient of reflection of 100 per cent., and similar readings were taken. It is proposed to compare the results thus obtained with a series of tests which, I understand, is now being made by Holophane, Ltd., in a smaller room hung with a series of different coloured papers. The Holophane tests should be of great value when completed. As far as the author's results have been carried it would appear that under average conditions the increase of flux of illumination on walls by reflection tends to vary somewhere from between 50 per cent. and 70 per cent. with white wall paper, down to between 20 per cent. and 30 per cent. with very dark papers. The increase of flux of illumination on white ceilings appears to be in about the same proportion as on the wall papers to which they are adjacent. The increased illumination on table planes in foot-candles appears to be about a mean between the increases in foot-candles of the flux on the walls and on the ceiling.

These results are, of course, very approximate, and they are only put forward as practical terms in which it may be found possible to express the results of future investigation.

GLOUCESTERSHIRE ARCHITECTURAL
ASSOCIATION.

MR. WALTER B. WOOD (President) occupied the chair at a meeting of the Gloucestershire Architectural Association, held at the Northgate Mansions on Thursday, April 27, when a number of members attended to hear a lecture by Mr. A. Saxon Snell, F.R.I.B.A., entitled "Baths

and Wash-houses." Mr. Snell, in the course of an exceedingly interesting and instructive lecture, pictured the ideal baths of the future, which should include a lounge, gymnasium, library, picture gallery, &c., after the manner of the Roman baths of old. This, he said, might appear visionary, but in view of the increasing interest that was now taken in municipal enterprise was quite within the bounds of possibility. The lecturer dealt exhaustively with the question of planning of public baths, and pointed out that in many cases insufficient attention was given to the choice of a site, an awkward site often resulting in costly planning. Although great improvements in planning baths had been made during the past twenty or thirty years, the lecturer thought that there was room for further improvement, but that in many respects the designer's hands were still tied by popular prejudice. This handicap, he hoped, would disappear in time. Mr. Snell mentioned that he had that day visited the Gloucester Public Baths, and remarked that they were among the most conveniently and economically planned baths he knew. At the close of his lecture Mr. Snell exhibited and explained numerous plans of baths and wash-houses carried out by himself and other architects, including plans of the Gloucester Baths (kindly lent by the architect, Mr. J. Fletcher Trew). An interesting discussion followed, in which Messrs. W. B. Wood, Fletcher Trew, H. W. Chatters, R. S. Phillips, and H. S. Davis took part. The meeting closed with a hearty vote of thanks to the lecturer. On Friday afternoon members visited the new Ladies' College baths at Cheltenham, by kind invitation of Mr. Snell, the architect.

COMPETITION NEWS.

BROUGHTY FERRY.—Competitive plans for the erection of a new school on the Whinny Brae, to accommodate 810 pupils, have been considered by the School Board of Broughty Ferry. There were eight competitors, and from these a selection of three was made—namely, plans by Mr. J. H. Langlands, architect, Dundee; by Messrs. Maclaren, Sons & Soutar, Dundee; and by Messrs. Charles Ower & Co., Dundee. By 5 to 2 in a final vote between Messrs. Maclaren and Mr. Langlands, the plan of Mr. Langlands was chosen, subject to the approval of the Education Department. The new school will provide accommodation for 810 pupils, and will enable the whole of the supplementary classes to be taught under one roof. The chief elevation will face east and west. The whole of the classrooms are placed so that the light falls from the left of the pupil, with free wall space for the blackboards facing them. Instead of one central hall, the plan includes two halls, each 54 ft. 6 by 27 ft., one on the ground floor and another on the first floor, the light coming from the east. As these halls will be used for physical drill, or possibly gymnastics, pits in the floors of each provide accommodation for storage of drill apparatus, so that when needed the halls could be cleared for assemblies of pupils or others. The rooms for the teaching of cookery and laundry are on the second floor, over the halls; while on the ground floor, at the north end of the building, with access from the corridor, the large room for manual instruction is placed, a feature of this room being the provision of a shoot, with fireproof door, by which shavings and other suitable waste products may easily find their way direct to the heating chamber to serve as fuel. The school will have a mechanical air supply and indirect heating. By an electrically-propelled fan air will be drawn through a special inlet and pressed into the main air trunk under the ground floor corridor, and from this trunk a distinct flue up to each classroom will be provided, with outlet flues therefrom to the roof trunks. No heating of air takes place underground, the low pressure steam radiator necessary to warm the air for each room being placed in its particular inlet flue above the floor level. The fresh air on being admitted at the main inlet is passed through a fine mist water spray, which moistens it, and at the same time carries down smuts and impurities. The estimated cost of the building is 9104½, with 500½ to add for architect's and measurer's fees; while the figure for Messrs. Maclaren's design was 9368½, exclusive of architects' fees, and of Messrs. Ower's 9499½.

DUNFERMLINE.—The competitive plans for the women's institute proposed to be erected by the Carnegie Dunfermline Trust have been assessed by Messrs. Sidney Mitchell & Wilson, architects, Edinburgh, and they have awarded the premiums as follow:—1 (20½), Messrs. John Melvin & Sons, Alloa; (2) (15½), Mr. John Watson, Rutland Street, Edinburgh; 3 and 4 (10½) Mr. James Lindsay, West George Street, Glasgow, and Mr. Archibald Welsh, 253 High Street, Kirk-

caldy. The committee of the Trustees decided that the most suitable plan was that of the last-named architect. The cost of the institution will be 7,500½. The institute will have a parlour for social purposes, table games, &c., a reading and writing room, three class-rooms to accommodate 40, and a hall with seating provision for 360.

LIVERPOOL.—Prizes of 20½, 10½, and 5½ given by Mr. W. H. Lever for designs for a group of cottages suitable for Port Sunlight have been awarded to Messrs. R. F. Dodd, W. E. Davies, and A. R. Sykes, second year students of the School of Architecture in connection with the University of Liverpool.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

To Save the Crystal Palace.

SIR,—The Crystal Palace is now definitely and irretrievably to be sold. The decision of the Judge ordering the sale was upheld by the Court of Appeal on April 25. Its sale is now as certain as that the sun will rise to-morrow. The question now is: Who shall purchase the Palace? Setting aside all alternatives, good, bad or indifferent, my Council urges that scheme which has been spoken of with remarkable coincidental unanimity by writers from several parts of the world as "the finest project ever placed before the British public"; which has the active support of literally hundreds of British newspapers; and the support of thousands of the British and Colonial public, and a large and influential body of titled gentlemen—namely, The King Edward National Memorial.

I now beg of all readers to consider the extreme urgency of the matter. Several hundred thousand pounds are needed at once as a minimum if the Palace is to be saved. Given this, we can purchase the Palace and secure it to the nation and Empire. All the more important banks throughout the country have undertaken to receive subscriptions, and have subscription lists. A great many newspapers and technical papers are doing likewise; and I want everyone who reads this paper to subscribe, and at once. *Bis dat qui cito dat.* The Palace cannot be purchased "by arrangement." It has to be a cash transaction. Let all promises (of which we have received hundreds) be forthwith transmuted, and all sympathy materialised into a precious metal offering, once and for all—and for ever the Palace is the possession and meeting-place of the nation and the Empire, shining ever in our homeland's sunlight a welcome to every British son—farborn and near—to the memory of the King beloved and for his peoples' good. We need gifts from 100,000½ down to 1s. All will be gratefully acknowledged in any daily or weekly paper selected by the donor. Contributions may be sent to any newspaper editor, or to any bank, or to the Earl of Kinnoull, the King Edward National Memorial Offices, 26 Shaftesbury Avenue, Piccadilly, London, W., from which address all particulars can be obtained.

Every subscriber of one guinea and upwards within the next month for England, and three months for American, and six months for Australian and New Zealand Dominions and Colonies, will receive a Life Free Admission ticket to the Crystal Palace.

The promotion is purely gratuitous by all parties, and in the event of our not being able to purchase the Palace all subscriptions will be returned.

TENTERDEN.

April 26, 1911.

St. Paul's Cathedral.

SIR,—In your issue of April 28 you say the Bath Stone Firms exhibited at the Building Trades Exhibition "a sample stone from the Wakeham district for St. Paul's Cathedral." Can they, or anyone, give any reason or authority for saying St. Paul's was built of stone from (or near) "the Wakeham district"?—Yours obediently,

ENQUIRER.

THE King and Queen have graciously intimated their acceptance of an armoire which is being carved by the students of the School of Art Wood-Carving, South Kensington, as a Coronation gift.

DETAIL OF ARCADING ON NORTH WALL OF THE CHAPTER HOUSE SOUTHWELL MINSTER

DRAWINGS SUBMITTED FOR THE PUGIN STUDENTSHIP, 1911.

By Mr. T. H. WHITTAKER.

The Architect, May 5th 1911.

FORTHCOMING EVENTS.

Saturday, May 13.

Royal Institute of British Architects: Final date of application for the Final and Special Examination to be held June 29—July 7.

Tuesday, May 16.

East India Association: Mr. John Begg (consulting architect to the Government of India) on "The Architect in India." At Caxton Hall, Westminster.

Wednesday, May 17.

Institute of Sanitary Engineers: Mr. G. W. Chilvers on "The Mechanics of Municipal and Sanitary Engineering."

Thursday, May 18.

Incorporated Church Building Society: Annual General Court at the Church House, Westminster.

Saturday, May 20.

Edinburgh Architectural Association: Visit to Aberdour and neighbourhood.

THE ROYAL ACADEMY EXHIBITION.—II.

CONTINUING our inspection of the ecclesiastical work we notice Mr. ROBERT H. CUNLIFFE's design for St. James's Parish Church, Accrington (1,601), as an example of elaborate, fussy and fidgety treatment of perpendicular detail with flying buttresses and many projections. Messrs. JOHN WILLS & SONS' "Design for Methodist Church and Schools" (1,588) is an instance of the elaborate phase of Perpendicular which seems to be the favourite style in vogue at present amongst the conformist church communities. Mr. HERBERT G. BERSON's "Baptist Meeting House, Chorley Wood" (1,615), shows another type of modern ecclesiastical design, set to harmonise with the rough-cast fashion of domestic work. This is shown in a clever coloured drawing that makes the most of its rough-cast and green slate. Mr. GERALD COGSWELL's "Proposed District Church to Anne's, Highgate," is quietly toned, apparently in black, represented in a pleasant grey water-colour drawing that rather disguises the material.

If some of the designs that are shown in clever and effective water-colours look prettier than they will probably be in realisation, the same cannot be said of such work as Mr. WILLIAM DAVIDSON's drawing of the proposed restoration of the Church of St. Margaret, Wotton, Norfolk (1,597), where a really quiet and restful design has given to it a false skittishness by an unfortunately flickering pen-and-ink drawing. How much is "restoration" is not clear, but the salient feature, a red western tower, is presumably due to the original. Another design that suffers from a poor presentment in pen and ink is Mr. WALTER TAPPER's "School Chapel, Perth, West Australia: South-west View" (1,594), a good, simple design that is not fairly treated by the draughtsman.

Mr. HUBERT C. CORLETTE's design for "New Rectory, Hornsey Parish Church" (1,626), is shown in a coloured pencil elevation which pictorially suffers from a rather unpleasant blue background to the figure objects. The iconography is interesting as a struggle with restricted doctrinal expression. Although the drawing of "Congregational Church and Schools, Manchester" (1,612), by Messrs. J. H. FRANCE & H. B. AYCOCK, is skied, it shows an effectively-grouped design even if there may be some undue straining to gain the effect. Considerations of cost have possibly limited the height of the central tower to the level of the ridge of nave and transepts, but the result is pleasing. Messrs. KELLY & DICKIE's "Church of St. Saviour, Lewism" (1,618), with a simple Italian type of building whose chief feature is the wide projection of the eaves, is very refreshing after the many examples of over-elaboration of grouping and detail that is largely prevalent

amongst the churches and chapels in this year's Academy. Messrs. JOHN WILLS & SONS have succeeded in avoiding over-richness on the one hand and undue severity on the other with their design for "Proposed Baptist Church, Eltham Park" (1,629), a brick building with Decorated tracery modified by the modern through mullion. A tall square tower, almost a campanile in proportion, is a striking feature of the design. Quite a different kind of tower is seen in Mr. WALTER PLANCK's "Church of the Second Congregation, Belfast" (1,631), a big, squat structure that is equally striking and would be even more satisfactory if its sturdy mass were not spoilt by thin angle buttresses and pinnacles tied to the tower angle with little flying arches. A good Perpendicular east window gives promise of a generally satisfactory design.

A somewhat unusual feature is introduced in Messrs. HEALING & OVERBURY's "Design for New Church of St. Catherine, Wotton, Gloucester" (1,633), of which an exterior coloured perspective view is shown. This feature is a south porch at the east end of the nave. Presumably the main entrance is through the western tower and the south porch is primarily an exit. The gain in composition is valuable although the departure from the usual position to which we have become accustomed by association strikes us as somewhat odd. Messrs. H. R. & B. A. POULTER's interior view of "St. Andrew's Church, Frimley" (1,630), shows an attempt at small cost by the use of timber roofing and posts to make a nave and aisles of a wide space enclosed by comparatively low walls. Professor BERESFORD PITE's design for the "Cathedral Church of St. Paul, Namirembe, Uganda" (1,651), is a somewhat peculiar conception of domed architecture that is marked by originality and would look a great deal better in execution than in the drawing.

Sir ASTON WEBB, R.A., is represented in this year's Academy by one drawing only, a coloured elevation and plans of the "Imperial College of Science and Technology: New Buildings, in Prince Consort Road, South Kensington, for the Royal School of Mines and Engineering Extension of the City and Guilds of London Institute" (1,542), which will be a notable addition to the collection of Government buildings in South Kensington. Mr. JOHN BELCHER, R.A., and Mr. T. G. JACKSON, R.A., do not exhibit this year, and Mr. R. NORMAN SHAW, as a retired Royal Academician, naturally does not contribute.

Of public buildings there are comparatively few drawings in this year's Academy, but domestic architecture bulks largely and comprises many interesting examples of the work of our leading men in this department, as well of those lower down on the ladder of fame who are not necessarily less devoid of ability. These sections of the show we shall deal with in future articles.

ROMFORD GARDEN SUBURB.

GARDEN suburbs and garden cities are springing up all over the land like mushrooms, but the nearest approach to the rapidity of growth of JONAH'S gourd is to be seen in the Gidea Park estate, which is now in process of transformation into a garden suburb of Romford, where some 140 houses have since last September arrived at various stages of completion, from a fully-furnished house ready for occupation to half-built brick walls which can hardly be finished and roofed in before the opening day of the Town Planning and Modern House and Cottage Exhibition, fixed for June 1.

The remarkable feature about this collection of houses is that it is an architectural competition, representing the efforts of a hundred architects to win a first prize of a gold medal and 250*l.*, or a second prize of 100*l.* for the design of a detached house to cost not more than 500*l.*, or to win a first prize of a gold medal and 200*l.* or a second prize of 100*l.* for the design of a detached cottage to cost 375*l.* The competing architects have either put up their own capital or found clients to provide capital for the erection of the houses, so that the competitive designs might be expressed in solid bricks and mortar, timber and stone, slate and tile rather than delineated on paper. Thus the promoters of the exhibition and the owners of the land have cleverly induced a number of architects and their friends to speculate to the tune of 60,000*l.* in the development of a new building estate.

This estate has natural beauties that should prove attractive to the general public, but to this has been added the further attraction of the best skill of the hundred competing architects, the *dernier cri* in artistic domestic design. We hope for the sake of the architects that the public will be sufficiently attracted to relieve the speculators from disappointment and embarrassment, but there is another feature in the case which may prove deterrent to shrewd purchasers.

We were informed at the private view last week that the purchase price of a 500*l.* house and the freehold land on which it stands would be about 750*l.*, according to the size of the plot. By the conditions of the competition the 500*l.* cost of a house includes builder's profit, architect's fee, and fencing, so the remaining 250*l.* represents cost of the land, lay-out of garden and any legal costs. Putting these two latter items at the outside figure of 50*l.*, we have 200*l.* for the price of the land, and as there are six houses to the acre we arrive at 1,200*l.* an acre as the figure on which the calculations of the owners of the land are based, a fairly high one for land in Essex east of Romford. Will the house-buying public swallow the bait?

It would be unfair at the present time to enter into a detailed criticism of the exhibition, as no catalogue is yet available, and many of the houses are not labelled or even completed, but we can truly characterise the results already achieved as the most remarkable exposition of the ability of English architects in domestic design that has ever been seen. Not only is there skilful planning of a very high order but an immensity of artistic ability and thought.

Needless to say, there are no two houses alike, except in one or two instances where these are intended to form a group in composition, but there is also an infinite variety of treatment. True, there are some examples of the rough-cast and green slate type, with which we are now almost nauseated, but these are in the decided minority, and perhaps the most outstanding feature of the exhibition as regards artistic design is the thought devoted to the use of common everyday material in novel applications for the sake of artistic expression.

Without a catalogue we are unable to give the names of all the architects represented, but amongst them are some well known in domestic work as designers of the "smallish house"—Mr. M. H. BAILLIE SCOTT, Mr. GEOFFRY LUCAS, Messrs. FORBES & TATE, Messrs. FAIR & MEYER, Messrs. WARWICK & HALL.

In connection with the Romford Garden Suburb there has been held a competition in town planning for a portion of the Gidea Park estate as yet not laid out and separated by the golf links from that on which the 140 competitive houses are built. The first prize of 100*l.* has been won by Messrs. GIBSON & DANN, the second prize of 50*l.* by Mr. GEOFFRY LUCAS, and the design of Mr. OSWALD MILNE has been highly commended.

Many of the competitors have adopted the system that proved successful in the Ruislip Manor competition and laid out the land in pretty patterns, which treatment has here the greater justification as the gradients are fairly easy, but this type of plan has been ignored by the judges. The winning design has a well-laid-out civic centre with a public hall, places of worship for both the Established and the Free Churches, cottage hospital and technical schools. Leading to this centre is a good shopping centre, and the approach to the railway station is direct and convenient. In the residential portions of the plan, the closed vista and the enclosed square are largely adopted.

Mr. GEOFFRY LUCAS has also a good civic centre though not so complete perhaps as in the first prize plan, the main feature of his arrangement being a grand avenue leading from the golf links, and around which are the public buildings. The important matter of approach to the railway station is also not quite so well handled. Mr. MILNE's design is very similar in disposition to that of Mr. LUCAS.

NOTES AND COMMENTS.

The preamble of the Bill of the Corporation of the City of London for the erection of St. Paul's Bridge has been passed by the Committee of the House of Commons, and in view of the evidence given before the Committee we cannot be surprised at the approval given to the plan proposed by the Corporation. Whether the evidence which necessarily turned very much on the personal opinion of the witnesses, was reliable is quite another matter. Sir ALEXANDER STENNING said that the Corporation plan would open up a very fine view of the Cathedral—and we agree with him—but no one said that any other plan would open up a better.

SIR WILLIAM NOTT-BOWER, of course, as the representative of modern police methods, advocated the scheme of furnishing a direct intersection of north and south traffic with east and west traffic, but no one gave evidence as to the amount of traffic that goes from south to west, south to east, north to west, or north to east. As our office windows overlook one of the busiest intersections in London of north and south with east and west routes, we have this view of the traffic question daily before our eyes and we cannot help realising the public danger that results from these divergent streams. Our chiefs of Metropolitan Police have not yet begun to dream of a safer method of dealing with cross traffic than the direct right-angle junction. Continental town-planning experts have well considered the question, and have shown that there are better and safer methods of dealing with the traffic that meets in streams from north, east, south and west than that intended in the Corporation plan for St. Paul's Bridge.

If the Corporation and the House of Commons prefer Sir ALEXANDER STENNING's fine view of St. Paul's to that of Professor PITE and other artists, we can only pity their taste, but from the point of view of the public safety we can confidently affirm that the Corporation are making a terrible mistake in the arrangement they propose of road traffic. We say of road traffic. We recognise that for the purpose of a direct tramway route from the Angel to the Elephant and Castle the Corporation's plan is admirable.

BUT is a direct tramway route from north to south the *summum bonum* of London traffic? First of all it benefits passengers only, not goods. Goods we recognise want to go from north to south, but is not passenger traffic to and from the City almost entirely radial? How many passengers travel by the City and South London tube from Clapham and Stockwell to the Angel and Euston? We know that this line is a great convenience to a few, but with some personal experience we are aware that there is comparatively a small number of threepenny tickets issued on the line. The real truth is that there is no great necessity to provide facilities for through passenger traffic by tramway from north and south. When this truth is realised the actual *raison d'être* for the Corporation's plan vanishes entirely. We are quite aware that tramways are not in the Bill, but it is perfectly clear that the north and south tramway route is at the bottom of the tenacity with which the Corporation's scheme is being pushed. Plus, of course, the *amour propre* of the projectors.

THE evidence in favour of the Corporation's plan was well presented, the evidence against was without advocates. The opposition was entirely that of financial and commercial interests concerned, and this opposition was tactfully squared. Nobody put up any money to fight the cause of the public safety or the æsthetic amenities of London; therefore, on the evidence, the Committee could scarcely do other than pass the preamble as proved. So the safety and beauty of London must go to the wall.

IN a discussion on "The development of the suburbs of the city," in connection with the provincial sessional meeting of the Royal Sanitary Institute, held in Liverpool on May 5, Mr. H. D. SEARLES-WOOD, Vice-Chairman of the Council of the Institute, presiding, Mr. J. A. BRODIE, city engineer of Liverpool, laid stress on the importance of laying out the main roads leading to the suburbs of a city of ample width, 80 feet rather than 50 feet. Neglect of this had cost the city of Liverpool during the past fifteen years $1\frac{1}{4}$ millions sterling, expended on providing main lines of communication, and without such widening the present system of quick transport traffic would have been impossible. As a result of the experience gained, the 1908 Act was passed, by which land for widening up to 80 feet could be obtained free of cost from landowners where the land was still unbuilt upon. A rather important question remained to be settled as to how the funds to cover the cost of such works are to be provided in the districts outside the city.

THE satisfactory planning of the town consisted largely in the proper arrangement of the main lines of traffic in the first instance, and a lot of detail could be left to be worked out at a later date. That was the plan adopted in connection with the new streets that were being made to the outskirts of Liverpool in Childwall Road, Woolton Road, and Thingwall Road. Prescott Road and the road beyond Wavertree Clock Tower would also no doubt be constructed 80 feet. They were dividing their areas into something like half-mile squares or rectangles. He believed that if the main lines of communication were properly provided in the first instance, the minimum of street works might be permitted. He thought it was wise that so much of the permanent work as was actually completed should be done in first-rate style and with first-rate materials, so that the maintenance, if it became afterwards a charge on the public authority, might be kept as low as possible.

SUBSEQUENT speakers endorsed the views which Mr. BRODIE had expressed and voiced their approval of the work he had done around Liverpool in carrying out the principles he enunciated. There is no doubt that one of the first steps to be considered by municipal authorities in adopting the provisions of the Housing and Town Planning Act for the lay-out of suburban areas is the necessity of adequate main roads to reach the suburbs.

SOME of the clergy of Yorkshire have been discussing at Hull the question of the fire insurance of churches. This bristles with many difficulties, first to decide on what basis of value a church should be insured, second how the cost of premiums is to be met, and then what can be done if the lay rector refuses or omits to insure the chancel. The discussion, under the chairmanship of Archdeacon MACKARNES, did not satisfactorily clear up the difficulties.

By the generosity of Mr. WATSON FOTHERGILL, one of the architects of Nottingham, a statue of RICHARD PARKES BONINGTON, one of the most notable men Nottingham claims to have produced, was formally unveiled in the grounds of the School of Art, Nottingham, on May 3, in the presence of the Mayor and Sheriff and representatives of the civic and art interests of the city.

THE statue, which has been executed by Mr. POMEROY, A.R.A., from a block of Carrara marble, faces the Waverley Street entrance. The statue is 6 ft. 6 in. in height (BONINGTON himself was 6 ft.), and represents the artist with palette and brush in hand. It is mounted on a big square pedestal of granite and surmounted with a handsome domed canopy, designed by Mr. FOTHERGILL.

MR. FOTHERGILL, who is of a Mansfield family, went to reside in Nottingham some fifty years ago, and has practised as an architect in the city for the greater part of the subsequent period. Keenly interested in art, and particularly in the art associations of his adopted city, it occurred to Mr. FOTHERGILL that the memory of perhaps the greatest painter born in the locality ought to be perpetuated in the city, and so he offered to the City Council to provide the monument.

RICHARD PARKES BONINGTON was born 109 years ago at Arnold, but he received his early education in Nottingham, where his father was engaged as a drawing master and designer. When RICHARD was fourteen years of age his family moved to Calais, where his father assisted to set up one of the first lace machines. He desired his son to follow the lace trade also, but the boy had already attained great proficiency as a painter, and devoted the whole of his time to it. Indeed, when, at the age of nineteen, young BONINGTON left Calais and went to Paris, he was received as one who had already made his name in art. From that time until his death at the age of twenty-six, BONINGTON was a prolific painter. The great majority of his pictures, however, have remained in France, though thirty-five of them form part of the Wallace Collection in London.

IN the Nottingham Castle galleries there are four or five examples of BONINGTON's work in oils, but not a single water-colour. They include "St. Bertin's Abbey at St. Omar," "The Piazza at Venice," "The Old Castle at Dieppe," and the figure subject "Meditation." Mr. FOTHERGILL possesses a couple of the artist's pictures, one an oil painting of "FRANCIS I. and his Sister," which he obtained a short time ago from the Staats Forbes Collection (the original sketch for which is in the Wallace Collection), and a water-colour of Antwerp Cathedral.

THE *Art Journal*, in illustration of an article on "MILTON and Art," by LEWIS LUSK, has an etching of Chalfont St. Giles by Mr. W. MONK, R.E., and also reproductions of other drawings by Mr. MONK of MILTON's "Pretty Box" at Chalfont St. Giles and the Church of St. Giles, Cripplegate, which are good examples of this artist's rendering of architectural subjects. An interesting article on WENCESLAUS HOLLAR, "A Complete Etcher," by LUKE TAYLOR, R.E., is of special interest, with numerous illustrations of his work, architectural and other. Mr. C. LEWIS HIND continues his series of articles on "The Glamour of Landscape," referring now to the work of BELLINI, MANTEGNA, VERROCHIO, DA VINCI, and other fifteenth century Italian painters.

THE *Connoisseur*, in an article on Sherborne House, Gloucester, gives views of the mansion as well as of several of the notable portraits that it contains. Dr. PHILIP NELSON continues his description of the Mediæval Ivories in the Liverpool Museum. Mr. EGAN MEW includes with his description of Japanese Old Lacquer some remarkably fine illustrations. Mr. WALTER CHURCHER describes his collection of Old Pewter.

ARCHITECTURE AT THE PARIS SALON.

THE Salon which has just opened does not differ as far as the architectural exhibits are concerned, from many previous exhibitions, but, as always, it impresses by its striking differences to the little room devoted to architecture at the Royal Academy. The Salon, if anything, errs on the side of providing too much space, and many of the drawings are really not worthy of being hung in an exhibition.

On the other hand, the farce of the one small room at the Royal Academy to exhibit the year's work in architecture must be apparent to all, and will surely eventually result in the Royal Institute of British Architects instituting an annual exhibition in their own galleries which we firmly believe would, if managed judiciously, be an unqualified success, in view of the greater interest taken in architecture by the public generally, owing to the increase of travelling facilities and the lectures which have been given of late in the museums on the subject.

The Salon has fourteen large galleries, each one of which is larger than the apartment devoted to architecture at the Royal Academy. One thing which continually strikes one is the great care with which architects state whose pupils they are, in spite of the influence of the Ecole des Beaux-Arts.

It will be convenient to deal with the drawings according to subjects.

Ecclesiastical work appears at a very low ebb in France. The most important exhibit is that of M. BRUNET who sends eleven large strainers of a modern Romanesque church at Coulommiers (Seine-et-Marne). It is a design in the latest manner with ferro-concrete roof, and the drawings are most complete, showing the foundation plans and structural details, but the design lacks any artistic feeling and makes one marvel at the sad results produced by a studentship at the Ecole. A model of the vaulting of the domical elliptical bays over the nave is also shown.

The weak wiry looking design for a church by M. MELAND upon ground intersected by streets at different levels, and the cartoons for stained glass shown by M. LACOSTE indicate that church architecture is practically dead, and that it is to England and America that we must turn for development in this direction.

Monumental architecture is also but poorly represented. M. COCHET shows his design for a monument in the Byzantine style, so much favoured for this purpose, in the Cemetery of Père-Lachaise; M. RECOURA, a pupil of M. PASCAL, his design for the tomb of ERNEST HERBERT, worked out by a fine water-colour drawing with central sculptured sarcophagus; and M. FAUQUET sends his weak Gothic sketch for a national monument to JOAN OF ARC at Rouen.

If the education given at the Ecole des Beaux-Arts produces such stuff as this, we trust that the Architectural Association will long continue to instruct the rising generation on the lines of English tradition and not be led away, as in a certain town in the North of England, to ape continental ideas.

Domestic architecture is in a still worse plight in France and can bear no comparison to that of England or America.

Some half-dozen exhibits may be mentioned:—M. GIRARD's design for the house of an amateur fisherman is in the spiky Swiss chalet style usually affected for this purpose by French architects.

M. PAGNERRE sends a design for a doctor's house with mullioned windows having Tudor labels, much resembling that produced here in the Early Victorian period.

M. BARROIS exhibits his design for a villa for a notary, with spiky roofs and total absence of repose. M. GUADET exhibits his drawings for a house in the Champs de Mars, a curious mixture of tiles and iron work, described by its author as "the application of hygiene to the dwelling-house." M. LEAUTEY sends his competition design for workmen's dwellings, completely worked out with heating and ventilation schemes.

Other designs are by M. POUTHER for a so-called villa at Paris-Plage, which suffers from the usual French fault of want of repose, and by M. BOUVY for a fussy street of houses in stone and brick.

If domestic architecture is bad, commercial architecture is worse. It is but poorly represented, it is true, by M. COURSIMAULT, who sends his "maison de rapport" erected at Paris, consisting of ground floor shops with flats above, the façade executed in a poor stone and brick design; and by M. BRANDON by his so-called "Palais Omar Effendi" at Cairo, a commercial five-storey building, in the "nouveau-art" treatment with central coloured dome carried up over the main staircase.

Public architecture—i.e. designs for public buildings—form as we should expect the best of the exhibits, mainly because the training at the Ecole des Beaux-Arts concerns itself principally with this aspect of design.

M. RENAULT is represented by his Hôtel de Ville for Chateaulin (Finistère) but, curiously enough, it is not in the traditional French manner, but in the far less appropriate Swiss chalet style, but arranged in the usual way with the "Halles-aux-blés" on ground and the "Salle des fêtes" on upper floor.

M. BECHMANN sends a practical set of seven large drawings of a large circular station of the Nord-Sud tube railway of Paris with central ticket office, which is mainly an engineering treatment.

Drawings are exhibited by M. CAPELLE for the Channel Tunnel, partly above and partly below the bed of the sea.

M. ADOUE has six drawings of his design for a museum at Bordeaux, with the traditional plain wall surface and central dome, and M. EUSTACHE sends his plaster model and photographs of the principal entrance, with coupled Doric pilasters and richly treated attic, to the Pavillon des Beaux-Arts at Rome.

M. RAYMOND HOOD is represented by his design for the City Hall for Pautucket, a twenty-storey American tower building, with lower part planned in the form of a cross and the upper part with diminishing stages.

The design for an abattoir for the town of Vichy, by M. MAIGROT, is represented by complete drawings and a bird's-eye perspective, and indicates that this class of work is retained by architects in France, and is not commandeered by the engineers.

One of the most interesting and the only English exhibit is by Mr. J. J. BURNET, described as a pupil of M. PASCAL, who sends his model and plans for the British Museum Extension. The simple reserved treatment of his fine northern façade compares favourably with any of the French designs.

The solitary town improvement exhibit is M. FLUGEL's design for the reconstruction of the "Pont des Arts," opposite the Louvre, by means of widening the approaches, which cannot be considered satisfactory as it leaves the width of the bridge itself untouched.

The most interesting and instructive of all the drawings are the "projets," as they are called, or imaginative designs, of all kinds, which form so important a part of a French architect's training, and which are sometimes of enormous size.

M. MIGEON sends three large strainers, one measuring twenty-five feet long, showing his design for a Yacht Club in the Mediterranean, placed on a tongue of land and consisting of three parts, a seaside palace, a club

house, and workshops, &c., for the building of yachts, a most unpractical idea, but one capable of exercising the imagination.

M. DURAND shows an ambitious design for the architectural treatment of a large public square, interesting at this period of Coronation, and showing true French delight in this class of work.

M. ARNAL's eight large strainers show his ingenious design for the transformation of the Archbishop's palace at Mans into a public museum and library, by encasing the central part with additional surrounding rooms.

The "Panthéon de l'art," a domical building with long apsed hall, situated in a public park and surrounded with statues and architectural settings is a "projet" by M. LEVY to contain six fine fresco decorations symbolising six great periods of art—Egypt, Rome, Athens, the Gothic period, the Renaissance, and the modern period. This is an example of a special design for decorative compositions very much favoured in France.

M. BRANDON has one of the most important exhibits in his sixteen large strainers—interiors, exteriors, and perspectives of the existing building, and projected alterations of the church of S. André at Chartres.

This is one of the most attractive sets of drawings, and indicates much labour. It shows the present church with its plain exterior and the proposed transformation by the addition of a spire and a new eastern portion which it is proposed to carry across the river Eure on arches, and to terminate with apsidal chapels. As altered it would form a magnificent group, but in many respects it is most fanciful and not likely to be carried out.

Another "projet" by M. DANIS consists of ten large strainers of "La Maison Royale de Trianon" (otherwise "Le Trianon de Porcelaine"), which was partly demolished in 1670, and is here restored according to the quaint descriptions of it by FELIBIEN DES AVAUX, with blue porcelain figures and vases.

M. GUERITTE sends a fine archæological study of twelve large strainers in his restoration of the "Pavillon, Jardin de la Bossière, à Paris," made up mostly from old prints and drawings, for the site is now occupied by the "Place Vintimille" and other streets.

The "Décoration d'une place publique," by M. CASTEL, is a fine imaginative composition with numerous statues and fountains, but far too elaborate for execution; as also is the fine late Renaissance design with a court of honour and formal garden for a Prince by M. CAMUZAT, and the "Colonial palace," shown on strainers 20 feet long, by M. VILAIN.

The drawings of old buildings are very interesting, and although they vary in execution very much from the English method, being shaded and projected with shadows, they are in many cases strictly practical.

The southern porch of the Cathedral of Chartres is rendered by M. PHILLIPE by a fine elevational shaded drawing.

M. GAUTIER sends some fine measured drawings of the interesting Church of Rocamadour-Camarel (Finistère), showing its big roof, covering nave and aisles, before the fire.

The Ministry of Fine Arts show some important drawings of old buildings in Poitou and Vendée, made by M. DEVERIN. Other drawings are those by M. BRUNET of S. Pierre at Chartres, by M. TITCOMB of the Town Hall at Brescia by BRAMANTE, by M. LEGUEN of the Renaissance house at Chartres, by M. GAGEY of the Church of S. Jacques, and by M. DANIS of the Great Hall of the Abbey of Pontigny.

M. PROST, however, sends by far the finest exhibit in this class. His twenty large strainers of S. Sophia, Constantinople, rival the fine set of measured drawings of DIOCLETIAN's palace at Spalato which appeared in last year's Salon. M. PROST's drawings consist of a general plan of Constantinople, and plans, sections, elevations in colour, and perspective sketches, forming a most magnificent set of drawings of this important building.

According to the section of the dome, its curious pointed appearance, which must be noticeable to everybody, is due to the wooden rafters added at the top to support the crescent, which was added by the Turks in A.D. 1453. It would, however, be interesting to know how much of the building was actually seen by M. PROST, for he shows the dome with bricks having radiating joints, and not as described by Mr. LETHABY in his book on the subject. The vault system is shown in a dissected state, as in CHOISY's great work. The twenty-eight drawings with suitable letterpress would form a valuable monograph on this important building.

Other measured drawings of note are the eight strainers of the "Château de Pau" by M. APPECEIX, the ten large strainers of the excavations of the French at Delos by M. GABRIEL, showing many suggested restorations of the houses in this interesting and important centre of Hellenic activity; and the set of drawings by M. BREUVILLIER, showing a restoration of the palace of St. Germain-en-Laye in the year 1665 with its formal gardens and terraces.

A feature of the Exhibition is the large number of water-colour drawings and pencil sketches of old buildings which give special interest to the department of architecture. The French method of expression in water colour is essentially suitable to buildings, and there are many delightful colour drawings of the picturesque edifices of France. We think it would be an excellent idea for this division to be accepted at the Royal Academy, as old and new buildings ought all to be classed as architecture. We would suggest that the present water-colour room and print room at the Academy should be given over to architecture, old and new, and that the present architectural room should be devoted to etchings and miniatures.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

A COUNCIL meeting of the above body was held last week at No. 31 South Frederick Street, Dublin. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. There were also present:—Messrs. W. Kaye-Parry, C. H. Ashworth, Lucius O'Callaghan, F. G. Hicks, H. Allberry, F. Hayes, G. P. Sheridan, R. Caulfeild Orpen, J. H. Webb, A. G. C. Millar, and C. A. Owen, Hon. Secretary. A further report from the Examination Committee was received and adopted. The members of the Examining Board were approved, the date for the first examination was fixed for November 20 and 21, and the Hon. Secretary was instructed to advertise particulars of the examination at once.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual general meeting of the Royal Institute was held on Monday, May 1, when the report of the Council for the year 1910-11 was submitted and adopted.

Since the publication of the last annual report the Council have held 25 meetings, of which the Council elected in June last have held 22. The following committees appointed by the Council have met and reported on the matters referred to them:—Architectural Copyright Bill, Board of Architectural Education, Board of Examiners, Board of Professional Defence, Burlington-Devonshire Drawings, By-Laws Revision, Competitions, Dinner Committee, Fellowship Drawings, Finance, Hébrard Drawings, Licentiate's Drawings, Licentiate'ship, Parliamentary Bill, Premises, Professional Questions, Prizes and Studentships, Royal Gold Medal, St. Paul's Bridge Petition, Sessional Papers, Town Planning.

In the course of the past year the Royal Institute has had to mourn the death of its Royal Patron, who in the course of the nine years of his reign had annually granted his gold medal for the promotion of architecture.

His present Majesty has graciously consented to continue the grant, and has conferred the honour of his patronage upon the Royal Institute.

The losses by death have been as follows:—*Fellows*: George Aitchison, T. J. Bailey, E. J. A. Balfour, O. Caldwell, Sir Caspar Purdon Clarke, A. Cullen, Campbell Douglas, H. L. Fedden, A. C. Forrester, C. Hodgson Fowler, W. B. Gwyther, A. Murray, F. W. Peel, G. Ransome, E.

Skinner, H. Spalding, A. H. Tiltman, E. F. Titley, R. Selden Wornum; *Retired Fellows*: E. Boardman, J. G. Smither; *Associates*: C. A. Callon, A. B. Cottam, M. H. Holding, W. S. R. Payne, F. W. Roper, E. H. Smales, A. E. Tiller; *Licentiates*: J. Shepherdson, A. E. Pearson.

The Royal Gold Medal was awarded last year to Mr. T. G. Jackson, R.A., for his executed works as an architect and for his valuable contributions to the literature of architecture. Mr. Jackson received the medal in person at the general meeting on June 20, 1910, when he delivered a short address on the Art of Architecture. It has been decided to award the medal this year to Dr. William Dörpfeld, in recognition of his eminent services to architecture through his archaeological researches. His Majesty the King has graciously signified his approval of the award, and the medal will be presented to Dr. Dörpfeld on June 26.

The following tabular statement shows the present subscribing membership of the Institute compared with that at the corresponding periods of 1908, 1909, and 1910:—

Year.	Fellows.	Associates.	Hon. Associates.	Total.
1908	906	1,288	45	2,239
1909	888	1,344	46	2,278
1910	874	1,431	48	2,353
1911	862	1,509	55	2,426

The number of Associates shows a considerable increase, and the Council desire again to suggest to those Associates who are qualified for the Fellowship that they should take the necessary steps to enter the senior class. During the official year since the last annual general meeting 18 Fellows have been elected, 115 Associates, and 9 Honorary Associates.

On March 23, 1910, it became the duty of the Council to invite applications from architects qualified for the new class of Licentiates. A widely circulated appeal was made to the profession in the United Kingdom and the Dominions, and the Allied Societies were invited to co-operate in the work of enrolling the practising architects of the empire. In connection with the movement the Council organised a series of meetings in the provinces, with the assistance of the Councils of the Allied Societies, for the purpose of laying before provincial architects the important principles of the Royal Institute's policy, and of giving them an opportunity of applying for admission to the Licentiate class. These meetings were well attended, and aroused great interest, and did invaluable service in bringing the members of the profession in the provinces into closer sympathy with the work of the Royal Institute. Mr. Edwin T. Hall addressed a meeting at Manchester; Messrs. George Hubbard and A. W. S. Cross addressed meetings at Cardiff, Birmingham, Leicester, Sheffield, Liverpool, Rhyl, Nottingham, and Swansea (by deputy); and Mr. James S. Gibson addressed meetings at Newcastle, Edinburgh, Glasgow, Dundee, and Aberdeen. Before the expiry of the 12 months fixed by the supplemental charter some 1,200 Licentiates were elected after careful and exhaustive inquiry into their qualifications, both by the Council of the Royal Institute and by the Councils of the Allied Societies. At the close of the 12 months the applications were still coming in so rapidly that it became obviously desirable to extend the period of admission. Accordingly, by a resolution of a special general meeting, so as to enrol if possible all eligible members of the profession, the date was extended to the end of June 1912, and at the present moment the applications for admission are still coming in freely.

Under the terms of the policy agreed upon by the Royal Institute on March 4, 1907, it became necessary during the present session for the Council to draft a Registration Bill to secure the statutory recognition of the profession. This work was first entrusted to a strong committee, which drafted the principles of a Bill on broad lines to provide for the objects aimed at—the enrolment of all qualified architects within the Institute, the compulsory architectural education and examination of those entering the profession in future, and the legal recognition of qualified as opposed to unqualified architects. At this stage it became necessary to consider the position of the Society of Architects. On the initiative of the President a friendly conference was held between representatives of the two bodies, and it soon became apparent that there was a broad ground of agreement in their respective policies. Serious negotiations were then entered upon, and a scheme was prepared by the Councils of the two bodies which provided for the winding up of the Society of Architects and for the election of its members into the various classes of membership and Licentiatehip of the Royal Institute. The details of this scheme and the principles of the Registration Bill were laid before a special

general meeting on April 10, and after a long discussion were approved. If the scheme is approved by the general body of the Society of Architects and the resolution to effect the necessary changes in the by-laws is confirmed by the Royal Institute it will at once be proceeded with, and will remove the last obstacle which hinders the architectural profession from approaching Parliament as a united body in favour of the principle of registration.

The past year will be distinguished in the history of the Royal Institute by the striking success of the Town Planning Conference. Owing to the death of King Edward it was necessarily postponed from the date originally selected in July to the middle of October. It was favoured by the patronage of the King, and had the inestimable advantage of the enthusiastic and energetic honorary presidency of Mr. John Burns, M.P., President of the Local Government Board. It is not too much to say that during the week occupied by the conference it was the most important public function of the time in the eyes of the general public, and that it did incalculable service to the cause of town planning in this country. It aroused and concentrated public interest and attention upon the great possibilities presented by the Town Planning Act.

During the course of the past session a Standing Committee under the chairmanship of Mr. John W. Simpson has been actively engaged in considering the terms of the Government's Copyright Bill, in so far as they affect architecture. The views of the Council have been laid before the President of the Board of Trade, and there is good reason to hope that they will be favourably considered when the Bill receives its final shape, and that the claims of architecture will, for the first time, be treated with the respect that has hitherto been reserved exclusively for the kindred arts.

In the last report the Council referred to the efforts they had made to induce the Corporation of the City of London to see the advisability of bringing architectural advice to bear upon their proposals for the new St. Paul's Bridge and for the new streets in connection with it. These efforts unfortunately failed, and the Corporation have laid before Parliament a Bill in which they seek powers to carry out their scheme on the lines that have been so widely condemned. The Council have felt it their duty to petition Parliament against the Bill, and to appeal to the public to prevent this proposal from going further until it has been properly considered from other standpoints besides the purely utilitarian.

The question of the responsibilities that have been thrown upon architects as the result of recent legal decisions in cases of dry rot has been seriously occupying the Council during the past year, and the Board of Professional Defence are now considering what steps can be taken to safeguard architects against hitherto unsuspected responsibilities.

The progressive examinations were held in June and November 1910. The results are shown in the following tabulated form:—

	Admitted.	Exempted.	Examined.	Passed.	Relegated.
Preliminary examination ...	299	76	223	146	77
Intermediate examination ...	250	10	240	94	146
Final and special examinations ...	245	—	245	108	137

The Ashpitel Prize was awarded to James Bertie Francis Cowper, who passed the final examination in June 1910.

The deed of award of the various prizes and studentships was presented to the Institute at a general meeting on January 16, 1911. At the presentation of prizes on January 30, 1911, an address to students was delivered by the President, and a criticism of the work submitted was read by Professor C. H. Reilly. An exhibition of the drawings was held from January 17 to 30 in the Institute galleries, and was visited by nearly 2,000 persons. A selection of the prize drawings is now being sent the round of the Allied Societies.

On June 24 the Royal Institute took possession of the new premises at 9 and 11 Conduit Street with entrance from Maddox Street, the leases of which had been purchased from Messrs. Knight, Frank & Rutley. A scheme of alteration and decoration, prepared by Mr. Henry T. Hare, the hon. secretary, was at once undertaken, and the work was rapidly carried out during the vacation, so as to render the galleries available for the Town Planning Conference. While this work was going on it became apparent that the old premises also were urgently in need of repair in various directions, and before the end of the recess the drainage system and the electric light installation were completely renewed, and a re-

arrangement and extension of the library was carried out which have added greatly to its convenient and efficient working.

During the course of the year the Council have been compelled to take action in several cases of professional advertisement and breach of professional etiquette.

Many architects have applied for and received advice on questions of principle and practice.

The new draft regulations for architectural competitions, as revised by the special committee appointed by the Council to consider the suggestions made during the discussions at the meetings of January 3 and February 28 last year, were submitted to the general body at the meeting of November 21 and agreed to after slight modification. The document as revised has now been issued as an Institute paper and the old regulations have been withdrawn. The Competitions Committee have had under their consideration the conditions issued by various promoters, and in cases where the conditions have been unsatisfactory letters urging modifications have been sent to the promoters. In the case of the competitions for the New Cumnock United Free Church, the Rochdale Nurses' Home, and the Wallsend New School Buildings, the Committee's efforts to obtain satisfactory amendment of the conditions having been unavailing, the Council by publication in the Journal and in the professional Press have advised members of the Institute not to take part in them. The following have been the President's appointments to assessorships during the official year:—

Bangor	Baths	Mr. F. Batchelor.
Bradford	Infirmery	Mr. Keith D. Young.
Brighton	Grammar School	Mr. John Bilson.
Chedderton (Oldham)	New Town Hall	Mr. H. W. Wills.
Denbigh	Public Buildings	MM. Leeming & Leeming.
Douglas (I. of Man)	Villa Marina	Professor S. D. Adshead.
East Anglia	Institute for Blind and Deaf Children	Mr. H. P. Burke Downing.
Henley-on-Thames	School	Mr. T. Edwin Cooper.
Manchester	Library and Art Gallery	Mr. Reginald Blomfield A.R.A.
Marylebone	Town Hall	Mr. Henry T. Hare.
Salford	Secondary School	Mr. A. W. S. Cross.
Stockport	Proposed New School	Mr. J. W. Simpson.
Stockport	Police Buildings	Professor C. H. Reilly.
Southampton	Univ. College	Mr. Henry T. Hare.
Swansea	Corporation Bldgs.	Mr. S. S. Reay.
Taunton	Council School	Mr. H. W. Wills.
Weston Mill	Church	Mr. Walter J. Tapper.
Whitley (Newcastle-on-Tyne)	Cemetery Chapel	Mr. A. W. S. Cross.
Woldsea	Garden City	Mr. Raymond Unwin.

The balance sheet and other financial statements appended to this report indicate the manner in which the Council have utilised the accumulated funds of the Institute for the purpose of obtaining greatly enlarged and improved premises on a practically permanent tenure. By the purchase of Messrs. Knight, Frank & Rutley's leases, followed by the purchase of the shares of the Architectural Union Company, the Royal Institute now finds itself practically in the position of a freeholder of the whole premises extending from Conduit Street to Maddox Street. The expenditure necessarily entailed amounted to a larger sum than was immediately available, and an overdraft not to exceed 7,000l. has been negotiated with the bankers to supply the funds temporarily needed. It is expected that the balance of income over expenditure will be sufficient to liquidate the debt. Under the will of the late Henry Jarvis, Fellow, who died on March 4, 1910, the Royal Institute received the most important bequest that has ever fallen to it. When certain legal procedure has been concluded it is anticipated that the Council will have to dispose of the sum of at least 20,000l. The Council have appointed a committee to consider and advise them as to the best method of employing the bequest.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE opening general meeting of the Society's year was held at the Leeds Institute on the 4th inst., Mr. H. S. Chorley, F.R.I.B.A., occupying the chair in the absence of the President, Mr. Sydney D. Kitson, F.S.A.

Both the Council report, read by the Secretary, and the balance-sheet, presented by the Treasurer, showed the Society's affairs to be in an eminently satisfactory condition, the total membership standing at 183, against 167 last year.

The following gentlemen were elected to the Council for the ensuing session:—President, Mr. Sydney D. Kitson, F.S.A.; Vice-Presidents, Mr. A. E. Kirk, A.R.I.B.A., Mr. Frederick Musto, A.R.I.B.A.; Hon. Treasurer, Mr. R. Fielding Farrar, A.R.I.B.A.; Hon. Secretary, Mr. R. W. Thorp, A.R.I.B.A.; Hon. Librarian, Mr. W. Whitehead, A.R.I.B.A.; Council: Messrs. G. F. Bowman, J. F. Walsh, H. A. Chapman, F.R.I.B.A., C. B. Howdill, A.R.I.B.A., J. C. Procter, A.R.I.B.A., and as Associate member, Mr. J. H. Farrar.

AN ARCHITECT'S DUTY.

IN the House of Lords on Tuesday, May 9, the Lord Chancellor and Lords Ashbourne, Alverstone, Atkinson, and Shaw heard an appeal by Messrs. Hickman & Co., building owners of a warehouse at 16 Christopher Street, Shoreditch, against a decision of the Court of Appeal, which held that there had been collusion between Messrs. Hickman and their architects. The Court of Appeal, therefore, had upset a judgment of Mr. Justice Hamilton in favour of Messrs. Hickman in an action brought against them by the executors under the will of the late Mr. Chas. Philip Roberts, who traded as a builder under the name of C. P. Roberts & Co. In 1906 C. P. Roberts & Co. agreed to erect the building at Christopher Street, and the dispute between the parties was as to a balance alleged to be due under that contract.

Mr. Hugo Young, K.C., for Messrs. Hickman, submitted that there had been no collusion between his clients and the architect. The architect, he said, might have been remiss in his duty with regard to the grant of a certificate, but Mr. Justice Hamilton, who heard the case without a jury, had found that though the architect had delayed giving a certificate at the instance of the building owner, he had not done so corruptly or in collusion with the owner, and that there had been no turpitude or anything that made him an unfit person to be allowed to settle further disputes between the parties. He pressed their Lordships to follow the decision of the judge of first instance, and enter judgment for Messrs. Hickman.

Without hearing counsel on the other side the Court dismissed the appeal.

The Lord Chancellor said he thought Messrs. Hickman could not in this case rely upon the architect's certificate either as a condition precedent to payment or as an adjudication binding on the other party. Mr. Robert Wm. Hobden, the architect, had, said his Lordship, placed himself in a position which deprived his certificate of the value which otherwise it would have had. In his opinion, however, this was not a case in which the terms "turpitude" or "fraud" were apt. The real error of Mr. Hobden's position was that he mistook his position, that he meant to act as mediator, that he had not the firmness to recognise that his true position was that of an arbitrator and to repel unworthy communications made to him by Messrs. Hickman. It was undoubted, however, that Messrs. Hickman tried to lead him astray in their own interests.

Lord Ashbourne concurred.

Lord Alverstone said it was very important that it should be clearly understood when an architect was appointed by both sides to act as arbitrator between a building owner and a contractor that he should maintain a strictly judicial position. Mr. Justice Hamilton fully recognised this principle of law, but decided against the contractor on the ground that he was aware of irregularities on the part of the architect and yet did not at once raise objection and stand upon his rights. He thought that in the circumstances Messrs. Hickman could not rely on the absence of a certificate for this part of the work. No certificate given under such circumstances would be binding, and therefore the giving or withholding of one was immaterial so far as the contractor's right to sue was concerned. He desired to adopt the language of the Lord Chancellor and to say that it seemed to be quite clear on the correspondence that the architect in this case had forgotten his duty to act strictly judicially.

Lord Atkinson also concurred, but remarked that in this case he thought that such words as "corrupt collusion" or "fraud" were too strong and rather extravagant words to use.

Lord Shaw expressed agreement with the other members of the House, and said that the position of an architect under a building contract was one of great delicacy. The Courts had held that he must act strictly in accordance with his judicial capacity and must maintain entire independence. His Lordship thought Mr. Hobden had not acted in accordance with that standard. In his opinion the action was properly raised and the subsequent grant of the certificate was too late to stay proceedings.

The appeal was therefore dismissed, with costs.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE annual meeting of the Sheffield Society of Architects and Surveyors was held on the 4th inst. at Sheffield University. A satisfactory year's work was disclosed by the annual report, and the statement of accounts was also considered satisfactory. Officers were elected as follows:—President, Mr. J. B. Mitchell Withers; Vice-President, Mr. A. F. Watson; Treasurer, Mr. F. Fowler; Hon. Secretary, Mr. James R. Wigfull; Council, all the officers and Messrs. W. G. Buck, F. E. P. Edwards, R. W. Fowler, C. B. Flockton, J. R. Hall, H. L. Paterson, E. Winder, C. F. Innocent, H. I. Porter, and F. H. Wrench. In proposing a vote of thanks to the retiring President, Mr. Edwards warmly acknowledged the labours of Mr. W. J. Hale for the Society, which he said had gained increased prestige during his period of office. Mr. Wigfull seconded, and the vote was heartily accorded.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting of the Edinburgh Architectural Association was held at 117 George Street, Edinburgh, on the 3rd inst., Mr. James B. Dunn, F.R.I.B.A., President, in the chair. Reports were submitted by the Chairman of the Committee of Management, the Chairman of Council, the Librarian, and the Convener of the Publication Committee. Prizes were presented to the following members of the Associate section:—Competition "A" (for draughtsmen), design for a village inn—1, T. Aikman Swan; 2, James Macgregor. Competition "B" (for apprentices), design for treatment of terrace, stair, and wall to mansion-house garden—1, D. M. Gilchrist; 2, W. Patterson and J. S. Porter. Competition "C" (College of Art summer sketching class)—1, J. S. Bennet. The following office-bearers were elected for 1911-12:—President, Mr. James B. Dunn, F.R.I.B.A.; Vice-Presidents, Mr. Edward C. H. Maidman and Mr. William Davidson; Hon. Secretary, Mr. James Kerr, 122 George Street; Hon. Treasurer, Mr. W. G. Walker, C.A., 39 George Street; Hon. Librarian, James A. Arnot.

ILLUSTRATIONS.

THE ROYAL SHRINE AT WESTMINSTER AS IT MAY HAVE BEEN IN THE FOURTEENTH CENTURY.

"The shrine of the most illustrious King Edward the Confessor was placed on high like a candle upon a candlestick, so that all who enter into the House of the Lord may behold its light."

THIS quotation in Mr. Lethaby's book on the Abbey suggests the arrangement of the High Altar before the fifteenth century screen was erected. In the drawing, the chantry of Henry V., which was erected in the same century, is also omitted, and the thirteenth century Lady chapel is indicated beyond.

The coffin of St. Edward was of gold and precious stones, and rested upon the existing high basement, which is inlaid with coloured marbles and gold mosaic. This is encircled by the tombs of kings and queens, while around and above is the wonderful building of King Henry III., which may have been equalled, but has never been excelled.

The design of the cover suspended over the shrine is based on that over the shrine of St. Cuthbert, given in the "Rites of Durham."

The size of the High Altar is fixed by the thirteenth century retable, now preserved in the Jerusalem Chamber, which is here shown in what was, no doubt, its original position.

The design of the frontal is conjectural, being the arms of the Confessor, divided by four figures under gold canopies.

The well known drawing of the sanctuary on the Islip Roll, 1532, shows a rood beam with figures, the tester and the hanging pyx over the altar; but mention is made in the Records of Henry III.'s moving the rood, so there was possibly an earlier one than this, of rather different design.

The same King "arranged for two candles to be lighted on feast-days, together with the three other candles hanging before the high altar; of these the centre one had always burned perpetually; and he gave four silver basons to set them in (the centre one presumably being already provided for)." (*Customary*, p. 45.)

All the tombs are shown with testers, decorated in colour and gold, which they originally had.

The windows are shown with grisaille glass and

medallions of bright colour. The clerestory windows no doubt had one or more tiers of figures all round.

The wonderful mosaic pavement in front of the High Altar exists now, almost as laid down by Abbot Ware in 1268.

The lettering (the collect and part of the epistle for All Saints' Day) is based on the illuminated Missal of Abbot Litlington. The figure in the capital at the top represents St. Faith, from the early painting in the chapel. In the capital O at the bottom is a rough outline sketch from the fifteenth century picture in the National Gallery—the Exhumation of St. Hubert—which shows an altar with low retable, ridel posts, &c., similar to the High Altar suggested above.

BATTERSEA POLYTECHNIC.—NEW LIBRARY.

THIS addition to the Polytechnic has been erected at the south-west corner of the site facing the Battersea Park Road, and adjoining the present Reading Room. The whole cost of this building and its equipment has been defrayed by Mr. Edwin Tate, the first chairman of the Governing Body.

Externally the building is faced with Lawrence's hand-made red bricks, with Bath stone dressings, and the roof is covered with tiles. Internally the whole of the panelling and finishings are in Austrian wainscot oak, and the floor is laid with teak blocks, and coved ceiling is in fibrous plaster with a heavy wreath moulded enrichment.

At the west end of the room is a stained glass window, containing a seated female figure, representing Literature—this was executed by Messrs. Shrigley & Hunt, of Lancaster. A gallery runs round three sides of the room, and over the vestibule is a small book store. Provision has been made in the building to accommodate 15,000 volumes. The whole of the external and internal carving has been executed by Mr. Gilbert Seale, London. The ornamental glazing to the internal windows was executed by Messrs. Wainwright & Waring, Chiswick. The centre electroliers and the table fittings were by Mr. Omar Albrow, and the ornamental metal grilles were by Messrs. Spital & Clark. The general contractors were Messrs. Holloway Bros. (London), Ltd. The architect was Mr. F. Dare Clapham, F.R.I.B.A.

This drawing, which shows the centre bay of the south elevation, was shown at the Royal Academy last year.

WILD'S HOTEL, EUSTON SQUARE, N.W.

THIS was a sketch design for the proposed rebuilding with additions of the present building in Euston Square.

It was proposed to use Portland stone for the lower portion of the main fronts and elsewhere, to face the building with Crowborough bricks with red quoins, the roofs to be covered with green Westmoreland slates.

The scheme provided for a hundred bedrooms, and a large restaurant was arranged for in the basement, for the accommodation of excursion parties.

The architect was Mr. F. Dare Clapham, F.R.I.B.A.

STUDY FOR REARRANGEMENT OF THE SANCTUARY OF A CHURCH BUILT IN 1736.

THIS is a study for dealing with the somewhat common arrangement of the churches of this date, viz., that of a railed-in sanctuary of very small dimensions, such an arrangement being unsuited to the requirements of the present day.

This drawing shows an attempt to provide a sanctuary with just sufficient depth for the necessary steps to form a dignified approach to the altar, and to lessen the effect of the excessive width (it being necessary to extend the sanctuary throughout the whole width of the church) by means of an open screen on either side.

The authors of the drawings are Messrs. Rogers, Bone & Coles, architects.

MISERICORDS, NEW COLLEGE, OXFORD.

WE reproduce a sheet of drawings of some excellent examples of carving on the Misericords of New College Chapel, Oxford.

CHIMNEY-PIECE IN BRADFORD TOWN HALL.

THIS is part of the recent additions to Bradford Town Hall, carried out under the direction of Mr. F. E. P. Edwards in consultation with Mr. R. Norman Shaw, R.A.

THE ARCHITECTURAL ASSOCIATION.

THE annual dinner of the Architectural Association was held on Thursday, May 4, at the Empire Rooms, Trocadero Restaurant, W. The chair was occupied by Mr. Arthur Keen, President. Amongst those present were Sir Alex. R. Stenning, Mr. Leslie Vigers (President Surveyors' Institution), Mr. Robert Cobay (Master of the Carpenters' Company), Mr. G. E. Bond, J.P. (President Society of Architects), Mr. Henry T. Hare, Mr. A. W. S. Cross, Mr. Henry Tanner, Mr. S. Chatfield Clarke, Mr. John Murray, Mr. W. J. Hardcastle (President Quantity Surveyors' Association), Professor R. Elsey Smith, Mr. G. Bird Godson (President Master Builders' Association), Mr. Laurence A. Turner, Mr. W. Flockhart, Mr. Ian Macalister, Mr. J. S. Holliday (President Institute of Builders), Mr. A. M. Brice, Professor E. C. Alston, Mr. C. McArthur Butler, Mr. W. J. Tapper (Vice-President elect), Mr. F. Dare Clapham, Mr. Gerald C. Horsley, Mr. H. P. G. Maule, Mr. C. Wontner Smith, Mr. R. Frank Atkinson, Mr. P. W. Lovell, Mr. Ellis Marsland, Mr. Louis Ambler, Mr. D. G. Driver (Secretary A.A.), Mr. W. Curtis Green, Mr. Alan Snow, Mr. Rudolf Dircks, Mr. Stanley Hamp, Mr. Edwin Gunn (Hon. Secretary), Mr. Herbert Batsford, Mr. Percy May, Mr. G. Northover, and Mr. Geoffrey Lucas.

After the loyal toasts had been honoured Mr. HENRY T. HARE proposed "The Architectural Association." It was, he said, the toast of the evening that had been entrusted to him, and he felt very keenly the honour. He had intended to begin by saying that the Association was becoming rather an ancient body, but during the course of that dinner he happened to mention to his neighbour when the A.A. was founded, and he was at once informed that they were only children in comparison with some of the institutions in the City. That was true, of course; but the Association had been in existence sixty years, and had become at all events an established institution. In early times when it was first established for the encouragement and mutual intercourse of the younger members of the profession it must have been promoted by a very large amount of enthusiasm, just in the same way as it is now carried on. Otherwise it could never have existed for so many years and prospered in the manner that it had done. His own earliest recollections were about the year 1881, and he could well remember at that time two or three very tiny rooms at the top of the back stairs in the Royal Institute. When one compared the housing of the Association in those days with its premises at the present day one could not help feeling a certain amount of gratification at the progress made. The first great step was when it acquired premises of its own—very considerable premises for that time—in Great Marlborough Street, and when it established its regular school. For some years this went on very successfully, and in due course it became advisable to establish a day school. With that movement he had had the honour of being associated, and he felt very proud of it. When they launched forth on this scheme they did it with a certain amount of trepidation, but it all turned out much more successfully than they ever anticipated. Now it had so increased that one might say it was the greatest school in the country. Although there was much cause for congratulation, they ought not to be too puffed up or self-satisfied about what they had done. He really believed that the Association was still in its infancy and that they merely stood on the threshold of further developments. The courses of study were established under the very able guidance of the first master, Mr. Bolton. To him they owed a deep debt of gratitude, for he had to initiate and invent a course of study without previous experience, and he did it in a most successful manner. And what Mr. Bolton did has been carried on by Mr. Maule and his assistants. A more enthusiastic head for a school than Mr. H. P. G. Maule it would be impossible to imagine, and he possessed the rare and valuable quality of imparting his enthusiasm to his students. Although these courses have been established, they had only up to now been feeling their way, and he did not himself think that the course of architectural education was all that it should be. It was a great question whether in the space of two years they did not attempt too much and whether they ought not to confine their energies and re-arrange the course so as to make it more thorough. But he felt sure they were going on the right lines, and that the ultimate result would prove of the greatest benefit to the profession generally. One of the influences of a school of such a kind was in the direction of helping, more or less, to educate the public. That was one of their aims, for unless they had public appreciation and encouragement it tended to damp architectural enthusiasm. Another

reason for some possible self-doubt was whether a tendency did not exist to make it too easy for students to enter the profession. It would be a great pity if such were the case, for it increased the number of those who were entering the profession without reasonable prospect of their succeeding. There seemed to be an idea abroad that architecture was one of the easiest and cheapest of the professions. It should not, therefore, be made so easy as to encourage people to become members of it without proper natural qualifications. The Royal Institute of British Architects were contemplating the promotion of a Bill which will make education for architects a compulsory thing, and that no man shall be an architect unless he has gone through a definite course of study and has a certain amount of qualification. Such a project had a very direct application to an institution like the Architectural Association. If such a Bill were to become law (as he trusted it would) it must give a great impetus to what was at the present time the most important school of architecture and which would, he hoped, become a national school. He would also like to see the Association more intimately associated with the head and directing body in the kingdom, i.e., the Royal Institute. He did not see why there should be any serious difficulty in bringing the Association more under the ægis of the Institute, and he trusted that that might be accomplished so that the Association might be assisted in its upward course and become a great national school of architecture. In conclusion, he would like to say one word about the management and staff of the A.A. He himself was brought into intimate contact with the Secretary, Mr. D. G. Driver, during his year as President; and so he, like every other man who passed the presidential chair, knew full well what a devoted, energetic, and single-minded servant the Association had in Mr. Driver. No one who had not passed the chair could realise what Mr. Driver did for the Institution, and whatever success it has attained in the past was very largely due to his energy and initiative. He could only express a hope that Mr. Driver would be spared for many years to hold the position he occupied at the present time. Mr. Hare then proposed "May the Architectural Association have long life and prosperity."

Mr. ARTHUR KEEN, the President, in replying to the toast, said the enthusiasm with which it had been received showed that it was in no way on the wane. Most of them would have heard of the toastmaster who asked the chairman, "Will you make your speech now, sir, or let them enjoy themselves a little while longer?" But as they had got to have a presidential speech, he would get it over. Biologists told them that the farther an organism developed the less likelihood there was of any important change taking place, and that seemed to be the case with all things. The Architectural Association had been in existence long enough to know its own mind, and it has settled down to steady and good work. A good many things that belonged to the past had had to go; some things which seemed at the time to be important. The day and evening schools now occupied the place of classes conducted by voluntary instructors and the evening studio. Although, however, a great many things of the past had passed away there were still a great many things which maintained their existence and remained as hearty and as useful as ever. These included the old Sketch Book, the monthly journal, and the ordinary general meetings; on the Saturday afternoons there were visits to buildings; and, finally, the annual excursions. All these were as lusty as ever and doing good work. The annual play was quite an old institution, and they hoped to have a performance at the end of the month in the gallery of the Institute. Among the young institutions was the Athletic Club. He had been told by Mr. Henry Tanner (the Chairman) that when one talked of the Athletic Club one talked of the Association. This year they had acquired a permanent ground of six acres at Elstree; it was, they hoped, to be opened by Lady Webb, supported by Sir Aston, at the end of the present month. He trusted that it would be the first of a long series of functions on the Athletic Club's ground. Of course the Architectural Association existed to a very large extent for its schools. As regards these they had their critics, many of whom were wise critics, and the authorities endeavoured to profit by what they said. They had been told it would be a good thing to show the students the interdependence of the other arts with architecture. Accordingly they called in the assistance of artists who gave a series of lectures on subjects like Italian Mural Painting, Stained Glass, and Town Planning, and he hoped that they would be able to carry on a similar course of lectures in the session before them. Another point was that they should make their students better draughtsmen. They all knew that very well. The difficulty was to find time for everything. The Association had also its unwise critics, who wanted them to run

before they could walk, without giving any indication of how they were to do it. Just as among the most important characteristics of good architecture was an obvious sense of the fitness and suitability of the building for the purpose for which it was designed, so it was with education. Unless they gave their students a thorough and solid basis they were not training them well and doing them good service. Such a basis they were trying to give their students instead of what some critics say about beginning at high flights and leaving the rest to afterwards. They might certainly carry their education a great deal higher, and it was desirable that they should do so at the earliest possible moment. The difficulty was one of time and money. It was exceedingly difficult to find room for any more in the two years of day schooling and the two years of evening schooling. They wanted more time, either another year or another two years. His own impression was that they ought to charge the students more than they did. Before undertaking this higher education they must see their way to more money. As regards actual work done in the schools, he could not find very much fault with it. It was certainly sound and worked up from the matter of building to the matter of architecture. It was thorough in every aspect. The students were taken to buildings to see how they were carried out, and they trained them as well as they could. Of course they must not lose sight of the fact that those responsible have the Board of Architectural Education constantly before their minds. They had been very loyal to the Board in the past, and he had not the slightest doubt they would be loyal to them in the future. The Board were reconsidering things, and were very carefully considering before they destroyed anything what it was they proposed to put in its place. He begged the Board to bear in mind the capacity of the average student, the time at his disposal, and the difference which exists in the conditions between this and other countries. The progress made in architectural art during the last sixty years was not a thing to be lightly thought of, and the methods which led to that progress were not to be lightly set aside. Everyone was, of course, entitled to their own views, but the views of some of their critics were a little difficult to understand. A man might have his own pet subject, as in the case of the gas engineer who always pointed out to his wife when approaching a town the precise position of the local gas-works. But when a man let this characteristic take the form of criticism it behoved him to be careful and to be assured that his charges rested on a solid foundation. The exhibition now being held at their premises of work done in the past term showed a most marked degree of ability and indicated that the method of training was a good and an uncommonly sound one. Many of the drawings there were specimens of draughtsmanship which would reflect the highest possible credit on anyone, and they also proved that the men were thoroughly well trained in construction. He earnestly hoped that the younger men would see the advantage of sticking to and supporting the Architectural Association. There were many who had belonged to it for forty years. It was a matter of personal regret to him that he had not belonged to the Association as a young fellow, for he was perfectly certain that he would have made a great deal better use of the world, and the world would have made a great deal better use of him, if he had done so. They would find that the A.A. possessed all sorts of advantages for them; it gave them friendships, it excited their enthusiasm, and so on. Finally, Mr. Keen said he would express his very cordial thanks to all who had been of service to the Association in the year during which he occupied the chair. Of these there were a very large number. Mr. Maule had already been referred to; he was a genius for organisation and for infusing his enthusiasm into the students, and he carried on the school with the greatest skill and ability. All who helped the Association were working for the best possible end if they taught the students the elements of their calling and helped them to design their buildings in beauty and to build them in truth.

Mr. GERALD HORSLEY proposed "The Royal Institute of British Architects," and spoke of the long time during which the Institute and the Association had been closely allied. That alliance was stronger to-day and more potent for the good of their art than ever it had been. To certain of the younger members it might be that the Royal Institute presented something of a sinister aspect, seeming to them an examining body and nothing else. But he ventured to say that its examining side was the least interesting of all the Institute's many functions. That was because the Institute recognised, in common with the majority of the most important educational authorities, that the need of the country was for education and not for examination. Hence the

Institute accepted the work done in the Association schools and exempted the scholars who passed the four years' course from all its examinations except the final. The drawings executed in the fourth year are up to the standard required at the final examination, and it might well be that a certificated student will in the future be exempted from all examinations. If that could be arranged it would be a great thing, because the misfortune of the examination system was the cramming it involved. They owed a great deal to the Institute for the recognition of their schools and the annual grant towards expenses and towards the Sketch Book. They were also very grateful to those who visited the school. The Association was essentially an educative body, and its life-blood was in the schools of architecture. These were progressing daily and becoming more and more proficient. It had been a great pleasure for them to hear, a few evenings ago, the high praise given to the work of the students by Mr. William Dunn. Anyone who saw the drawings at present on exhibition in Tuflet Street must realise the progress made. To maintain the excellence of students' work is the chief object of the A.A. In carrying on the important work which the Association were doing for the good of the profession, and at the wish of the profession, they hoped they might continue to have a large measure of that kindly help and valued encouragement such as they had enjoyed hitherto. They had, further, to thank the Royal Institute for the very sympathetic way in which they viewed all their varied activities, especially this year, for the loan of the Institute galleries for the A.A. play. That night they had to regret that so zealous had been Mr. Leonard Stokes in the discharge of his presidential duties that a brief holiday and rest was necessary for him. They would all wish Mr. Stokes a speedy recovery and a speedy return. But that night they had present one of Mr. Stokes' able coadjutors in Mr. A. W. S. Cross.

Mr. F. DARE CLAPHAM asked permission to introduce into the toast list a toast which, with characteristic modesty, had been omitted, viz., that of "Mr. Arthur Keen, their President." The company then sang "For he's a jolly good fellow."

Mr. ARTHUR KEEN, in a few words, returned thanks for the compliment.

Mr. A. W. S. CROSS, in replying to the toast of "The Royal Institute of British Architects," expressed regret at the unavoidable absence of Mr. Leonard Stokes. As a past President of the Association, for some twelve years ago Mr. Stokes had occupied the chair, Mr. Stokes would have won the esteem of many of the older members. His self-denying labours on behalf of the Institute were probably better known to those present than to the speaker because from the unflagging energy he then displayed as their President, they would expect the same from him as President of the Institute. During the past year the work carried on within the four walls of the Royal Institute had increased by leaps and bounds, and the personal work of the President had increased in like proportion. Indeed, he was afraid that this temporary breakdown of Mr. Stokes was in a large measure brought about by his unselfish devotion to official duties. The question of education seemed to loom as large in the minds of the Association as it did at Conduit Street where rarely was there a council meeting without some reference to this burning topic. But the advent of the educationist within the hallowed precincts of Conduit Street resulted in the almost total disappearance of another person who on his first arrival was anything but a *persona grata*, viz., the registrationist. That militant gentleman, the cause of much internal strife, is now lost to the Institute for ever, his very name being tabooed and his ephemeral existence forgotten. He has sunk into an obscure grave unwept and unmourned. And it was deservedly so, for he committed something infinitely greater than a crime on his first appearance; he made a blunder—he called himself a registrationist. Hence his hostile reception and subsequent death. "What's in a name?" A name has a very great value indeed. With the advent of the registration movement we find strife, controversies innumerable, discredit, and separation of life-long friends. It was not known who introduced the word educationist. Since the advent of that word all has been harmony. If a systematic course of training is ever brought about the Royal Institute will look to the Architectural Association for sympathy, aid, and co-operation; and they knew they would not look in vain.

Mr. ARTHUR KEEN proposed "The Guests," coupling with the toast the names of Mr. Leslie Vigers, Sir Alexander R. Stenning, and Mr. Robert Cobay.

Mr. LESLIE VIGERS (President of the Surveyors' Institution), in reply, said it must have been in the early 'seventies when he first had the advantage of attending some of the

meetings of the A.A. At that time Mr. Phenè Spiers was taking a very active part. He felt sure that the Association must be of the greatest possible use to architecture, and he could only wish there was some similar educational body attached or connected with the Surveyors' Institution, because he felt it was of the utmost importance that young men as they came up to join their profession should have other opportunities of learning it than merely passing examinations for which they were more or less crammed. It would be a great step in advance for surveyors if some organised school could be started where the young men would gain practical experience.

SIR ALEXANDER R. STENNING confessed that on looking back he remembered that he had been a member of the Architectural Association somewhere in the 'sixties, although not a very regular attendant. In those days the Association was not what it was to-day. On paying a visit to Tufston Street a few days previous he had been struck by the beautiful drawings and specimens of work done; these did great credit alike to the teachers and to those who learnt in the schools. He felt that if surveyors had some school where the pupils could be taught the foundations of their profession it would be a very excellent thing. He had been asked to rejoin the Architectural Association. His fear was that he might be expected to pass some examination, as the only one he had ever passed was for the district surveyors.

MR. ROBERT COBAY (Master of the Carpenters' Company) also responded.

A musical programme was given during the evening by Miss Ruby Helder, Miss Ruby Wilson, Mr. Lorne Wallet, and Mr. Bull (banjo).

ARBITRATIONS.

(Continued from last week.)

THE withholding of a certificate is a very powerful weapon in the hands of a valuer, and when a valuer acts fairly and justly between the parties, will greatly assist business being conducted in a reasonable and smooth manner; it will make the unreasonable owner reasonable and the jerry-builder scamp his work less, but whether it is to be a powerful weapon for good or ill depends so much upon the man who has the exercising of the power.

The responsibility is very great, and because it is great it is a responsibility which should be entrusted to the best men, and that is one reason why I personally consider your Institute and similar professional bodies so useful; because by their examinations they ensure that men are qualified, and by your opportunities for mutual intercourse and discussion you are enabled to bring before the members of your institutions the proper methods of conducting your professions. You ensure to some extent that your young men at any rate shall be well equipped with a knowledge of their business, for surely there is nothing less desirable than that any one should undertake a business which he does not understand.

Another distinction between a valuation and arbitration is that the authority of a valuer cannot be revoked when the parties have agreed that a third person, or third persons, shall by his or their skill and experience settle a question of value between two persons. That was decided in a case of the Northampton Gas Company *v.* Parnell; but a submission can be revoked, as we shall see later. Neither can such a valuation be set aside like the award of an arbitrator.

Arbitrations are judicial functions, and although arbitrators must decide upon the facts placed before them by the parties to the arbitration and are precluded from calling witnesses themselves without the consent of the parties, yet they may decide disputes and issue awards without hearing the parties or taking any evidence in certain cases such as:—

1. Where it is agreed that such shall be the method of procedure.
2. Where neither party asks for a hearing or to be allowed to give or tender evidence in support of his case.
3. Where the arbitrator is employed as an expert to settle some question in which he has some special knowledge or skill, and there is in the agreement to refer a clear intention that he should thus act.
4. Where the facts to be decided are confined to the knowledge of the arbitrator, and there is no outside information to be brought before him.

One very good test of whether a person is acting as arbitrator or valuer is to ask oneself the question what would happen if the person in question died or refused to act or became incapable of acting? If he was to act as an arbitrator

then the Arbitration Act of 1889 sections 5 and 6 would apply, and the Court would have power to appoint another in his place, but if the deceased was to have acted as a valuer and not as an arbitrator then the Court has no power to appoint anyone to act in the case of such a vacancy and someone else would have to be appointed by the parties themselves, and if the parties did not agree the contract could not be specifically enforced. Section 9 of the Sale of Goods Act 1883 provides "where there is an agreement to sell goods on the terms that the price is to be fixed by the valuation of a third party and such third party cannot or does not make such valuation, the agreement is avoided. Provided* that if the goods or any part thereof have been delivered to and appropriated by the buyer he must pay a reasonable price therefor. Where such person is prevented from making the valuation by the fault of the seller or buyer the party not in default may maintain an action for damages against the party in default."

Again an arbitration is usually intended to oust the jurisdiction of the Law Courts which in the usual way would be the method of settling disputes between litigants.

It is not possible to consider the history of arbitrations in the short time at my disposal and which is a section of the history of law, and would hardly be sufficiently interesting to you to-day. It would entail a careful consideration of legal procedure at the commencement of the nineteenth century, at which period it is quite conceivable that litigants preferred arbitration to the intricate procedure over an extended period which had to be gone through with uncertain results.

It must not, however, be supposed that the fact that a dispute has been referred to arbitration will make the question more easy of settlement. I am concerned myself with an arbitration which has extended over three years at this present time—the parties having been before the Arbitrator whose award was upset by the High Court, then before the Arbitrator again for a large number of days who published his award; this second award was remitted to a Judge of the High Court for argument; he decided that the Arbitrator was partly wrong and partly right; the parties then sought the assistance of the Court of Appeal, who decided that in the questions submitted to that Court the Arbitrator was totally wrong; the successful litigant before the Arbitrator who was partly successful before the High Court and unsuccessful before the Court of Appeal then went to the House of Lords, who decided that the Court of Appeal was right and the Arbitrator wrong. Well may the parties after three-and-a-half years of continuous legal proceedings, and enormous cost running into thousands of pounds, ask if *this* is what a simple arbitration is what is a real law action?

Sometimes, of course, a simple question can be submitted to an inexperienced arbitrator and settled. One of the earliest on record that I can think of for the moment was when King Solomon was asked to decide who was the mother of the child and displayed an amount of wisdom which made him renowned throughout the world as a wise judge. I wonder if his task would have been as easy if he had been called upon to decide who was the father? You can each make up your minds how you would conduct that inquiry.

And remember it is not always simple questions that are submitted; in fact, in complicated questions of account and such-like matters Courts of Law recognise that what is called a reference is the better plan. To-day, however, we are not dealing with references, but with arbitrations.

Let us, therefore, consider in what way the ordinary jurisdiction of Courts of Law is ousted and whether any ultimate appeal to the Law can be obtained, and, if so, under what circumstances.

By the agreement to arbitrate it will be provided either:—

1. That no action shall be brought and that all questions shall be referred to a domestic forum, or
2. That no action shall be brought until an award of an arbitrator has been given.

If an Act of Parliament provides for arbitration the jurisdiction of the ordinary Courts of Law is ousted altogether. But if not provided for in an Act of Parliament or in an agreement confirmed by statute, then the jurisdiction of the Courts of Law is not necessarily ousted by an agreement to arbitrate, as either party can commence an action against the other subject only to the other party applying to the Court under Section 4 of the Arbitration Act for an Order staying such action, which Order the Court has a discretion whether it will make or not, and such application for the stay must be made before any "step" is taken by the applicant in the action.

As to what is a "step" is a question of some legal technicality, and hardly of interest to-day; for if any such pro-

ceeding should be contemplated by any of you, I take it that as wise men a legal adviser would be called in; and, further, it is a question which many a legal adviser would have to look up before giving an opinion. Should, however, the occasion arise, these words of mine may be a signal that advice is necessary.

On the question of discretion the Court will as a rule enforce the agreement and stay the proceedings, considering that the parties having chosen their own tribunal, they are bound by their agreement and should stand by the bargain made; it may be, however, that one of the parties denies the validity of the contract containing the agreement to arbitrate; under such circumstances the Court would certainly not stay the action, but would decide first the validity of the agreement before allowing an arbitration to proceed. It matters not whether the questions to be decided are questions of fact or questions of law, although the authorities on this point are somewhat difficult to reconcile. However, it must always be remembered that the Court will not give assistance to a domestic forum, and that the arbitrator's jurisdiction is limited to the four corners of the submission, so that a pending action relating to matters not included in the agreement to arbitrate would not be stayed by the Court, neither if a substantial part of the claim did not fall within the agreement; but if the claims could be divided or separated, then the action would probably be allowed to proceed as to the portion not in the submission and stayed on to the other portion. The one case where the Court will as a rule refuse to stay is when questions are to be submitted to arbitration, and either party charges the other with fraud; if a *prima facie* case is made out, the Court will not stay the action unless the parties have previously explicitly agreed that questions of fraud shall be arbitrated.

Instead of endeavouring to oust the jurisdiction of the Courts altogether, the parties may have agreed to make the arbitration only a condition precedent to any right of action under the contract, so that no action can be brought upon the contract until an arbitration has been held on preliminary questions or disputes; the legal position was very concisely and clearly stated by one of the cleverest exponents of English Law in *Dawson v. Fitzgerald*, 1876, by Sir George Jessel, the then Master of the Rolls, who in the course of his judgment, said: "I take the law as settled by the highest authority, the House of Lords, to be this:—There are two cases. First, where the action can only be brought for a sum named by the arbitrator. Secondly, where it is agreed that no action shall be brought till there has been an arbitration, or that arbitration shall be a condition precedent to the right of action. In all other cases where there is first a covenant to pay, and, secondly, a covenant to refer, the covenants are distinct and collateral, and the appellant may sue on the first, leaving the defendant to pursue one of two courses, either to bring an action for not referring or to apply under Section 11 of the C.P.L. Act, 1854, to stay the action until there has been an arbitration." (At the present day, of course, the procedure would be to apply to have the action stayed under the Arbitration Act, as before explained.)

The agreement to refer having been entered upon the Arbitration Act provides that unless a contrary intention is expressed therein, the submission shall be irrevocable except by leave of the Court or a Judge, and shall have the same effect in all respects as if it has been made an Order of Court.

Before, however, the Court would revoke an agreement to refer a very strong case would have to be made out. It used to be considered a ground where it could be proved the arbitrator was wrong on a point of law, but that would hardly be the case now, as the party alleging he was going astray would have his remedy under Section 19 of the Arbitration Act and could apply for a case to be stated on the question of law raised, and the arbitrator could not well, unless the question was really frivolous, refuse to state such a case; if he did, an application to the Court would remedy the matter.

The Court will not restrain arbitration proceedings simply because they are being conducted irregularly. Nevertheless, at such a time it is important that the parties should know how to act, as by continuing to take part in the irregular proceedings, it may be held that they have waived any right to take advantage of the irregularity. The proper course to pursue under such circumstances is to take exception to the proceedings, and then having stated your objection, to continue to take part in the proceedings "under protest," thus preserving your right to apply to the Court

to set aside the award if irregular; but at the same time continuing to take part in the proceedings to see how matters proceed and how much further the arbitrator may be led astray or go astray, and also to bring your case before the arbitrator, that he may know the merits in case you subsequently lose on your technical ground.

An arbitrator is the person selected by the mutual consent of the parties to determine a dispute or disputes or controversies, whether they be matters of fact or law, and he should undoubtedly be actuated in coming to a decision by the same rules and principles which would actuate a Court of Law although in matters of procedure he is not so fettered. His jurisdiction is limited by the terms of the submission, and it is his duty to decide all and only such questions or disputes as may be submitted to him; he must be careful not to leave undone what he should do or not to meddle with such things that are not submitted to him. The parties to an arbitration do not in any way surrender any rights beyond those which by their agreement *legally* construed they have put within the arbitrator's power, and no mistake of the arbitrators as to the limits of the matters committed to their decision can bring anything within the scope of his jurisdiction which the parties did not by their contract when rightly interpreted place within it.

Although anyone can be an arbitrator the really important thing to bear in mind in arbitrations is to have an experienced arbitrator. Under the ancient system of pleading there was much technicality and considerable art, so much so in fact that in many instances a case was killed by its pleader, as, I am informed, babies are sometimes overlaid by their nurses. A case was frequently pleaded out of Court. It was a crowing match rather than a genuine fight. The present system is not so technical, there is not quite so much crowing. Now that legal procedure has been simplified so much it seems to my mind strange that so many people prefer to pay high fees to arbitrators to settle disputes for them instead of having such disputes decided by a Judge of the High Court. Arbitrations, however, appeal to people; it is provided for as common form in many classes of agreements and Acts of Parliament, and people may be brought into an arbitration before they realise what has happened and without their consent. Under such circumstances I would suggest to you that you should advise your clients to be careful as to who they appoint as arbitrator or umpire, and if you are acting as umpire or arbitrator perhaps I may suggest one or two things worthy of consideration. An arbitrator (and when I say arbitrator I include also of course umpire) should first of all be well versed in the law of evidence. This is all-important. As a rule, although there are always two sides to a question there is generally only one side to a case. No doubt a good deal of side is often put on by the learned advocate and made to look so like what ought, in his opinion, to be the other side that it really may be mistaken for it. In such circumstances you want as judge a man of experience not easily to be deceived, not one governed by prejudice or emotion, not a man who will be led away by his own peculiar views and crotchets, but who is capable of being able to judiciously consider all the surroundings, cute in perceiving fallacies and in estimating the character of witnesses. He must have a clear understanding of the nature of the evidence, as Lord Bacon writes: "In suits which a man does not well understand, it is good to refer them to some friend of trust and judgment that he may report whether he may deal in them with honour, but let him choose his referendaries for else he may be led by the nose." An arbitrator must conduct his inquiry in a judicial manner, he should be able to act as both Judge and jury, and to do this he must be able to decide what is evidence and what is not evidence. This can only be judged by one who has the question at his finger ends. It must be clearly understood that I do not mean to suggest that the arbitrator must therefore necessarily be a lawyer; many of the most efficient arbitrators have not been lawyers, and of course many of the persons administering law in this country to-day are not lawyers. Take the great number of men who devote a great deal of time to their public duties, the "Great Unpaid" or magistrates, but they have always the advantage of having a more or less competent clerk to advise them. To my mind an arbitrator with a judicial manner and knowledge of legal procedure is much more satisfactory as an arbitrator than one with a special expert knowledge but no legal training—and my advice would always be, get a man who thoroughly understands how to conduct a trial, otherwise the proceedings may become entirely abortive by reason of some irregularity in the conduct of the arbitration or the preparation of the award.

A study of the history of the law of evidence is extremely interesting and may account in some degree for arbi-

trations becoming popular. Less than a century ago in Law Courts the mouths of plaintiffs and defendants were closed, and so they could not give evidence; in fact, no one could give evidence who had the slightest interest in the result of the case, and consequently more often than not the mouths were closed of those who knew most about the dispute. It is quite unnecessary to quote from old law reports on this point, but I can refer you to the report of a law case which you will all be familiar with, viz.: *Bardwell v. Pickwick*.

Have you ever wondered why in the case of *Bardwell v. Pickwick*, Mrs. Bardwell never gave evidence to say that Pickwick did promise to marry her, and Mr. Pickwick never went into the witness box and denied that he ever promised to marry the plaintiff and explain away the circumstantial evidence which had been given against him? The reason was that when Dickens wrote "*Pickwick Papers*" neither plaintiff nor defendant was allowed to give evidence.

Arbitrators must make their award in writing within three months after entering on the reference or after having been called upon to act by notice in writing from any party to the submission, or on or before any later day to which the arbitrators by any writing signed by them may from time to time enlarge the time for making the award, and when an award is remitted by the Court or Judge the arbitrator or umpire shall, unless the order directs otherwise, make their award within three months after the date of the order.

(To be concluded.)

ARCHITECT'S CLAIM FOR FEES.

FOR professional fees in connection with a projected scheme for the building of a skating rink and assembly rooms at Newcastle, Mr. Clare Arnold Clayton Greene, a licentiate of the Royal Institute of British Architects, practising at Sunderland, brought an action before Mr. Justice Coleridge in the King's Bench Division, on Saturday, against Mr. James McEwan, a Newcastle builder. The defence was that plaintiff was only to receive five per cent. commission on the work actually carried out, and that the building had been abandoned.

Mr. Rayner Goddard, for the plaintiff, said that by the present action plaintiff was claiming two and a half per cent. on 13,000*l.*, which he estimated as the cost of the completed building.

When Mr. McEwan first discussed the scheme for the establishment of the rink, counsel said, he told Mr. Greene that as he had not yet acquired all the necessary land, anything that Mr. Greene did at that time must be gratuitous. Plaintiff got out sketch plans on these terms. Gradually the scheme evolved into something larger, and it was finally proposed to include in the plan one large assembly hall, a dancing hall, and a billiard room. Later the land was bought, and then Mr. Greene's services as architect began. He and his assistants were engaged altogether about fifty-three days on the work. He made several sets of plans, a complete set of contract drawings and the necessary tracings. All the alterations required by the local authority were carried out, there had been a survey of the land, twelve journeys to Newcastle, and the getting of estimates, which was no part of the duty he was bound to perform. The 13,000*l.* on which commission was claimed counsel suggested was a moderate figure, as cubed up at 6*d.* a foot the cost worked out at 17,000*l.*; but plaintiff had no desire to increase his claim.

Mr. Ralph Bankes, K.C. (for defendant): We made out the cost of the building at 18,000*l.*, and that was why it was not proceeded with. The cost was limited to 10,000*l.*

Mr. Rayner Goddard disagreed with the suggested limitation. Plaintiff, continued counsel, was entitled to two and a half per cent. commission on the total cost, as by a letter stating the terms on which Mr. Greene was willing to act as architect he stipulated for two and a half per cent. on the starting of the work. Mr. Greene did everything an architect ought to do down to the starting of the work. Therefore on that ground alone he was entitled to his two and a half per cent. But he was also a member of the Institute, and the regular scale of the Institute for abandoned work was two and a half per cent., as the defendant must have known.

Mr. Greene, in evidence, said that defendant never suggested that he should only receive commission on the amount of work actually carried out, and never complained to plaintiff that the plans were too elaborate.

Cross-examined by Mr. Ralph Bankes, witness said he was not told by Mr. McEwan to design a building to cost 17,000*l.* or 18,000*l.*, but he was not a free agent in the matter of the

extensions. Mr. McEwan controlled the scheme throughout. Witness denied that defendant limited him to a cost of 10,000*l.* or that a considerable portion of the excess was due to ornamentation. He agreed that Mr. McEwan might have said at first that he would like the scheme to work out at 10,000*l.* He denied the suggestion that "while the plans were very elaborate and expensive, on the other hand they were singularly lacking in detail, and there was no proper specification."

Re-examined, witness said that he had received a letter from defendant saying that no money was obtainable for skating rinks, and he had decided to drop that out of the scheme. Beyond this letter he had hitherto received no indication from defendant of the reason for the abandonment of the scheme.

Other evidence as to the sufficiency of plaintiff's plans and specifications was also given.

For the defence Mr. James Critchley, an architect and surveyor, practising at Newcastle, said he took out the quantities of plaintiff's scheme. Owing to discrepancies in the dimensions as shown on the sections and on the elevations, the work took him longer than it should have done, but eventually he worked out the cost of the scheme at 18,000*l.* Defendant told him to try and cut the expense down. He cut the decoration and elaboration out of the scheme, and this time the cost worked out at 13,500*l.*, which he told defendant was a minimum unless the stone work were deleted. The doorway as shown on plaintiff's scheme was not so very handsome, indeed there was such another doorway in Newcastle. It did credit to the design. Mr. Critchley said that a building was now being erected on this site at a cost of about 9,000*l.* He did not think plaintiff was entitled to two and a half per cent.

The defendant said in evidence that plaintiff's scheme had not been carried out because he had not been able to raise the 11,800*l.* It was not his fault that the scheme developed into one which would cost 18,000*l.* He paid plaintiff 100*l.* on account before he knew what the value of plaintiff's work was, but when he made up his mind not to go on with the scheme he decided not to pay him any more.

Cross-examined, defendant agreed that when the present building was finished there would be on this site a picture palace instead of a skating rink, but he would not agree that the carrying out of plaintiff's scheme fell through because no one would at that time finance a skating rink.

The Judge: Are you employing another architect on this building?—Yes.

The Judge: Is he working on the plans of Mr. Greene?—No.

Defendant said he always told Mr. Greene that his limit for the rink was 10,000*l.*

His Lordship, in giving judgment for the plaintiff, remarked that the parties in this case had entered into a special contract, and if the building had been erected and the work gone through, plaintiff would have been entitled to rely on the terms of the contract irrespective of whether the remuneration due to him was the usual architect's fee. But inasmuch as the scheme had been abandoned, the contract was never fulfilled on either side, and there was no stipulation in the letters which formed the contract to the effect that nothing should be paid if the work did not go through, then the claim became one for services rendered irrespective of the terms of the contract. The plans prepared by Mr. Greene were, continued his Lordship, detailed and, so far as he was a judge, highly artistic. He took no notice of small flaws. The plans were all that could be desired or deserved by defendant. Originally, no doubt, Mr. McEwan had spoken vaguely of 10,000*l.* as the amount he thought might be obtained for the purposes of the building; but that was at a time when the various items in the scheme were not in contemplation. The dancing hall and billiard saloon were suggestions made at a later date, and naturally increased the probable cost. Finally, the matter was rather vague, but still mention was made as to the estimated cost not exceeding 13,000*l.* and he dared say that at the time defendant rightly thought he might be likely to raise so much in view of the handsomeness of the proposed building.

When the plans came to be investigated, it was discovered that they contained a great deal of ornateness which might be scratched out without detriment to the structure. As they stood the building could not be erected for less than 17,000*l.* or 18,000*l.* Ultimately it was found that without ornament it could be put up for 11,800*l.*; and his Lordship said he had to take some figure between these two for the calculation of commission. He thought plaintiff's estimate of 13,000*l.* was not excessive; and adopting that, he took as a sort of rough guide percentage of two and a half usually charged

by architects. But it was said that the two and a half per cent. included a charge for getting out specifications sufficient for an outsider. In this case plaintiff had not to do that, and although the work done was in fact sufficient, there would be a deduction of 20% on that account.

A minor claim with regard to plans for a dwelling house was also made by the plaintiff, and his Lordship allowed the 18% claimed in that case.

Judgment was accordingly entered for the plaintiff for 223% and costs.

THE ILLUMINATING ENGINEERING SOCIETY.

A MEETING of the Illuminating Engineering Society was held in the rooms of the Royal Society of Arts on Tuesday, March 14, at 8 p.m.

Mr. Charles Hastings took the chair in the absence of the President, Professor Sylvanus Thompson, for whose inability to attend he expressed regret.

Before the discussion on school lighting was resumed, Dr. Harman gave a demonstration with an instrument which he has devised for testing eyesight. It consists of a long bar, having fixed upon it a screen with a hole. At the other end of the bar is a little rack for holding test cards containing characters of various sizes. The instrument can be adjusted for varying distances between the eyes of different persons, and the aperture in the screen can be reduced until the proper balance is arrived at. Dr. Harman proposes to use this upon children three times a day, and then strike an average.

Mr. T. E. RITCHIE exhibited a number of slides showing artificial lighting in educational institutions. The first was the chemical laboratory of the London Day Training College, which measures 48 feet by 30 feet; height to ceiling, 20 feet; illumination, average of 16 readings on benches and tables, 3.06 foot-candles; minimum, 2 foot-candles; maximum, 4.2 foot-candles; watts per square foot of floor surface, 1.38; and the diversity co-efficient, 2.1. The blackboard in this room has an average illumination of 2.07 foot-candles; minimum, 1.9; maximum, 2.3; diversity co-efficient, 1.2. Another narrow blackboard on the wall had an average of 1.68 foot-candles; minimum, 1.6; maximum, 1.8; diversity co-efficient, 1.12.

The museum in the same institution measures 40 feet by 19 feet; height, 12 feet; illumination on tables and cases 4 foot-candles; minimum, 3 foot-candles; maximum, 5.4 foot-candles; watts per square foot, 1.3; diversity co-efficient, 1.8. The average on the blackboard was 2.37 foot-candles; minimum, 2.2; maximum, 2.6; diversity co-efficient, 1.18 only.

The manual training room at the same college showed a very even illumination. The measurements of the room are 39 feet by 32 feet; height, 12 feet; average illumination on benches, 4.84 foot-candles; minimum, 3 foot-candles; maximum, 6.1; watts per square foot, 2.6; diversity co-efficient, 2.3. The blackboard illumination was 2.6; minimum, 2.5; maximum, 2.8; diversity co-efficient, 1.12.

The gymnasium was another excellent illustration of even lighting upon the floor. The measurements were 50 feet by 39 feet; height, 20 feet; average illumination on the floor, 2.64 foot-candles; minimum, 2.4; maximum, 3; watts per square foot, 1.02; diversity co-efficient, 1.25.

The lecture theatre is lighted by indirect means, the light being reflected from lamps high up and invisible to the eye. The measurements are 50 feet by 50 feet; height, 18 feet; average illumination on the centre benches, 4.12 foot-candles; minimum, 2.2; maximum, 4.8; watts per square foot, 1.32; diversity co-efficient, 2.18.

The next slide was a photograph of the exterior of the Westminster Technical Institute taken at night, which showed a very diffused light, and the absence of all glare. The interior of the testing laboratory at this institution has an average illumination on the desks and the benches of 5.25 foot-candles; minimum, 4.9; maximum, 5.8; watts per square foot, 2.2; diversity co-efficient, 1.2. Mr. Ritchie called attention to the fact that this latter figure is lower than any of those mentioned by Mr. Gaster or Mr. Dow, in either German or English schools, and was the lowest he had personally come across. The blackboard illumination in this room was an average of 2.58 foot-candles; minimum, 1.4; maximum, 3.1; diversity co-efficient, 6.3.

The wood-working department in the same institution was another illustration of the efficiency of indirect lighting, as it enabled very excellent photographs to be taken by its aid.

Other photographs were shown of the antique art room, the men's clay-modelling room, the elementary art room, in

which latter the blackboard illumination was particularly fine, the art class painting from models, and finally a room in which five-ampere arc lamps were burning three in series on a 220 volt circuit, with a total watts per square foot of only 0.81, which is extremely low for a light value of that kind. Mr. Ritchie expressed the opinion that this form of lighting might be found particularly suitable for small classrooms.

"Some Notes on the Illumination in Various London Schools and Colleges," by Leon Gaster and J. S. Dow, were then read as follows:—

It occurred to the writers that it would be interesting to supplement the valuable papers by Dr. James Kerr and Dr. Bishop Harman by a few tests showing the actual conditions of illumination prevailing in various London schools and colleges.

With this end in view, a few schools attended by children and infants, some of the large public schools for boys, and a series of colleges were visited. It was naturally impossible to do more on this occasion than select a few typical examples of each class, and the results of these casual visits made are not to be regarded in the light of a comprehensive examination or report. A truly searching investigation into the lighting conditions in any one college or school would alone furnish ample material for an evening's discussion. It is hoped, however, that the results will be of service in showing the usual arrangements for lighting at present employed, and the average existing order of illumination. They should also serve to show how comparatively simple measurements of illumination have now become.

We hope that others will be sufficiently interested to follow up the suggestions tentatively thrown out, to make measurements in the particular schools or colleges under their supervision, and to devise improved methods of lighting. It would be to the interest of school and college authorities to encourage investigations of this description, as it would doubtless often be possible, by comparatively small modifications, to secure substantial improvements. Work in this direction is certainly needed. The question as to what constitutes ideal illumination in educational institutions of different kinds still remains to be settled but there are already evident many directions in which improvements are possible and desirable.

The data collected refer mainly to artificial illumination; there are, however, also a few measurements of day light which may be of interest. The results as regards artificial light are summarised in Tables I., II., III., IV., and V.; daylight is treated in a special section.

In each case the chief object was to make measurements of the illumination on desks and blackboard. In addition an approximate estimate was made of the consumption of gas and electricity, as far as local conditions and information available allowed. All measurements of illumination were made with the Holophane Lumeter instrument.

In examining elementary and other London schools, schools at Haverstock Hill, Charing Cross Road, Richard Street, Islington, and Merton Road, Wandsworth, were visited. The two former are electrically lighted and the latter by gas. It appears that the conditions at Haverstock Hill are typical of the new electric installations. Here the artificial illumination on the desks is very uniformly distributed; in this respect it presents a marked contrast with the daylight illumination. The opal shades are specially designed for the size of the classroom. They cover the half-frosted tungsten lamps in such a way that one is not able to see the naked filament of the lamp even from the back desks; and the blackboard illumination, over 3 foot-candles, is also above the average.

A great simplicity is effected by the adoption of a standard size of classroom and the choice of the system of lighting best adapted to the conditions. The watts per square foot, about 0.5, would probably be considered satisfactory in view of the illumination secured, and the wiring arrangements have also been devised with a view to the greatest possible simplicity and economy in first cost.

The lighting of the schools in Charing Cross Road is of older date. Carbon filament lamps are still used, and it will be observed that the consumption per square foot is high. Nevertheless the distribution of illumination in the various rooms visited is less satisfactory than at Haverstock Hill. For example, in the cookery and laundry rooms several defects may be noted. In the former case the illumination of the demonstration table is too weak, and on the dresser even more so; in the latter the arrangement of the lamps tends to throw too much light on the gangways, while the illumination in the neighbourhood of the sink and mangle in the corner is only about half a foot-

A COUNTRY HOUSE AT WITZENHAUSEN.—Herr RICHARD RIEMERSCHMID, Architect.

candle. In some cases the naked filaments of the lamps are only imperfectly concealed from the eye by the shades used. In a third room, devoted to ordinary classwork, this was particularly noticeable from the back row.

By the kindness of Mr. Chalmers, manager of the school at Richard Street, Islington (lighted by gas), one of the authors had an opportunity of visiting these schools. It is interesting to observe that the distribution of illumination in many of the classrooms resembles very closely that at Haverstock Hill. A large number of rooms were visited, and the value of the illumination on the desks repeated itself very consistently. One would be inclined to suggest that the shades used might be exchanged for some form (such as that described by Dr. Harman) in which the mantle is completely screened from the eye; in several cases those at the back of the room could hardly avoid being dazzled by the indirect view of the mantles when looking towards the blackboard. In several classrooms complaint was made of the light, and yet the intensity of illumination proved on measurement to be up to the standard maintained in the others. It appeared, however, that in each of these cases work especially exacting to the eyes, such as sewing, shorthand, or reading music, was carried on. It may be suggested that in such cases a higher standard of illumination is desirable, and also that special pains should be taken to exclude anything in the nature of glare. In many cases the increase in illumination might probably have been secured by throwing downwards some of the light which at present escaped and illuminated the walls. On the other hand, it must be recalled that rooms are often used for quite distinct purposes at different times, and must be lighted accordingly. For example, a hall may be used for a large sewing class on one night and for drilling on another. Perhaps the most severe task of all for the eyes, owing to the lack of contrast between the material and cotton, is sewing dark cloth with black thread.

Another gas-lighted school visited was that in Merton Road. This was mentioned to us as being a new installation. The standard of illumination proved to be well above the average, namely, $4\frac{1}{2}$ foot-candles on the desks; the black-

board lighting, however (1.7-2 foot-candles) was somewhat low, as a consequence of the opal shades used. The shades have the merit of almost completely covering the mantle, so that it is not likely to be seen by the scholars.

An excellent illustration of the recognition of the need for higher illumination in the case of special work is furnished by the Arts and Crafts School (Southampton Row). In the accompanying table the illumination in the various

Nature of Work			Style of Lighting	Illumination (Foot-candles)
Wood carving room	Local Pendants	30
			Shaded Lamps	
Architecture	"	...	Inverted Arcs	7
Silversmith's	"	...	"	4.5
Art	"	...	"	6.5
Bookbinding	"	...	"	8.0

rooms devoted to wood-carving, book-binding, &c., is given: it is of quite a different order from that met with in elementary schools. Some special devices for the lighting of a compositor's frame, jewellery work, and etching, are used. It is interesting to note that green light seems to be preferred for fine jewellery work. It may be added that throughout this building no case was met with in which the actual source was exposed to the eye, and the illumination, besides being high, was singularly free from glare.

In the Trade School for Girls (Bloomsbury) inverted arc-lighting is employed, as it also is very extensively in the Arts and Crafts School. In other rooms where machine work is done local drop-lights are used. The local illumination here is again high, from 4 to 8 foot-candles.

It was also thought of interest to secure permission to take measurements in the classrooms of a few of the larger public schools, and this was done in the case of Harrow, Dulwich College, St. Paul's, and the City of London School.

It should again be emphasised that these few data do not constitute anything in the nature of a report on the lighting in the schools visited; it would clearly be out of the question to attempt anything in this direction without much more exhaustive investigation. All that has been done is to make measurements in a few typical classrooms in each case.

At Harrow the big hall is lighted by several chandeliers carrying opal shades and frosted tungsten lamps. We understand that the hall is only very occasionally used by artificial light. The lamps are high up, but the distribution of illumination is not very even. Immediately below the chandeliers it is as high as 5 foot-candles, but on some of the back desks only 0.5; however, it is stated that the desks in these extreme positions are not often occupied. In the classrooms opal shades and frosted tungsten lamps are used throughout; the average illumination is of the order of 2 to 2.5 foot-candles, but the remote desks sometimes received slightly over a foot-candle. In summer no artificial light is required; in winter work goes on until 6.45 p.m. three days a week.

(To be continued.)

COVENTRY MUNICIPAL BUILDINGS.

AT the meeting of the Coventry City Council on Tuesday the minutes of the General Works Committee stated that the Town Clerk had submitted correspondence with Mr. Dawber and with Messrs. Garratt, Simister, Buckland & Haywood-Farmer, who were awarded first place in the competition for the new municipal buildings, as to the partnership subsisting between the latter gentlemen, Mr. Dawber stating that in his opinion the terms of the conditions and instructions had been complied with.

Councillor Halliwell said he was anxious to ask whether the assessor gave any reasons as to why in his opinion the terms and conditions had been complied with. When this matter was before the Council at its last meeting he (the speaker) gave certain information with the result that the Council took a certain course. Now it appeared there had been some communication with the assessor, and he (the speaker) would like to know what information the assessor had based his opinion upon. This matter was not going to rest where it was, as it was going before the Institute of British Architects in order to see that fair play was carried out. The assessor did not say whether he held that these four names were one firm or two firms. He (Mr. Halliwell) had evidence at the last meeting that they were two firms who had collaborated for this particular purpose.

The Town Clerk said that the assessor had reported that the firm in question had given a declaration that the plans had been drawn up in their office and had submitted a list of works carried out by them.

Councillor Wale asked whether it was a fact that Mr. Halliwell had in his possession anything which controverted the statement made by the assessor.

Councillor W. H. Grant said the Council left this matter in the hands of the assessor, and his decision was to be final, and he satisfied the committee as to the bona fides of the firm to whom the award had been made.

The Council confirmed the minutes.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

Conference on Education and Training of Engineers, June 28-29, 1911.

SIR,—The Council direct me to give notice that they have made arrangements to hold a conference on the subject of the Education and Training of Engineers, at the Institution, on June 28 and 29. They are of opinion that the present is a desirable time to consider the methods of preparation to be adopted by those who contemplate entering the engineering profession, in compliance with conditions laid down by the by-laws for election into the Institution.

The requirements of the by-laws are: A sound general education developed upon lines suited to subsequent scientific study; a competent knowledge of those branches of science which form the basis of engineering; and practical training under actual engineering conditions, adapted—to quote from the last report of the Council—to fit persons to take part in the design, as well as in the control and direction of engineering works.

The report of the Committee on Engineering Education and training, adopted and published by the Council in 1906, made it abundantly clear that the broad principles of training indicated in the report are applicable to every kind of

engineering. There are, however, questions of detail and method involved in the realisation of those principles which are of great consequence both to students and to those under whom their education and their professional knowledge is acquired. It is mainly for the consideration of important questions of this kind, which experience has shown to deserve careful attention, that the Council have arranged the conference.

Its subject-matter will be dealt with in three groups, viz.: (1) General Education; (2) Scientific Training; (3) Practical Training.

The subjects selected for consideration are given below, and arrangements have been made for their introduction upon lines similar to those adopted in the former conferences of the Institution. A further communication will be made to you when the arrangements have been settled in detail.

LECTURE AND CONVERSAZIONE.

It has been arranged that the nineteenth "James Forrest" lecture shall be delivered at the Institution, at 9 P.M., on Wednesday, June 28, by Dr. F. H. Hatch—the subject being, "Gold Mining in the Transvaal"—and that the annual Conversazione shall be held in the Royal Albert Hall on the evening of Thursday, June 29.—I am, yours faithfully,

J. H. T. TUDSBERY, *Secretary.*

Great George Street, Westminster, S.W.

Subjects to be introduced for consideration at the conference:—

"The extent to which mathematical and scientific subjects should share with other subjects of literate education the attention of schoolboys who intend to enter later the engineering profession."

"The question of specialised entrance examinations for University or College courses of study in engineering science with a view to the curricula to be followed, and also of the inclusion in the latter of courses in modern languages."

"The relation of practical training to college study; whether, or to what extent, before, sandwiched, or after its conclusion."

"The position and uses of engineering laboratories in relation to education at college."

"The value of a University degree in engineering science in relation to professional competence."

"The requirements of practical training in works, with the necessary complement of scientific study."

"Practical training in workshops or on works of construction, with special reference to training in the engineer's office."

"The relation of engineering employers and colleges from the point of view of the practical training of college students."

"Workshop training as a preliminary to practical training in other branches of engineering."

Painters' Cradles.

SIR,—We have with regret learned of the death of a man through one rope becoming free and allowing the cradle to tilt endwise, when the man slid out to earth.

Similar accidents have previously happened, but being due to negligence of the men in not properly securing the ropes, we do not think measures have been taken to guard against recurrence.

No accident has ever happened with a cradle supplied by us, but there has always been a chance for such an accident, and therefore we think improvement can be effected, and will not patent the idea, but give it to the building world, namely (1) adopt upper pulley blocks having a brake fitted in them; (2) fit a door or pair of doors at each end of the cradle which, if kept closed, will prevent the men sliding out should the cradle tilt up.—Yours faithfully,

J. H. HEATHMAN & Co.

THE Renaissance, Elizabethan and Stuart furniture of the Rev. John Stephens, of Tooting Graveney, is to be sold on May 23 and two following days. It includes two rare Henri Deux cabinets of chestnut and walnut wood, as well as Italian, Flemish, and English examples of domestic furniture, some of which are illustrated in the pages of Macquoid and Cesinsky. There are refectory and side tables of Henry VIII., Elizabeth, and James I., old French armoires, Dutch cabinets, Italian brocades and embroideries, and a few pieces of seventeenth century Oriental pottery and porcelain. Messrs. Knight, Frank & Rutley's sale catalogue, which will contain photographs of the principal pieces, is now in preparation.

FORTHCOMING EVENTS.

Saturday, May 20.

Northern Architectural Association: Meeting at Newcastle. Visits will be paid to (1) The General Post Office Extensions, and (2) The Northern Conservative Club's new premises.

Edinburgh Architectural Association: Visit to Aberdour and Neighbourhood.

Institution of Municipal Engineers: Visit to the tar-paving works and quarries of Messrs. Chittenden & Simmons, Ltd., Borough Green, Kent.

Society of Architects: Visit to Lambeth Palace.

Monday, May 22.

Royal Institute of British Architects: Mr. Lawrence Weaver on "The Interleaved Heirloom Copy of the Parentalia, and some Notes on the Wrens." Exhibition of Photographs of Wren's work.

Wednesday, May 24.

Royal Society of Arts: Mr. Frank M. Andrews (New York) on "Architecture in America."

Thursday, May 25.

Surveyors' Institution: Country Meeting at Liverpool (May 25-26).

Saturday, May 27.

Northern Architectural Association: Students' Sketching Club. Society of Engineers: Annual Dinner.

THE ENGLISH STAIRCASE.

WE are nowadays so accustomed to think of the staircase as the central feature of a house interior that it is hard to realise that until the sixteenth century it was architecturally considered little better than a ladder to an upper level. Until our forefathers became acquainted with the possibilities of the staircase as exploited on the Continent, and particularly by the artists of the Italian Renaissance, our English mediæval builders seem to have been ever oppressed by the traditions of the outside flight and the corkscrew turret of the Norman castle where such treatments in the days of hand-to-hand fighting had a distinctly defensive value.

But if we were late in our architectural use of the staircase, it cannot be denied that from the beginning of the sixteenth century its development has received a wonderful amount of thoughtful ingenuity and artistic endeavour that have placed it far in front of all other parts of our domestic interiors as a centre of interest and exponent of character. The character of a house is nowhere more clearly expressed than in the proportions, the dimensions and the treatment of the staircase and its adjuncts.

Therefore it is with pleasure that we welcome an excellent monograph on the English Staircase,* which is remarkable not only for the clear explanation that is given by the author of the historical development of the staircase in England but for the admirable illustrations. The historical account deals necessarily with the mediæval form of staircase, but deals with it briefly, and quickly passes on to the great change that took place with the introduction of the wooden type of staircase in the second half of the sixteenth century. Wooden in construction that is, although based largely as regards plan on the stone staircases of Italy. It is perhaps this peculiar combination that makes the beauty of our English staircase from the sixteenth to the eighteenth century and more particularly in the earlier part of this epoch. The dignity of Renaissance planning displaced the meagreness of the mediæval, whilst the use of wood rather than stone gave the charm of homeliness that is lacking in the Italian palazzo.

It is interesting to notice how in many of the earlier examples the tradition of the turret stair survived, and the thought of the age is reflected in the passage quoted by the author from BACON's essay of "Building," wherein although a stately staircase is recommended, it is stipulated that "in all the four corners of that court fair staircases, cast into turrets on the outside," should also be provided.

* *The English Staircase*, an historical account of its characteristic types to the end of the eighteenth century. By Walter H. Godfrey, architect, author of *The Life and Work of George Devey*, and *The Parish of Chelsea*. Illustrated from photographs by Horace Dan, &c., and from Measured Drawings and Sketches. (London: B. T. Batsford. 18s. net.)

The various stages through which the newel staircase passed before it gave way to the continuous handrail type is well elucidated by Mr. GODFREY, and with this he treats also of the evolution of the baluster or rather of the varied basic principles of the design of the baluster. Allied with this division of the subject is the treatment of a continuous balustrade or decorative infilling between handrail and close string, "made famous by the exquisite workmanship of GRINLING GIBBONS and his school of carvers." A very curious and interesting mediæval example of the continuous balustrade treatment is illustrated from Down-holland Hall, near Ormskirk.

In the eighteenth century there was undoubtedly somewhat of a loss when the possibilities of the continuous balustrade were negated by the general adoption of the cut string in place of the earlier close string. This, of course, meant the supremacy of the single baluster, which undoubtedly is far better suited to the horizontal lines of the cut string than to the raking one of the close string, which latter always suggests that the balusters standing on the slope are in danger of slipping down. There can be no question that, æsthetically, continuous balustrades are the more satisfactory treatment for close strings and single balusters for cut strings.

To our mind some of the least pleasant examples of staircase design are the attempts of eighteenth-century designers in their employment of wrought-iron balusters with stone steps or cut wooden strings to attain the effect of a continuous balustrade by connecting the balusters and distorting them to fit at one and the same time the horizontal lines of the steps with the raking line of the handrail. We cannot even admire the efforts of ROBERT ADAM in this direction, of which examples are given by Mr. GODFREY. One might perhaps forgive the balustrade on the rake if it were always accompanied by such a masterly treatment on the level as is illustrated from No. 35 Lincoln's Inn Fields. Nor need we cavil overmuch at such a design as that of the iron balustrade shown from Chesterfield House, London; but it will be observed that here the balustrade is entirely on the rake, which is followed by its base line, this being merely supported, accidentally as it were, on the horizontal steps. Yet one cannot help feeling even in this instance how much more satisfactory would have been the effect of a close string of marble.

It is curious that in the last phase before what Mr. GODFREY terms the "decline of the staircase" there should have been a reversion in general plan to the circular stair of the mediæval builders, minus the important constructive central newel. Thus "the long continuous line of the balustrade curving in one sweep from floor to floor . . . was the goal of the Georgian designer: the subservience of every part to the upward gliding plane of the stair itself." Hence the decline. The flowing line

[From *The English Staircase*.]

being paramount, all the charming detail, the change of light and shade, the conjunction of level and raking lines that are so important as components of earlier staircase design are lost, and bathos results.

By the courtesy of the publisher, Mr. BATSFORD, we reproduce two of the many admirable illustrations in Mr. GODFREY's book; for the best of them, the beautiful colotype reproductions of excellent photographs, we refer our readers to the volume itself, a perfect treasure-house of exquisite detail, pregnant in suggestion and teeming with delightful instances of the wealth of artistic expression to be found in old examples of the English staircase.

THE ARCHITECT IN INDIA.*

By J. BEGG, F.R.I.B.A., Consulting Architect to the Government of India.

I CONFESS to having had a strong temptation to attempt an address on the architecture of India from the more purely archæological point of view. Though I have no wish to associate myself with those who are accustomed habitually to laud the ancients at the expense of the moderns, yet I cannot help admitting that, so far as India at least is concerned, it is decidedly the ancients who "have it" in the matter of architecture. I cannot help feeling that a very much more fascinating paper could have been prepared for you on the old work of the country than on the new. It would seem like a flagrant neglect of opportunity were I to omit to consider those glorious examples of the work of the

past which make India unique among the countries of the world in the possession of architectural gems of the highest possible order of merit. Clearly one should speak of the rock-cut work of Ellora, Tanjore, Elephanta, and Kar. of the Taj Mahal at Agra, of Fathpur Sikri, of Delhi, Ahmedabad, and above all, of that fascinating field of study where are to be seen the grandest and most masculine examples of Mohammedan building in India, the all but deserted city of Bijapur in the Deccan. But I have no alternative other than to commit this very solecism. I have no right to dwell on these glories of the past for the reason that, archæology having (for certain sufficient administrative reasons) been divorced from her consort architecture, have had no more than ordinary opportunities for studying it. In fact, I have had less than ordinary, for (so close has my nose been kept to the particular grindstone allotted to me) during my ten years of service in India I have never been able to spare time for travelling beyond the range of my actual duties. Bijapur, Ahmedabad, and Delhi are the only great archæological centres to which my work has called me; while Agra, Fathpur Sikri, Ellora, and the rest I have, so far, not visited.

I must, therefore, confine myself to a consideration of architecture in India from the point of view of the present-day architect. In the problems which he finds to tackle in the country, as he drives across comparatively unbroken ground his rather lonely furrow, I think I shall be able to show you sufficient to justify my claiming your interest and attention. I shall further limit my subject by concerning myself mainly with the work of the official architect—shall I say, with the building work of the Indian Public Works Department. I need not, however, tell those of you who are familiar with Indian conditions that the latter

* A paper read on May 16 before the East India Association.

[From The English Staircase.]

STAIRCASE AT ASHBURNHAM HOUSE, WESTMINSTER.

limitation is not by any means so formidable as it would be in most countries, or is such as to prevent our obtaining an adequate view of modern Indian architecture. Official design and building work still bears, and must bear for yet a long time, a ratio to the aggregate of work in the country in enormous excess of what it does, say, in England. This is so not only by virtue of its actual bulk, but because it leads the way, and will, I hope, continue to do so till a respectable tradition has grown up sufficiently to render our leadership no longer a necessity. That won't be, I fear, in our day, nor yet in the day of the next generation of our fellow-workers, nor, perhaps, of the next again. It won't be till India has so advanced that we are able to relinquish our leadership in other professions too—in law, in medicine, in engineering—and pretty much in the order in which I have named them, architecture coming last of all. I wish, you see, to start fair by avoiding giving the impression that I am over sanguine. India is a country of slow movement. In certain directions very slow.

The design and construction of the buildings of modern India is, then, for the most part, in the hands of the Indian Public Works Department—a service officered by men specially selected and specially trained—or till lately specially trained—for their work. When I say "specially trained," however, I do not mean to imply that they have been trained as specialists. Quite the contrary. Their work has certainly ranged over a wide field, a field embracing many kinds of specialism, such as railway work, irrigation, architect's work, &c.; but the men themselves

have not been largely encouraged to specialise, but rather to acquire a general training in the practical and theoretical considerations bearing on the varied work they are called on to take charge of. Though they enjoy the generic title of "engineer," it does not follow that that title is the best or most accurately descriptive one for them, or that it would convey other than a vague idea of what they really are to anyone unacquainted with Indian conditions. While some of them have been drawn from the Royal Engineers, some from the ranks of the civil engineering profession, and some few, like "Topsy," have "just growed," the majority owe their training to the special colleges, principally to the late Indian Engineering College at Cooper's Hill. But for the typical Public Works Officer the term "engineer" afforded quite an arbitrary and by no means accurate definition. He was not—he is not—an engineer quite as the term is understood in England or in Europe generally, and he has merely been called so because his most direct professional progenitor was perhaps the Royal Engineer. He might have been called "master of works," or he might have been called "architect," and it is certainly probable that, had it been expedient to recruit him from the ranks of any one existing orthodox profession in Britain, the particular blend of engineer, architect, administrator, and honourable gentleman necessary for the conditions of his life and work would have been more readily found among the members of the profession of the British architect than of any other ready to hand. I say this because it is the architect who is really the all-round man, while the engineer is the specialist—the

man who has specialised on what is essentially and *ab origine* a branch of architecture, namely, *construction*. Also because the architect's training teaches him to go by something beyond mere figures and formularies. It involves the cultivation of what might be called a *sense*, and is, therefore, calculated to make him adaptable and to aid him particularly in new and strange conditions.

Times have changed and work conditions have progressed in India. Railway work has long been definitely recognised as requiring specialists. Irrigation may be said to have followed suit. Electricity has invaded the country, and has brought the electrical specialist in its train. The generally-trained "engineer" is still, as he must needs be, in a numerical majority, and is concerned with the vast mass of work involved by repairs, maintenance, and other petty works, by road making, bridge building, and general works administration, but with little of original or creative work to do which is not building work, and, as such, directly within the sphere and competence of the architect. When I remind you that Cooper's Hill College is no more, and that all its splendid machinery for the training of the Indian Public Works officer has been scattered to the four winds (a measure, however, at which I do not wish to cavil), and when I further remind you that, retaining the arbitrarily acquired name of "engineer," recruits to the Public Works Department are being poured into the country from among the younger members of the civil engineering profession in Britain, to the all but total neglect of the architect's profession, you will understand that a situation has arisen which can hardly be regarded by the architect with a large amount of equanimity.

There is a temptation to exaggerate the gravity of the situation, and it would be easy for the architect to do so. But I want to be quite fair in my statement of the case. I do not want to pretend that the architecture of the Public Works Department has been contemptible. It has not been so. Many of the more important buildings of India, if not looked at too closely in detail, though, of course, in a sense amateur work, are distinctly above the average of such work. I would instance the High Court and Public Works Secretariat of Bombay. I might also mention the Victoria Terminus of the same city, though the latter is hardly an example of official designing, for Stevens, its author, had abandoned Government service before he did it, and, besides, being a genius, is not a man to be judged by ordinary standards. On the whole, India may well challenge any country in the world to show an equal number of amateur buildings more or less free from glaring architectural solecisms, more nearly approaching the standards of the professional designer. It is not to be wondered at. Necessity is the mother of invention. In the almost entire absence of architects, India invented for herself some very fair substitutes—just as Simla, in her dire need of professional actors, has produced some by no means contemptible acting on the part of her amateurs. In architecture a certain selective process as to men has certainly been at work in India, and it would be hard indeed if clever men—and there have been clever men—with their backs to the wall, and working on first principles with plenty of practice and a considerable amount of funds at their disposal, with ideal building sites and good materials, should not have contrived to give themselves some sort of a training, and stumbled on some of the genuine secrets of design. So much for the past. Nor must we be too pessimistic as to the present and the future. In 1902 the Secretary of State, moved by the then Viceroy (Lord Curzon) created the post of "Consulting-Architect to the Government of India," and appointed as its first incumbent a trained architect in the person of Mr. James Ransome. That was a great step, and the idea prompting it was a great idea for architecture. But it was not a new idea entirely, for the Government of Bombay had at that time an architect in their employ in the person of myself. When I first went to India, at the beginning of 1901, I was, I believe, the only architect-trained architect in Government employ in India. There are now seven of us, and soon there may be eight. The time can, I think, hardly be long delayed before every province and administration of any importance in India has its architect with his properly equipped staff. But even then it will be no more than a step which has been taken in the right direction. This handful of men can do no more than touch the fringe of the vast mantle of bricks and mortar which the continent of India requires continually to be weaving to veil her growing sense of nakedness. At best they can do no more than design a comparatively small number of the more important buildings which every year must rise up in re-

sponse to the increasing needs of the country. And these they can merely "design," as it is called, leaving the equally, if not more important, branch of the architect's work—the building—still in the hands of the amateur. "Design," as it is called, I say, for no man can design properly who is not in constant practice at actual building work. Similarly, no one can properly build who is not an expert designer. However skilled an engineer he may be, he must still be to some extent, as I have styled him, an amateur. That is why I say that the situation cannot be viewed by the architect with equanimity. Seven new architects in ten years is not enough.

The best, therefore, that can be said of the architectural work of India is that it is in the hands of an agency made up for the most part of intelligent (and certainly zealous) amateurs, with a small leaven of professionals. These latter are necessarily in comparatively subordinate positions—that is, they are merely in advisory positions. They may advise, but it by no means follows that their advice is followed. In a great many instances it is not followed fully and unreservedly. The fact is that, with the best intentions on the part of those in authority, it is too often impossible to give effect to the architect's advice, for the reason that the machinery, so to speak, for carrying out his advice is of the nature to which I have applied the term "amateur"—that is, amateur from the strict point of view of the professional architect. A surgeon may advise that a certain operation should be performed in a certain way, but unless he performs it himself, or can rely on its being done by another competent surgeon, his advice can certainly not be followed. This illustration, it is true, is robbed of some of its poignancy by the fact that, thank Heaven! we have practically got rid of amateur surgeons, whereas the world is largely peopled by amateur architects. And we do not want to get rid of the amateur architect. He is, in some respects, the best friend of the professional, to whom he affords real help and stimulus; and it is from among the number of these amateurs that the architect finds his most genuine admirers and effective supporters. He is not to be got rid of; merely to be led and restrained. But, I ask you, how can the seven newly-imported architects of India hope to lead or restrain the hundred thousand more or less who fill the stage? Let me rather take the illustration that is suggested by the last word, "the stage." The professional actor may advise, he can even show how a passage should be rendered. But can he hope that his amateur pupils, however well intentioned, however intelligent, however humbly desirous to learn, will be able to follow his advice? Now, the amateur architects of India, be they operatives or engineers or administrators, though well intentioned and by no means unintelligent, are seldom humble. Their life, their training, their traditions, their seniority, and the amount of their pay, compared to that of the architect's, none of these things make for humility or docility in this connection. As things are in India, *humility* is hardly a quality to render a man an effective servant of the Empire.

May I now allude to some of the difficulties which this new breed of architects have to face in India? Chief amongst these is, perhaps, the prevailing misconception as to what an architect is and does. It may astonish architects to hear that, when I first went to India ten years ago, I found it to be universally held that the architect had nothing to do with the *erection* of buildings. The man who saw to that was the engineer! Materials, strains and stresses, thickness of walls, strength of piers, beams, girders, and trusses, contracts and work arrangements of all kinds, together with the prices that should be paid for labour and materials—these were all beyond the architect's province. Further, matters such as the number, size and arrangement of rooms, their lighting, whether by windows or artificially, their ventilation, &c.—in fact, the planning and entire conception of the building, here the engineer was held to be the proper authority, and for none of these things was it considered fitting that the help of an architect should be obtained. People would not believe me when I told them that all such things were the commonplaces of the architect's daily work in England, and, in fact, everywhere else but in India. Even such things as decoration and the colour of the paint to be used, whether internally or externally, were supposed to be quite beyond the province of the architect. The engineer was apparently the man to settle all that, and he frequently left it to his subordinate, who left it to the painter, who, in turn, might save the situation by consulting the wishes of the prospective occupant of the building. Such a state of topsy-turvydom had to be experienced to be believed.

What then, it may well be asked, was the architect supposed to do? Upon my word, I do not know. I believe that a few of the more enlightened considered he was concerned with the exterior appearance of the building—the appearance, that is, so far as the mere form of decorative details went—for colour, whether applied as paint or by the choice of materials, was certainly denied as being within his competence. I was thought to be seeking unduly to magnify the importance of my functions when I either sought to do otherwise than confine myself to the narrow limits of exterior appearance or represented the architects of other countries as doing otherwise in the ordinary course of their duties. I think that, had we taken our official superiors at their word from the first—had we not, in spite of frequent discouragement, followed our own line to some extent—the office of Government Architect would have been a sinecure indeed.

The architect in private practice in India has an easy way of meeting this ludicrous misconception of his functions. He simply inscribes his brass plate with the words "Architect and Engineer." But the official architect has no voice in the choice of his designation, and must accept that, with his work, as each comes from his official superiors, and there has been no lack of work for us. I suppose they must have found us useful. I can point to one curious instance of some years ago. A Government architect was ordered to prepare the detailed designs for a large and important bridge, involving alternative treatments in stone, steel, and reinforced concrete, though it was admitted that this, at least, was certainly not within the officially recognised category of his duties. All the while the engineer to whom the duty would naturally have fallen was engaged on the design of a big block of residential flats. The architect did suggest that perhaps an exchange of work might be effected, but this was met with the coldness such presumption deserved. Yes, they must have found us useful—more useful, I think, beyond our acknowledged province than within it. I am glad to say that much of the misconception has been lived down. Before I left Bombay in 1906 to take up my present appointment with the Government of India, the Government of Bombay had sanctioned the establishment in my office of an executive branch and the entrusting to me of the construction of all more important buildings designed in the office. Generally speaking, the architect is becoming more and more freely admitted to the councils of the Public Works Hierarchy on an increasing number of matters connected with his calling.

Then there are the difficulties an architect finds in getting his details, specifications, and other instructions understood on the works. Neither the workman nor the Public Works subordinate has been sufficiently trained in what is known as the "reading" of drawings, and the engineer is not able to afford the time to explain things.

But a more formidable trouble is the absence of any reliable source for the supply of capable assistants. In Europe, especially in the towns, there is no lack of these, and they can be got to work for surprisingly low wages—even for love—for the sake of experience. The Indian Public Works Department is able, by virtue of its long establishment and the considerable figure it makes in the public eye, as well as from the fact of the existence of several engineering colleges, to obtain an adequate supply of subordinates sufficiently trained for its ordinary requirements. But the architect's requirements are of a very different nature. The ordinary Public Works subordinate is of little or no use to him. Moreover, he requires the assistance of men of a different class than can be made to pass muster under the more perfunctory and routine character of the ordinary Public Works Department work. It therefore follows that the architect, when he goes to India, has very considerably to modify his methods if he is to get through his day's work at all; and it also follows, alas! that he cannot turn out his work with the same amount of completeness and thoughtful care as at home. This circumstance militates grievously against his success, for so much less skilled are all through whom his ideas and instructions have to be transmitted to the workmen—his own immediate staff, as well as the overseeing machinery of the "executive engineer"—and so much less skilled are the workmen themselves as compared to those he has become accustomed to at home, that to obtain equal results he ought to employ superior rather than inferior methods, to give fuller rather than more scanty instructions and details.

Towards the diminution of this difficulty various schemes are under consideration. There is the proposed establishment of a thorough system of pupilage in the existing architects' offices. There is the suggested sending home of

approved architectural pupils to complete their studies in Europe. The Bombay School of Art is doing good work with training classes for architects' assistants, and other schools in the country may perhaps be induced to follow. But all the schemes bristle with difficulties, the chief of which arises from the fact that the better class of Indian youth does not often seek to follow architecture as a profession, either because his order of mind is not "built that way" or because his attention has not yet been sufficiently turned to the profession. Your young educated Indian of good class seeks to become a lawyer or a doctor, or a few aim at being engineers, though I must say they have hardly yet shown that, as a race, they possess outstanding aptitude for the latter calling. But the few who have essayed to become architects have not hitherto been generally of a class or of an education to fit them to take the necessary training, and the native architect has hardly yet arisen who could satisfy the most moderate professional requirements. Meantime the country is overrun by clerks—clever, highly educated, and only too glad to work for exceedingly low wages. If but a small proportion of them had thought of becoming architects, and if the means had existed for training them at the proper stage in their educational careers, the architectural profession in the country, both private and in Government service, would be in a more hopeful position to-day. This is a state of things which every well-wisher of India should be glad to see altered, if for no other reason than to provide one more little outlet, among the too few that exist, for the energies of a growing class of young educated Indians—growing in numbers as in discontent with the faint promise of careers that the future seems to hold out for them.

It would be a great thing for India if she could be put in the way of having a strong, living architectural profession of her own, and of being more or less self-contained in the matter of providing its personnel. Her arts are dead or nearly so, and her crafts are little better. The Indian workman has become a complete master of one art only—that of scamping—and it is a rare thing to find one who takes a real pleasure in his work for its own sake, or for any other sake than that of the expected pecuniary reward. The taint of commercialism, at its crudest, poisons his whole outlook, without, as yet, the virtue that should accompany it—commercial honour. It is architecture which is the great mother of all the arts and crafts, and it is the architect alone who, as the lineal descendant of Tubal Cain, can, I believe, inspire the craftsman with that pride in his work which is the sure antidote to a too exclusively commercial outlook. I know from more than one happy experience that the Indian workman can be so inspired; and I believe that if there were only more of us, and if we were of the right sort—the sort to bring with us enthusiasm for our work—then the crowds of Chinese carpenters and smiths, for instance, who have obtained a practical monopoly of their respective trades in Calcutta and elsewhere, would soon have to pack and go.

And think of the civilising effect which it would have on the country if we could only get the crafts set on a proper footing. The very foundation of a modern nation's progress in civilisation is surely work—sound, honest, joyful work. I cannot see that that foundation has yet been laid in India, or that such of it as was laid by the Moguls centuries ago is being used sufficiently to support the structure we are labouring to rear. Looked at from this point of view, it seems to me that in the progress of the architectural profession in India we might have a big thing, and in the architect's mission a big mission.

But some may say that India is not a modern nation—rather a collection of tired remnants, the refugees, one might say, of many old ones. Quite so. But what have we been doing for the past hundred years if not trying to make it conform to the ways of modern nations—to make it, in fact, a modern nation? And I think we are not only beginning to succeed, but are beginning to recognise our success. At any rate, I take it as a sign of the latter that British public opinion is at last venturing to question the eternal wisdom of the saying as to East and West that "never the twain shall meet." When so stubborn a thing as British public opinion shows a sign like that of adapting itself to the times, surely there is hope for even the slow and stubborn East. Just as the India of the past can show some of the world's greatest architectural achievements, so we may rest assured that in the present and future she has the main essentials for holding her own with other nations in this respect. She has a wealth of fine building materials in her various grades of basalts, freestones, marbles, and granites;

slate, tiles, bricks, and lime. She has a certain amount of indigenous timber, and a ready access to the teaks of Burmah and the gums and other timbers of Australia. Then her climate conditions and ways of life demand large and lofty rooms, and that all goes to make for a broad, big, and masculine type of building design, in which dignity and grandeur of manner are encouraged by the formality and ceremoniousness that are associated with her traditions in the conduct of government and public affairs generally. Moreover, in the larger aspect of architecture—that concerned with the planning of towns and cities—there is endless opportunity, nay, even crying need, for the architect's best efforts. That is a lesson which has been learned within the last ten or twelve years during the operations of the Bombay Improvement Trust. Calcutta is now starting an Improvement Trust of her own. May we hope that that city will be so wise as to profit by Bombay's experience in this respect?

Meantime, in judging of the architecture of the present day there is just this to be borne in mind. It is neither so admirable a thing as certain amateur enthusiasts are wont to represent it, nor is it so contemptible a thing as it is apt to appear to the severely professional critic, accustomed to see the work of our best men at home. I would in particular emphasise the latter aspect of the case in so far as our work is seen from this side of the water. I would ask you to bear in mind the enormous disabilities under which, as I have pointed out, the work of the architect in India is carried on, and would plead for a correspondingly sympathetic and lenient judgment of results. If you think me unwise in giving this apology too much the form of the excuse that accuses, I would ask you to bear with me in this also. The architect is of necessity somewhat of an irritable creature, and these remarks are written after ten long years without a break of continuous anxious work, contending with the difficulties I have just been indicating. Under these circumstances, some degree of pessimism is hardly to be wondered at in contemplating one's efforts. But, at the same time, I do pretend to a very real optimism with regard to the future, from the point of view which also I have tried to indicate to you. While disclaiming the desire to pose as prophet, I think I may at least ask those of you who are interested in architecture generally, and in Indian architecture in particular, to keep a sympathetic eye on the work of the Public Works Department, and to declare my confidence that the progress you see will not disappoint you. Do not look for any startlingly individual development of a "style," as the term is popularly understood, for the individual character of a real living style can never be judged by the generation that produces it. But look for buildings designed alike with honesty, with thought, and with common-sense, as with the quality of "style" in the bigger sense—that quality which is hardly definable, and which is best conveyed to my mind by the expression of a Scotch architect friend—"the real crack of the whup!" Look for those buildings showing the qualities of sound, honest workmanship, and inquire whether there are still in Calcutta as many Chinese carpenters as ever.

THE Royal Sanitary Institute will hold a provincial sessional meeting at Exeter on June 2 and 3. The meeting on Friday, June 2, will be held in the Royal Albert Memorial, University College, Exeter, at 7.30 p.m., when a discussion will be opened on "Ventilation in Theory and Practice," by Mr. J. Jerman, F.R.I.B.A. It is hoped that the following will take part in the discussion: Mr. George Adkins, Medical Officer of Health, Devon C.C.; Principal A. W. Clayden, M.A., Exeter University College; Alderman Chas. Cole, architect and surveyor, Exeter; Mr. James Crocker, F.R.I.B.A., Exeter; Councillor R. M. Challice, architect and surveyor, Exeter; Mr. S. Hutton, surveyor, Exmouth U.D.C.; Mr. Percy Morris, F.R.I.B.A., education architect, Devon C.C.; Mr. Thomas Moulding, M.Inst.C.E., city engineer and surveyor, Exeter; Mr. P. H. Stirk, school medical officer, Exeter; Mr. C. J. Vlieland, M.D., assistant M.O.H., and Mr. W. J. Wreford, sanitary inspector, Exeter. A general discussion is invited. The chair will be taken by Mr. H. Percy Boulnois, M.Inst.C.E. (Chairman of the Council of the Institute). On Saturday, June 3, at 10.30 a.m., members will meet at the Guildhall, Exeter, and proceed to visit the sewage disposal works, septic tank system. In the afternoon the members will reassemble at the Guildhall, Exeter, and proceed by brakes to visit the Corporation waterworks at Pynes.

TEMPERAMENTAL ARCHITECTURE IN THE NEW YORK CATHEDRAL CHURCH OF ST JOHN THE DIVINE.*

By WM. H. GOODYEAR, M.A.

Curator of the Department of Fine Arts, Museum of the Brooklyn Institute; Hon. Member, Society of Architects of Rome; Hon. Member, Edinburgh Architectural Association; Hon. Member, Royal Academy of Fine Arts of Milan; Hon. Academician, Royal Academy of Venice; Corresponding Member, American Institute of Architects.

THE recent dedication of the Cathedral of St. John the Divine offers an appropriate occasion for the consideration of certain architectural refinements which are used in the choir and which were suggested by mediæval precedents thus reviving principles which found very widespread application in the old cathedrals. Mr. C. Grant LaFarge has already touched upon this matter in the article which he contributed to "Scribner's Magazine" in April 1900 (p. 400).

The fact certainly merits all the prominence and emphasis which can be given to it, that the choir of this cathedral has an asymmetric plan, that its arches and pier spacings are asymmetric, and that its pavement is built to slope upward toward the eastern end of the church. The firm of Heins & LaFarge was thus the first in modern times to revive those intentional asymmetries of dimension and plan which are so frequently found in mediæval architecture and to which the Brooklyn Institute architectural exhibition is devoted.

With the exception of another and earlier asymmetric plan (at Methuen, Mass.) by the same firm, St. John the Divine appears to be the first instance of a modern revival of mediæval constructive asymmetry.

This fact has additional interest because Mr. Heins has formally announced and explained his own point of view on the subject of "refinements" in the article under the title which he contributed to the Sturgis-Macmillan "Dictionary of Architecture," and because further matter on the same subject may be quoted from a personal letter which he wrote only a few months before his lamented death.

The circumstances under which this letter was addressed to me, in 1907, may be first mentioned. It may have been about 1898, and during or soon after my report on the Brooklyn Institute architectural research which appeared in a series of articles in the "Architectural Record," that Mr. Heins first made known to me that his firm would introduce refinements in the choir of the cathedral. It was a little later that the original manuscript of his article for the Sturgis "Dictionary" was confided to me. This manuscript was of very much greater length than Mr. Sturgis had been able to publish in the "Dictionary." Meantime it was understood between Mr. Heins and myself that the firm did not care to have public mention made of the use of refinements in the choir until it was actually built.

In 1907 the choir was so far finished that this temporary restriction on public mention was withdrawn. I was then making plans for a book which is still unwritten and, with this book in view, asked Mr. Heins to furnish for the publication his own account of his reasons for introducing the asymmetries of construction. Some passages from his reply follow here, and it will be observed that one of them includes the permission to publish an account of the choir.

Lake Edward, P. Q., May 28, 1907.

Dear Mr. Goodyear,—

Your note came just as I was in the final agony of breaking loose for a couple of weeks in the woods, which is my apology for not having answered at once. I hope this will be in time * * *. The way all these refinements appeal to me is the way the wood appeals to me. If the trees were all alike I should be tired of them in an hour—just as much as one would tire of living in a street where the houses are "built in a row." It is unnatural to make things all alike and I do not like them so, but cannot give it a name. It seems as though we had become so accustomed to machine-made repetition as to find it difficult to express repugnance for the system—just as it is said that if a man is imprisoned long enough will object to being set free—the idea of having to make a choice of his own initiative becomes terrifying. I can only say that the idea of modulation and refinement seems to me covered by the word "art" and artistic, but I have no word in my vocabulary to express the antithesis, except to say that such things are ugly and unpleasant and repellent. We have words to express both sides of other things: good, bad; true, false; hot, cold; but art (?) what?

* This article was written by special request of the editors of the *New York Architect*, and appears in the current issue of the Magazine.

I maintain that refinements and modulations belong to the domain of art, though they are not all of it. *They are indispensable to a building that shall continue to please people of discernment for centuries after its erection. In other words they are indispensable to a work of art.**

Do not hesitate to publish whatever you determined upon with Mr. LaFarge. Our hesitation was only of temporary quality, as you understand.—Yours very truly,

G. L. HEINS.

Before quoting from the general views of Mr. Heins about refinements, as farther expressed in his contribution to the Sturgis "Dictionary," it may be well to describe a little more closely the special nature of these refinements in St. John the Divine.

The pavement of the choir has a rising slope toward the east of six inches. The arches are of discrepant sizes, with variations in the height of the capitals. There are also variations in the spacings of the piers. The lines of the piers converge in plan toward the east, to the amount of 19 inches in 57 feet. They diverge, to a corresponding extent, from the outer walls. To quote the exact words of Mr. LaFarge in the "Scribner" article: "It is with the desire to avoid to some extent the banal aspect of mechanical regularity that certain refinements are practised in the cathedral. The choir arcades are not parallel, but converge slightly. Their springings are not level; the spacings of the arches of choir and ambulatory are unequal; the floor slopes upwards to the east and the great columns are unequally spaced."

Mr. LaFarge has also quite recently furnished me with the following statements:

Taking first the high arches which are in pairs at either side of the choir, the western arch has a radius of 10' 6", and the eastern arch a radius of 10' 0". The caps from which these arches spring, taking the western cap as zero, lift as they go east, the middle cap being up 18" and the eastern cap 3' 0". This last level is then carried around for all the arches springing from the great columns of the apse.

Taking next the lower arcades under the organ galleries, these being on each side in two pairs, each pair coming under the single high arch, and continuing from east to west, the radii are as follows:

First arch	4'	7"
Second arch	4'	10"
Third arch	4'	6"
Fourth arch	4'	4"

The caps engaged in the piers from which these arches spring are all on a level, but the caps of the free standing piers which occur at the meeting of each pair of arches are up 6". * * *

Any variation from these figures would be very slight, and would not be important.

Mr. LaFarge adds to these figures others for the arches, still to be built, opening from the great crossing into the (unbuilt) transepts and into the (unbuilt) nave.

As designed, the present, or eastern arch, which opens from the crossing into the choir, springs from a level 16 feet higher than the arches opening into the transepts, and 25' 6" higher than the western arch at the nave; that is to say that, starting from the east end of the nave, the transept springing lifts 9' 6", and the choir springing 16' 0" above that.

I personally consider this, as did my late partner, one of the very finest elements in the whole design of the interior.

My belief about it, and my reasons for it, are clearly set forth in my article which was printed in *Scribner's Magazine* of April, 1907.

The lifting of the effect of the choir by these successive rises has precedents in S. Paolo Ripa d'Arno at Pisa and in the Cathedral of Monreale. In the first-named church, which is comparatively a small one (145 feet long), the last bays of the nave rise above the preceding ones, 2.22 feet, south side, and 1.23 feet, north side, while the transept arches are from 12 to 14 feet higher.

The widths of the same bays of the nave increase 9½ feet, south side, and 7 feet north side (from 16.20 to 23.76, south; from 16.38 to 23.33, north), thus approximating closely to the width of the transepts, which is 24 feet.

The changes of width and height are not noticeable (for which parallel cases will be mentioned later), and as regards the height the effect is one not only of uplift, but of smooth transition and avoidance of abrupt contrast.†

As regards Monreale, Mr. LaFarge's own words in the "Scribner" article may be quoted. "The richness of decoration is so striking that we are quite likely to lose sight of one of its most remarkable qualities, the singular majesty

of effect, due in no small measure, it is true, to the arrangement and scale of its mosaics, but even more to the bold subtlety with which the succeeding arches rise one after another, to the springing of the half dome of the sanctuary in which is the colossal mosaic bust of Christ."

In spite of the large amounts of the variations in the unbuilt part of St. John the Divine just quoted by Mr. LaFarge, it may be confidently said that the eye will note the effect without noticing the means by which it is produced.

Lest visitors to the church should anticipate the possibility of easily detecting the variations in the completed choir, it may be said that the pavement of Santa Maria Ara Coeli on the Capitol Hill at Rome, a church which is well known to every tourist, has a rising slope of 2.90 feet between entrance and choir rail, which will probably never have been noticed by anyone who reads this paper. It is doubtful that many who read this paper will have noticed a rising slope at Chartres of three feet seven inches between entrance and choir rail. The reason for these oversights is that every flat surface below the eye slopes upward in perspective, and that the eye confounds the artificial effect with the one which is universal and natural. Instances in Italy might be multiplied indefinitely, but it is sufficient to say that the Brooklyn Museum research has records for levels of pavements with a rising slope toward the choir in eighty-five Italian churches, and observations for a much larger number, although no history of architecture has ever mentioned a single instance of this constantly recurring arrangement in mediæval churches.

The slope in St. John the Divine will, therefore, certainly not attract attention, although the levelling of the floor of the choir stalls resting on the slope makes it more apparent than it would be otherwise.

As to noticing a convergence in plan of 19 inches in the alignment of the piers, it may be mentioned that a convergence of seventeen feet in the walls of S. Giorgio in Velabro at Rome, or of twenty-three feet in S. Stefano at Venice, is absolutely inconspicuous.* In fact, Mr. Street's "Brick and Marble in the Middle Ages" quotes a uniform width for the nave of S. Stefano of "about 48 feet," without noticing that the nave narrows in plan to correspond with the walls. This measure must have been taken at the second bay of the nave, on the presumption which is usual in modern surveys, that one measure is sufficient.

As to the varying heights of the capitals in St. John the Divine, Mr. Heins is himself authority for the point that this variation is wholly inconspicuous.

In one passage of the quoted letter he says: "I am constantly surprised to find that it is almost impossible to see that there is any variation in level of the caps from the choir floor; it is readily observable from the gallery level." On this head it may be added that variations which aggregate a maximum of three feet in the height of arches in Fiesole Cathedral are almost universally overlooked. To say nothing of foreigners, hundreds of Italian antiquarians are wholly ignorant of the existence of these and similar discrepancies, such as the drop of five feet in the eastern crossing arch of Siena Cathedral. (During a recent visit to Florence a friend who was with me in S. Maria Novella, and who knew from my publications that this church has variations in pier spacings aggregating a maximum of thirteen feet, undertook to point out the widest arch. He selected the wrong one, but I could not be certain of his error until I had applied the tape.)

Thus it appears that the architects of the most imposing church in America have taken the trouble to give variations to the dimensions which they cannot themselves detect from the floor of the church.

In his conversations with me Mr. Heins always insisted on the point that his firm would have gone much farther in the use of refinements in this cathedral, if the conditions of modern practice, the novelty of the idea, and the traditional habits of modern masons had made it possible or convenient to do so. That he was fearful of arousing prejudice by premature announcement of his plans before they had been executed may be stated, and that he was led to proceed cautiously by the consciousness that such a prejudice existed is also positive.

From the standpoint of a church like St. Ouen, at Rouen, whose entire plan is swung on "Hogarth's line of beauty" the number of variations in the Episcopal Cathedral

* There is an error of proof in the Sturgis *Dictionary* relating to the convergence in S. Giorgio in Velabro, where the amount is stated to be one foot. This error is certainly due to a confusion resulting from Mr. Sturgis' work of condensation, as the matter was obtained from my publication.

* Italics by W. H. G.

† The measurements for S. Paolo Ripa d'Arno have never been previously published.

may appear to be inconsiderable and unimportant. That they are tentative and experimental has been avowed by the designers. The great fact that they exist because they were considered desirable by the designers is still there, and this fact assumes enormous importance when we consider that no modern church (except the one at Methuen, Mass., by the same firm) had previously been designed with an asymmetric plan.

Of equal importance is the point that Mr. Heins has publicly opposed, in a standard "Dictionary of Architecture," the generally current modern view that the mediæval architects were incapable of refinements and that all their variations from geometrical design were the result of incapacity or indifference. That Mr. Sturgis agreed with the opinions of Mr. Heins and selected him to write this article as one of special importance, and in view of these opinions, is also known to me.

If Mr. Heins had not written the article in the Sturgis "Dictionary," or if his firm had not built the New York Cathedral choir, either one of these facts might appear less significant, but the facts, when taken together, are certainly much more important than either one would be if considered alone. For it now devolves on the sceptic as to mediæval refinements not only to ignore the existence of a great modern church which has revived the practice, but also to controvert and answer the reasoning and the statements which are contained in the Sturgis "Dictionary."

(To be continued.)

ILLUSTRATIONS.

THE ROYAL SHRINE AT WESTMINSTER AS IT MAY HAVE BEEN IN THE FOURTEENTH CENTURY.

"The shrine of the most illustrious King Edward the Confessor was placed on high like a candle upon a candlestick, so that all who enter into the House of the Lord may behold its light."

THIS quotation in Mr. Lethaby's book on the Abbey suggests the arrangement of the High Altar before the fifteenth century screen was erected. In the drawing, the chantry of Henry V., which was erected in the same century, is also omitted, and the thirteenth century Lady chapel is indicated beyond.

The coffin of St. Edward was of gold and precious stones, and rested upon the existing high basement, which is inlaid with coloured marbles and gold mosaic. This is encircled by the tombs of kings and queens, while around and above is the wonderful building of King Henry III., which may have been equalled, but has never been excelled.

The design of the cover suspended over the shrine is based on that over the shrine of St. Cuthbert, given in the "Rites of Durham."

The size of the High Altar is fixed by the thirteenth century retable, now preserved in the Jerusalem Chamber, which is here shown in what was, no doubt, its original position.

The design of the frontal is conjectural, being the arms of the Confessor, divided by four figures under gold canopies.

The well known drawing of the sanctuary on the Islip Roll, 1532, shows a rood beam with figures, the tester and the hanging pyx over the altar; but mention is made in the Records of Henry III.'s moving the rood, so there was possibly an earlier one than this, of rather different design.

The same King "arranged for two candles to be lighted on feast-days, together with the three other candles hanging before the high altar; of these the centre one had always burned perpetually; and he gave four silver basons to set them in (the centre one presumably being already provided for)." (*Customary*, p. 45.)

All the tombs are shown with testers, decorated in colour and gold, which they originally had.

The windows are shown with grisaille glass and medallions of bright colour. The clerestory windows no doubt had one or more tiers of figures all round.

The wonderful mosaic pavement in front of the High Altar exists now, almost as laid down by Abbot Ware in 1268.

The lettering (the collect and part of the epistle for All Saints' Day) is based on the illuminated Missal of Abbot Litlington. The figure in the capital at the top represents St. Faith, from the early painting in the chapel. In the capital O at the bottom is a rough outline sketch from the fifteenth century picture in the National Gallery—the Exhumation of St. Hubert—which shows an altar with low retable, ridel posts, &c., similar to the High Altar suggested above.

COMPETITION DESIGN FOR OVENTREY MUNICIPA BUILDINGS.

THIS scheme, by Messrs. Nicol & Nicol, is a regular and axial plan on a most irregular site. The acute and obtuse angles at the termination of the principal façade have been treated with entrances and carried up to roof turrets, which would effectually deal with the difficulty of the intersection of the horizontal mouldings on such angles. In the centre of the main façade there is a similar feature but on a larger scale and of such a character as to dominate the whole design. The irregular curved building line to this front has been taken advantage of by bringing the centre of the façade forward, and as this part has also additional ornamental features, it emphasises the centre of the building and the more important rooms which are placed there. The style of the design is Gothic, so that the buildings will harmonise with those adjoining, but at the same time it was felt that the purpose and dignity of the building demanded something more than an irregular and picturesque group, and in consequence the main lines of the scheme are classical in their composition and even the details have been made more suitable to the requirements of such a building than the pure Gothic details would have allowed.

The accommodation asked for has been provided on three floors, with a lower ground floor at the lowest part of the site.

The Council Chamber, committee rooms, Mayor's Parlour, and ante-rooms are all *en suite* and placed in centre portion of the first floor, with a spacious staircase and a lift for use in connection with them. The chamber is placed in the rear, but the committee rooms are placed in front, where they can be used together for receptions and such functions.

The Town Clerk's department adjoins the Council suite, and on the other side are placed the education offices adjoining their special committee room.

The ground floor is occupied with the large departments to which the public require easy access, such as the gas and electrical departments, and the rates office.

The surveyor and medical officer are placed on the second floor, where fine drawing offices are provided with the proper lighting. The corridors are in all cases well lighted direct from the open and not through the rooms; the lavatory accommodation is provided in two isolated blocks on each floor.

The Town Hall is planned on the site suggested, and provides for the accommodation asked for in a well-lit and lofty hall having connection with the municipal buildings on both floor and gallery level; the crush halls, stairs, and cloak-rooms are placed next the road.

Messrs. Nicol & Nicol's plan is one of those that adopts the principle of well-lighted rooms on both sides of a corridor, which, as we urged in our critique of the drawings is, in our opinion, far preferable to the type of those premiated when, as at Coventry, the site is restricted.

AN oak chancel screen designed by Mr. F. Thorman is to be erected in All Saints Church, Bramham. The memorial screen is expected to cost 650l.

MR. HARRY W. TAYLOR, A.M.Inst.C.E., Newcastle-on-Tyne, has been appointed to act as assessor in the fourteen competitive schemes submitted for purifying and collecting the sewage of Corbridge.

HACKNEY Borough Council has accepted the offer of 3,000l. from Mr. Carnegie for the erection of an additional public library in the north-west part of the borough, subject to Mr. Carnegie agreeing to allow the division of the balance of his gifts, namely, 15,850l. among three branch libraries, and to his amending his condition as to the amount of the penny rate.

A MEMORIAL to Sir Thomas Drew was unveiled last week in Christ Church Cathedral, Dublin. It was executed by Messrs. Sharpe & Emery, under the supervision of Mr. Harold E. Coyle architect. It is in the form of two Latin brass plates surmounted by carvings in Cong stone. The carving over the memorial represents his knight's helm, with the Drew arms, hereditary, displayed with the acanthus leaf. The brass plate beneath has a chevron bordering. The inscription reads as follows: "To the glory of God, and in memory of Sir Thomas Drew, LL.D., T.C.D. (Honoris Causa), President of the Royal Hibernian Academy 1900-1910; President of the Royal Institute of Architects of Ireland, 1889-1901; Fellow of the Royal Institute of British Architects; honorary member of the Royal Scottish Academy; honorary architect of this Cathedral, 1880-1910; only son of the late Rev. Thomas Drew, D.D., Rector of Loughinisland, Co. Down; born 18th September, 1838; died 13th March, 1910. 'Blessed are the dead which die in the Lord.' Erected by his widow."

THE SOCIETY OF ARCHITECTS.

MEETING of the Society of Architects was held at Bedford Square on Thursday, May 11, Mr. G. E. Bond, president, in the chair. After some preliminary business Mr. A. Saxon Snell, F.R.I.B.A., read the following paper "Hospitals":—

When you did me the honour of inviting me to read a paper before the Society you naturally and kindly suggested a subject with which I have been more or less closely acquainted throughout my professional life.

I cannot guess whether you hope or expect to hear something new on this old subject, but I may at least trust that I will not feel disappointed if I confine myself to hospitals. They are rather than to what they might be, and may be one day. The ideal hospital of the future would no doubt be an fascinating subject, but it is of too wide and impractical a nature to be dealt with in an evening's discussion.

The building of hospitals is one of the most ancient and interesting instances of the progress of mankind in the direction of altruistic effort. It was, and is, a practical expression of man's sense of his responsibility to his fellow creatures; and as such it ought to command our wide and ready sympathy.

It is not, however, my purpose to-night to deal with history, or to refer other than quite casually to ancient examples which have for us a sentimental interest only, though they do also mark the progress we have made. We learn little from them except what to avoid.

Modern hospital planning in this country dates from 1858, when the Blackburn and (a little later) the Herbert Hospitals were built. Then for the first time the pavilion system was adopted. Previously the wards generally consisted of a number of rooms containing a limited number of beds, usually ranged on each side of an enclosed corridor. Though but one external wall, this necessarily entailed absence of through ventilation, a matter which we shall see is of great importance.

The administrative offices and sanitary conveniences were in more or less direct communication with the wards; and the materials and methods of construction did not differ essentially from that of ordinary buildings for the healthy.

These are the main points which mark the difference between old and new hospitals, and to appreciate the importance of the change in these matters, we must look at the fundamental principles which actuate them.

Now, as a first point, I will remind you that a hospital should be, designed first and last for the housing and care of the sick, diseased, and injured; an elementary proposition too often overlooked, or not always realised in the building. We may start out with that ideal before us, but sooner or later other considerations obtrude themselves to its front. To see clearly how this proposition is to be realised, let us examine in detail the thing to be done and the conditions under which it can be done.

Sickness may be defined as the temporary disorganisation of our internal machinery. Disease we will call the invasion of our system by destructive or paralysing forces. Injuries are violent breakage, laceration, or disruption of the bodily structure.

Shortly put, all disease, sickness, &c., is disorganisation or temporary disarrangement of our bodily machinery. Cure is restoration or reorganisation.

Our bodies are so wonderfully designed that, given fresh food, heat, and water, they can effect their own repairs with but small outside help, the amount of which varies, of course, according to the extent of the disorganisation or injury. Outside help comprises mainly careful and skilled nursing and medical or surgical skill.

If all these were, so to speak, on hand at all times for as required, hospital planning and administration might be simple and stereotyped; but as we can only obtain them in varying proportions, we have to adapt our systems and buildings to meet the circumstances.

I feel that some apology is due to you for thus stating these elementary propositions. The truth is that, though I may have been engaged, as I have, for thirty or more years upon hospitals and buildings akin to and connected with hospitals, one is driven again and again to recall them as progress is to be achieved. If we are inclined to find satisfaction in the enormous progress achieved in hospital design, it is salutary to turn over the pages of Miss Nightingale's "Treatise upon Hospitals," published as long ago as 1863, and the works of De Chaumont and Galton. We shall quickly realise that we have not even yet put into practice

all the lessons they taught us from their long and close acquaintance with the realities of sickness and disease.

No doubt it is true that every one of us endeavours, and in part succeeds, in making each building we design an improvement upon its predecessor; but these improvements are too often in matters of detail only, and our satisfaction and absorption in them is liable to lead to forgetfulness of larger problems as yet unsolved.

Do we not indeed see this tendency even in the purely architectural design? The columns and cornice of a Greek temple were but idealised construction, and the form of each part had some definite relation to the practical work it had to do. Who, contemplating the latest creations of neo-Greek, can trace any connection between the details of the most pleasing and refined elevations and the original purpose of cornice, column, and beam? The beauty and refinement may be there, but they are merely applied ornament without relation to realities.

In the same manner it is possible to improve and refine details of hospital design whilst losing sight of their practical purpose.

The really perfect hospital will be realised only when we can free ourselves from conventional ideas and try to get a true sense of the end to be achieved, and keep that end steadily in view. No one of us can hope to make a revolution, but each one of us can do something towards it if we have will and initiative.

One might multiply these abstract ideas indefinitely, but I think it will be more interesting to you if I descend to more practical matters. I propose, therefore, to give a general description of the buildings which go to form a modern hospital, and to deal in detail with the most important part, *i.e.*, the ward unit.

For this purpose I show a block plan which will serve as a general illustration.

Dealing first with the question of site.

The ideal site has often been described at length, but may be shortly defined as being in the open country, but within convenient distance by rail or road of the town or area from which the patients will mostly be drawn. A light soil overlying gravel or permeable chalk sloping gently towards the S.E., and protected by hills or rising ground or trees from the N., N.E., and N.W.

A good water supply should also be available, and facilities for disposal of sewage.

For special hospitals which depend upon the services of the highest medical and surgical skill, much has to be sacrificed to bring them within reasonable distance of the specialist's consulting room.

The disposition of the buildings depends, of course, largely upon the shape and area of the site, and the only general rules we can make is that the ward blocks should be so placed as to be free from the traffic of the other buildings and the noise and dust of a public highway, should not be shadowed by other buildings, and should have uninterrupted light and air.

This plan does not by any means pretend to be ideal, or it is only so to the extent circumscribed by English limitations.

In this country we do not appear to be able to allow ourselves the luxury of spaciousness and magnificence which are quite common features of Continental public buildings. It has always been so, as witness the size and restraint of our cathedrals and castles as compared with those, say, in France. Our genius is confined to our country houses, than which nothing more perfect, or indeed approaching them, is to be found anywhere in the world.

In the case of hospitals you have only to study the several block plans which I show. Note how the Germans space their ward blocks, and that they are one, or at most two, storeys in height only. Also the plan of Dresden Hospital, with ward blocks one storey in height and lifted high above the ground.

One reason is, no doubt, that in England so many of our buildings, and particularly hospitals, have been built and endowed by individuals, instead of, as abroad, by the State; and States, of course, have large resources to draw upon.

Turning to the block plan, you will note that the public or road approach is on the N. side, from which easy access is obtained to the administrative offices, leaving the ward blocks freely exposed to the S., S.E., and S.W.

Lodge.

Commencing at the entrance gates, we have a small lodge placed midway between two pairs of carriage gates. One of

these entrances should be reserved for goods traffic, and should have a full-sized weighing-machine on the inner side of the gates. It is always to be desired that carts bringing in coals, provisions, &c., should be weighed on entering and leaving, for the purpose of checking.

The lodge should be occupied night and day, and be in telephonic communication with the rest of the hospital.

Out-Patients' Department.

To the left of the lodge I place the out-patients' department, which should have separate entrances and exits into the road, and it should also be entirely disconnected from the other buildings. This is a point which is not always observed; indeed, cannot be with some sites, especially in city hospitals.

Bearing in mind that dirt and disease are largely cause and effect, no patient is admitted to the wards of a hospital until he or she have been bathed and re-clothed in perfectly clean garments. This cannot be insisted upon in the case of out-patients, and it is obvious that dirt and disease germs to a considerable extent must be deposited in that particular department; and it is therefore best isolated.

The out-patients' department is too large to describe in detail. It comprises a number of consulting-rooms, each devoted to certain classes of disease and surgery ranged round a large waiting-hall.

The main point to be observed in the plan is that the hall should be sufficiently large, along a long parallelogram, to allow of easy classification of the patients. In large institutions it is customary to have smaller waiting or preparation rooms intervening between the hall and each consulting-room, where patients can undress if necessary and otherwise be prepared for examination by the surgeon or physician.

It is also important to provide separate exit doors for the consulting-room, and if it can be so arranged, patients should not return to the main hall, but go directly into the waiting-hall adjoining the dispensary. This is very difficult to manage unless the consulting-room is lighted from the roof. It is so arranged at Charing Cross Hospital.

Casualty Department.

Adjoining, and indeed forming part of the out-patients' department, is the casualty department, which, for identical reasons, should also be disconnected from the main building.

For this department it is essential to have easy and quick access from the public road, and it should be possible to bring a cab or vehicle almost to the door of the operating room, because fatal damage may be done to the injured person in removal. At Charing Cross Hospital you will see that the doors actually open on to the court yard.

Attached to the operating room would be a waiting hall for patients' friends, and a room or small ward for the injured after treatment.

Observation Wards.

Beyond this block is a smaller one for the observation of cases suspected of infectious disease, or such as may develop in the hospital itself. This building should have no closed communication at all with other buildings. A small though important rule, but rarely adopted.

Isolation Wards.

In all hospitals a few rooms or a small isolated building is provided for fever cases which may arise among patients admitted to the hospital for other diseases. It is of course better that such cases should be at once removed to an infectious hospital, but it is not always practicable. The planning and fitting of this building falls under the head of fever hospitals, which is a subject for a separate paper.

I need only say here, that if one, however small, is attached to a general hospital, it should be absolutely isolated with a zone at least 40 feet wide all round. It should be complete with kitchen and nurses' quarters.

I show the plan and section of such a building planned on the lines of the Pasteur Hospital at Paris, which may interest you, and for a description I may refer you to the short paper I read last year before the Royal Sanitary Institute.

Medical School.

On the right of the lodge is placed the medical school, lecture room, &c., and beyond these the pathological department, museum, mortuary, and engineering plant house, &c.

The medical school should contain besides a large lecture theatre, smaller lecture rooms, museum, library, students' studies. The students' recreation and reading room may be conveniently placed in the same building, though it is not altogether to be commended. They would be better placed in

connection with the living quarters or hostel if one is provided.

Mortuary.

Even in public mortuaries this is recognised, and you will find for instance that in Marylebone bodies are placed in a building which is more or less a small chapel.

For a hospital, it may be quite a small place if there is adjoining a large room or preferably a mortuary chapel. You may call it, or use it as, a "viewing room."

In practice, bodies are placed in the mortuary proper, which is severely and coldly practical in its construction and finishings with its washable walls and floors, and ample ventilation.

When friends or relatives come to see their dead, the body is brought into the viewing-room or chapel, to spare them the gruesomeness of the mortuary.

It has always seemed to me there should be a separate entrance from the mortuary yard to the public road, as a hearse and funeral procession is not a cheerful sight for either patients or staff.

Attached to the mortuary, or in close proximity, is a post-mortem room and pathological laboratory. Both rooms must be severely plain with washable and impervious walls and floors. The danger of blood-poisoning awaits the careless operator in these rooms. Pathological theatres are seldom used now. Instruction in pathology is given in lecture rooms, and practical demonstrations are held in small classes.

A hospital mortuary should be something more than a sort of cold-storage room.

How wonderful is Death,
Death and its brother Sleep

... so passing strange and wonderful,

sang Shelley; and even the meanest of us will always be awed in its presence; always by instinct pay respect to the cold clay, save only those whom constant familiarity has rendered callous. It has always appeared to me a beautiful idea to make the mortuary a consecrated place.

Operating Room.

Every hospital must have an operating room; and its area and arrangement differ according to whether the hospital has or has not a medical school attached to it. In the former case all that is required is a fairly large room, preferably square on plan, say from 200 to 250 feet in area. Its adjuncts comprise a small sink room, anæsthetic room, and sometimes what is clumsily called an after-recovery room, which is merely a small ward in which to place a patient immediately after an operation.

Separate operating theatres are often provided, one for each surgical ward, partly to avoid carrying patients long distances and partly because distinguished surgeons differ much in their ideas as to fittings, arrangements, &c.

Otherwise, a more reasonable and economical plan is to place them all in one building with their adjuncts in communication. A very good arrangement may be seen at the London Hospital.

Administrative Block.

Coming now to the main range of buildings, we have in the centre an administrative block which should contain the offices, kitchen stores, &c., and beyond it to the south or even on the upper floors, the nurses' home may be placed.

I say this with some reserve, as for many reasons the nurses' home is better separated entirely from the hospital proper; and, indeed, it is a more ideal arrangement to place this block in its own separate grounds and out of sight of the hospital. No one who has not undergone the hard life of a nurse, surrounded on all sides by pain and suffering many more hours than the British workman thinks desirable for his own work, can realise the relief of different surroundings and atmosphere.

The administrative block contains all the rooms, offices, &c., used in the general administration of the hospital, commencing with the secretary's department, committee room, medical officers' consulting rooms, waiting room for visitors, general kitchen, stores, matron's office, &c. Obviously it is best placed in the centre of the establishment, and its planning is governed by an appreciation of the various uses of its several parts. It need only be said that the secretarial and office part should be well separated from the kitchen and stores department. It is general to make the main corridor the division between them.

Kitchen and Stores.

One large kitchen really suffices for a hospital. It is quite unnecessary to provide a separate one for the staff.

In many hospitals a separate kitchen is provided for a

aced in the nurses' home; but it is a more economical plan have one kitchen only, and if the nurses' home is at a distance from the hospital, the nurses' dining room may be aced in the main administrative block close to the kitchen.

Except in the neighbourhood of large towns or cities, it well to have plenty of storage room, as it is cheaper to buy ods in large quantities. In large centres, however, weekly, even daily, deliveries are easily arranged for.

Nowadays we use little or no coal in the kitchen for oking, which is done almost entirely with gas and steam.

I need scarcely add that both kitchen and scullery should be well lighted and ventilated, and preferably by lantern ghts. Also that the walls should be lined at least six feet gh with glazed bricks or tiles.

Floors are best covered with hard vitrified tiles with close joints. It is also well to bear in mind that rounded corners nd skirtings are as necessary in these rooms as in the wards.

Boiler House.

In any institution larger than a cottage hospital steam is essential for all kinds of purposes from heating to sterilising; and a large and well-equipped boiler-house is desirable.

It is a great mistake for architects to overlook this important matter and to imagine that any small and out-of-the-way corner is good enough for the boilers and engineering plant. The department is best placed in a detached building, and so arranged that there shall be ample room not only for the necessary boilers and plant, but also that these can be renewed or replaced at any time without the necessity of pulling down buildings or walls.

Plenty of boiler-power is really economical. It is cheaper in the end to work a large boiler at low pressure than a small one at high pressure.

Steam may be required not only for heating and cooking, but also for laundry purposes and electric lighting, and many small matters.

(To be concluded.)

ARBITRATIONS.

(Concluded from last week.)

OUR last question to consider to-day is how to appeal to the law if we so desire.

Having selected your own Judge for your case he becomes the final Judge of all questions of law and fact submitted to him, and there is no appeal from his decision; that surely is alone sufficient reason for the parties seeing that they have a competent person to decide their cause. As to the procedure which takes place prior to the hearing and at the hearing I have expressed my views fairly fully in the lecture I gave on arbitration procedure in November last, and of which you have all had a copy.

Nevertheless by proper methods either party can always secure that any question of law should be submitted to the Court for the Court's opinion, and any arbitrator can always obtain guidance from the Court on any points he may be doubtful about.

This is not done by way of appeal in the ordinary acceptance of the word "appeal." An appeal is a proceeding taken after a decision is given contending that such a proceeding has been decided wrongly, whereas the method of procedure in getting a case stated must be prior to the arbitrator giving a final decision.

There are two methods, either

(1) The arbitrator can state his award in the form of a special case, which means that he will ascertain the facts, draw his own conclusions, then leave the questions the Court has to decide, stating what his decision would be according to the way the Court shall answer his question or questions; or

(2) The arbitrator may himself or either party may call upon him during the pendency of the arbitration to state a case under Section 19 of the Act for the decision of some question of law, and if he does not so state the question an application to the Court can be made and an order obtained for him to state a case.

A case stated under the first power, Section 7, will go to the High Court in the first instance, either to the Divisional Court or a Judge of the High Court, can then be taken to the Court of Appeal and afterwards to the House of Lords, whereas a case stated under the second power, Section 19, goes to the High Court, and then that decision is final.

We may well consider for a moment how to set these proceedings in motion and which is the better.

The arbitrator may adopt either method without consulting the parties.

The parties may request the arbitrator to so state a case, and if he refused it would be misconduct and his award would be bad.

Either party can request the arbitrator to adopt one or other of the before-mentioned courses of bringing the question or questions before the Court, but if the party does not so request him, and the question of law on which the opinion of the Court is desired is material to the issues between the parties, and is under all the circumstances one which, the Court considers, should be settled by the Court, the order will be made and an arbitrator must adjourn the hearing of the arbitration pending such an application.

The Arbitration Act, 1889, introduced new principles and invested the Court with powers and control over arbitrators which it did not previously possess. If an arbitrator were able, by declining to express an opinion upon a point of law and hurriedly making his award, to prevent an order being made upon him to state a case the intention of the legislation would be defeated, and Section 19 would be nugatory and of no effect.

That Act confers on the parties to an arbitration "the right to apply to the Court for an order directing the arbitrator to state in the form of a special case for the opinion of the Court any question of law arising in the course of the reference. The right thus conferred must not be restricted by the arbitrator, and if a party to an arbitration, acting bona-fide, requests an arbitrator either to state a special case raising a question of law arising in the course of a reference and material for consideration to delay his award until the party can apply to the Court for an order directing a special case and the arbitrator refuses to comply with either of such requests the arbitrator is prima facie at all events guilty of a breach of duty towards such party.

"Such a breach of duty is prima facie misconduct on the part of the arbitrator within the meaning of Section 11 of the statute, and justifies the Court in setting aside the award under that section or in remitting it for further consideration under Section 10. Even in such a case as that supposed there may possibly be some grounds for justifying the refusal of the arbitrator, although it is not easy to imagine any. But it is obvious that, if an application for a special case or for an adjournment is frivolous and is made merely for delay an arbitrator will be perfectly right to refuse it and will be upheld by the Court in so doing."

Well—which is the better method? If I am acting for a party who wants to put off the evil day and several questions are likely to crop up it is a question whether it is not better to ask for a case to be stated under Section 19 each time a question crops up, and thus continually obtaining adjournments.

On the other hand, if I am going to win I feel that I should like the question settled once and for all, and not be taken to the High Court, Court of Appeal, and then the House of Lords.

I have known both plans to be adopted, and both have taken an immense time and cost an immense sum in costs. It is a matter one cannot well advise upon unless you have a concrete case, and know what is in dispute and who are the litigants.

We must not forget that after an award has been published by an arbitrator applications can be made in proper cases for the award to be set aside or remitted to the arbitrators for various grounds, some of which I have enumerated in the lecture on arbitration procedure. An instance of this which recently came under my own experience I will tell you prior to finishing the question of appeals to the Courts.

It was a case of medical men who had been in practice and were dissolving, and they each appointed arbitrators who did not appoint an umpire, but entered upon the reference. The matter was conducted without legal advisers, and one of the partners suggested that the debts of the old firm should be collected by the accountants who had previously collected them, but the other partner objected. However the arbitrators thought it quite a reasonable suggestion, and in their award they directed that Messrs. A. & B., accountants, should collect the debts of the firm. The objectioning doctor refused to take any notice of the award, so the successful one instructed his solicitor to have the award enforced by the Court. He duly made the necessary application, and the Court made the order enforcing the award and ordering the unsuccessful party to pay the costs. Thereupon the unsuccessful party took advice, and the award was shown to me. Well, the award was bad. The arbitrators had no power to appoint the firm of accountants to collect the debts, so I advised that proceedings should be commenced in Chancery to set the award aside. This

was done, and it was set aside, with costs against the other side; and to-day one party has an order of the King's Bench Division enforcing an award, which award has been set aside by the Chancery Division on the ground that the award was bad. They want very careful drawing.

I am not addressing these words to you in order to suggest that you should do the lawyer's work. The profession of the law cannot but benefit when men act as their own lawyers; it has been from all time one of the most fertile sources of litigation and necessarily must be. Law and practice depend to a large extent on something going wrong, and nothing can go much more wrong than when a man dabbles with what he does not understand. A skein of thread is easily wound off by one who is accustomed to the work, but let a clumsy hand attempt the task, and who can unwind it after him? If I have been able to suggest some thoughts as to a certain line of action to you, who in your professional career must necessarily be concerned in advising and taking part in arbitrations in one capacity or another, I am content.

Finally, an arbitrator is a power. Under the Common Law the Court had no jurisdiction to remove an umpire or arbitrator; now, however, where an umpire or arbitrator misconducts himself the Court, under Section 51 of the Arbitration Act, can remove him; such applications are rarely made, because the misconduct of the arbitrator or umpire does not often appear until the award has been made.

I feel that you will have heard quite enough about arbitrations to-day, and that I must not further detain you. It has given me very great pleasure to come here and place at your disposal my views on this particular subject roughly, and, I hope, in not too legal language, so as to make myself intelligible. If there is any question upon which I have not made myself clear, and you would like me to give an explanation, I will do so with the very greatest pleasure.

THE CONCRETE INSTITUTE.

THE Second Annual General Meeting of the Concrete Institute was held on Thursday evening, May 11, in the Lecture Hall of the Institute at Denison House, Westminster, Sir Henry Tanner, Kt., I.S.O., F.R.I.B.A., in the chair. The following were elected members of the Institute:—

William John H. Allen, Gravesend; Thomas Henry Bull, P.A.S.I., Architect's Department, London County Council; Thomas T. B. Cliff, A.M.I.Mech.E., Valparaiso, Chili; George Hatton, M. Iron and Steel Inst., Brierley Hill; Alfred T. MacDermott, Assoc.M.Inst.C.E., P.W.D., Federated Malay States; John Brittain Walker, A.M.I.Mech.E., Buenos Aires.

It was announced that the following students had been admitted by the Council:—

Thomas Percival Geen, Stud.Inst.C.E., Cardiff; John R. Gwyther, B.A., B.E., Stud.Inst.Mun.E., Manchester.

The appended annual report and statement of accounts were adopted. The result of the annual election of members of Council was announced, and Messrs. G. C. Workman, W. T. Hatch, Charles F. Marsh, D. B. Butler, E. P. Wells, C. S. Meik, J. Ernest Franck, Henry Tanner, W. G. Perkins, Bertram Blount, and J. Gibson Fleming were elected.

The Concrete Institute had on December 31, 1910, 901 members and 14 Special Subscribers; the membership has increased, therefore, by 51 during the past year, and is still increasing. The finances of the Institute are in a satisfactory condition and show a balance in hand.

The general meetings and the visits that have taken place during the past year have been recorded in the "Transactions."

The Council has in the past year been concerned with various technical and administrative matters.

The Council has had under consideration a draft of suggested regulations to be made under the provisions of Section 23 of the London County Council (General Powers) Act, 1909, with respect to the construction of buildings wholly or partly of reinforced concrete. These regulations were submitted by the Superintending Architect of the London County Council to the Institute for its consideration in accordance with the provisions of the 1909 Act referred to, whereby it is enacted that the Concrete Institute together with the Institution of Civil Engineers, the Royal Institute of British Architects, and the Surveyors' Institution, are to have notice of the Council's intention to apply to the Local Government Board for allowance of any regulations as to the use of reinforced concrete in the County of London. In connection with this the Royal Institute of British Architects convened a meeting of representatives of various technical

societies interested in the matter, and Mr. Charles F. Marsh, M.Inst.C.E., and Mr. T. B. Shore were appointed as delegates of the Concrete Institute. This Conference of Societies held a number of meetings, and recommendations were arrived at which were transmitted by the Royal Institute of British Architects to the London County Council. The Science and the Reinforced Concrete Practice Standing Committees of the Concrete Institute held six joint meetings at which were drawn up a number of recommendations for amendment of the draft regulations. These suggested amendments were put forward by the Institute's delegates at the Conference of Societies. The Council transmitted to the Superintending Architect the proposed amendments arrived at by the joint committee of the Concrete Institute, and informed him that the Institute was in substantial agreement with the recommendations of the Conference of Societies, but would be glad if the London County Council would also consider the further suggestions contained in their joint committee's amendments. The matter is at present confidential, as the draft regulations submitted were merely in preliminary stage; the Council is therefore unable to furnish detailed particulars of the recommendations made to the London County Council.

The Engineering Standards Committee asked the Concrete Institute to appoint a representative on their Sectional Committee on Portland Cement, and the Council in May appointed Mr. Herbert W. Anderson, Assoc.M.Inst.C.E., to act in that capacity.

The Engineering Standards Committee at a later date asked the Institute to appoint a representative on their Sectional Committee on Bridges and Building Construction, which deals with the standard specification for steel, and Mr. William G. Kirkaldy, Assoc.M.Inst.C.E., was appointed by the Council.

The Royal Institute of British Architects asked the Concrete Institute to appoint two representatives on the Joint Committee on Reinforced Concrete, and the Council appointed Mr. William G. Kirkaldy, Assoc.M.Inst.C.E., and Mr. Charles F. Marsh, M.Inst.C.E., to act in that capacity.

At the end of March 1910 the offices of the Institute were moved from 1 Waterloo Place to 8 Waterloo Place, and on March 25, 1911, the Institute's offices were moved to Denison House, 296 Vauxhall Bridge Road, Westminster, near Victoria Station. The former offices were only looked upon as temporary, and the Institute now has the great advantage that a hall suitable for its meetings is situated in the same building. The offices, too, are larger and more convenient and in the sole occupancy of the Institute. A library is now in process of formation and periodicals are being obtained so that members will be able to use one of the rooms as a library, to which members are invited to contribute.

Professor Adams was appointed to the Executive to fill the vacancy created by the retirement of Mr. A. E. Collins, the former Honorary Secretary, and subsequently Mr. Serrallier and Mr. J. S. E. de Vesian were appointed additional members of the Executive.

Last year the Council had the question of the revision of the rules under consideration, and a sub-committee was appointed, which reported in due course, and last October the new rules were passed at extraordinary general meeting of the Institute, and are now in force.

The general effect of the new rules was to do away with the Executive and to abolish the offices of Honorary Secretary, Honorary Treasurer, and Chairman of the Executive, thus enabling the management of the Institute to revert directly to the Council, the conduct of the general business being done under their supervision by a permanent Secretary. The appointment was advertised, and 217 applications received; a selected number of applicants were interviewed and eventually Mr. H. Kempton Dyson was appointed Secretary in May 1910.

The amended rules also provided for the creation of a Students' Section, which it was felt would be an advantage to the Institute in respect to future members and would be in conformity with the professed object of the Institute, which regards the education of the public in matters concerning concrete generally. This Students' Section has been started and eleven students already enrolled.

The Earl of Plymouth having retired from the office of President, Sir Henry Tanner was appointed to that position, and Mr. Alexander Ross was appointed a Vice-President to fill the vacancy created by Sir Henry Tanner's acceptance of the Presidency. The Council also appointed Mr. Edwin O. Sachs, the former Chairman of the Executive, as a fifth Vice-President. The Council desire to record their appreciation of the great services rendered by Mr. Edwin O. Sachs in the formation of the Institute.

The rules of the Institute provide that four members of the Council shall retire every year. This year three additional vacancies were created by an ordinary member of Council having been made a Vice-President and by the resignation of two other members of Council. The rules so provide that in 1910 the number of members of Council shall be increased from 22 to 26. Thus in all there were vacancies, which have been filled by ballot.

It was decided by the Council that in future elections, after the current one in 1911, the most practical principle for filling the seats of President and Vice-Presidents would be for the President to be appointed from among the Vice-presidents, and the Vice-Presidents in turn to be appointed from the ordinary members of Council, and it was also decided that if any President or Vice-President should not attend meetings of the Council for two years previous to their time for retirement they would not be re-elected.

When the new rules came into force the Finance Committee was appointed, consisting of Mr. E. P. Wells, the former Honorary Treasurer, as Chairman, and Mr. W. T. Hatch, Mr. Alexander Ross, Mr. Edwin O. Sachs, Mr. L. Fraillier, and Sir Henry Tanner as members.

The Council has decided to hold a two days' summer meeting in June next, and in connection therewith to hold the first annual dinner on the evening of one of the days.

It has also been decided to give a course of six educational lectures on the subject of reinforced concrete in the Meeting Hall of Denison House, and if these are successful it is proposed to continue them in subsequent years, dealing in turn with various aspects of concrete and its constituent materials.

A medal will be granted for the best paper read at general meetings in each session, it being thought that this should encourage the contribution of data that would prove of service to members, particularly when recorded in the "Transactions."

Certificates of membership will be issued and their form is now under consideration; designs are being obtained for a seal which will be used for the general purposes of the Institute, and more especially for the certificates of membership and stationery.

The "Transactions" will be issued in a different form from the first two volumes, by making the size conform to the standard adopted by other engineering societies. In future issues of the "Transactions" abstracts of articles, papers, and communications from all sources will be included so as to keep the members posted in facts regarding the nature, properties, and use of concrete and reinforced concrete and the materials of which they are composed.

With a view to the removal of restrictions in the building by-laws in respect to the construction of reinforced concrete and the short loan periods granted by the Local Government Board on structures of such material, the Parliamentary Committee has been in communication with the Board in reference to by-laws respecting reinforced concrete construction and walls of new buildings, and the reply, dated December 8, 1909, stated:

"The Board are only aware of one authority, the Urban District Council of Newquay, Cornwall, who have in force by-laws specially dealing, except in connection with steel framing, with the construction of buildings of ferro-concrete. The Board confirmed a series of by-laws for that authority on the 22nd October 1909, which has the effect of allowing the walls of new buildings to be constructed of reinforced concrete of such thickness as shall be necessary to secure due stability. Some local authorities, including the Town Councils of Leeds, Salford, and Windsor and the Urban District Councils of Brentford, King's Norton, and Northfield, Penge, and Southall Norwood, have made by-laws allowing the construction of buildings of steel framing filled in with brick or other incombustible material, which, of course, includes ferro-concrete. . . . In a large number of rural districts in the country either there are no by-laws in force regulating buildings or the by-laws are based on the Board's rural code, which makes no provision as to the structure of walls for securing stability or the prevention of fires. In such districts the construction of buildings of ferro-concrete would be unrestricted. In many other districts a by-law has been adopted similar to that numbered 1 in the Board's provisional Intermediate Model, which allows the erection of domestic buildings, subject to certain conditions as to size and position, of other material than brick or stone. The use of ferro-concrete would thus be permitted in the construction of such buildings. The Board may say that they have not found that a large number of local authorities have expressed a wish to make provision in their by-laws for the use of ferro-concrete. They will, however, bear in mind the question of regulating its use in any future edition of the urban model code which they may issue."

The Parliamentary Standing Committee of the Institute replied to the Local Government Board, suggesting the

inclusion of provisions in the Model Code to permit the use of hollow concrete blocks for walls.

As regards the work of the Science Standing Committee, Mr. W. G. Kirkaldy, Assoc.M.Inst.C.E., Mr. Bertram Blount, F.I.C., and Mr. H. D. Searles-Wood, F.R.I.B.A., F.S.I., were appointed by the Council as additional members. Mr. E. R. Matthews resigned membership of the Committee owing to his inability to attend. The Committee as recorded above had under consideration the Draft London Regulations for reinforced concrete, and it also considered in detail the 1909 report of the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects, and made various recommendations to be put forward by the Institute's representatives when the revision of the report was under consideration.

A joint committee is being formed by the Science Committee to inquire into the proper loads to be allowed for in the design of highway bridges, and the Institution of Municipal and County Engineers and the Institution of Municipal Engineers have already appointed representatives.

The Science Committee drafted a report on the rusting of steel inside a concrete covering, which was submitted at a general meeting on March 9, 1911. In connection with this report a deputation of members of the Concrete Institute visited a number of reinforced concrete works in Paris, an account of which visit is recorded in the "Transactions."

The standard notation for calculations for reinforced concrete, which was drafted by the Science Committee and approved by the Council, has been favourably received and will in all probability be adopted by the Joint Committee on Reinforced Concrete, appointed by the Royal Institute of British Architects, in their revision of the report first issued by them in 1907, and by the London County Council in their regulations governing the erection of reinforced concrete structures in London. It has also been adopted by the authors of text-books, and is to be considered by the American Joint Committee on Concrete and Reinforced Concrete. It therefore promises to be of considerable utility.

Mr. W. T. Hatch, finding it impossible to devote the time to the duties of Chairman of the Tests Standing Committee, Mr. William G. Kirkaldy, Assoc.M.Inst.C.E., was appointed Chairman in his stead. Mr. A. Alban H. Scott, M.S.A., was appointed Hon. Secretary of the Committee, and Mr. A. C. Davis, Mr. Alexander Drew, Mr. P. M. Fraser, A.R.I.B.A., Mr. William F. King, Mr. R. H. Harry Stanger, Assoc.M.Inst.C.E., and Mr. E. P. Wells were appointed additional ordinary members. The Tests Committee is collecting data regarding aggregates and compression tests on concretes made with various mixtures. Information is also being collected regarding the presence of sulphur in concrete aggregates, and various other subjects are under consideration with a view to the issuing of reports dealing therewith in due course. Suggested standards for tests as to the crushing resistance of concrete are being drafted and will also form the subject for a report.

The Reinforced Concrete Practice Standing Committee to which the Council appointed Mr. E. P. Wells as an additional member, has in hand a report on the standardising of drawings for reinforced concrete, which it is hoped to issue shortly, and other subjects being investigated are methods of treating the surface of concrete, the cracks due to expansion and contraction in reinforced concrete, the consistency of concrete, and conditions of contract relating to sub-contractors for reinforced concrete work.

THE QUEEN VICTORIA MEMORIAL.

IT was with fitting pomp and circumstance, and under ideal weather conditions, that the Queen Victoria Memorial erected in front of Buckingham Palace was unveiled on Tuesday last. To all artists a pleasing feature of the ceremony was the well-deserved knighthood conferred on Mr. Thomas Brock, R.A., the sculptor, at the foot of his great work.

It is exactly ten years ago since the Executive Committee appointed by King Edward VII. entrusted the task of preparing a design for the monument to Sir Thomas Brock. Five architects were invited to compete for the design of the architectural setting, viz., Mr. Ernest George, A.R.A., Mr. T. G. Jackson, R.A., Sir Aston Webb, R.A., Sir Rowand Anderson, LL.D., and the late Sir Thomas Drew, P.R.H.A., that of Sir Aston Webb being accepted. It was proposed that the sculptor should travel on the Continent for twelve months in order to make a close study of the many great memorials. But instead of doing so Sir Thomas Brock prepared sketch models to one-tenth size, and these were considered so success-

ful that the itinerary was abandoned. The design was approved by King Edward in June 1902. The model was subsequently exhibited at the Royal Academy.

Two years ago the lower portion was opened to the public. This embraced the marble fountains and basins, retaining walls, sculptured reliefs (bronze and marble), granite paving, steps and plateau, as well as the bronze electric lamps. The work accounted for one thousand tons of marble and eight hundred tons of granite. The sculptor had also at that time all complete in his specially-built studio on Primrose Hill, Regent's Park, the figure of Her late Majesty, as well as the groups of "Justice" and "Motherhood." Next came the gilt figure of "Victory" surmounting the great central feature, and the bronze figures of "Courage" and "Constancy" at "Victory's" feet. There still remain to be put into position the six bronze groups around the fountains before this splendid work can be regarded as complete.

The 108,000 gallons of water required per hour is provided by shallow wells sunk in the gravel at the end of the lake in St. James's Park, augmented by a supply from the lake itself. The total amount of the subscriptions received was 323,609*l.*, contributed by the dominions, colonies, and dependencies of the Empire, by British subjects resident in foreign countries, and by citizens of the United States.

THE ILLUMINATING ENGINEERING SOCIETY.

(Continued from last week.)

DULWICH COLLEGE is interesting because the older part of the building is lighted by gas and the newer science buildings by electricity. The big hall, where assemblies take place and evening preparation is also done, is lighted by two rows of twin incandescent burners down the sides of the hall. The mantles are completely covered in by opal globes, and this, while giving a soft and diffused light, also absorbs a good deal. The result is that midway between the lamps there is only about 0.6 to 0.7 foot-candles, much less than that met with in the elementary schools visited. In the classrooms inverted opal bowls covering twin incandescent burners are used, the light being partly transmitted and partly thrown down by the white ceiling. From the standpoint of absence of glare the method has much to recommend it, but the illumination is weak, being under 0.75 foot-candles in the case of some of the more remote desks, and the blackboard illumination is also low. It may be added that until two years ago, we were informed, the lighting was all by flat-flame burners.

Carbon filament clear-bulb lamps (8 c.p., 205 volts) are used in the electrically lighted rooms; they are hung in a cluster without any form of shade, and are in the direct line of vision from the back desks to the blackboards; the position is also clearly disadvantageous as regards distribution of light, and inclined to throw head shadows. It is not surprising to find that the back desks receive only 0.4—0.6 foot-candles.

(The school library is lighted in a rather interesting manner, by inverted electric incandescent lamp fixtures: it was, however, undergoing alterations on the occasion of our visit, so that no tests could be made.)

In St. Paul's School the lighting is by electricity. The assembly hall is illuminated by rows of 110 volt tungsten lamps high up on the battens. This high position is again favourable to reducing the effect of glare, but it leads to a somewhat low illumination over the hall, only 0.7 to 0.8 foot-candles. This room is used for assembly, but only occasionally for classes. In the classrooms the order of illumination was about 2.5 foot-candles over the desks; clear bulb lamps with ordinary opal shades were used.

In the City of London School artificial lighting is of minor importance, as work ends at 3 p.m. The Assembly Hall is in this case never used for class-work; the artificial illumination over the hall is, indeed, too weak for it to be conveniently used for this purpose. The centre of the room is so far from the side brackets that it only receives about 0.3 foot-candles. On special occasions, it was stated, the gas "suns" near the roof, with flat-flame burners, are also lighted, but this is only rarely done.

In the classrooms the illumination was also low, in some cases only 0.4—0.7 foot-candles, but, as stated above, artificial light is not much used. Clear bulb carbon filament lamps (200 volts), with ordinary opal shades, are used.

It also occurred to the authors that it would be of interest to collect, and transfer into British units, some data regarding Continental schools. As an example of these we

have reproduced Table III., which is taken from Bloch Grundzüge der Beleuchtungstechnik (p. 124), and Table I.

The most striking points to be observed are the relatively high illumination and the good uniformity of the results obtained. On the other hand, the consumption per square foot of floor area does not seem noticeably different from that usually met with in this country. Special interest attaches to the high-pressure indirect gas-lighting which has been utilised in Munich and elsewhere, and which excellent results are said to have been attained. Among the chief claims made for indirect lighting are that the actual brilliant source of light is well screened from the eye; that the method conduces to uniformity, and that the possibility of shadows being cast by the writing hand is reduced to a minimum.

In this connexion it is of interest to make passing reference to the work of Dr. Max Oker-Blom, of the University of Helsingfors, Finland (*Int. Archiv. f. Schulhygiene*, January 1911), to which Dr. Kerr kindly drew our attention. Artificial lighting is of special consequence in this locality in view of the short winter days. Thus Helsingfors on January 15 only receives 6 h. 40 min. of daylight, and Sodanklä 3 h. 32 min., while in Utsjoki the sun does not rise at all for two months. The author referred to describing a series of experiments, using direct lighting with different groupings of lamps. He presents half-tone illustrations of the hand shadows on the desks in various parts of the room; there were almost invariably some desks on which inconvenient shadows were cast.

A number of types of shades are met with in various schools. The commonest arrangement consists in the use of the ordinary opal shade and a clear bulb metallic flame lamp.

This is almost always unsatisfactory, because the illumination is imperfectly shaded, and therefore, when the lamps are placed more or less in the direct range of vision, dazzling to the eye. A better arrangement is that with completely frosted lamps. It is employed at Harrow, in the new rooms at the Northampton Institute, &c. By complete frosting the lamps the glare is diminished, but a considerable amount of light is lost; moreover, even a frosted lamp when hung somewhat low, is probably inconvenient to some extent. A preferable type of shade seems to be that now used by the London County Council, and in use at Haverstock Hill, at the Arts and Crafts School, &c. This completely screens the lamp, which need only be half frosted.

One distinctly peculiar arrangement is the bunch of unshaded clear bulb lamps used in the Science Buildings at Dulwich College.

The design of shades for gas-lighting has been dealt with by Dr. Harman. In this case also it is desirable that the mantle should be completely screened from the eye. Except for the loss of light involved, the opal bowls used at Dulwich College are satisfactory. The rooms lighted in this manner have a pleasant "soft" appearance, but the illumination, as stated, was somewhat low. At the East London College the illumination is supplied by Holophane glassware or reflector bowls, hung high up, being used in the lecture theatre with very satisfactory results.

In the case of colleges the question of illumination assumes a somewhat different aspect. The lighting of lecture theatre, drawing offices, or laboratories, are quite distinct problems. It may be remarked, however, that, whereas in the case of elementary schools it is often necessary to practise rigid economy, this is less often the case for college. Engineering institutions in particular might be expected to do their lighting well, not only because the staff should presumably possess a technical interest in the subject, but also because they have frequently a lighting plant of their own which is more than sufficient to supply generous illumination to the entire building.

One would suppose that a lecture theatre, in the design of which special pains are often taken, would be regarded as furnishing an opportunity for special ingenuity in securing the most ideal lighting conditions, and that a priority would be taken in securing the most perfect arrangement. At present, however, it must be confessed that in most cases the lighting is often of a rule of thumb order, electric clear bulb lamps with opal shades, at regular intervals, forming the sole means of lighting. Even when frosted lamps are employed there is a risk of the lights interfering with the comfort of the audience unless their position is carefully determined.

Theoretically one would imagine that the chief essential in a lecture theatre is, as in classrooms, the provision of sufficient illumination on the desks, coupled with the avoidance

nce of any glaring lights such as weary the eyes of students nd make it difficult for the lecturer to see his audience. The latter condition was rarely satisfactorily complied with n the colleges visited. The next point to be considered ould be the desirability of special lighting of the blackboard nd diagram sheet, and of the lecture table where experi- nents are frequently arranged and which is the central oint of interest. Here again it proved to be unusual for pecial provision to be made for this purpose, and such ethods as are used at present are clearly open to improve- ment. Indeed the illumination on the lecture table only arely exceeds that on the desks, the reverse being often true. In most cases, the light is very unevenly distributed the problem being similar to the lighting of shelves in

libraries), and the expenditure of energy devoted to this object appears excessive in comparison with that of the rest of the room.

An interesting method of lighting has been adopted in the electrical engineering lecture theatre of the Central Technical College. The general illumination is provided by tungsten lamps surrounded by paper screens and hung near the white ceiling; the effect is pleasant and subdued. Two screened enclosed arcs are used to furnish extra illumination for the demonstration table and diagrams. The illumination on the desks is 1.3 foot-candles, and on the lecture table 4.5 foot-candles.

In some institutions visited, *e.g.* South-Western Polytechnic, Westminster Technical Institute, &c., inverted arcs

are utilised for the general lecture theatre lighting. The system, in conjunction with special local illumination for blackboard and demonstration table, has certain advantages as regards distribution of light, absence of glare, &c., and the very "flatness" of the impression, if it serves to accentuate the more brightly lighted parts of the room, may be a merit. It is, however, essential in such cases to select well-designed lamps and good quality carbons; otherwise the flickering and spluttering of the lamps when turned on and off for lantern slides, &c., is apt to be an annoyance.

The general order of illumination in classrooms is about two foot-candles, although isolated instances in which some, or even the majority, of the desks received only 0.5 foot-candles were met with.

Indirect arc-lighting, and an intensity of illumination of four to six foot-candles is frequently used for drawing offices. When pendants are used it should hardly be necessary to point out the desirability of good shading. The arrangement used at one London technical college embodies a number of defects. The draughtsman can see the unscreened filament of the lamp at a distance of less than three feet away, and not only this, but all the rows of lamps in front of him are visible. Possibly objection might also be taken to the direction from which the light comes, but it would take us too far afield to consider all the details of drawing-office lighting.

TABLE IV.—ILLUMINATION IN VARIOUS ROOMS IN THE TECHNISCHE HOCHSCHULE, MUNICH.

N.B.—It may be noted that this Commission seems to have been of a very representative character, receiving the assistance of Herr Arzberger, Chief Engineer of the Munich Gas Works, Dr. Schneider, an oculist in Munich, Herr Utzinger, Chief Engineer of the Siemens-Schuckert Co., and others, and the co-operation of the Munich Institute of Hygiene.

Finally, it may be pointed out that the effectiveness of experiments often depends on all the apparatus being clearly visible, and the use of special portable and well-screened lights for this purpose is to be encouraged.

It is very interesting to observe that, just as in the case of libraries, the average illumination in schoolrooms seems to be in the neighbourhood of 2.3 foot-candles, and it may be suggested that this standard should be aimed at and preserved when ordinary class work is to be done. But when extra fine work, sewing, &c., is carried out, a considerably higher value, say 5-10 foot-candles, seems to be required. A value of this order is commonly met with in drawing-offices, &c. As has been pointed out by Dr. Harman, the requirements of children and adults differ somewhat: it is particularly vital to supply good illumination for infants and growing children.

The second point that seems to require emphasis is the need for effective shading. There are still far too many cases in which undesirably bright sources of light are left unscreened and allowed to dazzle the eyes of students or children. No unscreened source should be allowed near the direct line of view.

The third point is the need for special local illumination of teacher's, or demonstration, table and the blackboard. At the same time it is admitted that the present methods of blackboard lighting could be improved by scientific study, and there seems a need for some form of fixture which will distribute the light quite evenly and screen the eyes of the audience while doing so.

Daylight, unlike artificial illumination, can be only very imperfectly controlled. The access of daylight is mainly determined by architectural considerations, and success or failure in this respect depends on the forethought of the

architect. One may therefore lay stress on the need for consultation between the architect, the medical officer, and the lighting engineer before a school is built—a course which seems to be often followed on the Continent.

(To be continued.)

OUR CONTEMPORARIES FROM OVERSEAS

THE American Architect (New York) has included in a recent number numerous illustrations of the cathedral church of St. John the Divine, New York, the first portion of which, after twenty years' work by the architects, Messrs. Heins & LaFarge, has now been consecrated. An illustrated article on Philadelphia's seventeenth annual architectural exhibition gives an opportunity of estimating the quality, which is high, of the latest work of the architects of Pennsylvania.

The Architectural Record (New York) for this month illustrates and describes "The Home of an Architect," Mr. R. P. Huntington, of the firm of Hoppin, Koen & Huntington. Two fascinating articles deal, one with "Andalusian Gardens," the other with "Old Sienna." Town architecture in New York forms the subject of an article on "Mitigating the Gridiron Street Plan," the devices considered being the treatment of rounding the corners and the closed vista, or "stopping the streets."

Arquitectura (Barcelona) contains an example of Spanish town planning in the form of a design for the Nueva Plaza de España at Madrid, by Don Jesus Carrasco.

Berliner Architekturwelt (Berlin) also devotes space and illustrations to town planning, with reproductions of some of the competition designs for the lay-out of the Rüdesheimer Platz. Other subjects this month are a hospital at Reinickendorf, of which Herren Mohr & Weidner are the architects, a yacht-club house on the Wannsee, some very picturesque small houses both in town and country, and some typical modern business premises in Berlin. Altogether a number quite varied in interest.

Construction (Toronto) gives descriptions and illustrations, including plans and elevations, of five of the competition designs for the new Ontario Government House, Toronto, including that of the first prize winner, Mr. George W. King. Mr. Donn Barber's Connecticut State Library and Supreme Court Building at Hartford is shown by some excellent photographs.

La Construction Moderne (Paris) has recently illustrated a new Baptist church at Nice by Mons. Paul Emile Dubois and a design by Messrs. E. Dhucque & Blondel for the opening up and forecourt treatment of the Palais de Justice at Brussels.

Het Huis (Amsterdam) has an illustrated description of a walk through the picturesque little town of Medemblik and an article on the Raadhuis of Haarlem.

Moderne Bauformen (Stuttgart) shows us what the modern art student of Germany is doing by examples of work from the Kunstgewerbeschule at Hamburg. It is, of course, very "new art." Many of the illustrations are well produced in colour, and some of these are quite satisfactory. The business premises of Fischbein & Mendel at Berlin, of which Herr Hans Bernoulli is the architect, are fully illustrated, and contain some excellent interior treatment. Several examples of Mr. C. F. A. Voysey's work are included in this month's number.

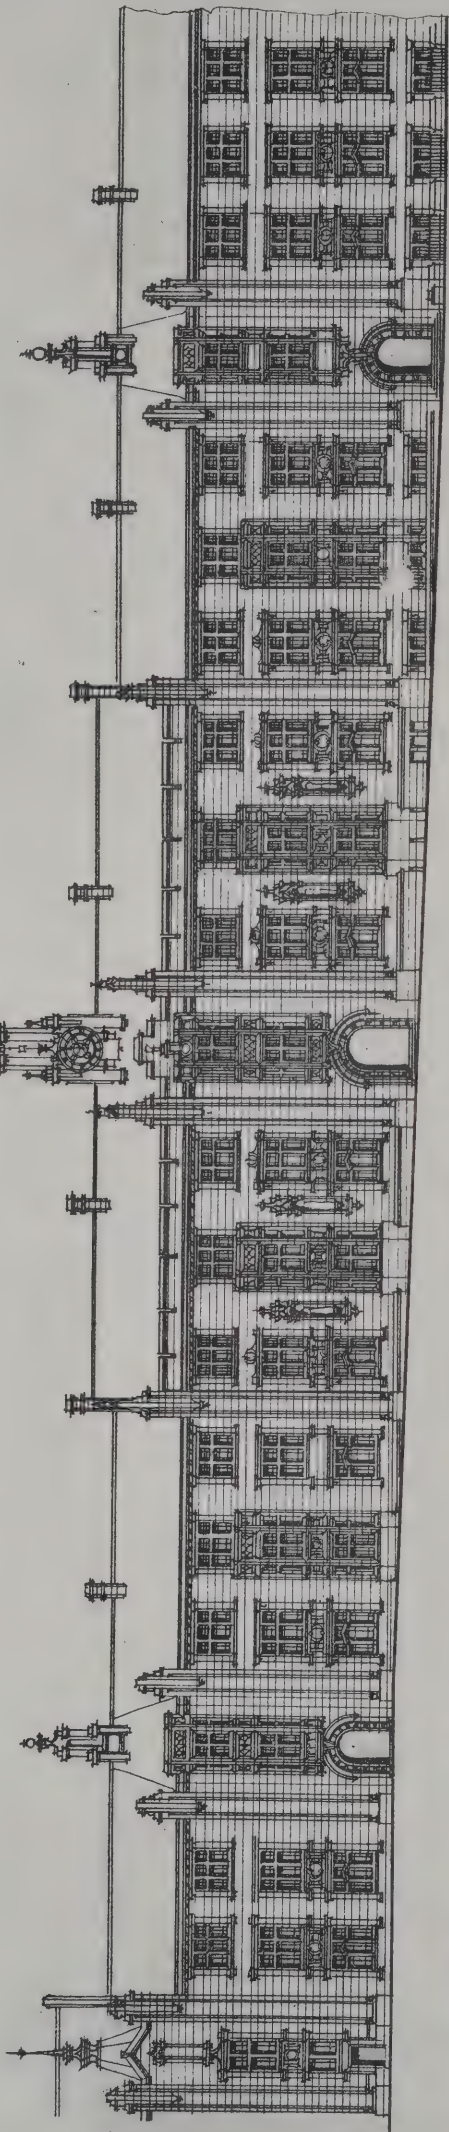

The New York Architect (New York) is a monograph on the cathedral of St. John the Divine, New York, very exquisitely illustrated.

The Western Architect (Minneapolis) for this month is devoted entirely to cottages and residences, not confined to the Western States, which, though many are more or less of the bungalow type, yet include some more stately houses, thus affording a capital conspectus of domestic architecture as it is in the States to-day, with one example—a house by Mr. E. B. Maufe—for the comparison of English work.

Engineering Record (New York) has an instructive paper on "Profitable and Fruitless Lines of Endeavour in Public Health Work," by Edwin O. Jordan, Professor of Bacteriology, University of Chicago, which takes a rational view of the absurd pre-eminence of "the drains" in the public mind as the alpha and omega of sanitation. The effective results in smoke abatement by supervision of plant construction obtained by the methods followed by the Smoke Inspection Department of Chicago are explained by reference to the report of Mr. P. P. Bird. A short article on "Rust-proof Slag Paint," by Mr. E. C. E. Lord, is worthy of notice.

- Royal Sanitary Institute : Meeting at Exeter, Discussion to be opened by Mr. J. Jerman on " Ventilation in Theory and Practice " ; also on June 3.

TUDOR DOMESTIC ARCHITECTURE.

THE gigantic labour upon which Mr. ARTHUR STRATTON has been engaged for the last five years has now been finished, and Mr. BATSFORD is able to offer to all lovers of English art a complete work on the domestic architecture of England during the Tudor period* which takes a high position amongst the monumental architectural books in the English language, and worthily completes the presentment of our national domestic architecture commenced by Mr. J. A. GORCH and Messrs. BELCHER and MACARTNEY in their works on the Renaissance period.

It is good to find that the homes of England, whilst still free from the Continental influence of the Renaissance movement and guided alone by a combination of national tradition, common sense and artistic instinct, are fitly illustrated and described with no less thoroughness than has been bestowed upon later phases of our domestic architecture. We can as Englishmen feel proud that the beautiful and homely homes so excellently depicted in Mr. BATSFORD'S latest achievement are the work of English artists and craftsmen, without any hint of assistance from those of foreign nationality.

At the opening of the Tudor period the domestic architecture of England had become emancipated from the necessity of providing for the defence of house-owners against attack from hostile foes, and so during that period it was free to develop with the sole aims of beauty and comfort. Hence the houses of that period peculiarly manifest the quality of homeliness and therefore appeal more forcibly to our sympathies than do the fortified strongholds of an earlier age. There was also the very important element of waning ecclesiasticism which no longer oppressed the designers of houses with the necessity or desirability of adhering as closely as possible to the lines of contemporary church design. Thus for the first time since the Romans left Britain did domestic architecture lift its head free from subservience to the soldier or the priest.

In speaking of the Tudor period in architecture it is not necessary to limit oneself strictly to the reigns of the Tudor sovereigns any more than it is possible to confine any previous period in the development of architecture to rigid dates. Domestic architecture gradually reached the freedom it attained during the Tudor period, and accordingly Mr. GARNER and Mr. STRATTON have not restricted themselves in their selection of examples to buildings erected after the accession of HENRY VII. and

prior to the death of ELIZABETH. It is convenient to label the epoch of the emancipation of our national domestic architecture as the Tudor period because it is always useful to have a label, and this particular designation defines with sufficient clearness the chronological place of the particular phase with which we are concerned.

The scope of the work which we have now before us is then that phase in the history of our domestic architecture when homes were being built for Englishmen free from military or ecclesiastical considerations and as yet untouched by the influence of the exotic art of the Renaissance. There are several lines on which the authors might have proceeded to treat the subject of their work, but they have, we think rightly, adopted, broadly if not strictly, a chronological sequence in the order with which they have presented the various houses included in their survey.

Thus we are permitted to follow the historical development and progress of the domestic architecture of England during the Tudor period, and we do not need a complete description or even a catalogue of all the remains of Tudor domestic architecture that still exist. It is sufficient for an adequate description of what that architecture was that we should have a wise selection of typical examples, and that we certainly have in this book. Despite the ravages of time, of fire, and, most deadly of all, of the restorer and improver, there is still in England so great a wealth of Tudor houses that it would be easy to make a lengthy list of those that Mr. STRATTON has not included, but it would be difficult to point out any that ought not to have been excluded in order to give a correct and fair impression of what Tudor domestic architecture was.

Although it would be possible, as we have said, to enumerate Tudor houses which Mr. STRATTON has not described, it need not be imagined that the publisher has been niggardly in restricting the authors to a small number of illustrations. On the contrary, the book is lavishly and sumptuously furnished with collotype reproductions of admirable photographs with excellent pen and ink drawings and numerous clear and well delineated measured drawings and plans, of which the large size of the volumes permits the reproduction to adequate scale. One feature of especial interest is the inclusion of sketches and drawings by J. C. BUCKLER, WM. TWOPENY, and other artists of the past which furnish records of buildings that have now passed out of existence or have been so seriously modified that their original form would otherwise have been for us a mere matter of conjecture. There is, in fact, a well stored treasury of our national art in the 192 folio plates, of which 120 are collotype reproductions of photographs and the remainder measured drawings and sketches, besides the 364 smaller illustrations in the 250 pages of text.

* The Domestic Architecture of England during the Tudor Period. Illustrated in a series of photographs and measured drawings of country mansions, manor-houses, and smaller buildings. With historical and descriptive text, by Thomas Garner and Arthur Stratton. (London : B. T. Batsford. 6l. 6s. net in two cloth portfolios, or 7l. 7s. net in two volumes, half morocco.)

The combination of photographic views and of measured drawings renders such books as this interesting and valuable both to the amateur and the professional student of our national architecture, as we have thus presented with clearness and fidelity both the effects that have been produced by the designers of the past as well as the means by which those effects have been obtained.

We cannot help being struck as we look through these charming views of Tudor domestic work with the revelation of the source from which our ablest and most prominent domestic architects of the twentieth century have imbibed the spirit that breathes in their work. And this without any archæological pedantry in the reproduction of the forms and details used in the Tudor period, but by a comprehension and absorption of the feeling that pervaded the designers of that time and imparted to their creations that peculiar character of home-likeness which is so pre-eminently expressed in Tudor houses.

To the young architectural student of to-day we would urge that if he desires to emulate the work of Mr. LUTYENS, Mr. DAWBER, and other front rank domestic architects of our time he must do as they have done, study the domestic architecture of the Tudor period; and as a first aid in that study he will find invaluable the beautiful book which Mr. BATSFORD now offers. Six guineas would be very well spent by the poorest architectural student if it helps him only a little way towards imbibing the spirit of Tudor domestic architecture, and we are very much mistaken if he were helped not a little way but a great way in his progress.

An introduction gives a general view of the historical development of domestic architecture during the Tudor period, and also collates the examples of the use of particular materials and features in the various houses illustrated which the chronological system adopted necessarily caused to be distributed. A topographical list of subjects illustrated and an excellent index further remove any inconvenience to the reader who desires to study a special subject that the chronological method might otherwise have occasioned. Thus it is perfectly easy, for example, to turn up the examples of oriel windows illustrated or to find what houses in, say, the county of Sussex have been included.

Turning now to the principal plates we find No. 1 is a view of the Prior's House, Much Wenlock, where, although connected with an ecclesiastical foundation, the domestic character of the house is strongly in evidence. Following we have in the earlier dated examples the survival of tracery of a modest character which only gradually gives place to a dominant use of square headed lights to the mullioned windows. The large size of the photographic illustrations and their exquisite reproduction gives full value to the texture of the buildings, whether due to the original construction or to the effect of nature's weathering, so that for the man who has already carefully studied Tudor architecture the measured drawings are scarcely necessary, but for the younger student their value is supreme.

No detail of Tudor houses is omitted from consideration and illustration; stonework, brickwork, half timber, panelling, carving, metalwork, glass are all included, and, as we have already mentioned, valuable records of houses "now destroyed" are included with the illustrations of those happily still existing. In fine we cannot imagine that the domestic architecture of England during the Tudor period could have been more worthily, more sympathetically, or more thoroughly treated than it has been by the labours of the late Mr. THOMAS GARNER and of Mr. ARTHUR STRATTON and their collaborators.

NOTES AND COMMENTS.

ALTHOUGH, as customary with exhibitions, the so-called Coronation Exhibition at the White City at Shepherd's Bush was not finished by the opening day, the Palace of Art gives evidence of being of some real interest. Architecturally there are some models of parts of buildings, as, for instance, Sir ASTON WEBB'S

Admiralty Buildings at Whitehall. There are some good examples of wood-carving and of sculpture as applied to building, whilst amongst the etchings are not a few of architectural character. The native craftsmanship of India still retains much of its traditional artistic instinct and hence the collection of workers from the Indian Empire is a feature of the exhibition that has rather more than merely popular interest. It is always fascinating to see an artist at work, whatever may be his particular craft.

THE Coronation Number of the *Pall Mall Magazine* has an excellent article on the Queen Victoria Memorial in which the story of its making is put into popular language, and so gives the British Philistine the opportunity of comprehending what is the process of making a memorial and the labour and thought that are required of a sculptor in his work. The article is illustrated by some admirable photographs.

By the passing through all stages in both Houses of Parliament, save that of Royal assent, of the "Greater Birmingham Bill," the second largest city in Great Britain is on the point of coming into being, and important problems in town planning come into view. As we have previously noted in these columns, Birmingham has already received the sanction of the Local Government Board to the preparation of two large schemes, one on the west and the other on the east side of the city. The additional parishes added to the area over which the City Council of Birmingham has authority will enable comprehensive schemes of town planning to be prepared and considered, so that Birmingham bids fair to be, with the characteristic progressive public spirit of its citizens a premier example of a well-organised city of the first rank. Details of the many varied municipal activities of the new city are fully described in a special supplement to the *Birmingham Daily Post* of last Monday.

THE opening of St. William's College, York, with its attached Maclagan Memorial Hall as Convocation House for the Northern Province, marks the completion of the restoration, under Mr. TEMPLE MOORE, of one of the most interesting remains of the mediæval city of York. It is gratifying to know that such a valuable ancient monument of the art of the past has been four-fitted for a purpose which is likely to ensure its permanence and reverent preservation.

SANATORIA for consumption have, as the result of experience, failed to sustain the high hopes of their usefulness that were held at the inception of the idea of open-air treatment, so that Mr. LLOYD GEORGE'S proposal to include these somewhat expensive forms of special hospitals in his national insurance scheme does not arouse enthusiasm amongst medical men. Indeed, it seems as if sanatoria for consumption can hardly be regarded as of special value other than as isolation homes for limiting the spread of infection, and for this purpose costly hospital building is unnecessary.

ALTHOUGH the Corporation of the City of London may get their own way in respect of their Bill for St. Paul's Bridge, it appears they will not be ready to commence construction for another five years, so that the time for enlightenment of the minds of the City fathers on the greater artistic and practical potentialities of the new bridge than their scheme possesses.

THAT garden suburbs and cottage homes are not the universal benefit which some town-planning "experts" would have us believe is shown by the report of the three delegates appointed by the Dundee Town Council to attend the recent Town Planning Conference at Edinburgh. Two were converted from the Scottish preference for tenements, but the minority report pointed out that three-fourths of the dwellings in Dundee were let at rents of 10*l.* and less a year, and that tenement buildings, if constructed on proper lines, were the cheapest, most comfortable, convenient, and healthful for the working classes generally.

TEMPERAMENTAL ARCHITECTURE IN THE NEW YORK CATHEDRAL CHURCH OF ST. JOHN THE DIVINE.*

By WM. H. GOODYEAR, M.A.

Curator of the Department of Fine Arts, Museum of the Brooklyn Institute; Hon. Member, Society of Architects of Rome; Hon. Member, Edinburgh Architectural Association; Hon. Member, Royal Academy of Fine Arts of Milan; Hon. Academician, Royal Academy of Venice; Corresponding Member, American Institute of Architects.

(Concluded from last week.)

SUCH reasoning certainly has greater weight as coming from a practising architect of distinction who made his practice conform to his reasoning in his most important work. Let us therefore listen to Mr. Heins, on "Refinements in Design," p. 264, vol. ii., of the Sturgis "Dictionary."

Refinements in Design.—Intentional deviations from mechanical exactness in architectural design.* These refinements do not relate to such general disposition of the masses nor to such shaping of the details as come under the head of architectural composition; they are elaborate devices, tending to give subtle artistic variety and interest to the architecture by delicate curvatures of apparently straight lines, by slight differences in sizes of corresponding parts otherwise presumably equal, and by a great number of variations and modulations too slight to attract attention as irregularities and yet sufficient to produce an agreeable effect.

The engineer's point of view, as it may be called, is that in a building straight lines should be mathematically straight, and vertical and horizontal surfaces and lines actually vertical and horizontal; also that apparently parallel surfaces and lines should be actually parallel; in a word, it assumes mechanical or mathematical accuracy of construction as a standard of excellence. The artist, however, is influenced in his ideals by what he sees in nature. His is the primordial or natural ideal and is fundamentally dependent upon free-hand work. The very irregularities, inseparable from the most perfect free-hand work, become agreeable to the trained artist sense, and just so far is the dull monotony of machine work repellent. The painter will refer for a subject in old house with picturesque variations and delicate modulations given by time, to a new villa freshly painted, which is, of course, lacking in such modulations.

It is interesting to note in Greek ornament how rarely any form is repeated. The opposite leaves of an anthemion will not be duplicates, one turn of a scroll will be almost invariably a trifle larger than another, and even in the most perfectly finished scrolls, breaks in the exact continuity of curves will occasionally be noticed. The Greeks unquestionably designed their buildings as well as their decorative patterns from the artistic standpoint, and shaped them with the free hand; hence their work was full of animation and interest, their walls, their spacing, having a charm and grace which is utterly lost in the dull copies of classical vortices made a generation ago in ignorance of the higher qualities of Greek art.

If, then, these peculiarities are hardly observed in modern architectural practice or in the instruction given to the modern architect, it is to be observed that such practice and instruction are so largely based upon drawings that, first, the student is a student not of Greek building, but of drawings of it, in which the refinements could not be given, even if the draughtsman cared for them; and, second, that the architect's career is more dependent upon the agreeable effect of his drawings upon his employer than upon the effect of his completed building. The architect to-day does not carry his free-hand design into execution, but passes it through the ordeal of mechanical draughtsmanship; whereby, as every practitioner knows, it loses immediately almost all its charm and the freshness of the original sketch, and tends to become hard and uninteresting. This tendency existed to a great extent in the time of the Renaissance; and still more generally during the Cinque Cento. The fifteenth century student of art studied and measured the remains of antiquity, and this unquestionably brought new ideas into architectural design, but he did not acquire the age-long traditions of the earlier art. Neither did he always retain the traditions of his own past, of the mediæval art in which his masters had worked. Such traditions would, with the natural decadence of art, become confused, misunderstood and overlaid with eccentricities; and it is but natural that when the rich and alluring vista of classical art opened before men's eyes, they should hasten to discard all hampering traditions, the good with the bad. In this way, while the traditions of the Greeks or the Greco-Roman builders were not to be revered, those of the Middle Ages were of course neglected.

After this introduction the article proceeds to describe the Greek refinements and the various theories which have

been advanced to explain them, and reaches the following conclusion:

If, however, we can give a satisfactory reason why a column should have an entasis, that same reason will suffice to account for all the other refinements as yet known to exist, at least in classical work. The only satisfactory explanation of them is that the entasis and other such refinements were introduced from artistic preference, from delight in the abstract beauty which results from their use.

The subject of mediæval irregularities is next taken up as follows:

With regard to mediæval buildings, the existence of apparently deliberate irregularities in measurement was pointed out by Ruskin in *The Seven Lamps of Architecture*, published in 1849, and in *The Stones of Venice*, published in 1851; and Viollet-le-Duc in the *Dictionnaire de l'Architecture Française*, s. v. *Trait* (Vol. IX., first published in 1868), deals with the same subject. There has been, however, no such comprehensive investigation as that undertaken by Professor W. H. Goodyear, of which the results were published in part in the *Architectural Record* (Vols. IV., VI., VII., VIII., IX., New York).

In such investigations great discretion must be exercised. It is evident that thrust and settlement may produce unexpected results; masonry is, moreover, plastic to a certain extent, and stone may be appreciably distorted by long-continued pressure. There is, too, the element of mere carelessness and incapacity for accurate work to be considered. The case is further complicated by the fact that these refinements are not universal in mediæval buildings. They are usually present in direct ratio to the amount of Byzantine influence visible in the work. Where they exist it is generally in larger and richer churches rather than in the poorer ones—and this has evidently some bearings upon the question whether they are the results of carelessness or of design. Where the same irregularity occurs on both sides of a church in corresponding places, where a cornice has an even and regular curvature, and examination shows that the stones were originally cut to fit the curve, where a curve in plan is regular from the base of the walls up, with no opening of joints, or where a striking irregularity of arrangement is found repeated in a large number of instances, the conclusion seems irresistible that these particular deviations were intentionally put in. * * * It is evident how inconspicuous they generally are when we consider the surprising fact that irregularities so large as some which have been pointed out should have remained unnoticed by thousands of visitors until revealed by careful measurement.

The remainder of the article is devoted to quotations of examples from individual mediæval churches, and although these examples, as published, are all taken from the Brooklyn Museum research, as described in the "Architectural Record," it is a point of much importance that the original manuscript of this article contained a number of citations of independent observations by Mr. Heins (not so mentioned by him, but so noted by me). On this account the manuscript was loaned to me and remained in my possession for about nine years. Mr. Heins asked for its return very shortly before his death and after the date of the quoted letters.

The memorial addition to the First Church at Methuen, known as the Nevins Memorial Chancel, narrows in plan from 21 feet 4 inches to 20 feet 4 inches. Mr. Heins stated in a letter to me dated April 15, 1898:

The idea was simply to avoid the harshness and monotony of exact rectangles * * * It seems to me that the effect in execution, while it is not noticeable as a distortion, unless pointed out, does make the chancel look less stiff and formal. You have so largely increased our information on this subject that I now feel safe in putting in many variations, in work of this sort, because they seem to me to make it vastly more interesting.*

Another interesting expression of Mr. Heins' views was contained in a letter which acknowledged the receipt of my "Reply to an Article in the *Builder* on the Glamour of Crooked Building" (published and circulated by the Edinburgh Architectural Association, November 1905). Mr. Heins' answer consisted of two sentences, one to acknowledge the receipt, and the other as follows: "My own point of view has led me to a very simple conclusion: Artists appreciate the glamour of crooked building, and it makes very little difference whether the rest of the world like it or not."

The natural inquiry now rises. Is the choir of St. John the Divine destined to be an exceptional and sporadic instance of revival of mediæval methods, or does it mark the beginning of a new movement in modern architecture? This inquiry suggests the remark that if the building of

* The term is capable of other interpretations; but the peculiar importance of the recently observed and surprising deviations mentioned in the definition above requires special examination.

* It may not be immediately obvious to those who have not paid attention to the subject that the actual effect of deflections in plan is to change and confuse the effects in elevation, but such is the case. The resulting optical effects of deflections in plan are effects in elevation.

FIG. 2.

FIG. 1.—ST. OUVEN, ROUVEN. SOUTH TRIFORIUM, LOOKING WEST. FROM A BROOKLYN MUSEUM PHOTOGRAPH OF 1910. TAKEN WITH THE BACK OF THE CAMERA CLOSE TO THE SOUTH TRANSEPT ANGLE. THE ENTIRE CHURCH IS PLANNED ON A DOUBLE OR RETURN CURVE (ATTENUATED LETTER S, OR "HOGARTH'S LINE OF BEAUTY"). THE VIEW INCLUDES THE BEGINNING OF THE RETURN CURVE WHICH CONTINUES IN THE CHOIR. A CORD WAS STRETCHED ALONG THE FLOOR OF THE GALLERY IN ORDER TO SHOW THE CURVE AS CONTRASTED WITH A STRAIGHT LINE. THE LINE OF THIS CORD HAS BEEN STRENGTHENED BY A PEN IN THE PHOTOGRAPH. THE DEFLECTION OF THE CURVE BETWEEN THE FURTHER WEST END OF THE GALLERY AND THE LAST PIER OF THE NAVE (IN THE FOREGROUND OF THE PICTURE, WHERE THE FIRST SHADOW FALLS), IS 0.70 FEET, OR $8\frac{1}{2}$ INCHES. AN 8×10 INCH DISK MAY BE SEEN AT THE POINT OF GREATEST DEFLECTION. THE SHADOWS FALLING ON THE WALL AND ACROSS THE FLOOR OF THE GALLERY SHOW THE POSITIONS OF THE PIERS AND THE POINTS AT WHICH THE MEASUREMENTS WERE TAKEN BETWEEN THE STRETCHED CORD AND THE FACES OF THE PIERS. THESE MEASUREMENTS SHOW A GRADUAL AND SEQUENT CHANGE OF POSITION IN EACH PIER, THUS REPRESENTING A TRUE CURVE. THE VARIATION IN AMOUNT OF THE CURVE ON THE TWO SIDES OF THE CHURCH IS ONLY 0.13 FOOT, OR $1\frac{1}{2}$ INCHES. THE CURVE ON THE NORTH SIDE (FIG. 2) IS 0.83 FEET, COMPARED WITH 0.70 FEET ON THE SOUTH SIDE. THE MEASUREMENTS FOR THE CURVE ON THE SOUTH SIDE (FIG. 1), AS TAKEN ALONG THE STRETCHED CORD, AT EACH PIER, ARE AS FOLLOWS FROM EAST TO WEST (FROM THE FIRST SHADOW TO THE END OF THE LINE) IN DECIMALS OF A FOOT:—0.00 : 0.11 : 0.32 : 0.45 : 0.55 : 0.70 : 0.45 : 0.31 : 0.15 : 0.00.

THESE CURVES BEGIN AT THE FOUNDATIONS BUT ARE MOST EASILY SEEN AND PHOTOGRAPHED AND MOST CONVENIENTLY MEASURED IN THE GALLERIES. COMPARE FIG. 2 FOR THE NORTH TRIFORIUM. THE TWO SIDES OF THE CHURCH ARE PARALLEL.

FIG. 2.—ST. OUVEN, ROUVEN. NORTH TRIFORIUM, LOOKING WEST. FROM A BROOKLYN MUSEUM PHOTOGRAPH OF 1910. TAKEN WITH THE BACK OF THE CAMERA CLOSE TO THE NORTH TRANSEPT ANGLE. THE ENTIRE CHURCH IS PLANNED ON A DOUBLE OR RETURN CURVE (ATTENUATED LETTER S, OR "HOGARTH'S LINE OF BEAUTY"). THIS VIEW INCLUDES THE BEGINNING OF THE RETURN CURVE WHICH CONTINUES IN THE CHOIR. A CORD WAS STRETCHED ALONG THE FLOOR OF THE GALLERY IN ORDER TO SHOW THE CURVE AS CONTRASTED WITH A STRAIGHT LINE. THE LINE OF THIS CORD HAS BEEN STRENGTHENED WITH A PEN IN THE PHOTOGRAPH. THE DEFLECTION OF THE CURVE BETWEEN THE FURTHER WEST END OF THE GALLERY AND THE LAST PIER OF THE NAVE (IN THE FOREGROUND OF THE PICTURE, WHERE THE FIRST SHADOW FALLS) IS 0.83 FEET, OR 10 INCHES. AN 8×10 INCH DISK CAN BE SEEN AT THE POINT OF GREATEST DEFLECTION. THE SHADOWS FALLING ACROSS THE FLOOR OF THE GALLERY SHOW THE POSITIONS OF THE PIERS AND THE POINTS AT WHICH THE MEASUREMENTS WERE TAKEN, BETWEEN THE STRETCHED CORD AND THE CLERESTORY WALL. THEY SHOW A GRADUATED AND SEQUENT CHANGE OF LINE IN THE WALL AND THUS REPRESENT A TRUE CURVE. AS TAKEN FROM EAST TO WEST, FROM THE FIRST SHADOW IN THE FOREGROUND TO THE FURTHER EXTREMITY OF THE LINE, THESE MEASURES FOLLOW HERE, IN FOOT DECIMALS:—0.00 : 0.20 : 0.47 : 0.70 : 0.83 : 0.80 : 0.70 : 0.52 : 0.20 : 0.00.

THESE CURVES BEGIN AT THE FOUNDATIONS BUT ARE MOST EASILY SEEN AND PHOTOGRAPHED AND MOST CONVENIENTLY MEASURED IN THE GALLERIES. COMPARE FIG. 1 FOR THE SOUTH TRIFORIUM. THE TWO SIDES OF THE CHURCH ARE PARALLEL.

FIG. 3.—GROUND PLAN, CATHEDRAL OF ST. JOHN THE DIVINE, NEW YORK. MESSRS. HEINS & LAFARGE, ARCHITECTS. THE COMPLETED PART OF THE CATHEDRAL IS SHOWN BY THE BLACKENED PORTION OF THE PLAN.

the new Fifth Avenue Baptist Church had not been interrupted, first by the illness of the pastor and then by his subsequent acceptance of a new charge, it would have offered a second important example of such revival. Mr. Wm. Welles Bosworth had not only determined to introduce variations of alignment and dimension in the details of the façade of the new church, but actually made a trip to Italy for the express purpose of studying the Pisan Romanesque with this end in view. Provisions for such arrangements were also formally made in his draughts of specifications for contractors' work.

Not the least important part of Mr. Bosworth's relation to this matter is his extremely interesting baptism of the subject by a new name, viz., "temperamental architecture." This was simply the title of an illustration in an article

which he recently contributed to the *American Architect*,* and he made no further reference to that particular title in his text, but this term may be worthy of replacing the word "refinement" as a general title for the topic. No one who reads Mr. Heins' letters, as just quoted, can fail to realise the aptness of this term.

The term "temperamental architecture" appears also to be a sort of solvent (all the more effective because unintentional) of that very natural but very mistaken view about the mediæval builders; that because they were never anxious about having architecture straight or uniform, they were never distressed or disturbed when it was rigid, hard and

FIG. 4.

FIG. 4.—GROUND PLAN OF THE CHOIR, CATHEDRAL OF ST. JOHN THE DIVINE, NEW YORK. MESSRS. HEINS & LAFARGE, ARCHITECTS. SHOWING THE CONVERGING LINES OF THE PIERS, AS DESCRIBED IN TEXT. THE PLAN ALSO SHOWS THE ASYMMETRIES OF SPACING OF THE PIERS, AS MENTIONED IN TEXT, BUT THE REDUCTION OF SCALE MAKES IT DIFFICULT TO OBSERVE THEM, UNLESS A COMPASS IS USED.

dry. The general view has been that many mediæval builders were indifferent to geometrical uniformity or mathematical accuracy and therefore that no mediæval builder ever deliberately counteracted or avoided the effect of monotony or uniformity.

Men as far apart in time and as diverse in training and knowledge as John Ruskin and Auguste Choisy have both made the point that the mediæval unintended lack of regularity was an expression of the same spirit which at other times intentionally avoided regularity. However misleading and erratic Mr. Ruskin's artistic criticisms may have been in many particulars, his "Lamp of Life," in the "Seven Lamps of Architecture," struck the right note in this par-

ticular. Auguste Choisy, who was one of the soberest intellects and one of the greatest engineers of our period, has also recorded his opinion that mediæval irregularities are more frequently the result of calculation than of negligence—"il y eut plus souvent calcul que négligence," and he adds on a following page: "D'une manière générale les architectes du Moyen Age évitent la froide régularité."*

"Temperamental architecture" seems to be a term which covers both the doubtfully purposed and the definitely determined irregularities of mediæval practice. It affirms that the picturesque, when unconsciously produced, is equivalent,

* *Histoire de l'Architecture* vol. ii., pp. 410, 412.

in results, to its creation when consciously produced with deliberate intention. It indirectly affirms that a determination as to deliberate intention is comparatively unimportant and unessential.

If we adopt Mr. Bosworth's term "temperamental architecture" it may somewhat assist a determination as to what part "refinements" may play in modern architecture. The answer seems to be: Given a temperament of the kind which Mr. Heins himself stated that he possessed, and which Mr. LaFarge's "Scribner" article shows that he possesses, and which Mr. Bosworth's quoted article shows that he also possesses, and it may be confidently expected that similar temperaments will be much assisted in their own development, or self-assertion, by a wider knowledge of what the mediæval temperament tolerated, or deliberately did, as the case may be, and without any very anxious inquiry as to the cerebral process involved.

Especially in country-house architecture is there a favourable opportunity for temperamental planning, because the absence of anxiety as to symmetrical effects has long been general in this field. For instance, if the door and window openings be designed from the interior point of view and solely for interior convenience, the inevitable variations will be such that excellent results in the given direction will have been achieved.

Thus the results of an historical or antiquarian research as to constructive mediæval asymmetries, as determined by a more exact attention than they have previously received, ought to be favourably greeted by members of the architectural profession. It appears probable that the future of modern "temperamental architecture" will be largely determined by the success or failure (in public estimation) of this historic research. That this research may achieve general recognition, ultimately, is certainly suggested by the choir of St. John the Divine and by the published opinions of Mr. Heins and Mr. Bosworth, not to overlook those of Mr. C. Grant LaFarge as contained in his "Scribner" article, and these may also now be quoted:

Within the last few years a large number of careful measurements have been made of all sorts of mediæval buildings, and very suggestive theories been deduced therefrom; theories which have been hotly discussed on both sides of the water. There is no intention, as there is no space, here to add to the volume of the discussion or to decide whether the innumerable and sometimes startling irregularities in nearly all such work were mainly accidental or a conscious and calculated element of design. But we may well ask why it is reasonable to believe that men who knew enough to build masonry so complex that it would baffle the most skilful to-day to design; who discovered the most luminous principles of construction and applied them in the noblest manner; who left works of such transcendent beauty that the world ever since has been lost in admiration, should at the same time have been such feeble incompetents that they could not build straight? If they had rules, these are lost in the mist of time and probably we shall never know them, but is it not at least a tenable hypothesis that these giants of old worked in the great mass with the same sensitiveness that guided their detail; that they knew how to give the whole vast structure the personal charm of a successful sketch? Let us rest assured that they were no slaves of the T-square and the triangle fetich, nor of the *chic* drawing; no victims to the idiotic notion that straight lines and equal measurements possess any intrinsic superiority.

NOTES ON THE ILLUSTRATIONS FOR THE GALLERIES OF ST. OÜEN.

In spite of the wide fame of St. Oüen, there is no extant published plan of this church which does not show its lines as straight. How far its curves are otherwise generally overlooked may be best determined by the readers of this paper.

The convincing character of these photographs is due to the fact that they are taken in the triforium galleries, which are only about two feet wide, and that they therefore show the curves in duplicate in each gallery; in the clerestory wall on each side, as well as in the line of the parapet on each side, as determined by the positions of the piers.

As a contribution to the controversy which Mr. LaFarge has mentioned as a "hot discussion," but which, in spite of his modesty, may be considered as closed in many directions by his own participation in the revival of mediæval practice, these photographs have unique importance, because they appear to give a conclusive negative to the explanation of the mediæval deflections in plan which has been offered by Count Robert de Lasteyrie, by Mr. John Bilson, and by Mr. E. S. Prior.

It has been announced by these distinguished antiquarians that (aside from irregularities of site) such deflections are explained by the mediæval practice of screen-

ing off the completed portion of a church, for purposes of worship during the completion of the remainder of the church. (This practice is illustrated in modern times by the screen wall in St. John the Divine, which separates the completed crossing and choir from the unbuilt nave.) Then (it is said by these authorities), when the unfinished portion of the church was continued, the lack of scientific methods, and of scientific instruments of survey was the cause of involuntary and unintended deflections of plan.

When this theory is applied to St. Oüen and to the measurements which are quoted in the captions of the illustrations, it appears that this theory would call for eleven screen walls in the nave and for four screen walls in the choir, thus involving a manifestly impossible and absurd number of stops in the progress of building, aside from the manifest improbability that accidental deflections in plan would take the form of two parallel return curves on each side which are parallel on both sides of the church. This argument applies to the nave and clerestory, but it must also be remembered that the outer walls of the church follow the same curves, so that we are obliged to presume that six parallel return curves in plan are all due to defective methods of construction and planning.

The only other possible explanation, aside from that of an æsthetic purpose is that of symbolism. The argument of Count Robert de Lasteyrie against symbolism appears to be conclusive. See his publication "*La déviation de l'axe des églises est-elle symbolique?*" (Paris: Librairie C. Klincksieck. 1905.)

St. Oüen exhibits the widening refinement in straight lines. See the *American Architect*, March 16, 1910, plate 4, and Professor Charles S. Hastings, of Yale University, in the *Architectural Record* for August, 1909. The piers lean out in lines which are straight from the pavement up, to the amount of 5-5½ inches to a side in a height of about 80 feet. These inclinations are parallel and uniform, both in the nave and choir. The exterior buttresses have been determined as perpendicular (in 1910) by plumb line photographs (so far confined to the north side). A remarkable feature about the triforium photographs of the curves, and the related measurements, is that they indirectly illustrate the accuracy of the widening refinement, because the amounts of curvature in the alignment of piers only vary by 1½ inches on opposite sides of the church, at the great height of the triforium, although the piers themselves are inclined from 5 to 5½ inches in a height of about 80 feet.

ARCHITECT'S FEE DISPUTE.

A DISPUTE as to the payment of an architect's fees was concerned in the case of *White v. Mitchell* and others, which came before Mr. Justice Scrutton, sitting without a jury, on Saturday, May 20, in the King's Bench Division. The plaintiff, James White, of Winchester, claimed 100*l.* for rent of property used by defendant, Chas. Mitchell, architect and surveyor. Ventnor, which claim was said to be admitted, and his Lordship had to consider a counter-claim by Mr. Mitchell and his son for 75*l.* 12*s.* for work done in preparing plans for a building (which in the end was not erected) for Mr. White at Eastleigh, Southampton.

Mr. Mitchell said he had done a lot of work for Mr. White and his charge had never before been disputed. The work in this case involved the preparation of plans and several journeys to Eastleigh from Ventnor, while there was also considerable negotiations with the local authority. Mr. Mitchell said that if the buildings had been erected he was entitled to the usual scale of 5 per cent., but as they were not he claimed for payment on some sort of scale.

Mr. White said he was willing to pay Mr. Mitchell a fair sum, and he had been advised that a payment of 18 to 20 guineas would meet the case, as there was no understanding as to a scale.

Mr. Belfrage, of Belfrage & Saville, London, said that he thought 18 to 20 guineas would be fair. The Institute charge was 2½ per cent. if buildings were not erected, and for that there should be preparation of plans and specifications, negotiation with local authority, and the receiving of tenders. The Institute charges were not always (added witness) upheld by the courts.

His Lordship, in giving judgment, said that in his opinion the architect's scale of 2½ per cent. where buildings were not erected was unreasonable, and quite out of proportion to the scale charged for fees when buildings were carried through. He was not bound by the 2½ per cent., and he had decided to allow 46*l.* 1*s.* for Mr. Mitchell's work, making the

total on the counter-claim, with items admitted, 55*l.* 3*s.* 6*d.* He therefore entered a balanced judgment for Mr. White for 44*l.* 16*s.* 6*d.* and costs, this without prejudice to Mr. White's right to proceed for the recovery of outstanding sums amounting to 30*l.* which his Lordship did not adjudicate upon.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) has illustrated recent work by Messrs. McKim, Mead & White, Messrs. Rankin, Kellogg & Crane, Messrs. Newhall & Blevins, and Messrs. Hewitt & Brown. Messrs. McKim, Mead & White's work is the Downtown Building of the Knickerbocker Trust Company, New York, whilst Messrs. Rankin, Kellogg & Crane are represented by their State Asylum for the Chronic Insane, Wernersville, Pa. Several examples of work by students of the Society of Beaux-Arts Architects are illustrated, and a competition design by Mr. Louis Boynton for the Confederate Memorial at Richmond, Va.

Der Architekt (Vienna) contains the first and second prize designs in the competition for a new Kurhaus at Carlsbad, the first by Professor Dr. Friedrich von Thiersch, and the second by Professor Emanuel von Seidl. There are also some rather weird "new-art" designs for a painted façade of a town house, or rather block of flats, at Pressburg, and a hotel façade at Aspang. One of Mr. W. H. Bidlake's country houses looks very refreshing after these.

Arkitektur og Dekorativ Kunst (Christiania) has an article on the architecture of Foreign Garden Cities, with illustrations from Hampstead, England, and Hellerau, Germany. There is also a description of the evidences of old roof constructive lines, as shown on the central tower of Trondhjem Cathedral, which is of antiquarian interest.

Arquitectura (Barcelona), in the April number, which has just reached us, includes the design for the Palace of Justice at San Sebastian, by Don Julian de Saenz Iturralde, submitted in competition. There are also a number of designs for churches in Russia, by A. Djorogoff, A. von Hoen, N. Vassieljeff, and V. Pokrovsky.

La Construction Moderne (Paris) illustrates a design by Mons. Sainte-Anne Louzier for the enlargement and restoration of the cathedral at Toulouse.

Stone (New York) has a special Building Stone number, which contains excellent photographic illustrations of the central doorway of St. Bartholomew's Church, New York, a new post office at Warren, Ohio, the Denkmann Memorial Library, Rock Island, Ill., the rood screen in St. Luke's Episcopal Church, Evanston, Ill., the entrance of the New Grand Central Palace, New York, a detail from the tomb of Andrea Vendramini, Venice, the central porch of Amiens Cathedral. Several examples of the failure of concrete construction are given, of which the most important is the tower of the new Harper memorial at the University of Chicago.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ELY.—FAST END OF CHURCH AND LADY CHAPEL, WEST DOORWAY AND PART OF GALILEE PORCH.

WE continue this week our supplementary series of photographs from Ely, which will be followed by others in the near future.

COMPETITION DESIGN FOR COVENTRY MUNICIPAL BUILDINGS.

THIS design, by Mr. Arnold Seaward Tayler, A.R.I.B.A., shows a symmetrical plan, having a central principal entrance at the ground floor level, with a wide corridor running east and west, and lighted at each end; the street angles are bisected and on the axial lines the side staircases are formed of regular-sided shapes on plan. The rooms at the angles are regular octagons.

The Lower Ground Floor accommodates the Rates department, which is in close proximity to the side entrance in St. Mary Street. The Weights and Measures department is also accommodated on this lower floor. The Ground Floor accommodates four departments, each adjoining and complete in itself, viz. the Town Clerk's, the Gas department, the Electric Light department, and the Treasurer's. The staircase by the main entrance is intended only for the use of Councillors, and gives direct access to the Council Chamber, Committee-rooms, &c., and does not go to the second floor nor

basement. The side staircases are intended for reaching the other floors, and for inter-communication. The approach to the public gallery of the Council Chamber is by a minor staircase direct from street level. The First Floor accommodates the Engineer's and Education departments, as well as the Council Chamber, Committee-rooms, &c. The Council Chamber is placed at the rear for the sake of quietness. The Second Floor accommodates the secondary rooms of the Engineer's department, together with the Waterworks department. The Medical Officer's department is placed at the eastern end. The central part of this floor is taken up by the upper parts of the Council Chamber and two Committee-rooms, as well as the public gallery in the former.

The general offices of each department (to which the public require access) are situated as near the entrances or the landing of stairs as possible, so as to avoid trouble in locating the departmental enquiry offices. Most of the rooms are connected by pass-doors. The staircase corridors are wide and well-lighted from the ends by street windows, by the staircase window at the centre, and also by the large lightwells to the side staircases. Lavatory accommodation is provided on every floor (except the basement) at the ends of the side corridors.

In designing the buildings the author considered that the mediæval associations of Coventry required a Gothic rather than a Renaissance or Classic treatment, which would break away from the historical buildings and traditions of the city. The offices were planned independent of the Town Hall, so that one could be built without the other. The elevations generally would be of stone backed with brickwork, with the faces below plinth left untooled with mason's joint, the upper part tooled with flush joint. The back elevations to be in brickwork, with stone dressings, and the roof covered with Cumberland green slating.

The Town Hall buildings were planned with the main entrance in Bayley Lane giving access to the ante and reception rooms. The Hall would easily seat 1,073 persons on the Ground Floor and 288 persons in the Gallery. The latter takes up three sides of the Hall, and has two approach staircases as well as two emergency exits. Generally, the whole building would be built in a similar manner and with similar materials as used in the Municipal Offices.

SIR ASTON WEBB, C.B., R.A., who completed his sixty-second year on Monday last, has been appointed Commander of the Victorian Order. The same *London Gazette* announced the appointment of Sir Thomas Brock, R.A., to be an ordinary member of the Civil Division of the Second Class of Knights Commanders.

THE Establishment Committee of the London County Council reported on Tuesday that they were now in a position to ask the Council to agree to tenders being obtained for the construction of the substructure for the new county hall. Being strongly of opinion that the tenders for this work should be invited from selected firms, they suggested that the Council should authorise them to approve the list of firms to be invited. As it was inexpedient at present to publish the amount of the estimate of the cost of the work in question, they proposed that the necessary estimate should be submitted at the same time as the tenders were considered by the Council.

MR. W. D. CAROE, M.A., F.S.A., has prepared plans for the renovation of the twelfth century church at Branscombe, Devon. Immediate steps must be taken to preserve the fabric; the walls are cracked and need to be underpinned and repaired; the roof beams must be renewed; there is at present no vestry, and the "box" pews are rotten and uncomfortable. Accommodation will be provided for 208 persons. The estimated cost is 2,000*l.*

MR. JOHN DOUGLAS, architect, Chester, died on Tuesday last, in his eighty-first year. Mr. Douglas served his articles in Lancaster and set up in independent practice at the age of twenty-five in Chester. His firm afterwards became known as Messrs. Douglas & Fordham and later as Messrs. Douglas & Minshall. The amount of work carried out was both considerable and important in Cheshire and North Wales. Among the churches he designed are those of Colwyd Bay; Christ Church, Chester; St. Peter's, West Kirby; Christ Church, Brynmawr; Congregational Church, Hoylake; Over, Altcar; St. Paul's, Houghton, Cheshire; Deganwy, Shotton, Buckley, Helsby, and he also supervised the restoration of Hawarden Church. Other recent work included the Gladstone Memorial Library, Hawarden; Delamere Cottage Sandiway; "Clare Lodge," Abbot's Park, Chester; "Oak mere," Cheshire; cottages at Port Sunlight; "Eccleston Hill Lodge," Eaton Estate; and "Abbeystead," Lancs.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL meeting of the Royal Institute was held at Conduit Street on Monday, May 22, Mr. Reginald T. Blomfield, A.R.A. (Vice-President), in the chair. The Secretary announced the introduction of certain corrections to the minutes of the annual general meeting held on May 1. After some slight discussion and amendments these were confirmed unanimously. The decease of Mr. William C. Poole, Associate, elected 1863, was announced. The names of the six candidates who have been nominated by the Council for Fellowship, nine for Associateship and 161 for Licentiate-ship have already been published in the official Journal.

Mr. R. ANNING BELL then read a short illustrated paper of which the following is an abstract) on

Painted Relief.

Painting applied to relief-work is one of the most obvious and ordinary forms of decoration; but very little work of a good class has been done in recent times. The architect, the sculptor, and the painter have specialised each in his own art in these later centuries, and have lost that comprehension of and sympathy with each other's work which characterised them in earlier and happier times. A reaction is undoubtedly setting in against the over-appreciation of work both in sculpture and in painting which aims only, or at any rate mainly, at giving the illusion of natural effects.

The education of our art-students is now beginning to be directed by a wider and saner policy, and soon it will be difficult to find any student who will look with blank indifference and even contempt on any art other than that which he is studying. The architect, owing to the difficulty of finding colleagues with whom he can work harmoniously, has been driven to confine his efforts in the direction of colour to such simple treatments as he can trust to the ordinary artisan. These irritating limitations make him feel disinclined to undertake more than a general supervision of the colour decoration of his building, and so he entrusts the work to one of the firms of decorators who are always at his elbow and who can be trusted to turn out a not unpleasant if not very original piece of work. These great firms have taken the place of the painter and the sculptor in the older system. Designers and craftsmen of great ability are employed by them; but the great objection to them is that they undertake too much for one man to control, and therefore lose the distinction given by a dominating and directing artistic personality.

The little work which has been done in modern times is not sufficient to show how wide is its range and how varied are the effects to be obtained by it. Speaking of figure-work in relief, gilded or silvered and painted, and executed in fibrous plaster or some form of biscuit or terra-cotta, the lecturer said the work is modelled in clay, then cast in plaster, which is then gilded and painted, or a mould is made from which the biscuit or terra-cotta is cast: this is then fired, and subsequently also gilded and painted.

The work is essentially a colourist's work, and the first sketch must be as definite and careful as one for stained glass. The modelling gives the resulting work a carrying power much greater than painting alone can do, and it must be so treated as to leave a distinct edge to each colour-shape if the colours are strong; this particularly applies to areas which are to be covered with gold or silver. The relief need not be high; but it may be so strong that the cast shadows from the layer forms have a prominent share in the composition. When high up, a broad treatment with simple flat planes, with but little modelling properly so-called, may be used with good effect. Most workers will agree that the modelling takes up much more time than the colouring, though the latter is the dominant factor in a successful result. Painted relief-work may be fanciful and gay, and it may be severe and sober and dignified. Opportunities for work of the latter kind have not been frequent, so that its powers in that direction have been by no means completely demonstrated. But its possibilities for serious and architectonic decorative effect in churches or public buildings are as great as those to be obtained from any other method of wall-decoration. It has, too, the advantage of costing less than many, and, if desired, by repeating the modelled work and varying the colour treatment a very inexpensive result is obtainable. With proper treatment it should prove very durable; the plaster surface can be hardened, or, still better, the whole may be fired in "biscuit." This is extremely hard, and gives quite a good surface for the colour. As to the colouring matter, Mr. Bell said he always employed gold or platinum and the usual artists'-colourman's oil-paints, and there

seems to be no reason why these should not prove as durable on plaster modelled as on the grounds akin to plaster which are used applied to canvas for the ordinary easel-picture.

It is rather necessary to dwell on and to emphasise the potentialities of this material for grave and rich and distinguished decorative treatment, as considerable doubt seems to be felt as to whether this method is capable of being used with satisfactory results in any but work designed in the lighter vein.

This is an unfortunate and false impression: deep and rich and even sombre effects of colour may be obtained; personally, he rather preferred the effect of a low-toned scheme—a sort of subdued gorgeousness which rich colour laid over gold so naturally gives, and when associated with a good deal of black. In this way extremely noble and splendid and restful effects may be achieved by a man who is a real colourist, effects which will be, in the words the late Mr. Brydon used, "very broad, very simple, very stately, very strong in lines, not at all naturalesque, and not at all confused or jumbled up." Very little work has, as yet, been done, very few experiments made, and very few artists have had the opportunity of testing their powers. It lies largely with the architects to give those opportunities for the greater encouragement of an art capable of very great and beautiful developments, an art which is worthy of the brains and hands of the greatest artists. Capable executants can be found to-day besides those few who have as yet practised the combination of form and colour; and as time goes on many young artists will arise who are quite capable of working with a true "architectural" understanding of the relation of their share of the work to the whole, and who, as colourists and as modellers will act as true colleagues and assistants to the architect.

Mr. WALTER CRANE, in proposing the vote of thanks, said he remembered that when he was working with Mr. Anning Bell arranging the British Section of the Exhibition in Turin the Italian papers talked of him as "the English Della Robbia." He was glad that Mr. Bell had alluded to the difficulties arising out of different artists working together, for there lay one of the great obstacles to public work. It is rare indeed that the sculptor harmonises with the architect, and *vice versa*. However, it is impossible to alter the economic conditions which have brought this state of things about, and it only remains for us to make the best of things. The slides shown on the screen suggested how much the ordinary photograph falsifies the relation of colour. Allusion had been made to the difficulties under which decorative artists now labour. It was very true that now many clever people were employed by firms who undertake to do everything in the way of decoration in the course of a few months and at a fixed price. There used to be people who had the courage to ask artists to do things such as had been illustrated on the screen that night. Decorative artists were thrown utterly for their future prospects on to the architects. It was only chances and opportunities which the modern artists required to achieve worthy work. The reason that public monuments are not successful in this country is that (apart from the lack of public appreciation) the public are not ready for them. The public do not regard them with the seriousness they should as the expression of national feeling.

Mr. GERALD MOIRA said that Mr. Bell had given them practically everything there was to be said about coloured relief, and incidentally he had heard a great deal more than he had ever known before. He was rather sorry to hear Mr. Bell say how a very charming and very cheap effect might be arrived at. His experience of coloured relief in figure work was that its principal feature was the flatness of modelling. It seemed to require an entirely different treatment from the bas-relief. The painter who works with the sculptor has likewise to treat it from a standpoint different to the usual.

Mr. F. LYNN JENKINS said that ten years had elapsed since on a similar occasion he read before the Royal Institute a short paper on the subject under discussion. He was then fired with ambition to secure from architects such an amount of practical appreciation of coloured relief decoration as would tend to make it one of the most vital branches of decorative art. He had dreams of a London made gayer with notes of harmonious colour to enhance the dignity of its eternal greyness. Those youthful hopes have been crushed under the iron heel of grim realisation. Perhaps, too, with advancing years he had become like the architects whose sympathies he sought to enlist—reticent in the matter of colour as applied to sculpture. This must be so, for on several occasions recently he had actually been referred to as

a sculptor, whereas formerly he was invariably termed a decorative sculptor. None the less, he still had deep down the shameful conviction that colour could be used legitimately and with great enhancement of effect in sculpture decoration, that it is a dignified form of decoration—possessing qualities and values unattainable by other means. Mr. Anning Bell, however, never faltered in his convictions, and has steadily gone on producing those wholehearted, individual, and distinguished works which will ever be associated with his name. He is quite right in affirming that coloured relief is a distinct art, in which the relation of colour and form must be that of lawful wedding, each taking its proper part in the production of a perfect result. This demands a singleness of purpose rarely to be found in collaboration; and there are few painters who, like Mr. Anning Bell, possess the ability to realise the full expression of their conceptions in both arts—modelling and painting. Perhaps this scarcity of accomplished artists in coloured relief work has been one of the factors against its wider use, following the law of supply creating demand. The fact remains that there has been no appreciable increase in demand during the past ten years, rather a decrease if anything. It would be interesting to hear some of the chief objections to this form of art, for strong objections, it is patent, there must be. None who spent any time seriously studying the wonderful collection of Japanese art last year at Shepherd's Bush could fail to be moved with wonder and respect for the masterly handling of colour as applied in flat tones, brilliant or delicate, to broken surfaces. And where these great decorative artists show such a lead surely we can without any loss of national or other characteristics follow in their footsteps. It has been stated that a lurking fear as to its permanence prevents architects from adopting colour relief in their decorative schemes. It is difficult to see why this fear should exist; properly treated, even plaster will stand the test of ages, and the process of colouring, as adopted by Professor Moira, for one, adds enormously to its assistance. There are occasionally opportunities when money does not so largely enter into consideration, and in such cases absolute permanency can be obtained by using bronze of various patinas, marble, ivory, mother-of-pearl and gold and silver to produce a harmony of brilliant but dignified colour. Surely, such materials would lend themselves most admirably for the decoration of sanctuaries, reredoses, &c. Yet they are seldom, if ever, employed. The chief apparent objection to coloured relief decoration has been its degradation in the hands of philistines, who have used it without any sense of fitness or taste either in execution or motive. These instances are to be deplored, as they militate against the serious consideration of its use by serious architects.

Mr. J. D. CRACE spoke of the importance of the surrounding spaces in the introduction of coloured relief. There was always some risk in the separate mention of any particular method of decoration, for architects were apt to think they were decorating a building when they put in a certain number of square feet of decorative treatment. Whereas in reality a mere island of decoration makes the building suffer as the architectural lines are lost in the attention paid to the treatment of that coloured island. There was one drawback to the use of biscuit for internal decoration, viz. in its weight; it was very much heavier than terra-cotta. As for durability, plaster will last as long as the building. This was exemplified in the work at Hardwick Hall, which has lasted three hundred years. In Spain there was a very interesting coloured wood relief executed in the fifteenth and sixteenth centuries. A most important remark in Mr. Bell's paper was that in which he contended that the success of coloured relief largely depended upon the modeller and the colourist being at one.

Mr. MAURICE B. ADAMS said he had been struck when visiting Hardwick Hall by the plaster or stucco decorations in the incomplete house standing in front of that building, and which were of a similar character to those in the big hall. Though they had been exposed to the atmosphere for three hundred years they were still in good condition. Stucco was, in fact, one of the most durable materials. Reference had been made to the objection some architects feel to this kind of work. There was some reason for this. When last at St. Albans Abbey he was horrified by the reredos or dorsal executed by Alfred Gilbert. The whole thing seemed to him to be utterly incongruous with that building. In a modern church it might have fitted with its framework. It illustrates what might have been a beautiful thing in itself judged apart from its position; but which is now an example of incongruity.

Mr. H. H. STATHAM said that Mr. Bell's paper had taken him mind back to the time when small reliefs by him began to appear in exhibitions, and people said to themselves, "Why, here is a new form of architectural decoration!" Now Mr. Bell showed pictures, and to these one went to find colour. No reference had been made to the Parthenon frieze. There could be no reasonable doubt that that was coloured. That was one reason why it was done in low relief for colour applied to high relief makes it too realistic.

Mr. R. T. BLOMFIELD, A.R.A., closed the discussion. Painters, he said, had laid the burden of the future on architects. Mr. Walter Crane was quite right in saying the architects were the hope of the future for decorative artists. If sculptors and painters were to have a chance they must look to architects. But the former must recognise that architects are artists too, and have an art of their own to serve. They did not seem to make a full allowance for the difficulties architects have to contend with. Mr. Bell had not dealt with the historical side of his subject. It was not known how far the Greeks used decoration in colour of their buildings. The evidence is that they used it in distinct subordination to the architecture. The same rule was followed in mediæval work of the best periods. It seemed as if Mr. Bell would advocate something more than that. He went further than that in not using his colour in subordination to the sculpture. In the relation of decorative art to architecture, it seemed as if it was about time they paused in their headlong career, and asked themselves how far they were going. Unless they were careful they might be rushing to disaster.

Mr. R. ANNING BELL, in reply, said he had wished to make it clear that the work of painting in relief should be subordinate to the architect's. Small pieces might be made elaborate and subtle; but for big surfaces only simple and strong work was desirable. The Parthenon frieze was undoubtedly designed for colour. The people of that period could appreciate colour and relief at the same time, whereas the people of the present day muddle them up.

The next meeting on June 12 will be a business meeting when the results of the annual elections to the Council and Standing Committees will be announced. An ordinary meeting will follow, when a paper on "Building in Egypt" will be read by Mr. Ernest Richmond.

PROTECTION OF CONSTRUCTIONAL IRON AND STEEL.*

THE pre-eminent position occupied by iron and steel in materials of construction is known to everyone. We know, too, is the unfortunate tendency of iron and steel to oxidise and rust in the air under ordinary atmospheric conditions. Hence the question of protecting the metals from deterioration through surface oxidation is one which is constantly engaging the attention of engineers and architect, as well as all persons who are owners of or are interested in property.

Apart from the artistic or sentimental point of view which demands that the unsightly appearance of ironwork in process of rusting or corroding shall be reduced to a minimum by suitable protective treatment, there are two fundamental considerations which underlie the recently-awakened interest in our subject. One is the fear lest the strength of iron and steel structures should become reduced owing to corrosion and consequent deterioration, especially in places not readily, at all, visible. The other is the feeling, more philosophic and perhaps more modern than the first, namely, that the conservation of national resources, in particular coal, without which iron and steel cannot be produced, demands that products and structures which depend for their existence on these national resources shall be maintained for as long a time as in as high a state of efficiency as possible in order to guard against reckless waste of nature's stores. This aspect of the question, although it can hardly be said to have yet commanded wide public attention in Britain, is already being seriously considered in America, and Professor Ira Remson, in his presidential address to the Society of Chemical Industry in 1910 was in effect a sermon based on this text.

That iron and steel corrode and that they do so with the greatest ease under the most ordinary circumstances will therefore, be readily admitted, and it will be granted further that all improvements in the efficiency of the methods employed to prevent or retard corrosion are matters of public

* A paper read by Mr. J. Cruickshank Smith, B.Sc., F.C.S. M.S.O., in opening a discussion at the first International Chemical Engineering and Industries Exhibition, on May 18.

economic interest. My mandate to-night is not to discuss the question of corrosion in regard either to the mechanism of its action or to its results, although that subject is intensely interesting and important. It is a most wholesome sign that the volume of scientific research which has been during the past five years and is at the present time being brought to bear on the problems connected with corrosion of iron and steel is very great, and a further satisfactory feature is that the men who are making the subject their own are connected with a variety of departments of scientific activity, and number among them not only pure chemists, but also electro-chemical experts, metallurgists, mechanical engineers, and technical manufacturers of protective coatings. Who can doubt that when the citadel has been shelled from so many quarters the position will at last be stormed, and the question of protecting structural iron and steel will at last be placed on a strictly scientific footing? Hours, days even, might be devoted to reviewing, criticising, or repeating the researches of Grace, Calvert, Moody, Crum Brown, Traube, Cushman, Walker, Friend, Agmuir, and Cobb. We might discuss *ad nauseam* the question whether moisture or oxygen or carbon dioxide or hydrogen peroxide or nascent hydrogen or electrolytic action is the fundamental and initial producing cause of corrosion of iron and steel, but in the end, and from the point of view now best to protect the surface of structural iron and steel from corrosion, we may, I think, from the mass of matter at disposal, extract a few broad generalities:—

(1) Deductions drawn from experiments with pure iron and pure reagents, including chemically pure water, are not relevant to ordinary industrial corrosion, in which neither metal nor the exciting conditions (air and water) are chemically pure.

(2) Electrolytic action between individual particles or aggregates of particles of the metal accelerates and may even initiate corrosion.

(3) Many experiments and deductions concerning the action of certain chemicals in retarding or preventing the electrolytic action are not relevant to the problem of protecting the surface of iron and steel from corrosion, inasmuch as in the experiments referred to such chemicals are frequently brought in contact with the metal in the form of solutions completely surrounding the surface, a condition which is, of course, inapplicable to structures.

(4) Complete and permanent exclusion of moisture from metal prevents corrosion.

This latter generality (4) is the one which must, I think, be present before being accepted as the fundamental axiom governing external protection of iron and steel. If the time should ever come when by applying to the metallic surface a solution or preparation containing ingredients which can be absolutely relied upon to inhibit any tendency to rusting in the underlying metal, even in presence of moisture, then a new epoch will have been opened up in the protection of structural iron and steel on the commercial scale. But that time is not yet. One must not say it will never be. Already it has been found that the "influence of small quantities" of the composition of iron and steel is a factor of no mean importance in connection with liability to corrosion. The introduction of small proportions of nickel, vanadium, niobium, chromium, and tungsten exercises considerable influence on the liability of the metal to corrode. The practical difficulty will probably be to maintain the necessary mechanical properties of the metal in presence of these expensive additions. The question of cost may also be unsurmountable. Hence at the present time and in the present condition of our knowledge the statement can be made with assurance that, given an iron or steel surface free from moisture (and this is a condition that does not always obtain in practice), that surface can be protected against corrosion so long as there adheres to it a suitably prepared coating which is free from and impervious to moisture.

We may now take a brief survey of the usual methods whereby structural iron and steel are protected from external corrosion.

(1) It is well known that the "mill scale," consisting of magnetic oxide of iron (Fe_3O_4) which is formed on the surface of wrought iron, provides a very effective protective coat so long as it adheres to the metal. Quite an old process for the protection of iron plates was that of Barff, which consisted in depositing on the surface of the metal a film of magnetic oxide. The plates were placed in a muffle furnace and heated to from 400° to 600° C., and were then subjected to the action of superheated steam for five to ten hours. The reaction expressed by the chemical equation

was formed on the surface of the iron. Bower's process consisted in heating the plates in a retort to which air and carbon dioxide were admitted under carefully regulated conditions. The ferric oxide produced by the action of the air was reduced to Fe_3O_4 by the carbon dioxide.

The objections to these processes were (1) their cost and (2) the tendency of the film of magnetic oxide to crack and scale if the plates were hammered or bent. This, indeed, may be said to be the weak point in connection with all metallic films as protective coatings. Nevertheless, the processes are interesting historically, inasmuch as to them is due in all probability the entirely exaggerated value which engineers and others have attached to magnetic oxide of iron in the form of paint as a protective material. It is true that some of the original "iron earth," as it was called, and which consisted largely of magnetic oxide of iron, was found to possess considerable permanence and to resist the action of acids in the atmosphere. But the mechanical aspect of paint grinding was not understood in those days, and it was not appreciated that although some samples of the pigment produced an excellent paint, others proved very indifferent in this respect. Hence it has come to be recognised that any virtue possessed by a protective paint made from magnetic oxide of iron is due not so much to the composition of the pigment, but rather to certain physical properties of the paint which are by no means attributable solely to oxide of iron.

(2) *By Films of Other Metals.*—The processes known as tinplating, galvanising, and sherardising are familiar examples of these methods, although the first of these can hardly be said to be applicable to structural iron. The various galvanising processes now in use are much in advance of the old methods. The Cowper-Coles process of electro-zincing and the more recent processes of Sherard, in which the iron plates are brought in contact under suitable conditions with zinc vapour, have rendered possible the utilisation of zinc as a protective coating for iron. Thus "zinc-flashing," i.e., the deposition of about 1 oz. of zinc per square foot of steel, has been adopted as a fairly satisfactory method of protecting ship plates and other pieces of iron and steel until the surface can be painted after erection. No one alleges, however, that zinc plating can be regarded as a permanent mode of treatment, subsequent painting being always necessary. Frequently too long an interval elapses before the painting is carried out, and corrosive action is set up between the iron and zinc. It is found in practice that zinc coatings rapidly become porous, and that the degree of porosity varies greatly. If real and permanent protection be desired, therefore, zinc or galvanising can only be regarded as a temporary expedient, and cannot be accepted as a substitute for painting. Zinc plates, before being painted, should be treated with a solution containing copper, in order to prevent the paint from peeling off.

Nickeling, silvering, and in general the application of films of the more expensive metals to steel for the purpose of protection, are methods which find favour for certain special and more or less restricted purposes.

Quite recently a process known as the Simpson process has been adopted in the protection of ship and armour plates. Tubes and wires can also be treated by it. In the case of ship steel the copper is deposited electrically. The plate is then baked in a mixture of carbon and sugar, and an inter-molecular absorption of copper and steel takes place on the surface. Great anti-corrosive properties are claimed for Simpson plates, but time alone will show whether the results fulfil expectations.

(3) *By Protective Coatings of Paint.*—When all has been said regarding other modes of protecting structural iron and steel, the fact remains that the method whereby successive coats of suitably prepared anti-corrosive and protective paints are applied to the metal is by far the most widely adopted, efficient, and economical. This does not imply that all so-called anti-corrosive and protective paints are either retarders of corrosion or efficient protectors against outside influences, or even that paint manufacturers have in all cases kept fully abreast of modern developments and research in the domain of protective coatings. The point I wish to make is that the mechanical, civil, electrical, or chemical engineer is not only not independent of but is largely in the hands of the maker of protective paints. Provided that the paint maker is a specialist in his subject, and is keenly on the alert to assimilate all that can be learned from the persistent and accumulated labour of chemists, metallurgists, and engineers on the subject of corrosion, there is nothing in this condition of affairs which need cause uneasiness any more than a railway company or a mercantile concern or a nation need feel

disquieted lest the engineers employed by them to construct railway bridges or factories or battleships do not possess the necessary qualifications for their work.

It is due to the paint manufacturer to say that both in Britain and America for the last ten years unremitting efforts have been made by the leading representatives of that industry to keep themselves abreast of every development and discovery which might assist them in offering improved products.

The subject of fine grinding has been reduced to a science, and one has only to look at the nature of the plant in a modern paint factory to appreciate the extent to which the manufacturer has taken advantage of the skill and experience of the engineer.

Again, in the choice of raw pigmentary material, the paint manufacturer has brought much expert knowledge to bear. The nature, composition, and physical properties of each pigment have been inquired into, and there has been established the important law that the durability and protective properties of a paint depend largely on the physical structure of its component parts, and on that of the film resulting from the application of the finished paint.

He has discovered that a blend of pigments is, as a rule, more serviceable for protective purposes than one single pigment, and that a pigment may be what is popularly known as pure without gaining in practical efficiency. He has elaborated new processes for the heating and compounding of paint vehicles, and has learned how to adjust the proportions of oil, hard resin, volatile solvent, and drier in such a manner as to yield the best results under known conditions.

He is keenly desirous of learning all he can from engineers and architects as to the nature of the various surfaces to be treated, and the conditions to which they will be exposed, because he feels that without this information he is like the physician who is called upon to prescribe for a patient without having made a diagnosis of the case.

It is for reasons such as these that the Paint and Varnish Society has come to the Exhibition of Chemical Engineering, and has invited the presence of engineers and architects, hoping to awaken interest and stimulate useful discussion in the highly complex subject with the mere fringe of which we can hope to deal to-night. With this object in view I shall enumerate a few of what may be termed fundamental axioms in connection with the preparation and application of protective paints for iron and steel.

As to the paint:—

1. The particles of the pigment should be reduced to the smallest possible size, and should be packed as closely as possible in the paint film.
2. There should be absolute perfection in the incorporation of the vehicle with the pigment.
3. The pigment and the vehicle should be properly proportioned, it being always borne in mind that the pigment is the real protective agent, while the vehicle binds the pigment, enabling it to be spread uniformly over the surface, and to resist the action of the atmosphere and moisture.
4. Volatile constituents should be reduced to a minimum.
5. Moisture should be absent from the paint, as also should be materials capable of yielding water as a product of partial decomposition.
6. Acid and materials capable of giving rise to acid should be absent.
7. The first, a priming coat, is of great importance, and should partake of the nature of a filler. In this coat both the pigment and the vehicle should be most carefully selected, as on it most of the efficiency of the succeeding coats will depend.

As to the surface:—

1. The surface should be perfectly clean and free from moisture, rust, mill-scale, and grease.
2. Not only should all ordinary surfaces be painted, but special attention should be given to bolts, rivets, nuts, ends of plates, and girders, and all flanges or angles which are to be bolted together in order that the paints may form an insulating coating. The condition of "metal-to-metal" will certainly induce corrosion.

As to the film:—

1. The drying of the film should proceed uniformly throughout the whole depth of the film.
2. Change in volume during and after drying should be reduced to a minimum.
3. The film will form an efficient protector in strict relation to the time during which it is impervious to moisture.

Brief reference must be made to one of the most recent

developments in connection with scientific paint-making, namely, the use of "inhibitive pigments." This term has arisen out of researches (chiefly those of Cushman and Walker) on the electrolytic theory of corrosion, and it has been sought to prove that pigments can be grouped in classes according as they tend to prevent or inhibit corrosion, accelerate corrosion, or are inert in this respect.

It is well to point out that certain conclusions are arrived at in respect of such recognised inhibitors as potassium bichromate, chromic acid, and caustic soda are not relevant to the problems attending the protection of iron and steel by means of oil paints, for the reasons that none of these chemicals are or can be constituents of such paints, and that they act only in watery solution, and the presence of moisture must be rigorously guarded against in paint. A further difficulty has been introduced through Friend having shown in his recent researches, that the effect of an inhibitor depends on the concentration of the solution, and that as the concentration varies the action may be reversed, the inhibitor becoming an accelerator of corrosion.

The study of pigments (using that term in its strict technical sense which connotes insolubility) in relation to their effect as inhibitors of corrosion has not so far been sufficiently exhaustive or long continued to permit of entirely satisfactory deductions being drawn. While it is unsafe, therefore, at present to claim very definitely for any pigment under the conditions to which it is exposed in a paint film on iron or steel, unfailing action, as an inhibitor of corrosion, or even to assert with any degree of certainty what pigments will be uniformly inert in this respect, signs are not wanting that we can with a growing degree of confidence point to certain pigments which act as accelerators of corrosion, and these should be rigidly excluded from protective coatings.

Sweeping generalities are therefore to be deprecated unless our exact knowledge based on experimentation conducted under service conditions is greater than it is at present. Thus, for example, the statement that carbon is an accelerator of corrosion, and must never find a place in protective coatings, appears to savour of rashness. Carbon, in its true form in the simple pigmentary form, is strongly electro-negative to iron, and under suitable conditions promotes corrosion of the latter. But whether carbon in one or other of its several forms after being intimately ground along with certain other pigments, the mixture being then perfectly amalgamated with a vehicle which surrounds each particle with a continuous film will thereafter in the solidified paint film exhibit electro-chemical properties, identical with those of undiluted and naked carbon, is a matter which only investigation will prove. It is a fact that although some carbonaceous coatings are very unsatisfactory protectors of iron and steel, others have given quite good results in service. This is only one instance out of many which might be adduced in order to show that until something is proved one way or the other under conditions strictly comparable with those which obtain in practice, it is safe to preserve an open mind.

The enormous increase in the use of steel embedded in concrete has given rise to serious questionings on the part of those concerned in the erection of such work as to the most effective manner in which the steel should be protected. Some say that no protection—beyond that provided by a coating of cement—is necessary; others, again, advocate elaborate treatment of the steel before it is hidden from sight. It is well known that the alkaline nature of Portland cement renders it up to a point an efficient retarder of corrosion by reason of the inhibitive effect exerted by alkali. At the same time, the physical and mechanical properties of ordinary Portland cement are not such as render it an ideal coating for iron and steel. A solution of the difficulty might be found in treating the steelwork with a coating which, while partaking of the nature of Portland cement in so far as its inhibitive properties are concerned, shall also possess the essential feature of a paint coating, namely, adhesive power and a minimum of porosity. Obviously, the usual oil paints are out of the question here, and the problem is one which cannot be satisfactorily solved without the co-operation of the engineer and the paint manufacturer.

Fortunately, the matter has been dealt with by a body which, for obvious reasons, has every reason to secure that practical difficulty should arise to cause nervousness on the part of those who wish to employ reinforced concrete as a mode of building construction. On March 8 last the Concrete Institute discussed the draft report of the Science Standards Committee on the Rusting of Steel inside a Concrete Covering. The conclusions arrived at were as follows:—

1. Keep the concrete in close contact with the steel so as to prevent the formation of air spaces.
2. Exclude moisture from the outside.

It is open to question whether permanently close contact between the metal and the surrounding concrete can be secured by mere packing, even if the metal has been previously coated with cement. Closer and more permanent contact would in all probability be obtained by first treating the metal with a suitably prepared production coating which, while possessing the alkaline and inhibitive properties of Portland cement, should also have those mechanical properties which would enable it to adhere firmly to the metal and provide a key between the latter and the surrounding concrete.

The economic side of protecting iron and steel is one which sooner or later obtrudes itself in all discussion of a practical nature, and any survey of our subject which left this aspect untouched on would be incomplete. May I remind you that there are three factors which influence the cost of preserving structures by means of paint?

1. Cost of materials per unit of area.
2. Cost of labour per unit of area.
3. Duration of effective service.

Unless each of these three factors be taken into consideration, we cannot form a correct estimate of the real protective value of any paint. The duration of effective service is a vital consideration. Taking twenty years as a convenient figure by which to represent the average life of an iron or steel structure, we have to estimate the number of times during twenty years that the structure under consideration will have to be painted with a given paint. Evidently the figure we decide on will partake of the nature of an estimate or approximation. At the same time, the data which manufacturers of protective paints are in the habit of collecting as to the length of service of their products, taken in conjunction with the experience which engineers and architects already possess on the subject, enable a fairly reliable figure to be arrived at. We must then know the cost per gallon or per hundredweight of the paint, and the number of square yards which these quantities will cover in one coat. We must also take into consideration the average cost for labour per yard per coat throughout a period of twenty years, and we then have all the details necessary to express in a simple mathematical form what I term the "durability figure" of the paint. The higher this figure is the greater will be the "ultimate economic value" of the paint. The "durability figure" of any paint is given by the formula:—

$$D \text{ (durability figure)} = \frac{120 c}{t (12p + l)}$$

in which—

c =spreading capacity of paint in square yards per cwt.

t =estimated number of times painted in twenty years.

p =price of paint in shillings per cwt.

l =cost of labour in pence per square yard per coat.

Suppose we wish to compare the "ultimate economic value" of two paints, a and b , of which the data required are as follows:—

	a	b
c	320	540
t	5	4
p	56s.	84s.
l	2	2

By inserting these values in the equation, we find that in the case of a , $D=5.8$, and in the case of b , $D=7.7$. In other words, b is the most economical in the proportion of 7.7 : 5.8.

I should like to emphasise the point that it is bad policy to neglect or unduly postpone the repainting of iron and steel structures. All structures treated with protective coatings should be examined at frequent intervals, and any signs of damage or deterioration to the finishing coats should be dealt with at once. In this way the charge for labour in preparing the work for repainting—always a costly item—will be kept at a minimum, and at the same time the outer coat, which has to withstand the stress of "all weathers all the time," will be maintained in an efficient, that is, an impervious condition.

And now, in conclusion, may I put forward this plea? Let engineers and architects, and all who are concerned in specifying or selecting protective paints, learn to regard these products as materials of construction, which they really are, and not the least important of the integral parts of the structure; for on them the very life of the structure depends. Let them appreciate that the laws of chemistry, of physics, and of mechanics can be applied to paint films and protective

coatings just as they are applied to iron and steel and concrete. So will they gain a clearer insight into what a true protective coating ought to be and what it ought to do, and they will aid in the attainment of that which is the true consummation in commercial and industrial affairs—efficiency with economy.

INCORPORATED CHURCH BUILDING SOCIETY.

THE above Society held their annual court on Thursday, May 18, at Church House, Dean's Yard, Westminster, under the chairmanship of the Lord Bishop of St. Davids.

The ninety-third annual report records that towards the end of the year the Society lost the kindly services of one of its honorary consulting architects, Mr. C. Hodgson Fowler, who, in the year 1900, was elected a member of the committee of architects, of which he was a zealous and much-valued member. The committee of architects elected in his place Mr. Walter Tapper, a choice which was gladly confirmed by the general committee.

The committee take the opportunity of thanking the members of the committee of honorary consulting architects, who give their services ungrudgingly to the Society in the examination with so much care of the designs submitted to them at their monthly meetings.

It is stated that the "Manual of First Aid for Archidiaconal and other Inspections," by Mr. W. D. Caröe, with a preface by the Archdeacon of Ludlow, has commanded a steady sale throughout the year. It is possible that in the near future a companion publication, for which application is often made, i.e., "A Manual of First Aid for Church Building Committees," may be compiled.

Although there is a decrease of nearly 2,000*l.* in the net income for the past year compared with 1909, there are increases in such items as donations, annual subscriptions, and collections; the fall in income is principally due to the small number of legacies.

The past history of the Society shows that it has been instrumental in aiding in the erection of no less than 2,641 additional new churches, and in assisting in rebuilding, enlarging or otherwise improving the accommodation in 6,715 other churches or consecrated chapels-of-ease. By these means more than two million additional seats have been secured, far the greater part of which are for the free use of the parishioners according to law. The actual amount of money entrusted to the Society and used in making grants towards the objects named has reached 937,866*l.*

During 1910 there were thirty-eight grants towards additional new churches, amounting in all to 5,200*l.*; ten grants for churches rebuilt (1,135*l.*); fifteen grants for churches enlarged, re-arranged, &c. (2,460*l.*); and eighteen grants for mission buildings, amounting to 520*l.*

The honorary consulting architects are as follows:—W. H. Bidlake, M.A., W. D. Caröe, M.A., C. H. M. Mileham, Temple Moore, Sir C. A. Nicholson, Bart., E. S. Prior, G. H. Fellowes Prynne, J. Oldrid Scott, R. Norman Shaw, C. S. Spooner, Walter Tapper, E. P. Warren, Sir Aston Webb, C.B., R.A.

The report was adopted on the proposition of Mr. Charles S. Spooner, F.R.I.B.A., who spoke as follows:—

It is the custom for a member of the committee of consulting architects to tell the Society at the annual general court something about the work of the committee.

First, may I say that the members of it feel that a heavy responsibility rests upon them, both to the Society and also to the promoters and authors of the churches, designs for which come before them? At the same time they feel that responsibility carries with it an honourable privilege in being thus allowed to help the Church Building Society in the excellent work which it is doing. I should like to express the sorrow we all feel in the loss of Mr. Hodgson Fowler.

The work of the committee year by year is necessarily very much the same. A considerable number of plans are laid before it, and the reports that the committee have to make on these plans are nearly always criticisms of detail, often of small matters. Small matters, however, make great differences. Such criticisms are always made in a kindly spirit—I fear, sometimes, this is not realised. Criticisms are, I suppose, generally vexatious, and everyone is inclined to reply—it is easy enough to find fault, but conditions and circumstances should be considered. The members of the committee do try to do so, as far as may be, but they are, of course, ignorant of some. My experience of the criticisms and suggestions made by the committee of consulting architects on such of my own work as has been submitted to it is that they have nearly always been suggestive and helpful.

The chief duty of the committee is to see that the rules of the Society are obeyed, and when the spirit of the rules is adhered to the criticisms, if any, resolve themselves into suggestions for some small improvement in convenience or construction. It is seldom, if ever, that matters of taste are touched upon, except to commend. Very rarely the committee is obliged to say it cannot report on a design, which generally means it is so bad that the Society could not contribute or give the prestige of its implied approval. The members of the committee naturally very much dislike having to make such a report—no one wants to put any difficulty in the way of church-building; but it is, I think, questionable whether the committee is not too lenient. A large number of very poor designs receive the approval and support of the Society month by month, designs which are devoid of dignity, poor and mean in proportion and spacing, feeble, thoughtless, and feelingless in detail, and uninteresting in the use of material, and yet comply with the rules of the Society. This is, I fear, strong condemnation, but it is not too strong of a certain number of the designs which receive the Society's approval.

This matter has been referred to several times before. Mr. Micklethwaite said in 1896:—"The committee of architects tried to keep up the standard, but a committee so constituted, dealing with drawings of all sorts and quality, coming from various parts of the country, could not draw the line very tightly. They sometimes had to pass plans simply because they were not as bad as they might be. He believed, however, that they had had a considerable influence in improving the arrangements of churches and making them really fit for the holding of services."

Mr. J. Oldrid Scott, in 1901, said:—"It was a painful fact that so many of the designs submitted were without merit." Mr. Caröe, Mr. Fellowes Prynn, Mr. Hodgson Fowler, Mr. Temple Moore, Mr. Prior, Mr. Warren, and Sir Charles Nicholson have each drawn the Society's attention to this matter since then. Is it not possible that some people would feel more inclined to contribute to the funds of the Society if it could report that its influence was causing a marked improvement, and that the number of poor designs for churches to which this Society contributed was steadily decreasing?

I am not, of course, speaking of all the designs which come before the committee; some are very good indeed, and a large number good—which fact shows that there are architects who can build a good church. Now a higher standard in design does not necessitate increased expenditure, as has been pointed out from this platform several times, notably and most eloquently by Mr. Prior in 1907. I think it cannot be said too emphatically that if the rules of this Society as regards stability of building are adhered to, there is no excuse for the poor designs too often submitted. Can anything be done to raise the standard? That is a matter which needs consideration and discussion, and this is not, perhaps, the time to consider it. But if the Society feels it is desirable to make some attempt I have no doubt its committee of consulting architects could offer suggestions. May I appeal to the clergy responsible for new churches to be more careful that the architect selected shall be a man who can build a church with dignity and interest? Let that be the first consideration and not (as I fancy is sometimes the case) that he happens to be a relation or friend of someone connected with the church, or that he lives in the neighbourhood, &c.—all of which may be excellent secondary reasons—but the first should be that he can build a church of which everyone may say, without any reservation, "I was glad when they said unto me, we will go into the house of the Lord."

We have heard a good deal lately about cheap churches. The adjective is one which, I think, most reverently minded people will dislike. I cannot imagine anyone caring to describe their church as a cheap church. Cheap is almost invariably accompanied by another and unpleasant quality which is apt to appear as soon as the work has to stand the test of wear and tear. Cheap building nearly always proves to be very expensive in upkeep, and so is the reverse of economical. The Church Building Society has set a very reasonable and good standard of building. Its rules have been made by men with great experience of church finance and of church building, in consultation. They have been made with a view to securing to the subscribers an assurance that their money shall be spent wisely upon buildings which shall be substantial, durable, and properly and conveniently planned. The general advice for new churches which precedes the building rules could not, I think, be much improved in the space occupied. The rules of the Society do not allow of the cheapest ways of building. Building committees and others, including, I fear, some clergy used to the methods

of the "jerry-builder," are apt to consider our rules too stringent, especially in the matter of thick walls. At the last revision, in 1909, the Society made this rule more elastic and allowed the committee of architects greater discretion, so that now it is possible to concentrate the strength necessary in piers or buttresses with curtain walls between. The curtain walls must, of course, be substantial. This certainly allows of economical building and removes any appearance of too great stringency. I say quite deliberately that anything less than the stability and quality of building that the rules require is the reverse of economy and ought not to be allowed by authority—and anything less than the space and arrangement demanded renders a church inconvenient and unsuitable for services of the English church. I feel that if the Bishops would require that standard of stability, arrangement, and space as a condition of episcopal sanction to plans they would very greatly benefit the clergy and churchwardens of the dioceses under their charge, and save waste of money. If that should ever be the case, the question of cheap churches need not cause us much anxiety.

An absolutely plain church, without moulding or carving, may be a very noble building, if it is well built. All who entered it were tremendously impressed by Bentley's great church at Westminster when it was first opened, yet it was nothing but a great brick hall with concrete domes overhead, no ornament except a painted rood hanging over the sanctuary. The whole impressive effect was produced by fine proportion and good spacing. Of course, mere bigness is a very impressive quality, yet even that may be rendered comparatively unimpressive by poor proportions or by bad building. Now the same sort of effect can be produced in a smaller building by similar means. Costly material is unnecessary, any good, durable building "stuff" will do in competent hands. If an architect cannot produce a fine effect by means of proportion and mass, the most glorious material in the world will not enable him to do so—nay, I think it would probably hamper him; he would be tempted to show it off, and to try to hide his incapacity behind its fine qualities.

I feel that in addressing the Church Building Society one may almost unreservedly condemn the idea of cheap churches without running the risk of being misunderstood. Everyone here knows well, I am sure, and sympathises with the difficulties that the promoters of a new church experience in raising enough money to pay for it. The object of the Church Building Society is to help and encourage these people, and not to put any difficulties in their way. I am sorry to be guilty of such a platitude, but it is the only reply to certain criticisms of our rules. I am sure that one of the greatest helps the Society gives in contributing to a new church is in saving the promoters from "penny wise, pound foolish" methods of building, and in strengthening the hands of the architects to resist pressure to build too cheaply and consequently badly. Strict economy is generally necessary, and it makes it difficult, no doubt, to build a church with enough height, or with large unoccupied floor space, which is so desirable. Nevertheless, a competent architect can build a good church, even when the severest economy is necessary, provided it be well and solidly built; but no architect, however gifted he may be, can build a good cheap church.

Grants of money were made in aid of the following objects:—Building the church of St. Gabriel, Bishopwearmouth, Durham, 250*l.*; rebuilding the churches of St. James, Milton, near Portsmouth, 100*l.*; and the Bourne, St. Thomas, Surrey, 70*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Brotherton, St. Edward the Confessor, Yorks., 25*l.*; Hucclecote, St. Philip and St. James, near Gloucester, 30*l.*; Layer Marney, St. Mary-the-Virgin, Essex, 60*l.*; Mold, St. Mary, Flint, 100*l.*; and Stoke St. Milburgh, St. Milburgha, Salop, 15*l.* Grants were also made from the special mission buildings fund towards building mission churches at Caergeiliog, near Rhoscolyn, Anglesey, 30*l.*; Heathfield, Sussex, 25*l.*; and Holmer, St. Mary, near Hereford, 25*l.* The following grants were also paid for works completed:—East Cowton, All Saints, near Northallerton, 70*l.*; Birchington, All Saints, Kent, 35*l.*; Tarrant Crawford, St. Mary, Dorset, 50*l.*; and Litherland, St. Andrew, near Liverpool, 40*l.* In addition to this the sum of 90*l.* was paid towards the repairs of ten churches from trust funds held by the Society.

THE Hexham Urban Council has decided to erect ornamental gates in the Abbey grounds to commemorate Lord Allendale's gift of the Seal to the town, and a special meeting is to be held to decide upon the design and position of the gates.

THE ILLUMINATING ENGINEERING SOCIETY.

(Continued from last week.)

IT will be recalled that in the daylight and artificial illumination of a classroom at Haverstock Hill School the most striking fact brought out is the large variation in the latter from one side of the room to the other; to counteract this the two lights furthest from the window are controlled by a separate switch, so that they can be turned on to supplement the failing daylight illumination when needed. The same variation is shown, even more strikingly, in the case of the Birkbeck Institute and a classroom at the Central Technical College.

In the former case the illumination varies from thirty foot-candles down to only 0.5. In the case of the classroom at the Central Technical College there is again a very wide variation, notwithstanding the fact that the room is a high one and one entire side is devoted to window space; one cannot help observing that even when the relation of window-space to floor area is not less than the prescribed value of one-fifth, there may often be some desks which receive insufficient illumination.

In both the cases referred to the view was blocked to some extent by buildings. A complete contrast is afforded by Harrow School. The window space in these old buildings appears at first sight clearly insufficient, the more so as they are composed of heavily latticed glass. We were informed, however, that the access of daylight was considered exceptionally good, the reason being that the school stands on a hill with no surrounding obstructions.

In passing, it may be mentioned that in all the schools and institutions visited it seemed to be accepted as an invariable rule that the windows should be on the left hand of the students. The only exception was one classroom at Harrow, where the antiquity of the building is probably the explanation. Seeing that this rule is so invariably followed in the case of daylight, one is led to ask why the same precept is not adopted in the case of artificial light, and whether a general illumination with light coming from all directions is equally effective?

The following approximate figures relating to the window space per square foot of floor area in different classrooms visited may be of interest:—

School or College.	Window area per Square Foot of Floor (Approx.).
CENTRAL TECHNICAL COLLEGE.	
Classroom	0.22
WOOLWICH POLYTECHNIC.	
Classroom	0.25
Lecture theatre	0.17
BIRKBECK INSTITUTE.

Headmaster's classroom	0.15
Mathematics "	0.15
ST. PAUL'S SCHOOL.	
Classroom	0.16
CITY OF LONDON SCHOOL.	
Classroom	0.24

(Some interesting suggestions for a modification of the well-known rule, based on an abstract kindly supplied by Dr. Kerr, are added in the appendix.)

APPENDIX.

Note on the Dimensions of Windows in Schoolrooms.

(Engelbracht, "Zentralblatt der Bauverwaltung," No. 52; "Kleinere Mitteilungen in Zeitschrift für Schulgesundheitspflege," xxiv. i., Jan. 1911.)

Hitherto the rule has been followed that the window area in schoolrooms should be one-fifth of the floor area. This fraction of one-fifth, derived from practical experience, applies more especially to class-rooms in which the depth of the room from the window is about 6 metres.

When one considers that the intensity of the light derived diminishes with the square of the distance, it is evident that rooms of greater depth than the above tend to be under-lighted, while those of smaller depth may receive an excessive amount of light.

Engelbracht has therefore developed a simple formula of useful application in such cases, namely

$$f = \frac{F}{5} \cdot \frac{t^2}{36}$$

where f = window area in square metres.
" F = floor " "
" t = depth of classroom in "

TABLE V.—ILLUMINATION DATA OF COLLEGES AND INSTITUTIONS.

	Linolite (for blackboard)	300				
Laboratory (physics)	Tungsten (opal shades)	650	0.6	—	{ centre 3.5 side 1.2	—
SOUTH-WESTERN POLYTECHNIC.						
Lecture theatre (Electrical Engineering)	4 Inverted arcs (white ceiling)	1,200	1.2	3.5	2.3-8	2.2
Lecture theatre (Mechanical Engineering)	4 Enclosed arcs	1,000	0.8	2.5	3.4	6.2
Drawing office	Carbon (enamelled shades)	1,800	2.0	4	4	0.6-1.0
WOOLWICH POLYTECHNIC.						
Lecture theatre... ..	Linolite (screened)	810	1.3	0.7-0.8	0.8-1.3	2.8-3.0
	Carbon	180				
	Linolite (for blackboard)	540				
Classroom	Tungsten (cardboard shades)	252	.94	2.4	2.8-4.4	0.8-2
	Linolite (for blackboard)	180				

From this formula it follows that

$$\begin{aligned} \text{with a depth of 7 metres, } f &= \frac{54}{5} \cdot \frac{7^2}{36} = 14.7 \text{ sq. m., roughly } \frac{1}{4} \text{ F.} \\ \text{,, ,, ,, 6 ,, } f &= \frac{54}{5} \cdot \frac{6^2}{36} = 10.8 \text{ ,, ,, } \frac{1}{5} \text{ F.} \\ \text{,, ,, ,, 5 ,, } f &= \frac{54}{5} \cdot \frac{5^2}{36} = 7.5 \text{ ,, ,, } \frac{1}{7} \text{ F.} \\ \text{,, ,, ,, 4 ,, } f &= \frac{54}{5} \cdot \frac{4^2}{36} = 4.8 \text{ ,, ,, } \frac{1}{11} \text{ F.} \end{aligned}$$

It will therefore be seen that on this estimation classrooms having a depth of about 7 to 8 metres will in general be completely under-lighted by the application of the rule referred to. On the other hand, in rooms of less than 6 metres depth needlessly large windows would be provided. According to researches undertaken in the Hanover district, Engelbracht's formula appears to have led to very consistently satisfactory results.

Mr. R. J. WALLIS-JONES, referring to the communication of Messrs. Gaster and Dow, said it would, in his opinion, add considerably to the value of the data given as to the illumination of various schools if the authors could also state the colouring of the walls of the rooms. He had found that walls distempered a light green tint resembling the colour of a heron's egg not only gave a good illuminating effect, but also had a restful tendency. He would like to know if the observations of illumination in foot-candles were measured by one observer only. He had recently obtained very good results in high classrooms by using Holophane "arc" fittings, i.e. metal filament lamps frosted with individual Holophane shades, several of which were grouped in a cluster beneath a Holophane dish of large diameter. With regard to blackboard lighting, he agreed with some of the speakers that a blackboard should be treated in the same way as a stage or picture, that is to say, the board itself should be illuminated with the source of illumination totally hidden from the students in the class. He also advocated that where incandescent electric lamps in classrooms were fixed within the range of vision, they should in all cases be frosted so that no portion of the filament is visible.

Mr. F. W. GOODENOUGH (Gas Light and Coke Company) said all the members of the Society would agree with him that they were very much indebted to Doctors Kerr and Harman for their valuable contributions on this subject. With Dr. Kerr's paper he was not concerned, because it dealt with daylight illumination, and naturally he preferred that daylight illumination should be as limited as possible. In his opinion, a discussion of this character helped to prove the value of the Society, and so far as practical results issued from the discussion, the reputation of the Society would be considerably enhanced if they could arrive at a standard illumination for various types of schoolrooms, lecture halls, and so forth. Such a work would be of very great value to the community at large. The standard of illumination mentioned by Dr. Harman as having been given by Sir H. Halford seemed rather out of date at the present time; we wanted a better illumination nowadays than one which enabled us to see the ace of clubs. Dr. Harman's remark that the naked jet was fast vanishing he thought was a reflection upon the enterprise of the British nation. Eight years ago he visited all the principal Continental cities to investigate systems of street and other illumination, and the most prominent thing which struck him during his inquiries was the entire absence at that date of the naked jet on the Continent, whilst we in this country were still using about 50 per cent. of naked lights instead of incandescent mantles. Two or three years after that he had occasion to approach the War Office on the subject of the illumination of barracks, many of which were still lighted with naked burners, and he received the very characteristic reply that the subject of incandescent lighting had been under consideration for some years, and that the War Office were thinking of taking action in the matter. He would only say to everyone concerned in the lighting of scholastic establishments that the sooner the naked jet became as absolutely unknown in this country as it was on the Continent, the better for everyone.

He now wished to join issue with Dr. Harman on the question of inverted burners. Dr. Harman said in his paper that the one sole advantage of the inverted burner was the absence of shadow below the light, but he did not think Dr. Harman had obtained all the information that he might have on the question of the relative efficiency of the inverted and upright burner. Careful tests showed that at least 33½ per cent. more light per cubic foot of gas used could be

obtained from an inverted burner compared with an upright burner, which was, of course, a very substantial advantage of the one over the other.

(To be continued.)

[The Editor will not be responsible for the opinion expressed by Correspondents.]

The Crystal Palace.

SIR,—A false impression has been created, due mainly to the inferences of two of your morning contemporaries in incorrectly allocating the authorship of the Crystal Palace Empire in Miniature idea. This misconception is likely to cause some confusion in connection with the work and very much wider sphere of the Homes and Grounds of Empire project, contemplated for several years past, of which the Festival of Empire Exhibition is a result, and forms with it leading features an All Red route, and its governing characteristics an extensive part of the original and future plan. Will you allow me through *The Architect and Contract Reporter* to foreshadow the very excellent prospect of the Crystal Palace as a permanent Exhibition Empire centre being discussed at the Imperial Conference? This probably will arise through the introduction to notice of the proposition "That the Crystal Palace and grounds (when acquired at a market valuation) should constitute London's gift to the Empire, to be maintained at the expense and by the joint control of the Parliaments in the King's dominions for expositions of Empire in perpetuity." It has, Sir, been ascertained that there is a remarkable unanimity of opinion among Liberal, Conservative, and Labour politicians and public men throughout the Empire favouring the Crystal Palace becoming the corporate property of the Empire, supported also by London borough councils and many members of the London County Council and City Corporation.—I am, Sir, yours truly,

W. A. BAYST.

Woodford Green.

Edinburgh Theatre Fire.

SIR,—This sad catastrophe carried with it a lesson that is in danger of being overlooked, hence this letter. The Press and the manager of the hall have made it clear that the safety curtain helped most materially in the fortunate escape of the entire audience. That curtain was made 19 years ago by John Stones, Ltd., of Ulverston, and is composed of an angle tee iron frame covered back and front with corrugated steel, and the 5 inch cavity filled with the best light and durable non-conducting material available.

Unfortunately in later years, influenced partly by fashion, partly by the greater ease with which it can be manipulated, partly by the convenience with which it can be fixed in position, and partly, perhaps, by the lower price, the woven asbestos curtain has in far too many cases been adopted. Its advantages as set out above are more than counter-balanced by the fact that (contrary to popular opinion) asbestos is a good conductor of heat, and at a fire of any magnitude will practically soon be as hot at the one side as the other; it is easily torn, say, by the falling of scenery or other debris, and even where kept taut by a heavy roller the draught of a fire causes it to sag at the sides until it ceases to be an effective barrier.

As an old volunteer fireman, I have seen both these classes of curtain in use at actual fires, also Gardiner's Patent which was supplied in use at actual fires, also Gardiner's Patent which was supplied with water in place of non-conducting material, and which acted quite well, but proved inconvenient to maintain so far as the supply of water was concerned, and I venture to hope that the lessons of experience will cause the Stones curtain to be used in preference to the other kinds.

Should it be said that I am influenced by the fact that I am chairman of John Stones, Ltd., may I say that I am also chairman of Seaman & Co., Ltd., of Stockton-on-Tees, who have made and supplied dozens of asbestos curtains?—Yours faithfully,

C. J. SEAMAN.

FORTHCOMING EVENTS.

Wednesday, June 7.
Concrete Institute : Summer Meeting (1) Paper by Professor Beresford Pite on "The Aesthetic Treatment of Concrete"; (2) Visit to the Wesleyan Memorial Hall; (3) Annual Dinner.
Thursday, June 8.
Concrete Institute : Summer Meeting (2nd day) (1) Mr. Alfred E. Corbett on "The Y.M.C.A. Building at Manchester," and Discussion on a Report of the Reinforced Concrete Practice Standing Committee on "The Standardisation of Drawings of Reinforced Concrete Work"; (2) Visit to Wharf and Warehouse in London Dock; (3) Conversazione in the R.I.B.A. Galleries.
Saturday, June 10.
Edinburgh Architectural Association : Proposed Joint Visit to Glasgow with the Glasgow Institute of Architects.
Institution of Municipal Engineers : Visit to the Works of Messrs. Aveling & Porter, Ltd., Rochester.
Northern Architectural Association : Visit to Sunderland.

ROMFORD GARDEN SUBURB.

THE marvellous exhibition which was opened yesterday at Gidea Park, an eastern adjunct of Romford in Essex, is the most remarkable object lesson on modern domestic architecture that has ever been offered to the British public. True that some of the houses are still unfinished, as in our previous notice we anticipated would be the case, but these are of little moment. There is more than enough to occupy the careful attention of the visitor for not one but many inspections.

As most of the houses have been built in accordance with the conditions of a competition which called for two classes of house, first, a detached house, to cost 500*l.*, second, a detached cottage, to cost 375*l.*, the exhibition at Gidea Park is that of the class of residence that has, up to now, been left to the speculating builder, and destitute of all architectural skill save that of the builder's son who has spent a winter session at a Polytechnic architectural department.

At Gidea Park the up-to-date architect has met the jerry-builder on his own ground and licked him into a crooked hat. Cheapness and a certain amount of meretricious show, mahogany handrails, and tiled hearths have been the strong point of the jerry-builder's monotonous row of ditto, ditto houses. At Gidea Park our modern architects have provided for the money the same amount of accommodation that the jerry-builder has offered, but with a separate individuality for each house or cottage and an artistic character that the jerry-builder and his Polytechnic or School of Art designer could never attain.

We are to-day face to face with a remarkable revolution in domestic architecture. In the days of POPE and ADDISON this class of building was the domain of the dilettante who as the lesson of his grand tour was imbued with the classicality and the stateliness of the Palazzi of Italy. In the Victorian Era the prominent architects of houses had for the most part clients who could afford to spend their 10,000*l.* or 20,000*l.* on their homes. To-day architects of great ability and high artistic skill are ready to work for the man who cannot afford more than 500*l.* or even 375*l.* for his house.

No one in future need live in a speculating builder's house, one of a hundred all alike, equally bad in arrangement, in construction, and in lack of beauty. Every man can have a house, individual in character, suited to his own requirements, beautiful and well designed by a capable architect, who will give him as good value for his hundreds as his richer compatriot can obtain for his thousands. This is the lesson that is taught by the Romford Garden Suburb exhibition.

Turning from the public point of view to the technical, we have some highly interesting solutions of the problem

of planning a very small house. The keener spirits amongst the designers of the houses that have been built on the Gidea Park estate have realised that the small house or cottage should be built to live in and not to entertain. Hence the "reception rooms" of the house-agent who is trying to let or sell the productions of the jerry-builder have given way to the "living rooms" of the up-to-date architect. The man who can afford only a small house does not want to entertain on a grand scale at home. He can do that far better at a restaurant. He wants a good room in which he and his family can live their daily life, the "keeping room" of East Anglian parlance, which naturally occurs to us in connection with a garden suburb in Essex. He also wants what the Americans call a "den," a small room in which he can read, write, or see a visitor for a quiet and private chat.

In class I., the 500*l.* house, some of the architects have made the mistake of providing a dining-room and drawing-room rather than the wiser arrangement of a large living room and small hall or study such as that in the house by Messrs. BARRY PARKER & RAYMOND UNWIN, No. 41 in Heath Drive, although this is not for competition. Somewhat of the same idea dominates the plan of No. 239 in Reed Pond Walk, also by Messrs. BARRY PARKER & RAYMOND UNWIN, which is for competition in class I., that is, the cost of building does not exceed 500*l.* Here the living-room and the hall or study can be thrown into one or can be separated into two distinct apartments. This is not quite ideal because the small room ought to be permanently distinct. It would be awkward, for example, if a visitor whom the master or mistress desired to see privately called when the two rooms happened to be in use as one, and had to wait whilst a busy re-arrangement of doors and partitions was accomplished.

A closer approach to what we consider the ideal plan of a very small house is seen in No. 227 and No. 228, Reed Pond Walk, for both of which Mr. C. M. CRICKMER is the architect. He calls his small rooms "dining-rooms," but as the sizes are 12 feet by 10 feet and 12 feet by 11 feet they are a little wee for dining. Mr. CECIL A. SHARP calls his rooms "living-room" and "boudoir" in the house No. 229 Reed Pond Walk, which is getting still closer to the right thing. Mr. BAILLIE SCOTT, in a clever plan of No. 232 Reed Pond Walk, has arranged living-room, parlour, and dining-room *en suite*, with wide openings between, so that the three can be thrown into one or sub-divided in a variety of combinations. By the way, we were fortunate in inspecting this house before lunch. We should not like to traverse the first floor corridor after a dinner with a City Company or a Masonic Lodge, or even after the wind-up of a day on the golf

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB,

CHIMNEY-STACK AT PENSURST, KENT.—From a Drawing by "Plato."

links, which are a feature of the Romford Garden Suburb. Another point of plan which is worthy of especial notice in the very small house is the relation of kitchen and scullery. The wisest arrangement seems to be to make the scullery merely an alcove adjunct to the kitchen, or even in the case of the 375l. cottage, to have a scullery only but with a cooking range in it. One must remember that there is a vital difference between the manner of life of an artisan and of the probable tenant of a 375l. house in a garden suburb. The artisan lives in his kitchen, the garden suburbanite does not. Possibly he does not keep a servant who lives in but is content with a daily worker who, as the Americans say, does "chores," and who does not want a sitting-room, as she works, or is supposed to, all the time she is in the house and then goes home. One point must not be forgotten, that in the very small house it is important for the scullery to be close to the dining place. We do not say dining-room, for meals may be taken in a distinct portion of the "keeping-room."

Such are some of the problems that have been faced in various ways by the architects who have designed the houses now on exhibition at Gidea Park, and who have given to their solution an amount of thought passing the comprehension of the smartest jerry-builder who ever sold a box of bad bricks and rotten mortar at less than cost price for the sake of an improved ground rent.

The solutions of these problems may be seen in "The book of the Exhibition of Houses and Cottages, Romford Garden Suburb, Gidea Park," which is the catalogue fully illustrated, of the exhibition opened yesterday, but the full effect of the planning and other manifestations of architectural skill can only be obtained by a visit to Gidea Park. One should not forget to mention that the Romford possesses much of historical and antiquarian interest, of which a pleasantly written account is given in the book.

There are also a number of opinions and epigrams by various well-known people, of which perhaps the most valuable are those of Sir FREDERICK TREVES, who amongst many useful criticisms, says: "One occasionally sees a medley of building material employed in the construction of single houses. In one such house I noticed Bath stone, red brick, tile hanging, half-timber work, and rough cast. This is surely undesirable, as is also imitation building material illustrated by plaster so treated and painted as to imitate half-timber work. The production of such mimicry would not deceive a child of six, and would spoil any house however well designed." Sir FREDERICK has put his finger upon the appendicitis of modern domestic architecture, the inflammatory exaltation of material, of which amongst much that is excellent there are some examples at Gidea Park.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

CHIMNEYS AT HAMPTON COURT.—From a Drawing by "PLATO."

POSSIBLY no other building affords better or more varied examples of the external treatment of chimney stacks than Hampton Court. The Palace, as is well known, originated with Cardinal Wolsey, who in 1515 acquired the land on a lease for 99 years and lost no time in erecting a most magnificent edifice. Wren, in later years, pulled down a great part of it and rebuilt on a large scale.

THE A.A. PLAY.

FOUR years ago *The Purple Patch* devoted its sixth Spasm to a play, or architectural extravaganza, christened "Putting the Best Face Upon It." For 1911 the promoters decided to repeat this success, trusting no doubt to shortness of memory on the part of such of their audience who might have been present before. The performance is, however, preceded by a curtain raiser, laid in the A.A. Council chamber, which has been written to show "the inherent inability to conduct a committee common amongst most of the members of the artistic professions," and to suggest the reasons for reviving the production which follows. It would appear that the lack of business training exemplified by the rather chaotic meeting of this A.A. Play Committee is only one of the many obstacles confronting these high priests of the drama. They lack sufficient encouragement, or rather sufficient funds; they have little idea and no agreement about possible subjects for a new play; there is an undercurrent of animosity against some of the habitual actors, and time is getting short. In consequence of all this little progress is made towards the A.A. Play for 1911, until the much-harassed A.A. Secretary (Mr. Cleek) proposes that an old one should be revived. Such an easy escape out of the difficulty is welcomed by all; and thus it was that they came to adapt "Putting the Best Face Upon It."

The stage is set to show a nearly completed villa just outside Rome, of the Middle Roman Empire, and the scenery reveals the fountain head of twentieth-century garden city architecture. The prologue explains that a Classic setting was chosen because architects have to obey the fashionable demand for Classic. Besides, "our modern clothes would ill become a comic opera writ in lightest vein." But the play combines both mystery play and masque, Greek tragedy and musical comedy.

The Purple Patch, as Prologus, quickly puts us into possession of the necessary facts and introduces the characters. "The Architect" is engaged on a veritable labour of love, for after a few visits from his client Saccharissa, fair, sweet, and twenty, he lost his heart to her in spite of insistent demands for cupboards and hot water everywhere. "The Builder," a prosperous man who makes his 10 per cent. or more on every job, had his dull soul inflamed at sight of the maid, too. Hence, he and the architect have come to regard each other with more than usual enmity. The Purple Patch has been asked by Saccharissa to act as assessor concerning the respective merits of these two worthy representatives of Art and Business, both of whom have by letter proposed to her.

Being the dinner-hour, the workmen are caught enjoying a little well-earned rest. How well earned no one knows better than they do, and their daily labours are thus described:—

We comes late to the job in the morning,
And we knocks off work long before night;
We sleeps in all kinds of positions,
Except when the foreman's in sight.

We are the masons and plasterers,
We do the plumbing and paint;
We are the brickies and labourers,
But we all think John Burns is a saint.

We plays with putty and plaster,
Gently we lays a few bricks;
The Union won't let us go faster,
And gets us more ha'pence than kicks.

We are building this house as a favour,
The hours between bricks to beguile;
So we've put on our nicest behaviour,
Though we hardly approve of the style.

Their employer, the builder, however, proves to be scarcely more reliable in his ideas upon honest work. For he declares his undying hatred for that ensanguined varlet and man of drains, the local sanitary inspector, as well as of all architects who spoil profits and costs increase.

In contrast to the builder is the earnest architect, who pursues his labours with so little encouragement and amidst so many distractions. One such he thus relates:—

A Town Hall I've built 's just completed;
Some hundreds were asked, I am told,
To a luncheon and duly repleted,
Whilst I was left out in the cold.
There were toasts of unusual dryness,
And the Mayor gave the Prince a gold key,
Taking care to conceal from his highness
The fact it was paid for by me.

It is included in five per cent.,
A key is designed and sent;
And then if they ask it,
A nice golden casket
Is thrown in for five per cent.

Fortunately the assessor is by, and awards generous marks in his favour.

But the villainies of the builder are exposed more fully by his pessimistic foreman, who reveals how he built a cheap cottage at a garden city for 149l. 19s. 11½d. without the drains. There the builder had been much troubled by the difficulty of erecting the chimney-stack, more especially as according to the plans it rested on nothing at all. By a worthy inspiration it occurred to him to make the stack of good stout cardboard, bound at the edges with stamp paper, and nailed to the roof timbers, the final touches being given by a little bit of compo and a dash of red. In doing this he considered he was following the young architect's instructions to encourage any of the workmen who showed a leaning towards individuality and a return to the old crafty methods. When laying the drains no less resourceful economy was brought into play. First a trench was dug, into which a long scaffold pole was placed; this was covered with good stiff clay, and after a couple of days the pole was withdrawn. Nemesis was close at hand, however; though it was not the builder who suffered. To act as a decoy the foreman was told to live in the cottage during the exhibition. He and his wife were sorely tried by the patent combination range and sink, and by the combination plan.

Unluckily, The Purple Patch proves a somewhat erratic assessor, and is absent while this and other damaging evidence is being given against the builder. Indeed, on various occasions he shows himself gullible by the latter, especially when, distraught by the uncertainty as to his acceptance or refusal by Saccharissa, the builder makes many wild promises of (at any rate temporary) amendment. For instance, he says that "Should she but condescend my suit to grant, a house I'll build for her of rare design, which shall be solid, free from damp, with drains of such surpassing beauty, they shall please the most exacting."

Architect and builder have at least one thing in common, and that is a tragic knowledge of the hardness of the times. The architect can say:—

There was a time in days of old
When builders made their weight in gold
And always did what they were told,
And paid out proper wages.

When clients dropped off trees like plums,
And contracts ran to gorgeous sums,
And Rome had then no horrid slums
And bricks were ten a penny.

And builders then were quite content
With something less than ten per cent.,
And no one borrowed, no one lent,
For one and all had plenty.

But this recital does not bring any addition to his marks, and the assessor leaves to consult with Saccharissa as their score is even. He returns and tells the lovers—

She felt your claims were both so just,
As level as could be,
That in the end she felt she must
Decide to marry me.

The caste for the curtain raiser, which was likewise no less than the principals helping to provide an amusing evening's entertainment.

The caste for the curtain raiser, which was likewise written by *The Purple Patch*, was as follows:—

"Mr. Clappit," Mr. Clapham; "Mr. Carveup," Mr. Carvill; "Mr. Scaley," Mr. Dakers; "Mr. Pilkington,"

Mr. Smithers; "Mr. Shovel" (Hon. Secretary Play Committee), Mr. Scott; "Mr. B. Ginner" (Pupil in A.A. De School), Mr. Boutcher; "Mr. Cleek" (Secretary A.A.), Mr. Wontner Smith; "Mr. Burbury" (Assistant Secretary A.A.), Mr. Yerbury; and "Mrs. Ronuk" (charwoman), Mr. Kennedy Smith.

The *dramatis personæ* of "Putting the Best Face Upon It" was:—

The Builder, Mr. W. S. Dakers; his Foreman, Mr. J. Dare Clapham; his Chauffeur, Mr. W. O. Langbein, junr., the Architect, Mr. C. Wontner Smith; his Clerk of Works, Mr. J. B. Scott; his pupil, Mr. Alec Smithers; The Purple Patch (acting as assessor), Mr. G. B. Carvill; with a chorus of bricklayers, carpenters, plumbers, &c.

The music was composed by Mr. Claude Kelly, and the orchestra played under the direction of Mr. Harold Lock.

The programme mentioned that "Mr. J. B. Scott" entirely to blame for the scenery."

THE SOCIETY OF ARCHITECTS.

(Concluded from page 319.)

Ward Blocks.

RIGHT and left of the administrative block are the ward blocks, each not more than two storeys in height and connected on the ground floor only by a broad corridor although a connecting subway is useful, if it is not entirely necessary. There are differences of opinion upon that matter.

The ward blocks should be so spaced that the distance between them is not less than one and a half to twice the height of the blocks. This minimum distance is, I am afraid, not often attained even in some of the finest hospitals especially those in urban centres.

Those responsible for the choice of sites have too often an indefinite idea as to the area required. In the case of King's College, I believe they were advised (not by an architect) that the area required was one acre to every 5 patients. That should be sufficient for ward blocks and administrative offices; but they did not add any additional ground for the large out-patients' department, medical school, &c., and I imagine the same thing happened at Manchester. Once again we have to acknowledge that they manage these things much better on the Continent. Ample space is seldom wanting in French or German hospitals.

We have noted that sunlight and air are the two most important factors in the cure of sickness and disease. These are best secured by adopting the pavilion form of ward and placing the axis approximately N. and S. The east and south walls are thus all exposed more or less to its rays at some period of the day, and every bed-place along the walls has the benefit of sunshine.

I do not know whether anyone has as yet dealt with the relative value of direct and diffused light in sickness, but definite information on the subject will some day have a material effect upon the planning of wards. One gathers that direct sun's rays are the more powerful agent; yet south light, which, owing to the altitude of the sun, penetrates the building to a much shorter distance than east or west, is commonly regarded as the most valuable. We always try to get a good south window into the ward. This is not always obvious in view of the fact that it is a common practice to build wards of exactly the same pattern on both sides of a central corridor, so that the end window in one case faces due north.

Coming now to the internal planning of the ward block or unit, I should remind you that the usual number of patients varies from 24 to 32. The smaller number is more commonly adopted at the present day. The large number was reckoned as the maximum which could be efficiently looked after by a ward sister and her complement of nurses. As in every department of life our work nowadays is more complicated and makes greater demands upon those who serve, it has been found necessary to reduce this number to about 24 as a maximum.

Of this number 18 to 22 may be placed in the main ward, the remainder being distributed in small one- and two-bed wards adjoining.

The dimensions of the wards are necessarily determined by the area and cubic space required by the patients. Apart from fever hospitals, that varies according to the views of different authorities and circumstances. One thousand to 1,200 cubic feet is, I think, the minimum that should be provided in a general hospital, although in the purer and fresher air of the country, seven or eight hundred is really enough if more cannot be afforded. In the latest hospitals, this amount

is largely increased. In the new King's College Hospital as much as 1,580 feet will be provided.

Taking 1,200 as the minimum and the height of the wards as 12 feet, it would allow 100 square feet of area per bed. Twenty-four feet used to be considered a sufficient width for wards, but 26 feet is more general now. They are at times made even wider; but, I think, it is quite unnecessary. With a width of 26 feet each bed would have a wall space of 7 feet 6 inches, which is quite sufficient for most purposes.

It is usual to keep the head of the bed at least 6 inches away from the wall, and this allows a width of 12 feet in the centre for stoves, tables, &c.

Stoves with open fires should always be placed along the axis of the ward; one fire to each 700 feet is enough if hot-water pipes are provided in addition for really cold weather. The question as to central or descending flues is one mainly of appearance. One great advantage of central flues is that we are able to obtain good extraction flues for ventilation alongside the smoke flues.

There are several makes of stoves on the market suitable for wards, but they are not so often used as certain popular and widely-advertised forms constructed mainly in iron and as unsuitable for the purpose as it is possible to be. The best stoves can be and are constructed entirely in brick or concrete, excepting only the grate.

Ward windows have been the subject of much controversy, and the most useful form is a combination of sliding sashes and ventilating hopper.

Great ingenuity has been expended in trying to obviate the obvious disadvantages this window possesses in the way of beads, internal angles, &c.; such, for instance, as making the sashes work in a groove and building the frames flush with the internal surface. But none of them touch the real objection, *i.e.*, the hidden parts of the casement frame. This is very typical of so many so-called sanitary improvements in fittings; all the surfaces and parts open to view are improved and simplified, but those out of sight are ignored.

A short time ago a manufacturer brought me what he considered a new and improved form of inlet ventilator. He showed it to me with unconcealed self-satisfaction and with an air of having brought me the thing for which I and others engaged in hospital work have been vainly seeking. He pointed out the plain enamelled surface of the front devoid of mouldings and projecting hinges (when shut). I think he was grieved when I pointed out that the internal parts exhibited enough angles, wheels, and undesirable areas to harbour any amount of dust and dirt. I mention this because it is so very typical of the principle that when the eye does not see the heart need not worry.

Returning to the subject of windows, it cannot be disputed that some form of casement in solid frames is really the best from this point of view. My personal preference is for a modification of what is known as the Middlesex window, because it was first used at the Middlesex Hospital. At Charing Cross Hospital each window consists of a number of casements hung on centres and closing one upon the other. They are made in teak. At the Women's Hospital, Plaistow, they are made in steel; and this is undeniably the best material.

If I were to deal with all the details of construction of a hospital ward there would be room in this paper for nothing else; and I must content myself with reminding you that the floors should be of solid fire-resisting construction and covered with a non-absorbent, and, if possible, jointless material.

Almost as important as the plan is the section of the ward block. Always bearing in mind that the more sun and air we get in and around the ward the better, it is well in the first place that it should not be overshadowed by other buildings, and, in the second, that impediments to free circulation of air should be avoided.

Tollet, with a logical thoroughness which is truly French, placed his ward blocks on stilts, so that the air should have free passage under as well as around. Recollect that the atmosphere is continually in motion, continually passing up and down, continually being purified and revived in its motion. Check that motion, which is, after all, the essence of life, and it begins to stagnate. Tollet made the mistake, however, of raising his building too high, but only because the administration—forgetting the principle he had in view—found the space beneath the wards adaptable for enclosure as stores, &c. A height of from four to five feet only would prevent this, and still be sufficient to allow the free passage of air. Much less height would render the space difficult to keep clean.

The section of Tollet's wards is very striking. It is practically a Gothic arch; and the centre is not less than 26 feet above the floor line. It provides an enormous volume of air

in the ward; but inasmuch as experiments have shown that there is little movement in air of a room at a greater height than 12 feet, it seems excessive. An elliptical section rising to a height of 14 feet is effective; and I am told that the ward I built of that section at Charing Cross Hospital is the best ventilated of all of them, and the one in which it is easiest to maintain an even temperature at all times. Obviously it prevents a violent deflection of the air entering the wards at the upper parts of the windows and ventilating inlets, and eases the passage of air up to the extract flues in the roof.

We will now consider the ward adjuncts.

Bath Rooms and Lavatories.

The position of bath rooms, lavatories, and conveniences varies in practice, but it is most usual to place what are quaintly called sanitary towers at the extreme end of the wards jutting out at the corners. I do not think it an ideal position, because, for one thing, it is just at those points that we are able to get the most and best sunlight which these towers necessarily block out.

Mr. Aldwinckle, at the Brook Hospital, placed these offices in a tower leading out of the centre of the ward, and this plan has its advantages from some points of view; but, on the whole, it seems that a better position (especially in a short ward) is at the lower end of the ward adjoining the ward kitchens, &c. This leaves almost all the outer wall surface and windows of the ward itself exposed to the sun without interruption.

It is most usual to place the baths in one of the towers, but this is, I venture to think, entirely unnecessary from a sanitary point of view; and they are more conveniently placed adjoining the kitchen and offices. In this way it is possible to make the towers of small dimensions—a matter of great importance, in view of the obstruction they form to the light and air of other parts.

For this reason too, and another, it is better to put the ward conveniences in one tower and the nurses' sink room in another. The other reason is that the nurses' work (at best not the most pleasant) is rendered easier and more agreeable. The special convenience for the use of nurses may also be well placed in the sink-room tower. It should contain separate sinks respectively for emptying and cleaning bed-pans without unnecessary handling; and also a long, wide, and shallow sink for washing mackintoshes. Also a small cupboard for preserving specimens of excreta for examination. This can be well placed in the thickness of the outer wall, and it should be thoroughly ventilated.

These towers are separated by cross-ventilated lobbies from the ward.

The air which is abstracted from the ward by open fires and flues must be replenished from the outside; and it will be drawn most freely through the openings which offer the least resistance to its passage. That may easily happen to be through the sanitary annexes; and it is of course the function of the cross-ventilated lobby between the annexe and the ward to obviate this. Care must be taken that this lobby is not a mere flue between them, and that can only be done by making the passage of air in the lobbies easier than in the annexe. It is possible to make the extracting power of the annexe stronger than that in the wards, so that the draught is away from, rather than towards, the wards.

Although I do not propose to deal at any length with the question of ventilation, I must state the general principles as applied to wards, because it has a bearing on the particular form of the pavilion block.

In the first place, I think it is not unknown that I abjure all forms of mechanical ventilation, and it is with no little satisfaction that I find that medical men as a rule are emphatic in their preference for what we call natural ventilation. Ample and efficient ventilation can be secured in this country by means of open windows and air inlets.

In the treatment of consumption it has been found that unlimited fresh air is one of the most important factors; and it is now recognised that it is equally valuable for every other disease. I think it is not too much to say that even the doubtful freshness and cleanliness of the air in cities is better in excess rather than in small quantities. In other words, have plenty of air in the wards, clean and fresh if you can, but if you cannot, at any rate have as much as you can of the best available supply. I am not suggesting that air is not best when cleansed of all dust and dirt, but until we can secure this by more simple means than machinery and long dark flues, we are better off as we are.

In most mechanical schemes the engineer cannot resist the opportunity of combining the heating with ventilation, *i.e.*, by delivering the air into the wards warmed. Those who can

enjoy and thrive in warm air love also sterilised water and other lifeless things. The majority of us prefer and thrive better on air and water as Nature supplies them.

In placing the windows directly opposite one another we can at most times get a gentle flow of air from one side to the other. This is the case even on the stillest day, because the temperature on any one side of a building is always greater or less than on the others, and as we know movement of air is caused entirely by the differences in temperature.

In rough or cold weather we have to rely more or less on the inlet flues which are placed—one to each bed—in the outer walls. They discharge into the ward about three to four feet below the ceiling level.

A little air may also be introduced at the floor level, the inlets being so placed that it impinges on and is slightly warmed by the radiators or hot-water pipes. This helps the general circulation of the air. An inlet or inlets may also be placed with advantage in connection with the central heating stoves.

Very important is the provision for extracting the foul air which is given off by the patients. The most powerful agent in this direction is the open stove, but strong extraction flues at the ceiling level are of equal importance, and an induced current is valuable.

The golden rule is to have plenty of air, fresh and cold, but not too cold for reasonable comfort, and to keep it gently moving.

Day Rooms.

Day rooms for patients cannot be considered essential, but they are desirable. They are most often placed adjoining the kitchen and separation wards, where they can be kept under better observation by the staff. Much, however, may be said in favour of placing them at the extreme end of the ward, where, with abundance of window space, they form veritable sun rooms. It is desirable that they should have conveniences adjoining. (You may see by reference to the plan of Willesden Infirmary, that I placed the day rooms in this position, and that the sanitary towers are so placed as to serve them as well as the sick wards.)

Scullery.

The ward kitchen or scullery is an essential part of the ward unit. It need not be large if the door and window fittings are conveniently placed. A deep sink is provided with drainer boards and plate-rack. Also a small cooking stove—preferably a gas range—for keeping food hot.

Separation Rooms.

One or two small rooms are very desirable to accommodate noisy patients or those for whom absolute quiet is essential. In a large hospital it is usual to provide one such room for two patients and two for one each.

Linen Store, &c.

To complete the ward unit we require a linen store room, broom cupboard, patients' own clothing room, and a small pantry.

For these space can be economised by providing a small cupboard in the outer wall of the scullery for food storage; cupboards along one side of the passage leading to the ward for linen, &c., and a cupboard in the kitchen for brooms, pails, &c. I prefer that the latter should not be placed in a closed space at all. They can be neatly hung on the wall of the kitchen. Cupboards are so handy for hiding dirty things.

Patients' own clothes should, however, be placed in a small room fitted with steel lockers, pegs, &c.

Ward Sister's Room.

In large hospitals a room is generally provided for the special use of the ward sister, but it should be in no sense a sitting or bed room. It should be more in the nature of an office.

The life of a nurse, as I have said, is very hard, and indeed only the strongest women can undertake it. Every consideration possible should be shown to them, and ample opportunity for rest and recreation, but not in or about the wards. We may hope one day to reduce their working hours to eight, and then we shall be able to employ many who have every virtue and capability for the work, but are now prevented from following the vocation by lack of the necessary physical strength.

Staircase and Lift.

If the ward block is of more than one storey, a staircase and lift is of course necessary.

The stairs should not be less than four feet in width and

with an easy rise, say 6½ inches, with an 11-inch tread. No winders should be allowed.

The lift should be large enough to hold a bed and two nurses or attendants.

It is desirable that the staircase should be cut off by a corridor or cross-ventilated lobby from the wards and adjuncts, so that the air from the lower ward may not be able to ascend to the one above.

Conclusion.

I fear I have treated this very large subject in a very inadequate manner, and in condensing my description I have omitted many matters of importance, but I may at least claim this virtue for the shortness of my paper, that it leaves time for discussion, which is, after all, the essence of these meetings.

Mr. Saxon Snell concluded the lecture by pointing out the special features of the plans exhibited, many of which had been lent by distinguished architects who have made a special study of these institutions.

Mr. H. FREYBERG, in proposing a vote of thanks, remarked that Mr. A. Saxon Snell's work was known to all of them. He could not help saying that if the laws laid down in that very excellent paper with regard to sanitary building construction were carried out to the letter, there would be very much less need for the large hospitals about which they had heard that night. There was only one technical point he would like to raise, and that was with regard to the regulation of the temperature of the air admitted to the wards. The lecturer had talked of its being slightly warmed at the hot-water coils; and it would be interesting to learn if there was any checking of that. It would also be interesting to know if at the Charing Cross Hospital there was any form of filtration of the air as it was admitted, and, if so, on what lines it was carried out. Some of them had been present at a meeting of the Sanitary Institute a few days before, when they were deploring the way in which buildings generally were being cramped, most especially in connection with suburban building estates. It was a pity to hear that the same thing occurred to hospitals. He could only hope that the time would come when they would see that any buildings—whether hospital or domestic—would have sufficient air space around them.

Mr. C. WATKINS, speaking as one of the workers in a hospital, endorsed what Mr. Snell had said. No reference had, however, been made to a disinfecter. It always seemed to him that there should be an observation ward in a hospital for those casualties which are brought in, but which don't require attention at the moment, and are able to leave again in four or five hours. Unfortunately, the architect was sometimes greatly troubled by the amateur committees who don't know anything about the subject, but who attempt to guide him and tell him what to do. Sometimes, in addition, architects have to try and satisfy the medical staff, who differ among themselves, and each of whom want their own fads carried out.

Mr. G. A. T. MIDDLETON, A.R.I.B.A., spoke of the difficulties as to temperature in hospitals constructed in the East and hot climates generally. In a hospital he had designed for erection in Syria it was very hot in the summer and extremely cold in the winter.

Mr. C. W. BALL considered that as the paper was somewhat short it was wonderful how Mr. Snell had got so much information into so short a time. The subject was a big one, and many people could write a paper on, say, the hospital ward alone.

Mr. A. SAXON SNELL, in reply to the discussion, said he did not think any architect could design a hospital by himself; he should go to those managing it to ask them what they wanted. It had to be learnt that the temperature of a room was an important factor in the recovery of the patient.

SEAL v. HUNT.

IN the King's Bench Division on May 29, Mr. Justice Phillimore gave judgment in the action *Seal v. Hunt*, in which Mr. Samuel S. Seal, of Elstree, Herts., sought to recover damages from Mr. Geo. H. Hunt, architect, London and Evesham, for loss said to have been sustained through alleged professional negligence on the part of the defendant in connection with the building of a house at Elstree. The complaint of the plaintiff was that the defendant caused the house to be constructed so that the ground floor was below instead of above the natural level of the ground, contrary to the approved plans, and the defence was that the house was built in accordance with plans shown to and approved by plaintiff.

His Lordship, in giving judgment, said that on the conclusion of the hearing of the case he had formed an opinion adverse to the defendant, who was charged by the plaintiff with breach of duty and breach of contract. He, however, did not give judgment, as he thought he ought to personally inspect the house at Elstree in order to see the nature of the site, appreciate the difficulties the architect had to meet, and see if there was not more to be said for him than appeared from the evidence given in Court. He had accordingly visited Elstree and the inspection did not now enable him to change the opinion he had formed. In his judgment Mr. Hunt acted carelessly, as he did not sufficiently give the plaintiff an appreciation of what he would term the geometrical aspects of the work. It appeared that Mr. Seal, on dismissing Mr. Hunt, employed another architect, who had to raise the house and reconstruct it three feet higher, and the defendant must bear responsibility for this. In view of statements that had been made as to the extra expenditure in which the plaintiff had been involved, he had decided to enter judgment for him for 465*l.* and costs.

WORCESTER COLLEGE, OXFORD.

By the Rev. S. H. W. HUGHES-GAMES, M.A. (formerly Scholar of Worcester College).

IN a former paper we briefly recounted the history of Worcester College; it remains to add some further details which may be of interest.

Immediately to the north of the present buildings, along Walton Street, is the old monastic gateway, now opening into the Fellows' Garden. In LOGGAN's print of 1675 this gate may be seen; and beyond it a lane, leading by the back of the old "camerae," or monastic cells. This gateway, surmounted by two shields, is from the outside the most noticeable sign of the twofold history of the College—a reminder of the real origin of the College—and of the time when all learning was confined to the Church.

As we pass through the iron railings, given by a former Provost, Dr. COTTON, and in by the modern doorway, to the right hand we find the stately architecture of the eighteenth century, to the left the more modest and picturesque handiwork of the fourteenth century. In dumb symbol the diverse spirits of both seem to stand facing one another—the middle ages, with their poverty, their devotion, their wonderful instinct for architectural beauty, and the classic and somewhat cold and irreligious days of Queen ANNE and the early GEORGES, embodied in stone, with but a strip of green sward between them. I do not know anywhere in England—at Oxford or at Cambridge—where we can get precisely the same effect. I think to all old Worcester men, and possibly to many others, the quadrangle must always seem one of the most interesting and picturesque spots on earth.

And the details are not unworthy of their setting. The four features of the College, as it now exists, which naturally claim attention are the gardens, the chapel, the hall and the library.

There are two gardens—apart from the Provost's Garden. The Fellows' Garden is not usually open to the public; it possesses a disused open fives court; it lies to the north of the College, and is rather sombre in winter but cool in summer. Except for strolling in after dinner during the summer term the Fellows, so far as I have ever seen, do not use it much.

The public garden to the south of the College, on the other hand, both in summer and winter, is seldom free from visitors. No other college garden in Oxford boasts of a lake; hardly any is more admirably wooded and planted. Much improvement in the planting has been effected by the present Bursar, Mr. LYS.

The site was purchased from Mr. THOMAS WRENCH in 1741 for 850*l.* Until 1827 the garden was little more than a water meadow. Mr. RICHARD CRESWELL was in 1827 Bursar of the College, and it is to him that the present arrangement of the garden is due. Along by the lake, and parallel to the canal, a shaded path leads to the Provost's Meadow, lately converted into a playing-field

for the use of the undergraduates. And now this is encircled by an excellent pathway.

In the garden to the east side is a covered fives court, built about the middle of the nineteenth century by the Senior Common Room, for the benefit of the junior members of the College.

With its playing-field, its fives court and tennis courts all close to, Worcester College is in one sense the most privileged of the colleges in Oxford. No other has so many external advantages, conveniences and amenities.

An excellent pavilion, subscribed for by former and resident members of the College, was opened on June 25, 1900, when a cricket match was played between past and present members of the College. The "Past" were captained by the Rev. E. S. CARTER, who in 1867-68 both rowed and played cricket for the University. Owing largely to his excellent lob bowling the "Past" won the match very easily.

The Chapel.

With the possible exception of the Cappella Palatina at Palermo, there is no chapel in the world, as far as I know, so rich in symbolic detail as the chapel of Worcester College. The building, commenced in 1720 and decorated in 1864 and the following years, is of singularly beautiful proportions. The decoration—designed by the late Mr. BURGESS—was effected at a cost of more than 7,000*l.*, and represents the whole scheme of Redemption, in type and prophecy, in preparation and fulfilment.

At the angles of the central dome in the ceiling are represented four kings from whom Our Lord traced His ancestry—DAVID and SOLOMON, HEZEKIAH and JOSIAH. On the eastern side of the dome the Fall of Man, the three theological virtues, with the fourth, Humility, are pictured, and on the western side the expulsion from Eden, and the four cardinal virtues—Justice, Temperance, Chastity, and Fortitude.

The windows, designed by Mr. HENRY HALLIDAY, on the north side represent the Annunciation, Our Lord with the doctors in the Temple, and the women at the sepulchre.

On the south side are portrayed the Baptism, the Offering of the Wise Men, and the Ascension.

Over each window are half-length representations of the prophets who are supposed to have foretold these several events.

In the four niches at the angles are statues of the four Evangelists.

The Benedicite and the Te Deum furnish the scheme for the decoration of the walls and the finials of the stalls.

On the floor is represented Man's Restoration—the Sower and his Seed, the Saints and Heroes, Doctors and Preachers of the Western Church, and of the Church in England.

The alabaster lectern was the gift of the scholars; the lectern Bible, with its silver binding, designed by Mr. BURGESS, was the gift of the present Provost when Bursar. And it may here be said that, during his lifetime and connection with the College, all the immense improvements in the decoration of the chapel and hall have taken place.

Other features of the chapel are the beautiful candelabra, two of alabaster and six of bronze, given, the alabaster ones by Dr. COLLIS, the others in memory of a former fellow commoner.

No one who visits the chapel should fail to notice the exquisite finish of the carving on the stalls, and, indeed, of the whole scheme of decoration. There is not one bit of slovenly work either in the conception or the minutest detail of its realisation; the craftsmen who wrought all this are nameless, but their work is worthy of all praise.

The Hall.

The decoration of the hall is also due to Mr. BURGESS. The east window represents banqueting scenes from

HOMER, VIRGIL, SHAKESPEARE, and MILTON, somewhat at variance with the modest repasts and decorous demeanour usual, and in fact invariable, at the high table underneath.

There is a handsome marble fireplace; and the richly panelled woodwork is inlaid with the armorial bearings of various members of the College, who contributed to the cost of the decoration.

There are some fine and some indifferent portraits. The portrait of the present Provost was one of the last, if not the very last work of the late C. W. FURSE, a most gifted artist who died all too young. The portrait, though not finished, is distinctly impressive.

The Library.

The library extends the whole length of the front above the cloister; it is of fine proportions, and larger than most college libraries.

Mr. PHILIP PUSEY, nephew of Mrs. COTTON, wife of a former Provost, presented some fine casts from the antique; the library is rich in works on architecture and classical archaeology. A valuable collection of pamphlets of the period of the civil wars, volumes of LAUD pamphlets, PRYNNE pamphlets, and a collection of old English plays, all presented by Dr. CLARKE, are of the greatest interest and value to the historian. There is a MS. "History of the Black Prince," in Norman-French, the final lines of which are on the monument of the Black Prince in Canterbury Cathedral; and a series of designs for Whitehall Palace, executed probably by INIGO JONES or one of his pupils, along with a copy of PALLADIO's work on Architecture (1601), the margins filled with annotations by INIGO JONES, are of special interest to the architect and artist. CARLETON'S "Thankful Remembrancer of God's Mercy" (1627), bound in velvet, and adorned with gold lace and seed pearls, should be seen.

The Men.

Alas! Worcester College, or Gloucester Hall, has produced few great men, as the world counts greatness. Yet from Gloucester Hall came Colonel LOVEFACE, and from Worcester College DE QUINCEY. "To Lucasta, on going to the wars," "To Althea from prison," "To Lucasta, on going beyond the seas," are three of the most beautiful love lyrics in the English language, and contain lines which everybody knows:

"I could not love thee, dear, so much,
Loved I not honour more."

"Stone walls do not a prison make,
Nor iron bars a cage."

Who has not heard them? They are part of the heritage of England.

And DE QUINCEY—is any prose more musical, more various, more subtle and strong and eloquent than his?

And yet the lives and careers of these two men—the favourite alumni of a favoured college—were dark with calamity, with sorrow, with weakness.

Worcester has, however, produced a few Colonial Bishops, and even a suffragan—and one at least territorial Bishop—a Welsh one. So it need not despair.

ILLUSTRATIONS.

ST. MARGARET'S, KINGSWOOD, SURREY.

THE illustration shows the garden front of a small house built of stock brick with cement rough cast. The plinth and chimney caps are purple-brown Crowborough bricks, and the roof is covered with dark-red hand-made tiles. The principal rooms face south, and the entrance is at the north-west. The entrance doorway is of Weldon stone and the door of Austrian oak. English oak has been used for the verandah posts and constructional half-timber work. The house is simply finished inside, but there is a certain amount of panelling, and the principal chimneypieces are of oak. The ground floor is of wood blocks.

Mr. H. P. Burke Downing, F.R.I.B.A., is the architect, and the builders are Messrs. G. P. & H. Barnes, c Streatham Park, S.W.

MEMORIAL TABLET, KNARESBOROUGH CHURCH.

THIS tablet, as will be seen on referring to the illustration, was erected in memory of Dorothy Slingsby, c Scriven, who died in the year 1673. It is an excellent example of the work of that period, and is executed in white marble, with the exception of the small corbel at the bottom, which is a restoration in stone. The tablet is placed at a height of about five feet from the floor, on the east wall of the Slingsby (now spelt Slingsby) Chapel. It is four feet six inches high by two feet six inches broad. There are several other monuments of great interest in the same chapel.

The drawing by Mr. E. H. Gibson was awarded a prize in the February competition of *The Architect Students' Sketching and Measuring Club*.

PANEL FROM HENRY VII'S TOMB.

THE tomb of Henry VII. and of his queen was the work of Torregiano, the Florentine. It was begun in the year 1512, but was not completed until 1518. In his curiously worded estimate he undertook to "make well, surely, cleanly workmanly, curiously and substantially, for the sum of 1,500*l*. a tomb of marble, with images, figures, beasts, and other things of copper gilt."

The drawing by "Plato" was awarded a prize in the February competition of *The Architect Students' Sketching and Measuring Club*.

OXFORD COLLEGE SERIES.—WORCESTER.

WE continue this week our illustrations of Worcester College, a further descriptive article on which appears above.

THE Royal Sanitary Institute proposes to hold an exhibition of Sanitary Apparatus and Appliances in the Ulster Hall, Belfast, from July 24 to August 2 next.

THE Newcastle Art Gallery Committee, which recently decided to again ask the Council to accept the bequest of the late Mr. J. A. D. Shipley of pictures and 30,000*l*. for an art gallery, have decided to recommend the Council to authorise the erection of an art gallery adjoining the present Laing Gallery.

PLANS are being prepared for a telephone exchange for the New York Telephone Company's long-distance switch board. The exchange will be the largest in the United States. It will provide employment for 200 operators, and the outset will have accommodation for 20,000 subscribers. The building is to be of 15 storeys, but will ultimately be increased to 25 storeys.

THE Southampton Board of Guardians have agreed to the erection of two pavilions, the extension of the nurses' home, and the making of other alterations and additions to the Infirmary of the Union at Shirley Warren, at a cost not exceeding 18,298*l*.

A POPULAR and handy volume describing the historical buildings of London, with adequate illustrations, is not as yet procurable, nor has the wealth of architecture, which is in the possession of London, been focussed so as to show its connected development and full significance. Mr. B. I. Batsford will shortly publish a volume, the object of which is to supply this need and furnish an interesting guide for the use of visitors as well as Londoners. It has been written by Mr. Walter H. Godfrey, an architect whose work in connection with the London Survey Committee is known to many. The volume will contain maps and a descriptive guide to the buildings, and will be issued at a moderate price.

THE Local Government Board have approved of a scheme of sewerage and sewage disposal prepared by Messrs. D. Balfour & Son, civil engineers, of London and Newcastle-on-Tyne, for the parish of Adwick-le-Street, in which is included the model village of Woodlands in the district of the Doncaster Rural Council. The sewage from a portion of the district is to be pumped from a storage tank by means of electric motors and pumps to the disposal works, where it is to be treated in open liquefying tanks followed by double filtration through percolating filters, the effluent from which will be discharged into Bentley Dyke. The Local Board have approved the scheme of main outfall sewerage prepared by the same engineers for Norton, Stockton-on-Tees.

AMERICAN ARCHITECTURE *

By FRANK M. ANDREWS.

THE art of architecture in any country finds a twofold source from the architectural tradition and the moral and intellectual character, political organisation, and mode of life of its people. To trace intelligently its development and artistic worth, these broad conditions must be accounted for.

Unlike the sister arts of painting, music, and sculpture, it cannot be detached from the masses, for it is not a creature of the museums or of the private collector, nor of the exclusive patronage of the favoured intellectual few, isolated as a thing apart, to be sought out and found in order to be felt and understood.

Contrary to these, it is the serviceable and intimate art of man, insistently a part of his familiar daily routine, a creature of his needs and circumstances, arousing in even the most heedless a consciousness of its existence and its power of expression either of beauty or of ugliness. For this reason, architecture artlessly becomes an inevitable exponent of the characteristics of the people it serves, and the unerring index of their time and epoch.

The wisdom of the Greek philosopher was the intellectual flower of the human race, belonging to all mankind, but the architecture of Greece expressed the genius of the Greek alone, indicating the antecedents, environment, and soil which nourished and made possible the Greek philosopher. The Gothic cathedral, the feudal castle, the walled town, the monastery, and the vanished hovel of the common people told the story of mediæval times, of the great religious movement and the feudal system of the Dark Ages, with its cloistered learning, its strong arm of military and exclusive political might, and the subserviency of the masses. Again, the readjustment of these conditions, the resulting dissemination of learning, and the establishment of political and religious freedom, are faithfully reflected by the architectural development that kept pace with it throughout Europe.

In this brief allusion to a period momentous in its importance to the development and uplifting of the human race, I am touching upon matters entirely familiar to yourselves, yet which I wish to emphasise in order that you may appreciate that a discussion of American architecture must necessarily be approached with a similar regard for its political and civic development.

What I have to present to you deals with, perhaps, one hundred years of antecedent history, and with not to exceed four decades of a subsequent movement that possessed any degree of architectural significance to others than ourselves, and yet as unerringly as in Europe we have recorded, in the terms of our art, the forward movement of our people.

Our land, colonised from England, Spain, France, and Holland, drawing to it ever since a population from most of the peoples of the globe—a land stretching from ocean to ocean, having climatic conditions ranging from those of Norway to those of Northern Africa—with its mineral, agricultural, and other natural resources sketched in with a broad and lavish hand, was in its inception and early history notable for its isolation. This isolation was not only geographical, but is reflected in a political system that is intensely and jealously individualistic, the keystone of its fabric being personal freedom and independence. As a new star in the firmament of government, it was peculiarly jealous of its own orbit, and largely justified its being by its very indifference to all European influence, fearing that therein lay discord and entanglements dangerous to the common welfare. Clearly the fundamental concept of this new government was the abandonment of the established European order of things, with its habits, customs, traditions, and conclusions, in so far as human determination could effect it. Pomp and display, class distinction and the exaltation by rank or otherwise of an individual or group, which in Europe played so important a rôle in the development of its civilisation, were not to find place in this new scheme of things, and, as a natural corollary to it, almost the entire vocabulary of architectural thought was automatically abandoned.

Therefore we find in early times but a trace of the interesting and inherent architectural beginnings such as were characteristic of Egypt, Greece, Rome, and the various European nations, nor do we find a place for a receptive disposition towards those architectural types which at that time prevailed throughout Europe, as its expression of the power and importance of government or of a class.

A timid concession to traditions, which could not be altogether denied, we find reasonably applied to the first structure of the national capital and in the executive mansion at Washington. That these structures should owe their existence and excellence to the interest of Washington and Jefferson, and to Hamilton, the locating of the capital itself gives to our most important architectural effort of the time a personal significance, corresponding to their influence in the affairs of our Government. Throughout the Colonial period we find in New England and in Virginia, with its sister States, a faithful adherence to the manners and customs of the Mother Country, its architecture consequently that of the coincident Georgian period of England, and the word for it in our architectural vernacular, "Colonial." With us an architecture of brick and wood, severe, simple, and with a certain refined stateliness, owing to its existence as a precedent to the influence of our then leaders of thought and action, and merely reflecting their point of view, it ultimately became only a mode or habit of construction without architectural force or vitality. Its earliest and best examples, preserved by a fortuitous circumstance throughout a century of neglect and indifference, became in the end a helpful educational influence pointing towards the true path of artistic excellence; a cudgel with which to belabour a heedless utilitarian public but too prone to an inartistic display of its swiftly-acquired wealth, and to awaken its artistic conscience.

Again we rediscovered the rare beauty, quiet strength, and world of suggestion in the old Spanish missions of southern California and the south-west. Glowing with artistic spirit, in their extreme isolation from the then civilised world, they seem a miracle of accomplishment. They are the product of minds who loved art, and remembered it as of the land of their birth; but, forced by environment and conditions to a fortunate simplicity, they preserved and created for the admiration of our future generations the essence of all that is good in the architecture of Spain. To-day this work is a powerful source of inspiration to the prosperous people of all that region of the United States where these good old mission fathers did their work of civilisation, leaving behind them evidence of their love of the beautiful. These, then, were the slender links that united us with the ancient architectural forms, and while they were not inherent nor endowed with a spontaneous expression of ourselves, nor an indication of our future development, they, for the moment, served as a borrowed garment, fortunately a good one.

The story of our departure from these standards, and the subsequent period of artistic squalor and ignorance, which I may refer to as our architectural Dark Ages, was one, however, not of wilful ignorance nor purposeful neglect, but of a condition.

It is the story of these people isolated by a great ocean, and by the greater intellectual ocean of abandonment of European traditions and ties; with the great task of solving an experiment in Government on a huge scale; with a vast wilderness to subdue and render serviceable to man; with the problem of assimilation of an influx of foreign population possessed of alien thoughts and customs; of a country that, as a whole, may be likened to the pioneer settler whose log-cabin is reared quickly out of the immediate material at hand for convenience and shelter only, so that he may the sooner set about the task of clearing his land and gaining his livelihood. Should accumulated wealth later bestow upon him or succeeding generations its independence of labour, and the opportunity to cultivate the mind, he may then observe the stored wisdom of history, and bow to its influence and tradition.

Therefore in our country, in this condition to which I have likened it, we find the Colonial type of domestic architecture principally interpreted, not by architects nor under an artistic impulse, but by the builders of the period whose personal vagaries and idiosyncrasies more and more overwhelm the meagre examples of this authoritative style. Throughout the country, and for the greater part of the nineteenth century, these conditions prevailed, for we cannot take as essentially typical the attenuated architectural movement, if it may be so described, that was discernible in a few of our more important sea-board cities. Broadly speaking, the entire scheme of things involved no application of artistic code or principle, but was merely the product of the builder-craftsman. In the older portions of the country we find the more important structures reared of brick and stone with a generally prevalent application of our own peculiar system of wood-construction to domestic requirements. Throughout the middle west, in Ohio, Michigan,

* A Paper read before the Royal Society of Arts on May 24.

Indiana, Illinois, Wisconsin, and all that region west of the Mississippi River, the saw-mill was king and the carpenter-builder its faithful apostle and exemplar. The strictly utilitarian held sway, and the rapidly-increasing population of this region had neither the time nor inclination to consider such matters as art nor the refinements of a wealthy and settled community, and thus there became impressed an habitual habit of thought which stood for years as an obstacle to artistic growth and development. Buildings were an object of pride, and aroused interest and appreciation only because they expressed in size, materials employed, and in numbers, the growth of a community or the prosperity of the individual. These structures, with here and there a reminiscent architectural detail, usually crude and illiterate, were devoid of architectural sense of meaning, as were the people themselves of a proper understanding of the codified systems of artistic thought.

In this connection it does not appear to me that it is logical nor permissible to trace the course of that spark of architectural knowledge which moved onward from the early Colonial days, revealing itself from time to time in isolated instances throughout this period, and claim that its description is the story of American architecture.

Personally, I prefer to deal with that which in its broader sense arises from the people, as with the seed that is sown with Nature's forces working invisibly and within, until, under favouring conditions, its growth and full flower appears. Despite their apparent indifference to artistic feeling and their devotion to material development, these people held within them the seed of art, and during this period its germination and hidden growth was sure, awaiting but the bursting of a materialistic envelope to blossom into a keen love for and appraisal of the value of beauty and art to mankind. Manifestly this must be true of them since there were no kings, nobles, nor courts to patronise the arts, nor leaders of thought who could arbitrarily establish an artistic movement. The accomplishment of this could only be through the gradual dissemination of knowledge of and love for the beautiful throughout a people concentrated on practical problems, until they, in a unity of thought and action, should respond to the resulting impulse, thereby making possible an architectural epoch in their history.

It must be borne in mind that we are dealing with the development of architecture within a democracy, describing a movement probably without a parallel in the history of the art. Republican Venice in its day of commercial supremacy had her traditions of Rome and Greece, an old order of things to build upon, and an unavoidably inherited environment not of its own creation; of an artistic bequest authoritative in its derivation, and certain of itself.

We are dealing with a nation in which no individual could so dominate as to become a mainspring of artistic action, a nation so wedded to the formula of democratic simplicity that he who would lead must become its consistent votary, a nation that expressed this habitual attitude architecturally by its wholesale neglect of the artistic excellence of its public buildings of this period.

Passing over the time of the Civil War, the reconstruction days, and the panic of 1873, we find architecture at its lowest ebb concurrently with the renewal of the energetic development of railroads and of other fundamental industries, a consequent rapid increase in accumulated wealth, and of the power of the individual as well as of communities to assert their importance by a material display. The individual respected no architectural authority, save that of his own taste, under the guiding influence of the carpenter-builder. The architect was a negligible quantity, a mere speck in the background; and, in fact, the name had small significance except only when applied to the builder. An architect was a dubious being at best, who insistently expounded impracticable and useless theories about art and other effete things of European origin that were quite inimical to the interests of the local dealers, building trades, and their political henchmen. These were the controlling influences, and this was the day of diluted East lake and whimsical variations of Victorian Gothic, of jig-saw ornament, and of cast-iron tortured into night-mare semblances that to this day can scarcely be traced to their remote ancestry even by an expert. Under this authority, and with this vernacular, the residential architecture of the time was created, and cities and states so announced their power and importance in their institutions of learning, their capitals, court-houses, and other public structures.

Thus we have before us the spectacle of democracy, with its growing newly-acquired wealth and leisure, embarking without rudder or compass to range aimlessly the broad un-

familiar stream of traditional art. Many souvenirs of this extraordinary excursion still remain with us, but, fortunately, the greater portion of the work of that day has vanished, to make way for better things. The climax of this era occurred in the exhibition buildings in 1876 in Philadelphia, and the greater part of the succeeding decade was required to mark its fall.

As a youth, the writer witnessed the fulness and the decline of this period, the beginning of the reform movement, the rising appreciation of proper standards, the sure but slow education of popular interest and taste, until to-day it may be justly claimed that the fundamental elements of our peculiar American type of architectural expression are discernible. Its precise formulation may not yet be possible, but it is a vital and growing thing, plastic, perhaps restless and unsettled, yet reflecting our rapidly-crystallising characteristics as a people. As an art, it has unquestionably found itself, and its underlying purposes and tendencies are capable of analysis and discussion. In method it is bound to no exact tradition nor architectural style, but does acknowledge the underlying principles and authoritative precedents that energeise them all. For the present it is transitional in character, and, as to detail, is essentially an architecture of adaptation, wedded, as I have said, to no particular style, but seizing for the purpose at hand any suitable architectural form that applies to our situation and environment, but controlled by a trained art intelligence.

The thin skirmish-line of architects—which stretched across this artistic wilderness from the century of Bulfinch, Hogan, L'Enfant, and others, to the century of Hunt, Root, Richardson, and their contemporaries, men who bravely maintained their loyalty to artistic purity and devoted pursuit of art under all discouragement—has now broadened into an army of architects and artists, the product of schools of art and architecture both at home and abroad. These men are inspired by exceptional opportunity and an appreciative public. In their numbers, and the power of their collective influence upon the civilisation and development of their country, they exceed that of any similar group of men of a single generation to be found in any recorded period of the world's art development.

Here, then, we have the interesting example of an art movement rather typically American, wherein the love of the beautiful and the desire of its intelligent expression is not due to the stimulus of the patron towards the artist, but, on the contrary, has flowed from the artist to the patron, or, rather, from an entire group of artists to an awakening public. Democracy having solved its fundamental problems, now encourages intellectual and artistic growth with a lavish patronage, that in its aggregate volume and result will some day be viewed with deep interest by the world at large. Even from the standpoint of historical analogy, the forces are at work and the material exists out of which to fashion this result.

The entire material equipment of this country which served its purpose throughout a period of transition and development must be, and is being, recreated in permanent and enduring form, thereby affording an extraordinary volume of architectural opportunity. A practical people, accustomed to quickly grasping and solving broad problems by concerted action, they have realised that beauty and art is a vitally important thing, and that to be acquired as a national asset their guidance and direction must be assigned to that group of men whose training and experience entitle them to it, and whose active propaganda are but reflected by this conclusion.

The educational influence now at work within us is as wide as the nation itself, proceeding primarily from the group of men referred to, also from schools of art, which are to be found in every important city in the land, from the regularly-established schools of architecture in our various colleges and universities, from the active and alert efforts of the lay Press, and the intelligent and interesting art-criticism and discussion of the popular magazines and the technical journals of the profession.

In this scheme of education Europe may be regarded as one great laboratory, in which the practical application of the theories and influences of this educational movement are tested and applied. The thousands of Americans who, year by year, cross the Atlantic and travel about Europe have regardless of their immediate motive, both consciously and unconsciously, absorbed the spirit, the grandeur and nobility of its artistic achievements, and have at last perceived that besides the material wealth of a country, there must be a spiritual and intellectual wealth which art alone can express, and without which no nation can be truly great nor the full fruition of a people's destiny be accomplished.

I believe these influences have resulted in a public sense of discrimination and a sound professional analysis of the art and artistic influence of Europe, and from this I reason that there will ultimately appear in America a characteristic American style that will be grounded upon the verities of architecture, sincerely expressing the organism, use, and purposes of our structures, yet not insisting upon the forced and unnatural adaptation of motifs and detail in archaeological reproduction of other styles not suited to ourselves. The day has passed in my country when the ideas and so-called originality of the individual is to be tolerated as a worthy substitute for the time-honoured forms and concrete conclusions which represent the cumulative authority of the many minds of the past striving for truth and beauty of expression.

That our growth and development will be to a large degree homogeneous is to be expected, because of the ease of intercommunication and consequent habit of travel between our various states and cities. While interesting variants may appear, due to the Colonial influence of which I have spoken, there will be none of those phenomena that have in the past arisen from restricted intercommunication, isolation of cities, division of languages, and customs which so strongly individualised and restricted the art and thought of European groups, and which so comprehensively affected the formation of its various styles of architecture. Speaking of one language, and existing under one government, with facile and established habit of intercommunication, we are not subject to, in any given locality, the possible provincial outlook nor the requirements of local materials or customs peculiar to that locality, as in Europe.

Undoubtedly the greatest, if not the primary, stimulus of the present artistic development of the United States is to be found in the Columbian Exposition of 1893 in Chicago. It was here that the profession for the first time found itself in possession of a theme monumental in its scope and dignity, and of that peculiar quality and complexity which put it beyond the capacity of the layman or of the builder to control; resulting, therefore, in its assignment to a profession now become powerful enough to assert its right to assume direction within its own domain. The initial moment in our art history that required the united action of a group of properly-trained men, it was the first time when they had to deal with a problem in which architecture was the dominant factor; recognised as the visible and vitally-important expression of the dignity and scope of the enterprise. The interest of a great public was to be aroused, and a situation of charm and beauty was to be created as a functional part of the display itself, and for this purpose the business men in charge perceived that good architecture was indeed a practical necessity. For the first time the ability of architects accustomed only to separate individual effort was to be gathered together, synchronised and welded into unified action, where the individual tendency must be subordinated to the requirements of all while dealing with a random plan, the grouping of buildings in harmony of mass and outline conforming to a central governing ideal.

(To be continued.)

THE ILLUMINATING ENGINEERING SOCIETY.

(Concluded from last week.)

MR. F. W. GOODENOUGH, of the Gas Light and Coke Company, continued his remarks as follows:—

Some tests made by the kind permission of the authorities at the Westminster City School, and the L.C.C. school at Barnsbury had demonstrated this fact very conclusively. Where the inverted burner was used the average illumination was 4.5 foot-candles, with a consumption of gas of 3.78 cubic feet per 100 square feet of school, whereas with the upright burner, the average illumination was 4.4 foot-candles—practically the same average illumination—but the consumption of gas, instead of 3.78 cubic feet, was 5.85 cubic feet per 100 square feet of school. Comparable results had also been obtained in other schools. Dr. Harman had spoken of sensibleness of variations in pressure. He did not know whether that was a misprint in the paper; it seemed that Dr. Harman meant that it was one of the points against inverted burners. On this point he would only say that the gas supply to every school, or indeed every building, should be governed from the meter, in order that there should be no variation in pressure. It was a comparatively easy and inexpensive thing to do, and it made both for economy and

efficiency. Dr. Harman had also remarked that inverted burners had not proved satisfactory in the hands of the average school keeper, but in his experience very few incandescent burners of any description proved quite satisfactory in the hands of the average school keeper, and he would again urge the point that he had urged before the Society before, of the advantage of every consumer placing the maintenance of incandescent burners in the hands of the gas company, who employed skilled men entirely for that work, and whose interest lay in giving their consumers the most efficient system of lighting. The comparative result given by Dr. Harman of the use of different kinds of reflectors was exceedingly interesting, and demonstrated very conclusively the value of the 90° reflector that was described and illustrated in his paper, but he was sorry to see that on the score of cheapness a compromise had been adopted instead of the 90° reflector. He thought it was a great pity that any public authority on the score of cheapness should go in for a system of lighting that was not the best, because he was sure that the satisfactory lighting of schools was of vital importance to the rising generation. Then there was the truly British fact that the lights in the classrooms were usually set rather with a view to symmetry than to good lighting. That was so like the British nation. The position of the lights was determined in a very haphazard fashion, and the desks, as Mr. Baker had said, were sometimes rushed in at the last moment, and the lights also. He hoped that this discussion, in which the L.C.C., through their officials, had taken so much interest, would lead to this state of things rapidly passing away. He would like to mention in connection with the tests that he had been making the difference of illumination found in some cases between the writing surfaces and the reading surfaces of the desks in the L.C.C. schools where the desks were adjustable; particularly at the backs of the rooms, it was found that the reading surface was very badly illuminated in comparison with the writing surfaces. This, he believed, was due to the dark dadoes that were common in these schools, and which had a very much more marked effect upon the illumination of the desks, especially when set up for reading purposes, than was the case in any other part of the room. This point certainly needs consideration from those responsible for the lighting of schools.

Another point upon which he would be expected, and would like, to say a few words was the connection between lighting and ventilation in schools. Where gas was used, it could be utilised very materially for assisting ventilation. Dr. Harman, in referring to another system of lighting, mentioned the advantage of the absence of consumption of air and so forth, but he would be very glad if Dr. Harman could get the L.C.C. to carry out some tests of the atmosphere of rooms when lighted by gas and when lighted otherwise, or even not lighted at all. Some tests on this point had recently been published. They were made by the medical superintendent of the Lewisham Infirmary, and he was led to make them as the result of some experiments at the offices of the Society of Medical Officers of Health. The results had been published in "The Medical Magazine," and they showed that the atmosphere of a ward lighted by gas was precisely as hygienic—neither more nor less—as a similar ward without any lighting at all. There was only normal ventilation in the ward lighted by gas, but the fact that the gas stimulated the ventilation resulted in there being no vitiation of the air. He would like Dr. Harman to consider this subject and see whether he could get the L.C.C. to carry out some tests on this very interesting point.

The Gas Light and Coke Company had taken a number of photographs of schools as good illustrations of lighting in their district, and he would ask his assistant, Mr. Clarke, to give the particulars in connection with these tests, as he had superintended them.

Mr. J. G. CLARKE, in describing the slides thrown on the screen, said that the L.C.C. Barnsbury school was typical of the gas lighting in most of the L.C.C. schools. The classrooms were lighted by six Kern burners with Scott globes. The area of the room shown was 750 square feet, with accommodation for eighty scholars. The mean illumination was 2.61 foot-candles, and the diversifiable co-efficient about 1.5. A classroom in the Westminster City School was shown, lighted by four inverted burners, shaded by opal shades, which gave a mean illumination on the desks of 2.63 foot-candles. Another classroom in the same school, lighted by upright burners, shaded, has a mean illumination of 2.7 foot-candles. The consumption of gas per square foot was considerably higher than that in the room lighted by inverted burners, so that although a very excellent illuminating effect could be obtained by upright incandescent gas burners,

it was more costly than the same thing done by inverted burners.

At the East Ham Board School inverted gas burners were used, hung about thirty inches from the ceiling and shaded by opal shades. The room shown had accommodation for sixty scholars, and the mean illumination was 3.1 foot-candles.

A series of photographs was then shown of halls in various schools. At the Barnsbury school, the area of the hall was 2,300 square feet, and the mean illumination on the floor 2.25 foot-candles. The diversity co-efficient was very low, showing a very uniform illumination. The hall of the Westminster City School had an area of 2,755 square feet, and here again, with gas lighting a very uniform illumination was obtained, the average being about 2.2 foot-candles. At the East Ham Board School, the hall has an area of 2,500 square feet, and is lighted by inverted lamps having white enamelled shades, the lamps being arranged centrally down the hall. The average illumination on the floor was 2.9 foot-candles.

Two slides were then shown of school workshops. The first was the workshop at the L.C.C. Barnsbury school, which has an area of 1,000 square feet, and is lighted by upright burners, fitted with the new opal shade described in Dr. Harman's paper. The illumination on the benches is practically uniform, and works out at 4.4 foot-candles. The other was the workshop at the Westminster City School, which was lighted by inverted burners. Here again a very uniform illumination is obtained, the average being 4.5 foot-candles. This room has fifteen benches, and accommodates thirty students.

The lighting of the art room at the Westminster City school is rather of a mixed character, owing to the necessity for having a very wide range of variation. Here the range is from 6 to 15 foot-candles in different parts of the room. In the middle of the room there are inverted lamps fitted with parabolic shades, the illumination in the vertical plane being between 10 and 11 foot-candles. The chemical laboratory in the Westminster City school is lighted by inverted burners similar to those previously described, and the illumination on the benches is rather over 3 foot-candles.

The CHAIRMAN pointed out that the series of experiments by Mr. Dow and Mr. Gaster and Mr. Clarke were all carried out with the same instrument, namely, Mr. Dow's lumeter.

Mr. RITCHIE also mentioned that his experiment had been carried out with the same instrument.

Dr. PISANI said he had been in India for many years, and had been interested in the causation of cataract. Many people attributed cataract to the ultra-violet rays, but he had not found any evidence whatsoever of this. Indeed, he thought there was very important evidence that ultra-violet rays were not the cause of ordinary cataract, for the reason that in mountainous regions like Switzerland and Norway, where the ultra-violet rays were very prevalent, cataract is comparatively rare.

Dr. E. H. NASH (Medical Officer of Health, Wimbledon) said his sphere of influence was much more connected with daylight lighting than with artificial lighting, and Dr. Kerr's section of the discussion seemed to have been rather left out. The lighting of blackboards in infants' schools was a very serious matter, and he would be very glad if the Society could do something to set up a standard of daylight illumination in such schools. This had been particularly brought to his notice by watching the teaching on the Dale system by means of coloured letters on blackboards, for which chalks were used. He demonstrated that certain of these colours at a certain distance were quite invisible. He did not think the Society quite realised the far-reaching effect which the discussion was going to have. It would affect particularly the whole question of the design and shape of classrooms, and also the size of windows. It had brought out the fact that the shape of classrooms should be altered. The Board of Education had laid it down that the square classroom should be replaced by a longer classroom, with rows of desks in order to avoid the present position of the natural lighting in full daylight being as low as half a candle-foot in certain portions of the room. If the Illuminating Engineering Society would tackle this matter it would be doing a very great service. The Society should also make experiments as to the position of blackboards during day time in relation to the window, and some advantage might also be derived from being able to tilt the boards. The present practice was largely to place the boards in a corner, but he advocated that they should be placed in the middle of the rooms near the window. This raised the point as to

the advantage of carrying the windows right along the wall of the classrooms, in order to avoid the large amount of brickwork which was at present a common thing in schools. In the majority of London schools, and indeed throughout the kingdom, there were large heavy mullions which took up a large amount of the light. He knew of one case in the provinces where the mullion was being dispensed with altogether, and it certainly was an important point in dealing with the illumination of such rooms. At the same time it should be pointed out that increasing the window space involved the problem of interference with the heating. It might be necessary to increase the heating by about 50 per cent., so that they would all realise the enormous importance of the problems now under discussion. As a school medical officer, he welcomed the discussion most heartily, because he felt it would enormously strengthen their hands. School medical officers were being scoffed at for knowing nothing about this matter, but the medical officer, at any rate, was keenly alive to the fact that the solution of the problem of maintaining the health of the children was in their environment, and that one of the most important factors in this was illumination, both daylight and artificial.

Mr. A. H. RYAN-TENISON, F.R.I.B.A., as an architect with experience in school design, said there were two points which troubled the architect; one was the difficulty of securing good natural lighting where the site was surrounded by buildings, and the other was the difficulty of getting good artificial lighting at the back of the rooms which were more than a certain distance from the lighting unit. The Board of Education rules required about one foot of glass area to six feet of floor area, but this, as the late architect of the L.C.C. had pointed out, was very much ruled by the effect of how much the school went back. The Board of Education required no wall space to be more than 24 feet 6 inches away from the windows, but—and in this he was confirmed by Mr. Bailey—it was a fact that they never got proper natural lighting in any room where there was any window within 22 feet of the wall. Thus with 24 feet 6 inches there were 2 feet 6 inches at the back of the room which would not be properly lighted. On the question of gas v. electric lighting it would be very interesting to architects to know how far the advocates of both methods of lighting would space the lamps apart. He had generally adopted 7 feet 6 inches when using 16 c.p. lamps, i.e. no child ought to be more than 7 feet 6 inches away from a light which fell on a desk at an angle of 45°.

Mr. JOHN DARCH said, in Dr. Harman's excellent paper on "The Artificial Lighting of School Rooms," he had made what he had termed a "modest demand" for a minimum desk illumination of 10 metre-candles, a little under a foot-candle. The demand was much too modest; for, as working and standard minimum, it might with advantage have been 30, or at least 20, metre candles. He was aware that it had been shown that visual acuity with ordinary types was possible at an illumination of 10 metre-candles, but bare physical possibility was quite a different thing to permissible minimum, and danger lay in the fact that published opinion of Dr. Harman might influence the makers of regulations and bye-laws, and, unfortunately, the taxpayer and the administrator usually felt that they had done their duty if they kept within a minimum.

But visual acuity depended not only upon the amount of illumination falling upon a surface, but also on the colour of that surface and the size of the detail thereon. Let us consider some of the causes of eye strain in schools. There were the map studies, in which minute detail, often on a coloured ground, had to be searched out; there was signposting, where the eye had to grasp very small lines and details in a short time; there was geometry, with its faint pencil lines and its needle pricks to be discerned; even the studies in arithmetic were made a little trying in a poor light. The reason of the common dark coloured scribbling paper—good enough otherwise—which the L.C.C. supplied; while the eye strain in needlework had been so obvious that in many schools this work had often to be postponed. He claimed, therefore, that for official purposes, 30 metre-candles or, say, 3 foot-candles, be considered a standard minimum for ordinary desk illumination, while the classrooms for drawing and needlework should have a minimum of 80 metre-candles.

He was glad to observe Dr. Harman's references to daylighting. There was no reason why the village school should not enjoy as scientific and as artistic an illumination from oil lamps as from the more modern forms of light; they needed only to be suitably designed and arranged, the candle power sufficient, the bare lights screened, the general lighting well diffused and separate local lighting provided where necessary.

Dr. Harman recommended a certain opal shade set 6 feet 6 inches from the floor. He had measured a typical classroom in one of our newest South London L.C.C. schools, and prepared a vertical section in which he had shown the lamps as recommended by Dr. Harman, and in which it would be seen that the opal shade, with a surface brightness of 1 c.p. per square inch or more, was right before the eyes of the children, and was bound to baffle their efforts to discern the blackboard. The remedy was simple. Either keep the lights up to within two or three feet of the ceiling and add screens if necessary, or, if the lights must be 6 feet 6 inches from the floor, then protect both the children's and teachers' eyes by means of opaque shades with the top left open for illuminating the ceiling and upper walls.

It was with much pleasure that he would support Dr. Harman's view of the need for a special and different treatment of the teachers' portion of the room. It was the place of exhibit and display, and should be suitably provided with covered lights for that purpose.

He had to take exception to the statement that high voltages and intensely powerful lights meant uneven distribution and black shadows. On the contrary, the greater the intensity of the light the easier it was to modify and diffuse, consequently the more even would be the distribution and the softer the shadows.

Nor should "the glowing filament" need reducing in intensity; for, in the first place, it should not be visible to the eye, and in the second place it should not be prevented by glass or anything else from shedding its fullest illumination upon desk and ceiling, in order to obtain the most pleasing effect and the greatest visual acuity.

Mr. JUSTUS ECK saw no difficulty from the architectural point of view of designing modern buildings so that sufficient daylight and also artificial illumination could be secured. The question of illumination of the remote side of rooms he thought could be very well met by adopting some of the modern glassware that had been so excellently adapted to gas and electrical illuminations. For instance, there was the Luxfer form of glass which threw beams of light horizontally across a room from a window. The question of the colour of the walls of rooms was also an important factor, and he hoped it would be dealt with to a greater extent on a future occasion. His experience was that in order to get the best effects from artificial illumination with good diffusion, it was necessary to carry a deep frieze, perfectly white, round the room, and below to have a light colour wall, say a light green tint. As a matter of fact, this method of interior decoration lent itself to improving both artificial and daylight illumination. He was a strong believer in indirect methods of illumination, but deprecated having uniform illumination all over the room, which might be obtained with light walls, and, say, a white linoleum on the floor or white carpet. Such surroundings would soon become very uncomfortable, as there would be no place for the eye to get a little rest; it was the contrast between illumination in one place and another that gave what was generally called feeble illumination, and it was in this connection that he hoped his suggestions would be of some value to the Society. The various speakers in the discussion had referred to illumination in various values, and he hoped that in the journal one standard form would be used, so that direct comparisons could be made. Dr. Harman had adopted an exceedingly low unit of illumination. One foot-candle was quite out of date for modern requirements. In the little country of Holland they had adopted a standard illumination for factories, under their Factory Acts, of $2\frac{1}{2}$ foot-candles. When he attended the International Congress of Medicine in Brussels in September 1910, Dr. Broca contributed a paper in which he put forward as the absolute minimum illumination for industrial purposes, 3 to 4 candle feet, and he was perfectly sure that a test of the quality of work and the rapidity in which work was done would show that this figure was by no means excessive. Mr. Gaster and Mr. Dow had assumed from two to three candle feet as a minimum for school lighting, and five to ten candle feet where special work was being carried out. The L.C.C. had gone even to $8\frac{1}{2}$ and 10, so that a minimum of not less than 4 candle feet seemed to fall within actual practice. To adopt one candle foot would lead them into the difficult question of glare. If one candle foot was to be the minimum illumination, then the source of light would have a very low intrinsic brilliancy, and he did not know whether such a source of light was to be obtained which would give light economically. It was necessary to have high intrinsic brilliancies with proper shades and proper distribution of the light; in this way it was possible to get rid of the glare question.

Mr. V. A. H. MACKINNEY pointed out that to space 16 c.p. lamps 7 feet 6 inches apart, as had been suggested, meant an average of $\frac{1}{3}$ of a watt per square foot for an average consumption, which was not enough for good illumination. With this value it would be impossible to get beyond 1 to $1\frac{1}{2}$ candle feet with the present light units, and in this connection he mentioned that there was the need for a very much greater increase in the energy consumption for school lighting. There was little doubt that indirect lighting was the ideal method if it could be adopted, and it might be interesting to the meeting to know that a scheme was on foot for getting indirect lighting with metal filament lamps at a reasonable energy consumption. Mr. Ritchie had shown some admirable photographs of indirect lighting with arc lamps, but there was a slight flickering with these, which was objectionable for close drawing work, and the like. He repeated the argument put forward at the last meeting of the Society that when the intrinsic brilliancy of the upper hemisphere increased, it was necessary to have a greater amount of illumination at the horizontal or working plane. He also exhibited a new form of tube for lighting on the linolite principle, designed to give an even illumination over an extended area. Used as a means of indirect lighting, he anticipated much more efficient results than were at present obtainable. Indeed, he thought there was little doubt that 80 per cent. of the useful light could be reflected on to the working plane by the aid of such a light unit. With regard to a standard illumination for schoolrooms, he thought it would be more useful, not necessarily, to state a standard so much as a minimum value according to the nature of the work that the rooms were to be put to. The point made by Mr. Baker of the difficulty of having the desks in position early enough to determine the positions of the lights, simply pointed to the need of greater co-operation between the architects, lighting engineers, the medical profession, and the authorities concerned with schools. He thought the new form of lighting which he had referred to would be ideal for blackboard purposes.

Dr. KERR, in a brief reply, said there was no doubt that the day of rule of thumb in relation to schools had passed away as far as illumination was concerned, but he thought the Society might go a little further because schools were only one thing, libraries were another, and so on, and we were undoubtedly going to develop in relation to hygiene in general some standard. The difficulty had been to measure lighting, and in connection with the recent legislation about bakehouses there was great difficulty in determining the lighting. He was of the opinion that legislation in respect of lighting would be largely extended as soon as the means for standardising the light existed. Could the Society form a committee to consider the question of school lighting, and draw up a few simple rules in relation to classrooms, large rooms, blackboards, &c., simply as a hint to educational authorities throughout the country?

Dr. HARMAN also briefly replied. He regretted that so little attention had been paid to natural lighting, because, after all, the greater part of the work of the children was done in daylight, and artificial lighting was the last thing in the world they wanted. In fact, he would like to see schools closed after daylight. Indirect illumination was splendid, but in practice he had not found it satisfactory. It was probably very fine for looking at pictures, but in rooms and workshops where close work was being carried out his experience was that it was not so satisfactory. He had mentioned in his paper that for museums and showrooms it was all right, but at the Cambridge Anatomical Schools, as mentioned in his paper, it was not a success. There must be a complete absence of flicker in classrooms of forty children, and especially where special subjects were being taught. With regard to Mr. Goodenough's remarks concerning gas, he thought that when gas claimed that the burning of coal gas in a room improved the ventilation, it was a sign that gas was on its last legs. He hoped it was. In his opinion, the only way in which gas could improve the ventilation of a room would be for everyone of the gas burners to have a shaft which would carry off the products of combustion, but nothing would convince him that under the ordinary conditions of gas lighting the state of the air of a room was improved.

Mr. S. COWPER-COLES exhibited some specimens of translucent glass, which he had found very effective for reducing the glare of bright lights, such as metallic filaments. The translucent glass is ordinary glass coated with a very thin film of gold, which acts as a good reflector, and at the same time transmits a certain proportion of the light as green light. If a translucent glass shade is placed in front of the source of light or below it the thin gold film on the glass

acts as a reflector, and throws a gold coloured light on the walls and ceiling, and the transmitted light is of a soft green colour. The combination gives a very restful and pleasing light to work by.

The CHAIRMAN proposed a hearty vote of thanks to Dr. Kerr and Dr. Harman, and also Mr. Gaster and Mr. Dow, which was carried unanimously.

PROTECTION OF CONSTRUCTIONAL IRON AND STEEL.

A MEETING of the Paint and Varnish Society was held on May 18 at the Agricultural Hall, Islington, in connection with the Chemical Engineering and Industries Exhibition. Mr. Leonard Archbutt occupied the chair, and Mr. J. Cruickshank Smith, B.Sc.; F.C.S., read a paper on "The Prevention of Corrosion in Iron and Steel," as printed in our issue of May 26.

The CHAIRMAN said the lecturer had given them a most interesting and suggestive paper, and had set an excellent example in not referring to any particular paints. He had treated his subject in a broad and scientific manner, laying down the conditions which a good paint ought to fulfil; and he had given his ideas in reference to the proper way in which two pigments ought to be compared one with another when an engineer had to decide which he should use. He invited full discussion on the paper.

Mr. MATT. GARBUTT was of opinion that Mr. Cruickshank Smith had provided the heads for a whole series of lectures. He would like to know how they were to get the protective coating on to the iron at all under some practical conditions. It seemed to the speaker that in the case, for instance, of re-painting a railway bridge the paint had generally little chance of getting into contact with the metal at all. When the workman set to work to "clean" the metal, he scraped off a certain amount of dirt. If there was a lot of old paint on the surface, he banged it with a hammer and it came off in flakes. But, after all, there was a film of something—probably dirt and moisture—between the metal and the paint. A great boon would be conferred upon engineers if they could arrive at some means of really cleaning metal before they put their paint on it. That always seemed to him to be a great engineering difficulty. It was conspicuous in the case of tunnels, carried by girder-work, through which steam locomotives passed. The roofs of those tunnels might be said to be never dry; the steam and products of combustion being almost continuously squirted on to the girder-work. There was perhaps only an interval of three hours in the course of a week available for painting. He would like a little more information upon the point that the author lightly touched upon as to the protection of steel in ferro-concrete. He gathered that it was the author's opinion that simply putting the steel into the concrete and packing it as well as possible by hand was not a reliable permanent protection. If that view of the case were correct, there was a great deal of trouble ahead in ferro-concrete buildings.

Mr. J. G. McINTOSH said the lecturer had referred to the fact of chromium and tungsten in small proportion in iron as reducing the tendency to corrode. That principle was well known to the speaker many years ago in regard to the lead-coating of drums for holding spirits of turpentine. If they coated an iron drum with lead, that lead would turn the spirits of turpentine yellowish-brown; but if even a quarter per cent. of tin were put into the lead, the latter would withstand the action of spirits of turpentine. That was the same principle which the lecturer had enunciated in regard to iron with a certain amount of chromium and tungsten. While fully endorsing the author's remarks in regard to magnetic oxide of iron paint not being so efficient as that specially produced on the metal by superheated steam, he was somewhat in doubt with regard to the stencil marks put on iron, and which were found to withstand the action of the weather better than the actual coat of paint itself—whether that was not partly due to the paint binding the natural mill scale to the iron, and both paint and mill scale thus conjointly protecting the iron. He could not endorse the remarks as to zinc plating of iron. In costly construction work, if iron was coated with lead and then put through rolls, the lead would be driven into the flaws by the pressure of the rolls. Any flaws in the iron acted as nuclei of corrosion, and were somewhat analogous to knots in wood. Although the lecturer had exhibited diagrams of zinc oxide and zinc sulphide, there was no diagram of white

lead. In regard to red lead, the physical action of stirring it with a stick, by breaking up its crystalline structure, would reduce it a hundred times more than the reducing action of the white.

Mr. A. E. MUNBY desired to express his appreciation of the lecturer's wish that scientific facts should come a little more into these questions. As regards electrolytic action, they might learn a great deal by experimenting. Science had contributed a great deal in the last decade to the question of rust on iron. This applied to America also. Moisture and air seemed the essentials of rusting, but as regarded the effect of the coating from an electrolytic point of view, he thought the best thing one could have to coat iron with would be iron scale, were it possible to make this up as a paint in suitable form. He would like to ask if the lecturer had any information as to the comparative electrolytic decay with iron oxide and lead oxide. He assumed red lead was much better as a medium in oil. He believed that most of the Angus Smith solution supplied was merely coal tar, and not the coal tar with the acid ingredients removed. He quite agreed that if they really obtained Angus Smith's solution they could not have a better covering. It was a substance analogous to rubber, which was quite impervious to any moisture. With such a covering the presence of solid particles would be quite unnecessary for protection of the material.

A VISITOR asked whether the lecturer had any experience of the prevention of oxidation of iron and steel by means of surface welding by acetylene?

Mr. F. O. BARRALET wished to know on what the author based his opinion as to the small extent to which the vehicle entered into the preservation of iron and steel. It seemed to him that the most efficient preservative was a tarry compound known as Dr. Angus Smith's composition, which, when put on properly, preserved the life of the iron almost indefinitely. In that material there was no actual pigment at all. The preservation depended entirely upon the absence of any chemical liquid or anything that was likely to cause corrosion by the film of tar or pitch that coated the metal. For this reason he thought that the substance which was in the nature of a vehicle had a very important function in the prevention of corrosion. Also that in the ordinary paint the actual vehicle must come into play to some extent. Otherwise, how was it that paints made with good vehicles were so much superior to paints in which the vehicles were not good, paints in which genuine oils had not been used, and in which there were no genuine diluents?

Mr. J. H. B. JENKINS said he had previously been of the opinion that the protection afforded by a coat of ordinary paint was due primarily to the oil-film; he understood the lecturer, however, to say that the protective value of a paint resided essentially not in the oil vehicle, but in the pigment. He had an open mind upon the matter, and would be glad if Mr. Cruickshank Smith could throw some further light upon that point. As illustrating the importance of the quality of oil-vehicle in ordinary painting, he thought the following experience might be of interest to the meeting. A little while ago he had to investigate a case in which a varnished surface had dried to a very imperfect coat. It had gathered itself up into a lot of roughly parallel lines or ridges, say one-eighth of an inch or so apart, the intervening spaces having little or no varnish. The paint surface upon which the varnish was applied had seemed to dry all right, so that suspicion had first attached to the varnish. Soon, however, attention was concentrated on the paint. This had been received as a paste ground in oil, and the latter, when separated and examined, was found to be adulterated with about 20 per cent. of a thin mineral oil (0.89 specific gravity). Before being applied, this paint paste was let down with pure oil, &c., so that in the thin paint, as applied, the percentage of mineral oil was reduced to about 3 per cent. When such a paint is applied there is a tendency for the linseed oil, on drying, to exude the mineral oil. This exudation becomes obvious with larger percentages, but with the 3 per cent. of mineral oil the separation which takes place along the brush marks is not visible. The coat of varnish, which is next applied, however, does not obtain a uniform hold on the paint surface beneath. Along the brush marks there are lines of weakness due to the exuded mineral oil, and these become evident as soon as the tension of the drying varnish coat becomes considerable, for the varnish, not getting a proper hold, is dragged away from these lines, and this gives to the varnished surface the final appearance complained of.

Mr. CHAPMAN asked the lecturer what protection he would advise for girders which had to be shipped abroad. He

noted a case where some had been damaged by sea water. Having removed the oxide of iron by an electric brush, would he lecturer consider it safe to ship these on a long voyage, or would he suggest a protective covering? If so, what? Painting, of course, would be out of the question on account of expense. He wished also to associate himself with those other visitors who had congratulated the lecturer and the Society on the able paper and interesting discussion they were having.

Mr. GASTON DEPIERRES was sure that those who had made a life-study of the matter would agree that the method of applying successive coats of properly prepared paint was by far the most efficient and economical method known at present of protecting iron and steel. The designing and compounding of suitable coatings was a problem which to-day was ever before the progressive and scientific paint-maker. Only the competent man who had made a careful study of the protection of constructional steel was capable with any degree of certainty of manufacturing a coating which would fulfil what was expected of it. He thought engineers and architects should pay no attention to many of the extravagant claims which were made to-day in some pamphlets and circulars. They should entrust to the specialist the responsibility of advising them. He agreed with Mr. Cruickshank Smith on the subject of the fine grinding of paint. He had for many years expounded the theory of fine grinding as one most important to the physical condition of the paint. Further, unless iron and constructional steel were properly cleaned, no paint would ever furnish a good protection to these materials.

Mr. T. A. DAVIDSON considered that it was open to question whether the pigment was the only protective agent in a paint. Until absolute proof had been adduced, it was well to hold an open mind. While it was possible that a certain amount of dissociation might occur with wet pigments placed in contact with iron, thereby enabling the pigments to be classified as "accelerators" or "retarders" of corrosion, it was extremely improbable that any dissociation would occur when the pigments were mixed with oil, so long as the resulting paint film was impervious to water. From his experience it was to neither the pigment alone nor to the oil alone that one could ascribe the protection, but rather to that combination of physical properties which could only be attained by a proper adjustment of the various ingredients. Perry suggested the idea that a perfect paint contained particles of different sizes, such that the smaller ones packed themselves into the interstices of the larger, and the whole were cemented together by a film of oil. The more perfect the adjustment of the ingredients the less pervious would the paint film be to water. If that were so, then he thought one must ascribe the protective action of paint to the oil medium as much as to the pigment.

Mr. WALTER C. HANCOCK, on the question of the protection of iron and steel in the case of ferro-concrete work, understood the author to say that it would be an advantage if some protective coating could be applied to the metal, partaking more or less of the nature of Portland cement. He did not know whether Mr. Smith was aware of a paper published in one of the American journals dealing with this subject (*Cement Age*, 1909, p. 424-429). From the experiments which were recorded there, it appeared that on the whole the metal rods, &c., used in ferro-concrete construction were well protected by the surrounding mass of cement or concrete, with one or two exceptions. The chief one was in the case where there was anything of an angle, into the corners of which it was impossible practically to force either the cement or the concrete, as the case might be. In such cases it had been found that the metal tended to corrode. In the paper referred to the suggestion was made of actually giving the metal rods a thin wash of a Portland cement paint, which could be applied and left to dry in the air, and did not peel off on exposure to the weather, while the rest of the concrete was being made up, and it was also pointed out from a number of experiments which were made that it did not at all interfere with the adhesion of the metal rods to the concrete or cement.

Mr. B. PHILIP-SMITH thought a coating of cement wash was all very well in a purely ferro-concrete building. But, unfortunately, architects and others had carried that a step too far in that they now allowed, under the London Building Act, the concrete to have a coating of cement wash on purely steel frame buildings. As to the relation between pigment and vehicle, he had always considered that the vehicle must in itself be a good protector against the corrosion of iron, and that as a fact the vehicle protected, and the pigment in turn protected the vehicle. Regarding the electrolytic

action of certain pigments on iron, he thought they had taken the electrolytic action in one direction entirely, but had omitted to take the reverse effect as between the pigment and the iron. If pigments which are electro-negative to iron cause, as is alleged, corrosion of the iron, then surely pigments which are electropositive to iron would, if the electrolytic theory holds good, be themselves corroded and destroyed.

Mr. CHARLES A. LINE suggested the use for paint thinners of sunflower seed oil, with a suitable manganese drier, there now being an ample supply of the Russian article available. He had always understood that Dr. Angus Smith's solution was applied at the works where the constructional steel was made. He might be in error, but he had an idea that iron or steel had to be dipped into it when hot, so that treatment at the works would enter into the question very much indeed. As an alternative, if a thin coat of suitable graphite paint were applied at the works before the steel was brought away (except, of course, in the presence of any serious amount of mill scale), it certainly was very effective indeed in the prevention of subsequent corrosion. He then mentioned the protection of girders. To prevent a bridge over a railway being injured by the steam and sulphur dioxide emanating from the funnels of the railway locomotive engines, a suggestion was made by himself to put a ceiling under it, composed of asbestos and Portland cement in the form of sheet, something like three-sixteenths or a quarter inch thick. This treatment was considered, after some years' trial, a success. As a consequence, only that day a consultation had been finished and an order placed for many thousands of yards of this material a quarter-inch thick, to be placed underneath steel girders and to thereby assist in their protection. His experience of a mixture of graphite, finely subdivided, and zinc oxide of suitable physical properties, thinned with drying linseed oil, containing manganese linoleate drier, was that this grey paint afforded efficient and economical permanent protection to iron and steel in an ammonia works, adjoining a gas works in a very exposed position. It can be mixed to any shade of grey, and presented a cleanly and smart appearance, not being subject to discolouration, as white lead paint always is.

The CHAIRMAN, in closing the discussion, said he thought the most important part of Mr. Cruickshank Smith's paper was that in which he emphasised the necessity of painting under proper conditions. Unless the material to be painted was properly prepared and properly dried, unless the weather was suitable and the tools and the workmen were good, he did not think even the best paint would prove efficient. It would be well if engineers would take more care to see that those necessary conditions were complied with. There were many good pigments on the market which would give excellent results, and which it would be difficult to find a better substitute for, if attention were paid to the points which the lecturer had laid stress upon. There was no such thing as Dr. Angus Smith's solution. He would like to destroy that illusion. If they read his specification they would find that what he patented was a process which was to take coal tar and boil it until they had expelled the water, the ammoniacal liquor, and the lighter oils, and apply it to cast-iron fresh from the mould. The process was invented for the preservation of water pipes. Those pipes were to be taken immediately they had been cast, before they had an opportunity of rusting or acquiring any moisture; they were to be heated to a temperature of 300 deg. F., and lowered into the prepared tar at that temperature, and left there for a time, then lifted out and allowed to drain. The use of tar varnish was not Dr. Angus Smith's process at all.

Mr. J. CRUICKSHANK SMITH, replying to the discussion, said that, as often happened in discussions like that in which they had been engaged, one speaker answered the questions put by another. This materially lightened his labours, otherwise at that late hour he would have had some difficulty in dealing fully with every point and question raised by those who had contributed to a very interesting discussion. He would first of all thank the Chairman for answering so clearly and correctly the questions that had been put regarding Angus Smith's solution. That material at its best, and even when properly applied, which it rarely was, was quite unsuitable for modern structural iron and steel, and most of the coal-tar products offered as Angus Smith's solution were loaded with tar acids, and tended to promote corrosion. They could not be painted over, and their use implied that the work must be finished in a black hue—which everyone did not like. The question of painting over old paint work, especially if the latter had perished and was scaling and flaking, was a difficult one, because it was

not easy to secure a proper foothold for the paint. The element of cost also entered into it. Unless a considerable sum of money were spent in cleaning the surface it was impossible to provide a surface capable of being painted on at all. Mere "washing and cleaning down," as a painter would understand the expression, would be quite insufficient. For old, perished paint work, loaded with carbonaceous matter from smoke, a blow-lamp treatment followed by sand-blasting and thorough cleaning with wire brushes might be necessary. Often architects and engineers were averse to spending sufficient money to ensure a clean and well-prepared surface. A surface, however, which presented the dreadful appearance described by one speaker, had clearly been left too long before being repainted. The real cure was to use good paint and to paint oftener. With regard to the treatment of steel in ferro-concrete, his view was that although it was generally admitted that Portland cement was an effective inhibitor of corrosion, it only acted as such when in close contact with the metal. Hence, architects and engineers staked everything on this close contact being maintained. He thought, therefore, that by coating the steel with a suitable paint coating they were obtaining additional security that the cement would adhere closely to the metal. A speaker had pointed out that in ferro-concrete the angles and bends corroded more readily than the flat surfaces. Several speakers had referred to the relative value of pigment and vehicle as the protective agents in paint. He disclaimed giving either undue preference, because both were essential in a properly-made paint. He maintained, however, that if they regarded the true function of a protective paint as keeping out moisture, then it was impossible to overlook the importance of the pigment, because it had been definitely proved that the presence of pigments increased the impermeability of the coating, and, further, that the more pigment there was, or, in other words, the less free oil space, the greater was the moisture-resisting power of the paints. He had laid stress on this because many people attached undue importance to the vehicle, and looked on the pigments merely as something with which to alter the colour. Someone had asked whether metals or metallic oxides were of most service as protective pigments. Aluminium, zinc, copper, and iron were all used for special purposes in certain protective paints, but their application was so limited that they could hardly be compared with the ordinary pigmentary oxides. He did not think it was possible to transport iron girders across the sea without first painting them, and he did not think anyone ought to try to do so. The stencil marks, whether of oxide of iron or any other paint, seen on girders no doubt owed their permanence, as another speaker had suggested, to their having been applied to the surface of the metal while the latter was still hot, and, consequently, clean. Asbestine was the trade name for silicate of alumina capable of being used as a pigment. He had not had practical experience of surface welding by acetylene as a prevention of corrosion. With regard to electrolytic action between the pigment and the metal, once moisture was admitted a whole set of complex electrolytic actions might ensue, which might be either checked or encouraged by the pigment. The great secret, therefore, was to keep moisture out. He thought that so far results showed that PbO did not promote electrolytic action so much as Fe₂O₃. He was not aware that sunflower oil, which undoubtedly possessed drying properties, was of sufficient commercial importance to render it a serious competitor to linseed oil at present. He entirely endorsed certain remarks that had been made regarding linseed oil. No linseed oil was fit for use in protective paints till it had been suitably treated and prepared, and when painters and paint users came to recognise this fact it would be all the better for everyone concerned.

Temperamental Architecture.

SIR,—The articles that you have just reproduced under the title of "Temperamental Architecture" cannot fail to command the attention of your readers, but there will necessarily be a divergence of opinions. This, however, will be quite in accord with Mr. LaFarge's views, as divergence "avoids to

some extent the banal aspect of mechanical regularity," such as parallel opinions might connote.

I write with all conceivable respect for those who differ from me or from whom I differ; but after thus saluting my adversaries, I will proceed to tilt at them.

There would seem to be some confusion between the modern conception of "temperamental architecture" (a really happy phrase) and the ancient conception of architectural refinements, such as were practised by the Greeks. We have no authority for supposing that the latter had any other object in view than the correction of optical illusions; the entablature and the scamilli impares were given respectively to the shaft of columns and to the stylobates and steps in order to obviate the apparent in-drawing of long and continuous straight lines; axial inclination was given in order to obviate the apparent outward spreading of long vertical lines. Other refinements were similarly practised, but in no case, it would seem, with any other object than to provide the "aspect of mechanical regularity."

The variations in regard to Greek ornament do not at all suggest such refinements as above referred to, these depending upon scientifically-practised deception for the purpose of correcting optical illusions, whereas in the case of ornament it was a display of frank artistic feeling with the object of avoiding symmetry, where this quality would be banal.

There seems no reason to doubt that mediæval designer may also have introduced refinements for correcting illusions and here I must draw a bold line—on the one side is approval of the wish to come to the assistance of the defects of the human eye, even at the expense of taking advantage of those defects.

On the other side, I stand as champion for regularity where irregularity has no reason. If "the idea is simply to avoid the harshness and monotony of exact rectangles," then a variation which is only detectable by measurement leaving otherwise the appearance of an exact rectangle (the result, of course, of optical illusion)—such a variation, I maintain, does not answer its avowed purpose.

Again, if the human eye is apt to give an apparent upward slope to flat surfaces below, as they trail off into the distance surely an actual upward slope would exaggerate this effect; to obviate it, a downward slope would be necessary.

I think, sir, the mistake lies in the attempt to cure optical illusions, irrespective of their nature. Some there are, such as the old Greeks recognised as needing vanquishment. But allow me to give two instances, to show the absurdities that might result from indiscriminate cure or indiscriminate neglect of cure.

The rails for a train seem to converge regularly from the point nearest to the eye; it is inconceivable that they should therefore be so laid as to satisfy the optic, for their practical utility would be thus destroyed; they have to be actually parallel, instead of seemingly so. On the other hand, consider the Nelson monument in Trafalgar Square if the statue of Lord Nelson were merely life-size, it would look insignificant from the footway, whereas its size is calculated so as to provide a natural appearance. Of course, it is absurdly gigantic if regarded from the abacus of the capital; it may be (and I think it is) wrong to place such memorial statues where they need exaggeration in size, but I will not debate that in this place. My wish is merely to demonstrate the necessity of discrimination in dealing with illusions.

In conclusion, I consider the use of temperamental architecture, as instanced by Professor Goodyear, opposed to the canons of Art. There is no more objection (rather less) to a rectangle, a square or a circle, than to temperamentalised substitutions; but if the latter are provided, they are useless if they are not made visually apparent.—Faithfully yours,

PERCY L. MARKS.

Albert Buildings, 49 Queen Victoria Street, E.C.

MILTON Rural Council have received a letter from the County Council asking them to give their earnest attention to the report of the County Medical Officer, who has recommended main drainage and sewage disposal works for Rainham. The scheme is estimated to cost about 12,000*l.*, whereas the population of Rainham is about 4,000.

THE Carnarvon Board of Guardians have approved the amended plan, prepared by Mr. Rowland Lloyd Jones, county architect, Carnarvon, of a new hospital in connection with the workhouse. The plan has been drawn on the pavilion principle, providing accommodation for 42 patients and four nurses.

FORTHCOMING EVENTS.

Saturday, June 10.
Edinburgh Architectural Association : Proposed Joint Visit to Glasgow with the Glasgow Institute of Architects.
Northern Architectural Association : Meeting at Sunderland to visit St. Gabriel's Church (Mr. C. A. C. Greene, architect), and the Water Company's New Offices in John Street (Messrs. W. & T. R. Milburn, architects).
Architectural Association : First Summer Visit to Nashdom, near Taplow (Mr. E. L. Lutyens, architect).
Monday, June 12.
Royal Institute of British Architects : Business Meeting, when the Annual Elections will be announced, to be followed by Mr. Ernest Richmond on "Building in Egypt."
Royal Institute of British Architects : Opening day of Preliminary and Intermediate Examinations.
Tuesday, June 13.
Manchester Society of Architects : Visit to Wilmslow to see (1) Parish Church and (2) Hawthorn Hall.
Wednesday, June 14.
Royal Archaeological Institute : Mr. G. C. Druce on "Notes on the Heraldic Jall or Yale."

EXHIBITIONS AND FIRES.

THE Brussels Exhibition fire of last year has afforded the British Fire Prevention Committee an opportunity of publishing an account of the catastrophe from an expert point of view, in which the subject is dealt with in a thorough and systematic manner to which we have become accustomed in the Committee's reports. But the chief value of the latest "Red Book" of the British Fire Prevention Committee is not in its retrospective aspect but in the suggestions as to safeguards at future temporary exhibitions set out in the form of model regulations.

Temporary exhibitions are usually housed in structures easily destroyed by fire, and necessarily contain much valuable property, often—as at Brussels—irreplaceable. Any extent of insurance, and of a highly inflammable nature. Hence it is highly desirable for the sake of property and the continued success of exhibitions (to say nothing of the danger to life) that every possible precaution should be taken to prevent the outbreak of conflagrations and to limit their extent should they occur. We do not desire to minimise the duty of exhibition promoters to prevent by every means in their power the loss of life, but the risk of this is usually small even when fires occur, as exits are ample.

But the British Fire Prevention Committee has not omitted the consideration of this important matter, and recommends that sufficient exits should be provided so that the maximum distance of any point in the interior of the buildings to the open should be eighty feet, that two routes of exit should be available, and that the exits be clearly indicated.

The provision of safeguards divides itself naturally into prevention, limitation, and extinction of outbreak. Prevention is concerned primarily with the causes of fire, secondarily with the construction of the exhibition buildings. The causes of fire are fully dealt with in the Red Book, and include open lights, smoking, waste paper and other material, lightning, stoves and flues, electric current, and other illuminants, with respect to all of which, and, if somewhat drastic, recommendations are made.

In connection with the construction of buildings, these are divided into classes as affording (1) practically "No" fire resistance, (2) "Temporary" fire resistance, (3) "Partial" fire resistance, (4) "Full" fire resistance; and the various descriptions of exhibits for which buildings of each class may be suitable are defined.

The limitation of outbreaks depends partly upon the restriction of the sizes of risks, and it is recommended that no one building should exceed in cubic content five million feet, and that no one part of any building should exceed one million cubic feet unless separated from the adjoining part by a wall of "partial" fire resistance, the openings in which are suitably fitted with doors or shutters. It

is also advised that buildings of more than one million cubic feet should be at least sixty feet distant from any other such building, that buildings of half a million cubic feet upwards should be at least forty feet away from any other building. Permission is suggested for small structures of under a hundred thousand cubic feet to be connected up or adjoin without being separated by walls of "partial" fire resistance, if the total cubic extent of these adjoining buildings in any one block does not exceed half a million cubic feet and such blocks are not less than forty feet away from any other such block or building, but this condition should not be applicable to any building used for side-shows, theatrical purposes, or a restaurant having a seating capacity of over 300 people. These small structures, it is advised, should not be less than twenty feet away from any other building unless they form part of a block of half a million cubic feet. Buildings containing irreplaceable exhibits, administrative offices, post, telegraph, or telephone offices, police or fire stations, should not be less than double the distance from other buildings of the figures generally applicable.

Limitation and extinction of fire outbreaks are to a certain extent overlapping divisions of the subject of the report, and the Committee's recommendations as to fire alarms, control service, and fire service apply to both. Fire alarm points should be numerous, but the Committee does not consider that automatic fire alarms are necessary as a general rule if the watching service is properly organised. It is advised that all fire alarms should communicate with the exhibition fire stations, watch and police offices, ambulance office, electrical, gas, and water supply centres, and the exhibition administrative offices.

A very important part of the Committee's recommendations is that denominated the "Control Service," which embraces the personnel entrusted with the prevention and limitation of fire outbreaks. The duties of this personnel are divided into two distinct departments: (1) inspection, and (2) watching. A high degree of efficiency would be the result of the advice given as to the organisation and training of this control service, which it is stated should be brought up to full strength two months before the exhibition opens and be continued at that strength during the month following upon the closing. Detailed advice is given as to the organisation and training of this service.

Full instructions are included as to the provision of water supply, hydrants, &c., to avoid failure, in which it is urged that there should be two primary sources of supply. The Committee in their tests have had considerable experience of "extincteurs," or liquid chemical fire extinguishers, of hand grenades and powder extinguishers, and it is instructive therefore to note that all such "first aid" apparatus is strongly deprecated for exhibition buildings. The older-fashioned water buckets are recommended.

The fire service it is advised should comprise officers and men of the local fire brigade, strengthened during the six months preceding the exhibition. The British Fire Prevention Committee and its chairman, Mr. EDWIN O. SACHS, are to be congratulated on the well-thought-out scheme of safeguards against fire, which should be valuable and obligatory for all temporary exhibitions.

NOTES AND COMMENTS.

THIS year's report of the Council of the City and Guilds of London Institute contains the record of the granting of the Supplemental Charter making the City and Guilds College a part of the Imperial College of Science and Technology, and to include the whole of the Engineering Department of the Imperial College. This change seems to imply the removal of the chemical department from the Central Technical College. The report notices with regret the continued diminution in the entry of students at the Technical College, Finsbury, which appears to suffer from depression in the electrical industries, competition of other technical colleges, and the desire of students for University degrees—an unfortunate result of the modern craze for examinations to the Finsbury College, which has always placed education before examination. The South London School of Technical Art has continued with about the same number of students as in the two preceding years. In the department of technology, the examination branch of the Institute's work, there has been a marked increase in the number of candidates, although the percentage of failures was slightly higher.

THE Photographic Survey and Record of Surrey continues to make good progress as detailed in the ninth annual report of the Council. In the section of architecture, 177 prints have been contributed during the past year, including records of some portions of the county that have hitherto been but scantily represented or entirely unrepresented in the Survey. Among these latter have been Chertsey, Frensham, and Churt. In the section of art and literature, Mr. J. KENRICK has again presented a very large number of photographs of water-colours by H. PETRIE, representing the churches of the county, and also other scenes in it painted between about 1795 and 1810.

THE *Art Journal* reproduces some of JOSEPH PENNELL'S lithographs of New York, in which one cannot but feel that the artist has endeavoured to conceal the ugliness of his subject by an impressionistic rendering. An appreciation of the work of W. ROBERT COLTON, A.R.A., is well illustrated by excellent photographs of some of the sculptor's most notable works. An article on "Domestic Decoration" is naturally concerned with architecture, and examples of the work of Mr. G. L. SUTCLIFFE, Mr. E. GUY DAWBER, and Mr. W. H. ROMAINE-WALKER are illustrated.

THE most important article in this month's *Connoisseur* is on Nailsea Glass, by H. ST. GEORGE GRAY, and an architecturally-interesting one is that on "The House of the Visitation" at Bruges, albeit the illustrations are chiefly those of the wall paintings. A fine coloured plate is given of a drawing of the Dymoke suit of armour at Windsor Castle. The forthcoming Coronation of King GEORGE V. lends point to a descriptive and illustrated article on a picture roll representing the procession arranged for the coronation of King GEORGE IV.

THE Dean and Chapter of St. Paul's Cathedral have wisely applied for and happily obtained a faculty empowering them to make excavations in the consecrated ground around the building to determine the nature of the

foundations and soil, with a view to forming a reliable judgment on the effect of the proposed St. Paul's Bridge upon the stability of London's metropolitan cathedral. There is undoubtedly just reason to fear that the tramway scheme which lies at the bottom of the St. Paul's Bridge project will endanger the safety of St. Paul's Cathedral and the Dean and Chapter are doing no more than their duty in endeavouring to obtain reliable information.

THE Library, Museums, and Arts Committee of Liverpool Corporation, in rejecting a proposal for an Art Union, on the ground that it might introduce "the thin end of the gambling wedge," afford us some amusement when we remember that their city holds a busy cotton exchange, where "futures," we believe, are quite as large an element as "spot" transactions, and did house some of the biggest bookmakers in the country until foreign residence seemed more congenial. The plea of the advocates of the Art Union that it might help to remove from Liverpool the stigma of being a bad market for modern pictures is clearly well founded.

IN *The Antiquary* Mr. J. TAVENOR PERRY suggests a derivative connection between the use of lions or other animals as a decorative support for the pillars of churches in Italy and the Hittite sculptures described by Professor GARSTANG. An interesting article is commenced by Mr. W. RAVENSCROFT, F.S.A., on the church of All Saints, Milford-on-Sea, Hants, with an attempt to explain the peculiar features of the plan of this church.

IT is interesting to hear of the discoveries that have been made in connection with the operations of the Office of Works at Holyrood, where preservative measures have been in progress at the ruins of the Chapel Royal. This was the nave of the abbey church built in the twelfth century by DAVID I., and reconstructed in the fifteenth century by Abbot CRAWFORD. Now the foundations of the ancient choir and north transept have been laid bare, and in the middle of the choir space utilised as the site of the mediæval church have been discovered remains of what appear to be the foundations of a Saxon or Culdee church. The masonry used in the construction of the foundations of the great thirteenth-century abbey church consisted of large square stones; the foundations of the earlier structure were built of natural stones and round boulders. The remains of this supposed early Christian church show that the structure was not of great dimensions—that, in fact, it was a mere cell. But beyond this is the revelation to the south of this early building of an early Christian place of burial. A large number of graves were found. Their existence anterior to the erection of the great abbey was determined by the fact that the foundations for the mediæval church were found to have been cut right across one of the graves. Moreover, in no case was anything of the nature of a "cist" or coffin found, the bodies having been put into the ground uncased, and in most instances rough slabs of stone placed over the grave. On one cover-stone found the name "SIBILLA STRATUN" appears, who may have been the SIBILLA who was the queen of ALEXANDER I., although tradition credits one of the islets of Loch Tay as being her last resting-place. The excavations which have exposed the foundations of the choir and north transept of the abbey church have served to settle one question in regard to which archaeological experts have taken leave to differ—namely, as to how the eastern end was finished. It was thought by some that the choir was Norman in style of architecture, with a circular apsidal end. That controversy has been set at rest by the exposure of the foundations showing a square eastern termination. The position and general outline of the chapter-house, with its central pillar in relation to some of the flying buttresses, have been clearly defined.

CHALDON AND MERSTHAM.*

REAT rolling chalk downs, masterpieces of green and white, with little villages nestling in the wooded folds of the hills, Coulsdon, Chipstead, Chaldon, and Merstham, our fathers built them. And we to-day show our appreciation of these healthy highlands chiefly, it would appear, by building palatial asylums in the most conspicuous spots. It is almost ashamed to lead you down one pretty lane this afternoon lest it might seem an insinuation on your sanity, there to right of us and to left of us were magnificent and inviting houses of the mentally unsound. But now to glance back a few centuries to the historic past. Perhaps the most interesting scene we may picture in connection with our churches of Chaldon and Merstham will be in connection with the Pilgrims' Way—"The Old Road" as described by Mr. Hilaire Belloc with such fascination. Picture, then, a group like Chaucer's, though we shall, of course, remember that his Canterbury Pilgrims were not travelling this road. First, then, his Knight, hardened by many a crusade, clad in rustian cassock; his Friar wanton and merry, his Merchant clad in motley colours, with forked beard and Flemish beaver hat; his Shipman from the West all brown of hue by many a summer sun, then Millers, Men of Law, Clerks, Squires and men, a brave and hearty company. See them winding down the valley skirting what is now Gatton Park, arriving at the Pilgrims' Well, there filling their gourds at the muddy little spring below the church. Then they will stroll up to bow their knees and say a prayer to St. Katharine of Merstham, singing with interest at the south wall of her church covered with paintings of the life and death of the martyred St. Thomas of Canterbury to whose shrine they were bound. Then on and over the downs to Chaldon ran the Pilgrims' Way; there they will gather and explain to one another the

parts of a large parish church, nave and double aisles, chancel, south chapel and south porch. Originally doubtless just a little Norman nave and chancel, the aisles were added in the twelfth century, when additions were made and the wall-painting executed. The foundation of what appeared to be outer walls were discovered extending between the arches of the south aisle. In view of the fact that the tower and spire were an addition in 1808, we may be thankful that they maintain the simplicity and scale of the rest of the church. We might have thought that one apostle would have sufficed as patron saint of so small a church, but the kind offices of St. Peter and St. Paul are both enlisted.

Apparently St. Peter has lost his bell, but that of St. Paul, inscribed "Campana beati Pauli," now hanging in the porch, claims to be the oldest in the South of England; it is granted that it is the oldest in Surrey. The pulpit of Jacobean date has interesting strap ornament. There is also a well designed memorial tablet of about the same date with the quaint inscription:

"Good redar warne all
Men and woomen whil they
be here to be ever good to
the poore and nedy. The
poore ever in this
Worlde shall ye have. God
grante us sumwat in
stoore for to save. The cry
of the poore is extreme and
very sore. God grante us,
to be good ever more. In this
worlde we rune oure rase
God grante us to be with
Christ in tyme and space."

CHALDON CHURCH.—From a Photograph by Mr. H. F. MURRELL.

details of the Ladder of Salvation, being probably really scared at the sight of the hindering demons and really cheered at the sight of the helping angels. Apart from pilgrims, this little hamlet of Chaldon is and has been for many centuries wonderfully isolated considering its proximity to the great metropolis, a lonely wold village. Who, on passing this queerly simple, doll's house of a church, would imagine that it was honoured with the possession of perhaps the most interesting wall-painting in Northern Europe? No upstart at this Chaldon; indeed it is probable that the Roman road ran through here from Godstone to Woodcote, a theory strengthened by the discovery of the remains of a Roman villa in a valley south of Chaldon. Then later it is mentioned in Domesday as Chalvedone, derived from Anglo-Saxon Cealf-un, probably Calf-down. In a charter of Frithswald, dated 1027, "apud Chepestede cum Chalvedene" were granted to the monastery of Chertsey, a grant confirmed by King Eadgar in 1057, and in 1062 by King Eadward. Later the Covert family, who came over with the Conqueror, held part of the manor. The little church, so small in scale, has yet all the

The gratitude of all archæologists must for ever be due to the Rev. H. Shepherd, the Rector, who in 1870, during a restoration, caught sight of some colour under the whitewash on the west wall. His efforts were rewarded by the discovery of the famous painting 17 feet 2 inches by 11 feet 2 inches. There were apparently traces of painting on the return walls and piers next to the west wall, but these were unfortunately destroyed during the Rector's absence. First may I trouble you with a foreword on mediæval paintings in general. Speaking of St. Mark's, Venice, Mr. Ruskin says: "I have above spoken of the whole church as a Great Book of Common Prayer; the mosaics were its illuminations and the common people of the time were taught their Scripture history by means of them more impressively, perhaps, though far less fully than ours now by Scripture reading. The walls of the church necessarily became the poor man's Bible." What the walls of St. Mark's were to the poor Venetian, what the great didactic sculptures of the cathedrals were to the French peasants, just that were the walls of St. Peter and St. Paul, Chaldon, to the clophopper of the Surrey wold. And need we pity him? He has in his picture the complete Bible story in outline and indeed a great deal else thrown in. It appears

* Read at a meeting of the Upper Norwood Athenæum by Mr. F. Franklyn Murrell, A.R.I.B.A.

evident that the picture was painted by a monk; its morals, indeed, are so exacting, he should have been a Puritan. Its probable date is about 1170, or a little later. The scheme of the painting, as we have seen, is a systematic representation of the Ladder of Salvation. "The Ladder of Salvation of the Human Soul and the Road to Heaven" is the title given to it in the "Guide to Paintings of the Greek Church." The idea of the ladder is evidently based on that of Jacob's dream. It is not to be supposed that any single monk suddenly imagined the whole scheme of the picture, but rather that he was following a common ecclesiastical tradition. I think you will agree that the name is unsuitable in so far that though the souls in the lower portion of the picture look most surely doomed those in the upper portion appear to have escaped, as it were, by the skin of their teeth.

In the lower right-hand section, in a beautifully decorative tree of life, winds the serpent, the cause of all the trouble. In the same section the Eastern torture of the bridge of spikes is presented, in endeavouring to cross which offenders, probably against Mother Church, are having a bad time. Mr. J. G. Waller suggests these figures as a blacksmith compelled to forge a horseshoe without a forge, a mason and a dishonest spinster; another figure is identified as having a

evident that the painter was chiefly anxious to point his moral, rather than to decorate the west wall of the church.

Merstham is chiefly noted to us of the building trade for its excellent limestone, to be exact, a greyish, greenish-arenaceous limestone is obtained here—you will have noticed that the church is partly built of it. There are various explanations of the origin of the name Merstham—Mearsoetham, *i.e.*, people of the marsh or boundary, or alternatively: Mère is defined as a marshland or boggy swine-walk, and stan as stone, or house of stone.

From Domesday we learn that the living was held by the Archbishop "de vestitu monachorum," supposed to mean for clothing the monks of Canterbury. The lord's rent was twenty-five fat hogs and sixteen lean ones. The living is still in the hands of the Archbishop. In the reign of Edward I the right of free warren of lands at Merstham was granted to Edmund de Passeleye. Practically the whole church dates from the twelfth century. Perhaps the best way to describe the church would be to see it through the eyes of our Canterbury Pilgrim of the late Chaucer period. After filling his gourd at the Pilgrims' Well and tying his nag, he climbs the steep bank and finds the elegant church of St. Katharina well set up on the hill and commanding a fair prospect. Like a well

WALL PAINTING AT CHALDON CHURCH.—From a Photograph by Rev. G. E. BELCHER.

stolen tithe of milk. Beneath it is the figure of Usury, a common vice of the Middle Ages; his eyes are being ruthlessly gouged out by tormenting demons, while on either side are figures representing "illicit affection." To the left of the ladder the burning caldron is reserved for patricides and fratricides, while to the left again, with poetic justice a wolf is gnawing the feet of ladies who have been too fond of dancing. The lady to the right of the caldron might well prove a warning to modern society; her hand is being bitten by a dog, presumably because she has in life indulged these pets to excess. In the upper right-hand portion is the Harrowing of Hell. The figure of Christ is represented as vanquishing the Devil, who is bound and lying on a primitive boat on the Lake of Fire. The Patriarchs are joyfully welcoming the Saviour. Enoch and Elijah are quaintly having a leg up the side of the ladder. To the left the interest centres on St. Michael weighing souls, the justice of his balance being hindered by a particularly objectionable demon on the left. The three Marys of the Gospels, looking particularly nude, are being directed to the ladder. Nothing is omitted, even the penitent thief being carried by a special angel to Paradise. The Maltese Cross at the bottom is the Dedication Cross.

The picture is painted in tempera; the colours are red, yellow ochre, native cinnabar and white. In execution the picture is a curious mixture of the crude and the refined. The figures of Christ and the Angels have real decorative value, while the demons are intentionally grotesque. It is

brought up member of the Athenæum he first wanders round the exterior of the church, and is especially delighted by the tower, with its shingled broach-spire similar to many in the fair county of Surrey. The west door of the tower is enriched with delicate dog's tooth carving of a unique pattern resembling that in the neighbouring church of Chipstead. Our pilgrim enters the church by the porch on the south side, leaving there his cloak and sword, bowing piously to the little statue in the niche over the inner door. Within he is astonished at the richness and beauty of the structure; walls and pillars blaze with colour, on the pillar near him is a bishop in the act of benediction. Then beneath the chancel arch stretches a screen of woodwork rarely carved, above it the Holy Rood is dimly seen. At the west end he notices a huge black font of Sussex marble similar to one he has seen at Shere, in Surrey. He is surprised at the curious windows of the clerestory over the arcade; some have four cusps, some have three, and all are set immediately above the columns underneath. But above all, he marvels at the carving of acanthus leaves on the capitals of the chancel arch; he has heard, indeed, of carving of this kind at the Cathedral Church at Canterbury, but most this reminds him of carving he has seen when at the wars in France. Then how beautiful is the Holy Sanctuary itself, surrounded by an arcade of pointed arches supported on shapely shafts and down in the corner a piscina, or rather one divided into two with rare carving under its basins. To the right of the chancel is the altar

f St. Katharina, about which lights are burning; behind is
er window with new glass of rich colour and figures of the

statue beneath that canopied niche. To the left of the chancel
seen a chapel newly finished with a roof in the most

excellent fashion, with shapely king posts. And now it is
getting dark and our pilgrim will hie him to "Ye Feathers,"
minding him that the landlord is a right hospitable man and
his ale not to be despised.

Before leaving the church there are perhaps one or two
features of which a twentieth-century pilgrim ought to take
note which would not have been visible to his fifteenth-
century brother. The tower arch is rather a freak, the
centre key-stone is from old London Bridge; really this carved
fragment, apparently a boss, must be of considerable interest
and should have been preserved in some spot where it had
some chance of being examined. There is a most interesting
stone effigy of a London mercer, apparently Nicholas Jamys,
one of the four representatives of London in 1415. The
church has five old bells, one bearing inscription "Sancta
Katerina, ora pro nobis." The old clappers are preserved
in the church.

Among other brasses is one in memory of the Best family,
one of whom in 1534 left "oone shepe to the hye autar of
Chepsted" and others to Merstham, Gatton, and Chaldon.

In conclusion, we have visited two churches this afternoon
which perhaps especially give us a picture of the rich
medieval life of the thirteenth, fourteenth and fifteenth
centuries, the period which in our superiority we usually
designate "the dark ages." Perhaps it may be that the
more we learn the more we may appreciate that this time
was characterised by a courage, a piety, and an artistic
ability of which to-day, had we them in like measure, we
might well be proud.

MR. JOHN BURNS, M.P., AT THE ROMFORD GARDEN SUBURB.

ON Thursday of last week the House and Cottage Exhi-
bition at Gidea Park, near Romford, was opened by
Mr. John Burns, M.P. In the course of a spirited address
he said that a year ago they had laid the foundation stone of
the first house in this new community upon an ancient
estate. On that occasion he had ventured to ask everyone
present to give their hearty co-operation. First he had
appealed to the architects, and they had responded admirably.
Then to the builders and workmen, who were no small factor
in carrying out such a scheme; and these had contributed
their share too. And lastly he had appealed to the pro-
motors who provided the enterprise and the money; they
seemed to have risen to the level of the architect, the work-
men and the builders. The beauty of the site of this
new community must appeal to everybody. He could now
congratulate the owners on so liberally taking his advice,
and on having preserved the beauty and amenity of this
district by not cutting down more trees than was necessary.
This was as it should be, for nearly everything old was
beautiful, and as he was fast becoming a picturesque and
aged ruin himself he had a right to say that. But there
was a moral underlying the principle. The adaptation of
modern needs to old-world characteristics, the retention of
trees, flowers and shrubs, the right proportion of each, and
the application to them of the skill of the domestic architect
were assets which every nation should strive to retain. The
reason being that in these over-worked days the tendency
was for nerves to be wrecked, and there was no sedative
so good, no counter-attraction so great as beeches, oaks and
elms rearing their heads above houses. Therefore he was
obliged to the promoters for having taken a part in that
spirit.

A year ago he said there would be a good demand in Essex
for that kind of housing estate and community. Since he
had said it, how had things changed from the population
point of view as revealed by the preliminary figures of the
census for 1911? In the City of London, twenty out of thirty-
one parishes had declined in population, and there was an
aggregate decrease of fourteen thousand people in the last
ten years. At the present moment London possessed 50,000
empty houses, the former tenants of which to their credit
had found fresh fields and pastures new for themselves, their
wives, and their children. It seemed incredible that in the last
ten years from 13,000 to 15,000 families had moved out of
London into Kent, Surrey, Middlesex, and Essex, and while
the population of Inner London declined by 14,000 in ten
years, the outer ring of London has increased its population
by 700,000, and Greater London beyond that has increased
its population by 670,000. In this march of the multitude,
this flight of bricks and mortar, Essex has gained in popu-
lation 245,000 people, or 30 per cent. more than its figure ten
years ago. Essex was no longer "derelict Essex." The out-
ward population of London (coupled with a few enterprising
Scotch farmers) have removed that reproach. Essex now

vied with London as a place for houses, for which in the future those erected in connection with that exhibition would be the models and exemplars. Any architect, builder, or owner willing to erect a house below the standard set up at Gidea Park deserved to have the brokers in as possessing a vandal sentiment. Some people might ask, "Is it not a bad thing that London should diminish its population?" His answer was that men, like manure, were no good in heaps, and that they required to be spread over the ground. To accomplish this no fork was so good as garden suburbs. In ten years London's death-rate had diminished from 18 to 13 per thousand, or 32 per cent., by this redistribution of population. Better than that was the wonderful reduction in infantile mortality. In 1900 the infantile mortality had been 159 per thousand, now it is only 103. That was largely due to the improvement in housing. It was impossible to have strong men and noble, enduring women in slums where their strength is sapped. At the present moment there was a movement in the county for the provision of sanatoria in Essex. But how much better than sanatoria, how much wiser than the administration of medicine was the provision for good dwellings? But even with the white scourge this distribution of population has meant that it has diminished 34 per cent., whilst all tubercular diseases have decreased by a similar amount. This was mainly due to the foresight and oversight of the local authorities. The day when the London County Council took the electric tramway over Westminster Bridge, and the battle of the bridges ended in a victory for the people, consumption had notice to quit, the slums to disappear, and misery had its marching orders. Many evils due to overcrowding were put an end to by the extension of the tramway, train and tube facilities. Some might say there was some drawback to all this. He answered there was none so far as the general community were concerned. If fifty thousand houses were empty it was mainly because they were badly designed and worse built on wrong lines. If the owners were suffering his advice to them was to pull down all the basement houses in the metropolis, and then they should re-erect them as superior houses (as good as those at Gidea Park, if possible) consistent with the pockets of their tenants. It was only by such a step owners could compete with great modern estates and co-operative schemes.

In the past Essex had been too frequently alluded to as the Cinderella of the metropolitan counties. Surrey looked down upon it, wealthy Middlesex thought herself superior, while Kent plumed itself on being the garden of England. That was going to be true no longer. He wanted Essex to be, during the next fifteen or twenty years, in the forefront of the home counties for absorbing London's population. He did not want Greater London in the next twenty or forty or sixty years to grow up without plan, system, or method, without the harmony and the other qualities which can only be taken into consideration by the adoption of a big view of the question. London ought not to grow up lop-sided. Now that Essex was coming into its own he sincerely trusted that it would be an attractive, healthy place. But what about the future settlers? Essex was not merely a very healthy county; last year it was the healthiest county in England and Wales, taking into consideration its difficulties. A poet had told them that westward the course of empire took; but he wanted the trend of London to be eastward. If this were recognised it would mean that Essex would be in for a very good time so far as trade, commerce, and the other things which make a good community.

The opening of garden cities was, said Mr. Burns, becoming a weekly function of his. Nearly every other week he was going about opening garden cities, garden suburbs, or workmen's dwellings. It was true that in a number he had visited or actually opened the estates had been mainly for people highly paid, rather than for the artisan and the lower middle class. But statesmen have to look after all classes. In the last five years he had sanctioned loans for 180 housing schemes for workmen in both town and country at a cost of 1,250,000*l.* The State lends the money at the lowest possible rate of interest consistent with a fair return. He himself was against charity rents for rich or poor. If housing in the rural districts was a difficulty, as they had been told it was, he had a suggestion to make. The farmer should raise the labourers' wages by a shilling per week. The labourers should spend two or three shillings a week less on beer, and none of them should be so foolish as to bet. The saving thus effected would enable them to pay the higher rent needed for better house accommodation, and they would not be enemies to themselves, their wives, and children.

He had that day to give away a thousand guineas from the promoters of the scheme to the authors of the successful

designs, and the other winners of prizes. The general public were indebted to the promoters for stimulating architects to compete. In the old days of jerry-building the architect was never thought of, until the house, having been erected it was ascertained that the drains were bad. But they were going to change that now, and to reverse the process. By harnessing to domestic architecture of this price and accommodation so much beauty and so much taste the organisers deserved the grateful thanks of all. One hundred and fifty houses had been erected, and incidentally that meant that something like fifteen hundred to two thousand men had secured work during a difficult period of the year. The house had been planned with a view to giving greater comfort and convenience than the type of house hitherto favoured. They must bear in mind that a house should be a home rather than a dwelling. It should stand on a pleasant site and be more convenient to the wife and children. When he was a boy workmen's houses were more like a repository than anything else. The front parlour ought to be added to the living-room for it used to be scarcely more than a mausoleum for china dogs, wax flowers, and dusty antimacassars in his young days. Father himself was regarded with scant courtesy when he wanted to be there, for it was reserved for the doctor, the undertaker, and the insurance man. To be in the front parlour used to be like being in some West End drawing-room now, where you have to be a good "cover-point" or "half-back" in order to dodge the milk-stools. Consequently that afternoon they had to express their gratitude—on behalf of the general public—to the architects and builders responsible for the houses at Gidea Park, and to congratulate them on what they had done. The estate had risen to the performance of what had been predicted of it at an inaugural gathering nearly a year ago. He only hoped that the houses would go off quickly. The estate instead of being spoilt by having nasty shops dumped down indiscriminately, with their consequent slatternly effect, was to have its shopping centre in one corner. There was no detail of this character in its development which had not been organised and provided for. Nor was there any freak architecture. They were the most artistic and comfortable dwellings he had ever inspected, and he looked to Gidea Hall Estate to be a model and exemplar.

The prizes in the competition organised in connection with the Town Planning and Modern House and Cottage Exhibition at Gidea Park, Squirrels Heath, in the Romford Garden Suburb, were distributed by Mr. Burns. The assessors were Mr. E. Guy Dawber, V.P.R.I.B.A.; Mr. H. V. Lancaster, F.R.I.B.A.; and Mr. Mervyn E. Macartney, F.R.I.B.A. Class I. Detached house, to cost 500*l.*—first prize, gold medal and 250*l.* (No. 208), Mr. Geoffrey Lucas; second prize, 100*l.* (No. 240), Mr. Reginald T. Longden; highly commended (No. 43), Mr. Curtis Green. Class II.: Detached cottage, to cost 375*l.*—first prize, gold medal and 200*l.* (No. 273), Mr. C. M. Crickmer; second prize, 100*l.* (No. 291), Mr. Herbert A. Welch. Class III. for the best internally fitted cottage in above classes; and Class V. for the best garden design will be awarded early in July. Class VII., open to builders: for excellence of workmanship and construction in the erection of a cottage in Class I. or II.—first prize, gold medal and 100*l.* (No. 43), Messrs. J. W. Falkner & Sons; second prize, 50*l.* (Nos. 241 and 242), Mr. F. W. Jarvis. Class IV. for a town plan of Gidea Park—first prize, 100*l.*, Messrs. R. Dawe & W. S. Gibson; second prize, 50*l.*, Messrs. Geoffrey Lucas & T. A. Lodge.

AMERICAN ARCHITECTURE.

By FRANK M. ANDREWS.

(Continued from last week.)

FOR the first time on American soil there was to be produced in orderly triumph the majestic splendour of ancient Rome, of Italy, of the dreams of France, and these architects, recruited from the field of conventional daily routine, thus found in their grasp the opportunity to display to a great people the possibilities and meaning of the art of architecture.

To-day it is a thing of the past, ephemeral in its material existence, but everlasting in its message and impression upon the nation. With difficulty can you, to whom the tradition of your own land and the storied riches of Europe are familiar things, realise the revelation contained in this world of art, and its stimulus to our people.

Its direct influence is manifest in every important city of our land, by local agitation for civic beauty, by established

and projected control, and direction of the art expression of individual enterprises, by the popular demand for the beautifying of streets, the monumental groupings of public buildings, and the constantly increasing intelligence of popular architectural criticism.

A hitherto unknown language to the masses, this enterprise aroused in them a spirit of inquiry and appreciation, at with one great sweep of thought elevated the profession the artist and architect into a plane of equality with all of the utilitarian pursuits of a practical money-getting age. With a public thus instructed, characteristically eager to form itself of new thoughts and ideas, we find a typical response thereto through the columns of the daily Press, the advertising of the Fair itself, and the pages of our popular magazines.

Alert in their department of public activity, they were newly alive to this demand for knowledge, and, in turning over the files of the popular print of the day, one may be surprised at the volume and importance accorded to this subject. For the first time the profession found itself a firmly-established part of the general scheme of things, a factor of public interest, upon which rested the responsibility of interesting the intellectual and material growth of a community hitherto subjected to intelligent scrutiny and analysis of its work, and in a position to deal successfully with the influence of ignorant Philistinism.

These people of practical and materialistic habit of thought responded promptly to the realisation that here indeed was a new field of development, that paid big dividends in its effect upon the physical and moral welfare of both the present and future generations.

Search as you may the current files of thirty years ago in the Press of any community in our land, and no reference will be found therein to architecture or any other art as being of public import or interest. To-day our important metropolitan newspapers maintain a regularly-established department devoted to illustration and comment upon the current architectural products of their vicinity, and the newspapers of the smaller cities display a keen interest in their local art movement.

To me this is a fact of deep significance, knowing as I do the power of the public Press in our land, which not only informs and formulates, but likewise reflects public opinion. From this awakened artistic consciousness, no longer concerned with art as an abstract question but as a matter of practical importance, there arises a stimulus which imposes upon each architect, when dealing with an important project, a responsibility so seriously involving his own personal prestige as to remove him from the field of irresponsible effort. Our building regulations and various movements towards the establishment of art commissions as a part of the organisation of city, state, and national government, are effective in their way and undoubtedly important, but the final authority rests with an enlightened public opinion which is the product of the influences to which I have alluded.

While according to these influences their general force and direction, I cannot altogether subscribe to the characteristic attitude of the writers of books and essays about art as they apply it to architectural discussion.

We who have to deal with the everyday conditions of our art, and live with it constantly, know that our feet are mired in the clay of practical, materialistic, and unlovely things, which cannot be tossed aside like the painter's canvas or the sculptor's sketch, if we find our artistic progress impeded.

Our ability to apply our art, knowledge, and skill to these things should be, in a large measure, taken as a matter of course, and—like the ability to play the piano which a composer must obviously possess—a means to an end, in our use too often overwhelmingly utilitarian.

Those who review our work for literary purposes generally fail to penetrate this realm of professional routine and practical impedimenta, and we find them wandering about the abstract discussions of the studios, arriving nowhere, and quite as apt to be of harmful influence as otherwise.

It is my purpose, therefore, to discuss our contemporaneous work from this perhaps unimaginative and materialistic standpoint, as being essential to a correct conception of an important factor in the moulding and the formation of a typical American architecture, and without which cannot be truly appreciated nor understood.

I love to soar to the heights with an imaginative writer when addressing himself to our stubbornly practical art, for it does us both good, but unless he belongs to the Brotherhood, and, like myself, has to get back to earth again, the return trip becomes rather lonesome, particularly when I find

myself humbly surveying a lot of actualities that have not been with me on the voyage. I believe that these actualities, that are our common fate and with us every day, are unitedly a component force reacting upon our artistic desire and instinct, which will finally produce a resultant force that may become differentiated as an American style. Of these two forces the artistic theory has been pretty thoroughly exploited, but I believe that the workings of the force, which I term "actualities," should be accorded equally prominent attention. As to the resultant force, have we now in America that formulated habitual expression of feeling and characteristic assemblage of detailed forms—a vernacular if you please—or an evolved system of massing, grouping of parts, or of proportion having a sufficient individualism of our own, to be designated as an American style? Obviously, this resultant does not yet exist, and indeed may be a creature of very slow growth, but is certainly in the making.

In the buildings erected during the past twenty-five years we have run the gamut of practically all known architectural thought—have experimented with about everything this side of the Indian wigwam. This has been done, not because of any lack of inventiveness on our part, nor of imagination, nor, again, does it suggest any feeling of satisfaction with such a state of affairs. We realise that we are dealing with something much more important than passing fads in millinery, automobiles, or dress, and that eventually this indiscriminate borrowing of other people's architectural garments must be succeeded by a costume more fittingly our own.

Considering, however, the prevailing circumstances surrounding our profession throughout this period, it becomes immediately apparent that my previous observation is reasonable concerning the causative action of our practical "actualities."

The incredibly rapid growth of our cities, increase of population, the demand for a new equipment of buildings of every variety of use and purpose, the razing of existing buildings (products, perhaps, of a previous decade, but become obsolete and in the way of imperative necessities), constituted a movement of such overwhelming volume, to be accomplished in such a short space of time, as to crowd upon the shoulders of one generation of architects—who virtually at the same time were re-creating themselves—a variety and volume of new problems, complicated in their every practical aspect, and presenting an entirely new artistic field of attack, that perhaps would not have been an easy task for three generations of men well entrenched amidst familiar traditions.

Again, the entire absence of suitable precedent or style, and the presence of a prevailing and entirely new form of construction having no European prototype, obviously presented a free range for the exercise of individual fancy, resulting oftentimes in incongruity and an inharmonious eccentricity and lack of restraint. Owing to the ever-increasing height and the form of our buildings—a subject of great importance to which I shall give a special attention—new problems in the scale and application of detail were presented, which resulted in many architectural catastrophes, but are now better understood.

Due to all these conditions the successful architect found himself burdened with an extraordinary and varied assortment of buildings difficult to deal with at one and the same time, with the demon of American rush-methods relentlessly pursuing him—regarded by all of our highly-organised and efficient building trades as a sort of human rubber-stamp that worked automatically—what otherwise could he do but throw up his hands in despair, with one backward look of envy towards the old monks who constructed a few feet of cathedral in a generation, turn archæologist, and plaster his steel skeleton with a tidy arrangement of architectural dope, calculated to soothe the owner, the public, and the contractor, making everybody perfectly happy, but the poor architect being left alone with his sadly disfigured ideals?

It is my personal belief that this has had much to do with the exploitation of certain historical styles by several of our notable architects; to the extent that their names have become synonymous with those styles, as, for example, Richardson with the French Romanesque.

It is an undertaking that requires no small amount of executive ability and a highly-organised office to successfully manage this condition, and whatever tends to standardise and unify its efficiency must perforce be found and used.

Richardson, with his masterly knowledge of the style, was quite justified in his adherence to the Romanesque. It was not too violent a departure from the prevailing mode, was easily managed by the building trades, and suitable to the then existing range of available building material. How

clearly he perceived this is proven not only by his own work and that of his immediate successors, who were trained under him, but also by the complete collapse of the movement he established when it fell into the hands of the horde of imitators who neither saw nor appreciated the importance of this fact, and who, in attempting novelties of treatment without proper means at hand, helped it to an early death.

Our next important architectural revelation fared more fortunately by proving itself much more adaptable to our wants, and, dealing with an almost infinite variety of refined flexible forms easily applied, became the reigning fashion for an extended period, and is to-day reasserting itself in a salutary and refreshing way.

This revelation came through the work of White and of MacKim, who did not at first display a full mastery of the style, but temporised with a curiously interesting architecture of brick and a reserved application of Italian detail. They soon became the leading exponents of the Italian Renaissance, and since their output of residential, commercial, and other classes of work, was enormous, its educational influence with us must be counted of prime importance, and by their own good taste, fine sense of proportion, and full appreciation of the refinements of the style, they elevated our standards to a plane that will not be abandoned. In their extensive use of the Georgian period they reminded us of our own best tradition, showed us the value of simplicity, control of expression, and respect for architectural law and order. Office expediency is to me apparent in much of their work, particularly in their bold confiscation of entire architectural compositions, as, for example, in the Tower of Madison Square Garden.

With us the first important exponent of the modern French school of thought and design was Richard Hunt, and his work was of such volume, his clientèle so important, as to place him as one of the factors that shaped our tendencies. His earlier work adhered closely to the contemporaneous French Renaissance, but later his frequent and facile application of the style of Francis I. to noteworthy structures produced a widespread interest in the style. His high place is accorded him, not only because of the importance and quality of his work, but also for his sturdy maintenance of the best traditions of the French school, which now have become so important to us.

These men were great artists whose inspiration given to the young men of their day, now become the active men of this day, and to the whole trend of architectural thought in the official, governmental, and private life of our country, cannot be overestimated.

It is important that I refer to the aims, influence, and results of the system of architectural education prevailing in our colleges at home and of the foreign schools, notably that of the Beaux-Arts in France. Our courses are largely influenced by the Beaux-Arts system of instruction, and the theory of architectural training as formulated by it. Better than any other, it seems to us to concern itself with the broad principles of architecture, of the laws of composition, mass and proportion, the proper use of ornament, and emphasises the comprehensive grasp of problems of a nature comparable to our own. Furthermore, it has evolved a technical method of expressing these things so intelligibly that it is peculiarly suitable to the student, first grounding him in principles and then developing in him the power to individualise his interpretation of them. It is this insistency upon principles, and freedom from exploitation of any particular style or fad and the resulting flexibility, which popularises this school of training with us. The general result of this organised system of education is already apparent, and will, in our succeeding architectural generation, mark the greatest forward step in the right direction that we have yet known. Already the sobering influence of logical thought based upon this training in principles is visibly impressing itself upon our buildings, to their infinite betterment, and revealing a firmness of touch and a sure handling of design. There is forming a unanimity or trend of thought that is replacing the scattered individual assertiveness of style that was characteristic of former days, which presages a typical American mode that will continue and prevail as a foundation for consistent development. I believe that the English influence and traditions will be always more in evidence in our expression of domestic architecture, because our habits of living are modelled upon the English customs, with particular reference to country life. Our public buildings, and our disposition of the larger civic architectural problem, will undoubtedly exhibit more decidedly than ever the French influence and system.

In the field of commercial buildings, we have presented to us our own peculiar characteristic American problem, and out of it we are developing our one positive contribution to architectural form.

Unlike the Gothic architecture, with its organic unity of construction and design, it partakes of one characteristic Gothic quality, namely, the emphasis of the vertical and subordination of the horizontal line in composition. But again, it requires a superficial envelope, a simulacra including and concealing the real structural elements beneath, and in this respect becomes analogous to the arcuated construction of the Romans with its outward application of Greek forms and orders.

That we should have indulged in architectural foundations and fantasies with such a problem as this to deal with is not to be wondered at when all things are taken into consideration.

Our most unruly problem, the tall building, is, from many ways of thinking, the result of the logical working of the law of supply and demand. It is neither fantastic, avoidable, nor useless, will not yield to adverse legislation because public necessity formulates a public opinion that will not legislate.

It is amusing to read in the publications of fifteen years ago the diatribes against it and prophecies of its early extinction which were provoked by the modest fifteen or twenty-storey structures of that time. The architect of the then tallest building in New York announced in print his belief that the end of tall buildings was in sight. Structures of twenty-five, thirty, forty, fifty, and even sixty storeys have been the answer. It furnishes a typical example of practical necessity and mode of existence creating a movement which ends in something distinctively characteristic of a people, and in this instance steel-construction and the tall building is affecting us as did the round arch and vault of the Romans. The business centres of such cities as New York and Chicago, as created to meet the conditions of 1860 to 1870, were soon outgrown, and the necessity for larger and better buildings became apparent. The established business centres could not be, or, at least, were not moved, property values and the existing inter-relationships of those centres being of too great moment at the time.

This generally prevalent condition produced different immediate results in different sections of the country, which long since have converged into an established common practice.

In Chicago, we find that the direct causes that led to the first example of true skeleton construction were—(a) the necessity for increased height; (b) which the character of the supporting soil rendered impossible on account of the weight of the then prevailing type of massive masonry wall and interior columns, and which could not be overcome unless (c) a system of construction be devised stronger and of less weight than other types, which was accomplished by the device designated by us as the "Skeleton Steel Construction."

Had this been the only merit possessed by this type it might have remained a localism of Chicago, or, at least it would not have become the highly-organised, complex, and widely-adopted construction that it is to-day, practically amounting to our accepted type for commercial purposes.

(To be concluded.)

CATHEDRAL SERIES.—ELY.—TRIFORIUM, NORTH SIDE, AND ORGAN LOUPE, LOOKING NORTH-EAST. SOUTH CHOIR AISLE, LOOKING EASTWARDS.

THESE views from photographs by Mr. J. W. Borlan are in continuation of our Supplementary Series from Ely Cathedral, and will be continued in a future issue.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE reproduce two drawings by "Finestra," to which prize was awarded in March last.

ROLLER SKATING PAVILION, Ayr, N.B.

THIS building has been erected from the designs of Mr. J. C. Reid.

HOUSE AT PRINCES RISBOROUGH.

THIS house was designed by Mr. C. W. Pike, from whose drawing our illustration is taken.

THE PRESERVATION OF ANCIENT MONUMENTS.

THE report of the Inspector of Ancient Monuments for the ending March 31, 1911, has just been issued.

It is prefaced with the following memorandum by Lord Beauchamp, the First Commissioner of Works:—

By Section 5 of the Ancient Monuments Protection Act, 1882, the Commissioners of Her Majesty's Treasury were empowered to appoint one or more Inspectors of Ancient Monuments, whose duty it would be to report to the Commissioners of Works on the condition of such monuments and on the best mode of preserving the same.

The first of such inspectors to be appointed was Lieutenant-General A. Pitt Rivers, the eminent archaeologist, whose services in the first years of the Act's existence were of great value. During the last ten years of his life, however, failing health prevented him from fully carrying out the duties of the post, and he acted almost solely in a consultative capacity for which he refused to accept a salary.

On his death in 1900, a successor was not appointed, and the work of inspection was in abeyance for a time. Informal inspections, however, showed the imperative need of action, and the Commissioners of Works accordingly appointed the late Assistant Secretary of the Department, Mr. James Fitzgerald, I.S.O., as Acting-Inspector.

Mr. Fitzgerald spent much of his spare time and most of his annual leave in what was to him a labour of love in every sense. By the end of 1908, all arrears of inspection had been overtaken and the work systematised.

Fortunately, the organisation of the Office of Works lent itself to the protection of these monuments. The department has branch offices in the great towns, with resident architect, clerk of works, foremen, &c., and it has a contractor in every district. It was impressed on the local officers that it was an important part of their duties to inspect the "ancient monuments" as well as new buildings in charge of the department.

In Scotland the board were particularly fortunate in the fact that the principal architect is an enthusiast upon antiquarian subjects.

Mr. Fitzgerald's zeal did much to stimulate local and municipal appreciation of ancient monuments and historic buildings widely scattered over the country, and this led to a marked increase of interest in their preservation.

In 1907 a Royal Commission was appointed to "make an inventory of the ancient and historical monuments and constructions connected with or illustrative of the contemporary culture, civilisation, and conditions of life of the people of England, excluding Monmouthshire, from the earliest times to the year 1700, and to specify those which seemed most worthy of preservation," and Mr. Fitzgerald took an active part in the initiation of the Commission's labours.

The excellent work done by Mr. Fitzgerald was unfortunately brought to a close by his death in the spring of 1909, and for a year the Commissioners were without an adviser in the difficult and responsible task of inspecting and maintaining those ancient monuments and historic buildings already in their charge, and in the still more onerous responsibility of negotiating the acquisition of monuments and buildings, the owners of which desired to transfer the care of their property to this department.

In view of the urgent necessity for a careful and continuous watching of the interests involved, Mr. Harcourt urged upon the Commissioners of His Majesty's Treasury the imperative need for the appointment of an inspector, and Mr. C. R. Peers, M.A., Secretary to the Society of Antiquaries, was appointed accordingly on March 25, 1910.

Mr. Peers in his report says:

I. The number of Ancient Monuments and Historic Buildings now under the care of the Commissioners of His Majesty's Works and Public Buildings is 104. The extent of the work is, however, inadequately represented by a statement of numbers, as a single standing stone must be counted as one monument equally with such an important group of buildings as Dover Castle.

II. They are divided into two classes:—

(i.) Monuments in private possession transferred to the charge of the Commissioners under the Acts.

(ii.) Monuments which are the property of the State.

The large majority of Class (i.) is prehistoric, no monuments belonging to the historic period having been qualified for State protection before the passing in 1900 of the Act amending the Ancient Monuments Act of 1882.

A full list of the monuments is given at the end of the Report, but they are briefly analysed as follows:—

(a) Prehistoric Monuments:—

	England and Wales.	Scotland.
Circles and standing stones ...	10	4
Dolmens and chambered mounds ...	13	3
Earthworks ...	5	4
Brochs, groups of hut circles, &c. ...	1	5

(b) Historic Monuments:—

Castles (masonry) ...	13	9
Earthworks ...	1	1
Ecclesiastical buildings ...	1	18
Domestic buildings ...	1	5
Town walls and gates ...	2	—
Sculptured and inscribed stones. (Single or in groups) ...	1	7
Other monuments ...	—	1

III. The number of monuments which have been placed under the protection of the Ancient Monuments Acts during the period March 25, 1910-March 31, 1911, is 15. Of these, 10 are in England and Wales, and five in Scotland.

They comprise the following prehistoric monuments in Anglesey: Standing stones at Penrhos Feilw and Tregwhe-lydd, dolmens at Bodowyr, Din Dryfol, Lligwy, Presadded, and Trefignath, and hut circles on Holyhead Mountain. In Orkney they are the Dwarfie Stone, Hoy and the Chambered Mound of Maeshowe.

The historic monuments are:—Eynhallow Church, Noltland Castle and Pierowall Church in Orkney; the Abbot's Fish House, Meare, Somerset, and part of the earthwork known as Skipsea Brough, Yorkshire.

Another section of the Edwardian town wall at Berwick-on-Tweed has also been brought under the Acts.

Of these monuments, 14 belong to Class (i.) and one to Class (ii.).

In addition to these, the transference of a considerable number of other monuments, offered to the Commissioners by their owners, is now under consideration.

IV. The condition of the monuments is, on the whole, satisfactory, though it is impossible with the funds available to put in practice as thorough a scheme of preservation as could be wished.

Among the works carried out this year the following may be noted:—

Arbroath Abbey.—The pointing and making good of decayed stonework has been continued. After negotiations with the Town Council, arrangements have been made for inclosing the remains of the chapter-house, &c., now much decayed through neglect.

Beaulieu Priory.—The walls and grounds generally have been cleared of rubbish and rank growth, and negotiations have been proceeding with the object of improving the boundary walls.

Berwick-on-Tweed Ramparts.—The re-pointing of ancient masonry, and general works of maintenance have been continued, an additional piece of Edwardian wall having now been transferred under the Ancient Monuments Acts.

Cambuskenneth Abbey.—The work of laying bare the ancient foundations is proceeding, and where necessary the masonry is being re-pointed.

Carisbrooke Castle.—The re-pointing of the walls is proceeding, the north-west bastion and adjoining defences being now under repair, and a good deal of ivy has been removed from the castle walls. Steps are being taken to prevent the scribbling of names by visitors, a disfigurement to which this castle is peculiarly liable.

Carnarvon Castle.—A very large extent of wall surface needs re-pointing and clearing of weeds and ivy. The walls from the Queen's Tower to the Queen's Gate have been cleared and pointed during this season, and the arch over the Queen's Gate secured by grouting.

Broch of Clickamin.—Exploration continued and some interesting outworks exposed. The question of the permanent treatment of the exposed works is now under consideration.

Maiden Castle, Dorchester.—The damage done by rabbits to the earthworks of this prehistoric hill-fortress is considerable, and continual care is necessary, as it appears impossible to exterminate the colony. A breach made in the chalk ramparts widens yearly, and would in the end bring down the whole face of the slope. The worst places are being made up to the former contour, the chalk being held in place by hurdles till the turf shall have grown over the new surface.

Dover Castle.—The exposed position of the Castle makes small repairs constantly necessary, but the buildings are, as a whole, structurally sound. The immense weight, however, of the iron water tanks on the roof of the Keep and its fore-building must be a very severe strain on the ancient walls,

and there are some signs of settlement in the chapel which occupies the fore-building. The walls of the church of St. Mary, in spite of careful pointing, are so damp that the plaster on them is rotten, and the mosaic in danger of becoming loose. Better ventilation will be to some degree a remedy, but a more effective system of keeping out the weather must be devised. The gatehouse of the moat bulwark and the foundations of the round church on the western heights are now, after a period of neglect, efficiently cared for.

Dunfermline Abbey and Palace.—The work of improving the amenities and exposing the remains of the cloister, &c., has proceeded at the expense of the Carnegie Dunfermline Trust. The re-pointing, &c., of those parts of the buildings in charge of H.M. Office of Works has been done where necessary.

Edinburgh Castle.—Work has proceeded continuously in the way of re-pointing the ancient masonry and generally preserving what is of historical interest.

Egilsay Church, Orkney.—The walls of the nave and chancel and round western tower have been carefully pointed, and are now in sound condition.

Elgin Cathedral.—The re-pointing and repairs to stonework have been continued, and the ground levelled so as to improve the general appearance of the site.

Fortrose Cathedral.—The re-pointing of the chapterhouse is finished, and the remains of the south aisle are now receiving attention.

Glasgow Cathedral.—The very important and costly work of strengthening and securing the ancient wooden roofs of the church is proceeding. These are of the same character throughout, and probably date from the 14th century, a most remarkable survival in a church of this scale. The construction is one which throws considerable strain on the walls and the roofs are, in consequence, somewhat spread and dislocated; but the oak timbers, considering their age, are in good condition, and when strengthened by steel principals, plates, and purlins, according to the scheme now being carried out, should last for many years.

Vale Castle, Guernsey.—The condition of this building is less satisfactory than that of any other under the care of the Commissioners. Part of the curtain wall fell in June, 1910, but has since been repaired, and the castle ditch has till within the last few months been filled with rubbish from the adjoining granite quarry. It is hoped that during the current year the site will be brought into a condition more suitable to a State-protected monument.

Holjrood: The Chapel Royal.—The re-pointing of the masonry is proceeding, and the cleaning of the incrustated stonework has revealed the 13th century carving of the capitals in wonderfully perfect condition. Measures continue to be taken for the preservation of the carvings on the west front to which the existing atmospheric conditions are very harmful. The vaulting of the south aisle of the nave has been cleared of rubbish, and the broken modern slating replaced by Caithness stone slates as originally used; the foundations of the presbytery and north transept have been exposed, and the work of banking, &c., connected with this is still in progress.

London: The Tower.—Surface decay is, and will doubtless long continue to be, a serious problem at the Tower, for as yet none of the many preservatives which have been used on decayed stonework have been able to resist the London atmosphere. Structurally, however, the buildings afford little or no cause for anxiety. The archways of the Middle and Byward Towers having been damaged by the hoods of wagons, the passage through them of all wheeled traffic is now forbidden by order of the Deputy-Governor of the Tower. Arrangements are now being made for the systematic photographing and more effective preservation of the long and interesting series of prisoners' inscriptions which occur throughout the ancient buildings. The work of removing from the ancient walls the casing of small flints in cement, which is both disfiguring and dangerous, is proceeding, and the old surfaces are being carefully pointed. The monuments in St. Peter's Chapel have been cleaned and securely fixed, and others of considerable artistic merit which had been removed to the crypt are being brought back into the chapel. The three wells in the Tower have been cleared out and examined, and prove to be of much interest, that in the White Tower being lined with 12th century masonry, with the original wood templates still in position at the bottom.

Newark Castle, Port Glasgow.—The re-pointing of masonry and repairing of roofs with more suitable slates has continued, the windows blocked up with brickwork or rubble have been re-opened, the Great Hall cleaned out, and the stonework repaired, exposing the fine stone mantel, &c.

Richmond Castle, Yorkshire.—The curtain wall on the east side of the castle, parts of which were in a dangerous state, has been repaired and is now in satisfactory condition, and the accumulated soil on its inner face has been removed. But much more work of the same kind is needed on the south and west before the buildings can be considered sound. Robin Hood's Tower, containing the 11th century chapel of St. Nicholas, has been repaired, the broken vault in the chamber over the chapel being made sound, the north-west angle of the chamber rebuilt, and the chapel floor cleared of a foot of modern rubbish.

Old Sarum, Wiltshire.—The excavations now being carried out here by the Society of Antiquaries are converting what was formerly a series of grass-grown banks into a site covered with the remains of the buildings, mostly of 12th century date, of the Castle of Old Sarum. In many places only the core of the walls remains, and though protected in every possible way will not long resist the action of the weather. A great part of the buildings can, however, be made permanently secure, and will add greatly to the interest of the place. The base of the Keep has been disclosed, flanked by ranges of rooms, one of them a chapel; a considerable length of curtain wall, two large towers, and two gateways. A number of pits, some of them of extraordinary size, and all lined with ashlar masonry, have been cleared out, and the castle well has been found, but not yet cleared.

Stirling Castle.—The re-pointing of masonry has been continued and the ancient Parliament Hall block completed, many interesting architectural details having been revealed; the buildings round the Lions' Den are now being re-pointed, also the Governor's House.

Stirling: Argyle Lodging.—Re-pointing and other repairs for the preservation of the ancient building are now proceeding.

Stirling: Mar's Wark.—The removal of cement and rough rubble from interesting architectural features is now in progress. After discussion with the town officials it has been agreed to remove an arc lamp-post, which is a great disfigurement, from the front of this ruin.

Tynemouth Priory.—The pointing of the ruined church is now finished and all is in good repair. The stonework is in many places much worn down, but rather by the force of winter gales than by any actual decay, and it is doubtful whether any treatment can stop the process, which in any case is very slow. The lines of the 11th century church, recovered by excavation some years since, are being laid down on the turf, and various improvements made in the general appearance.

Whithorn Priory.—The re-pointing and repair of the masonry after removal of shrubs, rank ivy, &c., from the walls, has been continued.

V. It having been reported that the Roman wall in Northumberland was being destroyed at several points by the whinstone quarries, Mr. Peers spent several days in the district in September, 1910. He says the destruction is not now rapid, but may at any time become so, and the whole character of the country, apart from its historical and archaeological value, would be entirely ruined in course of time. Something, of course, is lost every year as it is. Several of the Roman camps along the wall have been excavated at different times, and their buildings left uncovered, as at Aesica and Cilurnum; and Corbridge, which is rather a town than a camp, is now being excavated and parts of it are to be left exposed. The wall itself, originally about 18-20 feet high, as it is supposed, stands in parts to 4-5 feet, but in many places is reduced to a heap of stones. On the Clayton estate a good deal of it was set up again about 50 years ago, and is now again falling down and being repaired.

SCHOOL BUILDINGS IN SCOTLAND.

THE following circular has been issued to clerks of school boards by the Scotch Education Department:—"I am directed to inform you that the Department have had under consideration the report and abstracts of evidence submitted to the Board of Education by the Departmental Committee of 1910 on the cost of school buildings, and that they have made inquiry as to the character of the school buildings erected in recent years in Scotland. They find that there has been a considerable increase in building, due in a great measure to the providing of the necessary accommodation for instruction in practical subjects in the supplementary courses. They also find that in the interests of economy the Department's architect has not hesitated to approve, while their inspectors have been active in suggesting the use of light and economical structures of wood and iron or other

material when the additions do not form part of the main school building. Indeed, similar structures have been freely allowed for ordinary school purposes wherever there was evidence of a shifting population, or where, as in the Western Isles, the pressure of rates was heavy. It is well, however, to remember that the greater expense of upkeep upon such structures is undoubtedly a factor that has to be reckoned with in judging of their comparative cost.

"In addition to admitting freely such departures from the normal building regulations where justified by circumstances, the Department's architect has frequently been able to reduce the cost of buildings by suggestions as to the arrangement of plans, the character of internal fittings, and the nature of equipment to be provided. But, as is pointed out in paragraph 16 of the above-mentioned report, satisfactory results are generally obtained not by any remarkable devices (i.e., as regards materials and methods of construction) but by a careful attention to small savings on numerous items. Accordingly the Department would impress upon school boards and managers, and would ask them to impress upon the architects they may employ, the extreme importance of keeping this matter carefully in view in the preparation of plans and specifications and in the carrying out of work. While the Department's architect is always ready to give his assistance by indicating opportunities for saving as far as practicable, it would not be feasible for him in his examination of plans to go into these minutiae upon which so much of the possibility of economy depends. Boards should realise that in this respect it is upon them and their architects that full responsibility for any excessive cost of school buildings must rest. The Department also desire to draw attention to the fact that while the building rules lay down what may be regarded as the standard requirements of accommodation in schools of a normal type there is no intention of precluding the submission of plans which do not conform in all respects to these requirements. As a matter of fact it has been the practice of the Department to consider on their merits all proposals that involve a modification of the general prescription of the building rules, and it should be clearly understood that managers are at liberty to submit proposals for providing necessary school accommodation according to their own ideas of how that accommodation can be best and most economically provided, always granted that there is good reason to suppose that an efficient building for teaching purposes suitable to the circumstances of the case will emerge.

"I am to add that it would obviously be unreasonable to apply the building regulations strictly in the case of alterations to existing premises. In such circumstances special difficulties are invariably taken into consideration, and each set of plans is looked at by itself."

THE ILLUMINATING ENGINEERING SOCIETY.

A MEETING of the Illuminating Engineering Society was held on Monday, April 24, in the rooms of the Royal Society of Arts, Mr. R. J. Wallis-Jones taking the Chair, in the unavoidable absence of the President.

The SECRETARY read the minutes of the last meeting; the names of application for membership received since the last meeting and the names of applicants for membership already submitted and approved by the Council. These latter were formally declared members of the Society.

The HONORARY SECRETARY read a letter from the Secretary of the English Section of the Dresden International Exhibition of Hygiene, inviting the Society to appoint delegates to attend the exhibition, which will be opened in June. It was also suggested that if the attention of the members were drawn to this exhibition, suitable exhibits might be sent. Those wishing to attend the exhibition, or to exhibit, were asked to communicate with Mr. Gaster.

A letter was also read from the Royal Sanitary Institute in regard to their meeting at Belfast this year. The Society was invited to appoint delegates to the congress, and those wishing to attend as delegates were asked to communicate with the Honorary Secretary, Mr. Gaster.

The CHAIRMAN then called upon Mr. Haydn T. Harrison and Mr. P. J. Waldram to read their papers, which we have already printed.

Mr. A. P. TROTTER said that although he had not read the papers thoroughly, the subject of wall papers and the decoration of rooms was of vast importance, to which architects must be educated up. Probably a more shocking example could hardly be found in London than the room of the Society of Arts, in which, by the courtesy of that body,

they held their meetings. The subject could be dealt with mathematically by the well-known formula of taking the co-efficient of absorption as a percentage of pure white, perfect reflection being 100 per cent. It was possible to get nearly 80 per cent. with the very best white surfaces, and so on down the scale which had been given by several people, especially by Dr. Sumpner, who was the first to publish it, and to give a very practical scale of co-efficients of absorption. The total light in a room entirely covered with a colour absorbing a known percentage could of course, be calculated mathematically, but as with many mathematical problems, it was not possible to get at all the conditions, so that in practice it was necessary to have recourse to experiments. The only case which approximated to the actual conditions was the Ulbricht globe, and Mr. Waldram had been testing, in exactly the same way that he did some years ago, with model rooms. It seemed that if they took the model room and covered it with a very small amount of wall paper—a half piece would be ample—and put $\frac{1}{2}$ c.p. lamps to scale in the room, a very fair idea could be obtained of the effect of different wall papers. If they did not know to what extent the different colours would be used, and had to apply the mathematical formula, one for the wall, another for the ceiling, and another for the floor, it would be rather a serious matter, and therefore it was well worth while experimenting in a more elaborate way than even Mr. Waldram had already shown.

The CHAIRMAN, referring to Mr. Trotter's remark with regard to the hall of the Royal Society of Arts, said it was due to the room to explain that this particular colour had been chosen because so many things were shown around the walls at different times, and consequently the walls got knocked about very much, and were made dirty by the various workmen. Therefore the Society had chosen what was known as a very dull colour.

Mr. JUSTUS ECK (Union Electric Co.) said there could be no doubt about the great value of having clearly in our mind the difference between light and illumination. Mr. Harrison deserved their thanks for giving his table of terms. It was the duty of a Society like theirs to try and get clear ideas, and the distinctions given were exactly what were wanted. They wanted something which distinguished the secondary source of illumination from the primary, and he suggested that the Society should, in future, adopt the term luminosity as secondary illumination. The suggestion that makers of illuminating devices should send out polar curves was certainly a very good one, but it did not always appeal to the manufacturer because of the misuse of such curves by their trade competitors. Any manufacturer, however, was always pleased to give such information in response to a serious request from an illuminating engineer, who would put the results to a proper use, and not try to draw improper conclusions to the detriment of any particular piece of apparatus. He regretted that Mr. Waldram had been prevented by ill-health from completing his paper, because the subject was an exceedingly fascinating one. He hoped, however, that Mr. Waldram would on a future occasion communicate to the Society the results of some of the tests which he had in hand. He rather wondered why Mr. Waldram, in the second paragraph of his paper, selected the electrical engineer for adverse criticism. Surely there were consulting gas experts who should provide the same sort of information as was expected to be provided by the consulting electrical experts. In conclusion, Mr. Eck expressed the opinion that they could all benefit very greatly from the very interesting model shown by Mr. Waldram, and the demonstration of how it was used for screening off the light from different sections of a wall. He thought everybody must have been greatly impressed by the large amount of ingenuity shown by Mr. Waldram in solving what was an exceedingly difficult problem; many of them thought it could not be solved except at great expense.

Mr. VAL H. MACKINNEY (Holophane, Ltd.), referring to Mr. Harrison's remarks concerning the Holophane Lumeter, said that it must be clearly understood that to measure foot-candle intensity or illumination with this instrument the standard card must be used. Mr. Harrison had mentioned that it was necessary that the two surfaces, the one outside and the one inside, should be identical. He assumed that Mr. Harrison meant the surface brightness should be identical. He had tested that afternoon the surface brightness of the surface inside Mr. Harrison's own instrument, and compared with that of the standard surface outside, and from a set of readings, they obtained 5.3 for the inside surface, and 5.7 for the outside. He then tested the surface brightness of the inside of a Holophane Lumeter, and also

the outside, and obtained figures of 5.2 and 4.9. Therefore, no serious differences should be obtained from readings taken with Mr. Harrison's instrument, or with the Holophane instrument. The measurements should read true foot-candle intensity. There were several points in Mr. Harrison's paper which he wished to qualify. It was mentioned that reflectors and globes would enhance, in one way, the value of a lamp, that is, the direct illumination given, but he pointed out that it did, if correctly designed and put to a proper use, enhance the value of the light in other respects also. For instance, Mr. Harrison left out of account the need of avoiding glare, which would seriously interfere with the comfort of the eye in observing surroundings, but could be completely removed by the use of a suitable shade. This related to the physiological effect of opening and closing the pupil of the eye. Mr. Harrison mentioned that by toning down the surroundings, the eyes would open, and enable one to read more clearly, but when reading, the iris contracted automatically and therefore, darkening the surroundings too much would have the effect of setting up a want of muscular balance, and cause eye strain just as much as if the surroundings were bright. In the design of globes and reflectors of the Holophane Co., that had been taken into account. Certain facts, known to oculists and opticians, had decided that for general purposes about 25 per cent. of the light should go over the upper hemisphere, and 75 per cent. down. The oldest series of reflectors put on the market by the Holophane Co. reflected 75 per cent., transmitted 22 per cent. up over the upper hemisphere, and absorbed about 3 per cent. Mr. Harrison rather suggested that in certain cases it was possible that a reflector might do harm to the illumination on the horizontal plane. He himself had figures which showed that even under the worst conditions from the point of view of the reflector, with white walls and ceilings, a reflector was still of use, i.e. the energy consumed was reduced compared with the absence of a reflector. His experience went to show that with properly designed reflectors and globes, the value of the light unit was enhanced in more ways than one. Coming to the main portion of his remarks, namely, the tests which the Holophane Co. have been carrying out, mainly at the suggestion of Mr. Waldram, upon the effect of different coloured walls and ceilings upon light distribution, Mr. Mackinney said that these experiments were carried out in a room 8 feet cube, so arranged that it could be fitted with wall papers of any desired colours. The plane tested was 2 feet 8 inches above the floor level, and one lamp in the centre. The room was made of wood, with white distempered ceiling and walls, and the floor black. A number of tests were made, as shown in the accompanying table, with various coloured walls with a bare lamp, and

Source.	Conditions of Ceiling and Walls.	Quantity of Light (Lumens over Working Plane to the nearest round Number).			Energy Consumption in Watts to give flux of 100 Lumens over Working Plane.
		From Source, Refer distribution curve.	From Ceiling.	From Walls.	
Tungsten 200v. 55w.	White ceiling, white walls. Matt distemper on wood...	17	50	33	100
	Black ceiling, white walls. Serge cloth	17	33	50	110
	White ceiling, dark blue walls (mean reflective power, 22%)	17	30	47	117
	White ceiling, dark red walls (mean reflective power, 28%)	17	36	53	104
	White ceiling, light green walls (mean reflective power, 45%)	17	53	70	78
Lamp with Holophane reflector No. E 60	Ditto	60	40	100	55
Lamp with Holophane reflector No. I 60	Ditto	90	35	125	44
Lamp with Holophane reflector No. F 60	Ditto	120	36	156	35

also with three types of Holophane reflectors. By using a black cloth, it was possible to cover up and so block out the reflection from any part of the room, and thus analyse exactly how the total flux of light was derived. As a rule, Mr. Mackinney said, engineers, in predicting the results

in an installation, were content to allow nothing for the effect of reflection from surroundings, but he believed that as a result of these experiments it should be possible to foretell exactly what the results in an interior, having a paper of prescribed colour and reflection co-efficient, and equipped with a specified form of Holophane reflector, should be. It will be noted from the table that the total flux of light is accurately divided into the direct flux, and the indirect portion due to reflection from the various surfaces. It is interesting to observe how the various components change as different wall papers are employed, and the figures show that even in a room with light green walls and a white ceiling, a saving of over 30 per cent. can be made by using the correct Holophane reflector.

Mr. T. E. RITCHIE referred first to Mr. Harrison's remark that the angle of incidence of the light rays closely follows the cosine law for the greater part of the angular movement. He would like to know in what portion of the angular movement the cosine law was not followed, as this was a point of considerable interest. With regard to the references that had been made to the correctness or otherwise of the Lumeter photometer, he had recently had an opportunity of comparing it with five very well-known and reliable instruments, and in that comparison it came out second, and stood upon an exceedingly high plane which was of considerable importance, having regard to the very moderate price at which it was sold. He differed from Mr. Harrison in two points in relation to his reference to the fact that shadowless illumination was always depressing. First of all, he did not know of a sound system of illumination which could correctly be described as shadowless. There was nevertheless one system— with which certain people had thought fit to associate him— which was exceedingly pleasant, in that its shadows were of a very agreeable nature, but it was not by any means shadowless, and he thought they would all agree that a really definitely shadowless illumination would be very unhappy. This was a point which required very close co-operation between illuminating engineers and decorative artists. It was a phase which had not been sufficiently emphasised, and which was of very great importance, particularly in any system of indirect lighting. With regard to the suggestion that manufacturers of lamps should supply polar curves, and upon which both authors had adopted a somewhat pessimistic attitude, he said that there were certain firms, at all events, that had been in the habit for a very long time of furnishing, when called upon, most helpful information of this kind, but as far as his experience had gone they were very seldom called upon for it, and the fault lay just as much with illuminating engineers and architects as with the manufacturers. He was in entire agreement with Mr. Waldram in his remarks as to the desirability of indirect lighting, and in this connection he pointed out that after a very exhaustive research he had only been able to find two instances in which any specific installations of indirect lighting had been condemned as unsatisfactory. One of these was that recently referred to by Professor Morris, in which he had admitted that the indirect lamps were placed in unscientific reflectors, and that the position of the lamps relative to the ceiling was determined by head room rather than by scientific considerations. The other one was the reference made by Dr. Bishop Harman to the installation at Cambridge, which was put in a large number of years ago, and referred to an alternating-current system. Moreover, in this particular case the illumination was required for dissecting purposes, which was an exceedingly unusual and special feature.

Mr. J. G. CLARKE (Gas Light and Coke Co.) agreed with the suggestion that polar curves should be supplied by makers of lamps, and thought that the existence of these would make illuminating engineering a more simple matter. It must be remembered that lamps sometimes had certain architectural features which must not be overlooked, and for this reason it was much better to use shades of a transparent character, on the Holophane principle preferably, so that a certain amount of light went upwards and developed the architectural scheme; quite a small quantity of light was necessary to serve this purpose. A point in connection with the illumination of different rooms was that it seemed that with a given scheme of lighting and a given colour of walls the illumination of the walls ought to be inversely proportional to the square of the linear dimensions of the room. This would be rather an interesting thing to investigate.

Mr. W. R. RAWLINGS, while congratulating the authors upon their papers, thought they had overlooked one or two important points, such, for instance, as the comfort which was to be derived from the light itself, or from the luminosity. The suggestion seemed to permeate the papers that it would

be far better to have white walls. Again, it seemed to be suggested that all rooms were somewhat of the shape of the rooms referred to in which the tests upon different coloured wall papers had been carried out, but in actual practice it was found that rooms had alcoves, and that the walls were hung with pictures and curtains, and all these had to be taken into consideration when dealing with the illumination. They did not want to fix a volume of light throughout the room. Each room must be dealt with upon its merits. In a dining-room, for instance, the light was wanted on the table, and as much as Mr. Haydn Harrison knew of illumination—and they would all admit that it was very considerable—he ventured to suggest that he had still to learn something in regard to the requirements of the ladies in connection with illumination. Mr. Harrison had suggested that ladies wanted more light than the gentlemen, but he was sure that Mr. Harrison knew nothing about ladies if he adhered to that statement. When ladies went out in sunlight they usually put on a veil in order to leave something to the imagination, and when it came to artificial lighting the same idea seemed to permeate, because he was frequently told, when dealing with the boudoir and the drawing-room, "Please do not let me have a bright light." In the same way, in the smoking-room it was usually necessary to have a very bright light, and he differed from Mr. Harrison on these two points. Nevertheless, he congratulated the authors upon bringing forward a matter of very great interest indeed, and he was particularly interested in the way in which Mr. Waldram measured the luminosity in different parts of the room.

Mr. J. HEWITT said that both papers had dealt with the matter from the point of view of house-lighting pure and simple, and in this connection there was one thing that had to be considered very carefully, viz., the avoidance of eye-strain and the effect of sudden transit from darkness into a bright light, and also the avoidance of direct light into the eye. Of course, if the source of illumination was not to be visible there was then an entire avoidance of eye-strain. One difficulty which the ordinary illuminating engineer came across in practice was the trouble he often had with the architect who was employed on the job. As an instance, he mentioned a case in which he was concerned in which he had designed very carefully the whole scheme of illumination for a building in which there were a large number of oil paintings. He had previously seen the architect, who had given him particulars of the scheme of colouring, and everything else. But when he went down to the job afterwards he found that the blue was a great deal deeper than that given to him, the brown was nearly as dark as the hall of the Society of Arts, and there were heavy oak beams which had been shown white in the drawing. The result was that he had to alter everything. He asked Mr. Harrison to explain to him more clearly the exact definition of the sense in which the term "Diffusion" was used in his paper. The meaning he put upon it was that it related to the light coming from every possible point. Personally, he failed to see that they could get any approximation to this, and as no doubt the point had occurred to many others, perhaps Mr. Harrison would make it clear.

The CHAIRMAN asked any other gentlemen who desired to speak to send their remarks to the Secretary for inclusion in the Journal.

Mr. HAYDN T. HARRISON, replying briefly, said that Mr. Mackinney had misunderstood him, as he did not wish to suggest that the Lumeter did not read candle-feet perfectly accurately when used with the screen provided for the purpose. Mr. Mackinney had hit a pet theory of his (Mr. Harrison's) on the head. Mr. Mackinney always treated lumens as the measurement of light at a solid angle, and in this paper he (Mr. Harrison) particularly suggested that lumens should be the rays coming indirectly from the luminosity, and therefore would absolutely be the same as candle-power from the direct source and the luminous value from the indirect source, in which case the solid angle would be done away with. At present we in England had not got into the way of talking of this solid angle as was the case in America. In Great Britain, at any rate, most of us preferred to talk about light and square of distance to the solid angle, and Mr. Mackinney would find that very few people talked about lumens. Whether this was the right way to settle the point or not must be for some future occasion.

Mr. WALDRAM also replied briefly. With regard to Mr. Trotter's suggestion that experiments should be carried out with model rooms, he said these were rather difficult and not at all easy. It was particularly necessary to find out whether experiments in a room 10 feet square were comparable with a room 100 feet square, and he was inclined to think they would be. He had recently found that results obtained in a

room 20 feet by 10 feet were almost the same proportionately as in a room 135 feet by 60 feet by 30 feet high. Thus it would seem that it did not seriously matter what size the room was in which the experiments were carried out. He disagreed with Mr. Clarke as to the fixed illumination of a room varying according to the square of the linear dimensions. He would have thought that in a white room they would vary according to the linear dimensions and not according to the square. Mr. Eck had been rather sorry that he had not criticised gas experts in his paper, or rather that he had left them out. He was afraid the difficulty was, speaking as an architect, that he found neither gas nor electrical experts could generally guarantee to provide a wiring installation which would give a certain feet-candle illumination in a given room. That was the difficulty he had found as an architect, and he must say that the only people he had been able to get anything from was the Holophane Co. There might be others, but it was his experience that if he wanted to get a certain amount of illumination, say on a rinking floor or a dancing floor, or, indeed, on any floor, he could get information concerning it from the Holophane Co. or their engineers. When it came to walls or ceilings it was not so easy. Mr. Mackinney took the table plane, but he hoped that they would not neglect the walls and ceilings. Mr. Rawlings seemed to be rather afraid that he was suggesting white walls. As a matter of fact, white walls and also white ceilings were largely used in America for economy, and their economy was obvious. There was need for standards of brightness for different coloured papers, and he hoped some action would be taken in regard to this. With regard to Mr. Rawlings's suggestion that a very good light was wanted in a smoking-room, he suggested that in an ordinary West End club-room it was more useful to have particularly dark colours and walls, and particularly bright lights on the tables. He hardly thought that a high general illumination on the walls of a card-room, for instance, would be satisfactory.

Mr. Waldram concluded by making a few criticisms upon Mr. Harrison's paper. An important point was the possibility of obtaining candle-power curves of lamps and shades together, because if the reflectors interfered with the laws of inverse squares, then the whole subject was insoluble, but he ventured to suggest that it was not so. He believed that it was possible to get a proper polar curve of lamp and reflector. If this were not so, then a polar curve of a lamp and shade measured at a certain distance would materially differ from a polar curve measured at another distance. If this occurred, then a very large element of doubt was introduced into all their results, but he did not think that was the case.

The CHAIRMAN, in proposing a vote of thanks to the authors of the papers, said that contributions of this description justified the existence of the Society. Mr. Harrison's paper brought out a figure which was quite satisfactory to him personally, namely, that the light green gave such good reflective results, a fact which he had suggested in connection with the last meeting of the Society. If anybody had any doubts as to the reflective value of various colours he did not think there was a better object-lesson than by going into Oxford Street and seeing certain buildings where there were a large number of windows all lighted in exactly the same way, and if they analysed the windows which had dark materials in them the lighting appeared to be most inferior as compared with the windows which had lighter materials. Mr. Waldram's paper might very well have a sort of text which would read something like this, "Dull walls, dull spirits," and he thought it was a valuable suggestion of Mr. Waldram's that the Council should try and draw up standards of brightness of illumination for different classes of interior work. Although the Council was very much overworked, he had no doubt that next session they would be able to give this suggestion consideration.

MR. A. G. CLIFFORD, architect, Glasgow, has been appointed by Dunfermline Parish Council adjudicator on the competitive plans for new offices for the Council, which are to be built in Abbot Street.

THE Council of Manchester University through a gift made by two friends has been enabled to offer a travelling scholarship in architecture under which a student who has taken first-class honours in architecture may travel for a time to study the subject abroad. The first award will be made in 1912.

MR. WILLIAM KELLY, A.R.S.A., has prepared a model of his design for an hexagonal tower to be erected at Inveramsay, about twenty miles from Aberdeen, on the site of the battle of Harlaw, the quincentenary of which is to be celebrated next month.

ARBITRATORS AND THEIR AWARDS.*

ON former occasions I have delivered lectures on the question of "Arbitration Procedure" and "Arbitrations" in general, and I have been requested to-day to deal with "Arbitrators and their Awards," which I have very much pleasure in doing briefly, as the time allowed for these lectures makes it practically impossible to go into the subjects at all in detail. I shall therefore speak to you shortly about arbitrators and then consider a few points which must be borne in mind when preparing an award.

1. *Who may be an arbitrator?* That is a question very easily answered, because as a general statement it is correct to say that anyone can be an arbitrator so long as he is approved by both parties to the arbitration. The persons concerned can nominate and agree to anyone, and if the person appointed turns out to be unfit, incapable, or unsuitable, the parties have only themselves to blame, and have no remedy by action for negligence or incapacity. The parties secure their own judge and select a person who they consider will be able to settle their differences and see justice done between them, and possibly consider will be able to do so at less expense than actual litigation in the Law Courts. But although anyone may be agreed upon as an arbitrator, yet the person appointing an arbitrator should do so with considerable caution, having regard to the qualifications of the person appointed.

The position of the arbitrators may be considered somewhat different under different circumstances. When the dispute is referred to two arbitrators and an umpire the arbitrators may well be considered as agents acting for their respective principals, endeavouring to try and settle the case without going into Court, but the umpire or single arbitrator occupies a judicial position, and is bound as far as practicable to follow legal rules.

You have therefore to consider who and what you are appointing, always remembering that your appointment is final and that once having chosen your tribunal, you must stand by your bargain.

When you choose your arbitrator to act with another and an umpire you will choose him possibly for his experience and skill in the particular matter in dispute, and have regard to his power of persuasion in arriving at a fair and equitable decision, certainly with a capacity to join in choosing a proper umpire. On that branch of the question we need not dwell.

It is when you choose or join in choosing a sole arbitrator and are selecting your judge and jury that you should see that he is a fit and proper person.

It may be that you have left the question of the nomination of an arbitrator to some body or person, some council or committee, or possibly the president of some institute such as your own. In such case you have placed it out of your power to do otherwise than acquiesce in the appointment, and unless an appointment is manifestly improper, which is not likely to be the case, you have no voice in the appointment, although I see no possible objection to your explaining to the person making the nomination, when you ask him to nominate, the kind of dispute which is to come before the arbitrator for decision and the kind of arbitrator you would prefer should be appointed.

But the person making such a nomination has an onerous duty to perform, and should be careful that he nominates a capable and efficient arbitrator, and one who will be able to deal properly with the dispute or question which will be submitted to him for decision.

In my opinion, an arbitrator should be a person who has had experience at the work, for not only will he have to be able to bring skill and common sense to bear upon the subject matter of the dispute, but he will also have to be able to conduct the inquiry in a legal and judicial manner, and should have a detailed knowledge of arbitration procedure and the way to prepare an award, otherwise, in all probability, his award will be upset by the dissatisfied party and the whole arbitration will be of no useful effect. You should avoid, as far as possible, a man who will be led away by his own prejudices or peculiar crotchets; he should be one who has a good knowledge of the work and is able to appreciate the evidence of witnesses, able to easily discover fallacies and weigh all the surrounding circumstances; he must, in fact, act as judge and jury.

As to his appointment, there are few instances given in the reports of cases impeaching awards on the ground of the

incompetency of arbitrators, and very little light is thrown on this subject, for usually the parties are fairly successful in appointing someone capable, and the incapacity is not as a rule found out until the award is published.

The Arbitration Act provides that when the submission is in writing, "if no other reference is provided the reference shall be to a single arbitrator."

The sole arbitrator is either

(a) Nominated in the submission.

(b) Nominated by a person named in the submission either as an individual or as the holder of a particular office for the time being, such as a person nominated by the President for the time being of the Auctioneers' Institute.

(c) Agreed upon by the parties, or

(d) Appointed by the Court.

In case of a submission to arbitration it is not unusual to provide that the two arbitrators named in the submission should appoint another arbitrator by whom, or by any two of them, the matters in dispute are to be determined; the appointment of such third arbitrator should be made before the arbitrators originally appointed do any other act. Such third person is not an umpire, but a third arbitrator, and the three must act together; in fact, until the third arbitrator has been appointed the two have no power to proceed with the arbitration in any way.

The most common form, however, of a submission to arbitration when the Act does not apply is to refer the dispute to two persons, and to provide that the arbitrators shall appoint an umpire who, if the two arbitrators do not agree in making their award, shall alone settle the matters in dispute; this third person is called the umpire. Sometimes the umpire is named in the submission, but more frequently than not the appointment of the umpire is left to the arbitrators. This power of appointing a third arbitrator or an umpire, when delegated to the two arbitrators appointed by the parties, is a matter of judgment and not of chance, and must be exercised accordingly; the appointment must be a matter of choice. Thus, where the arbitrators, not being able to agree as to the person to be appointed, cast lots as to which of the two arbitrators should nominate the umpire, the Court considered that method of procedure to be improper, and set aside the award made by such umpire.

If, however, the parties themselves agree to, or acquiesce in, the procedure of appointing an umpire or third arbitrator by lot, the appointment would undoubtedly hold good. In an old case where on a reference to two arbitrators and, in case of their not agreeing, to an umpire to be appointed by them, each arbitrator furnished the names of three persons which were not objected to by the other, and in the presence of the parties, who attended before them for the very purpose, the choice of umpire was determined by lot from such six names, and a memorandum of the appointment of the person so selected was indorsed on the agreement of reference in the presence of and with the concurrence of both parties, the Court refused to set aside the award made by such umpire, the parties themselves having directed the mode of choice, and if the parties, with knowledge that the arbitrators had appointed an umpire or a third arbitrator by lot, attend at the meetings before such umpire, such attendance would be considered a waiver of any objection; but, on the contrary, if the parties attended before an umpire so appointed without knowledge of the method of appointment they would not be prevented from taking objection to the award if they afterwards discovered the irregularity. In order to render the attendance of the parties before the umpire a waiver of this irregular mode of appointment it would have to be proved that the parties were cognisant of all the circumstances under which the appointment was made, so that where two arbitrators each nominated a person to be umpire, and each objected to the other's nomination, and they elected between themselves, without the knowledge of the parties, one of such two by lot, and the party against whom the award was made had attended before the umpire with knowledge that the umpire has been chosen by lot, but not knowing that that person had been objected to by one of the arbitrators, it was held that such attendance would not be considered a waiver, and the Court could under such circumstances set aside an award made by an umpire so nominated.

Where the nomination and appointment of the umpire is left to the arbitrators, the appointment must follow the submission; it must be either under the hands and seals, or under the hands only of the arbitrator, as required by the submission. The appointment of an umpire by the arbitrators does not require a stamp.

Arbitrators named in the submission with power to appoint a third arbitrator or an umpire should make the appointment before they do any other act. For, as Lord

* A lecture delivered by Mr. George Phillips, J.P., of the Inner Temple, barrister-at-law, at the annual meeting of the Western Counties branch of the Auctioneers' Institute of the United Kingdom, at the Rougemont Hotel, Exeter, on Monday, May 8.

Ellenborough said, "It is very convenient for arbitrators to begin by appointing an umpire, because they are more likely to agree upon a proper choice of one before they themselves begin to quarrel."

If the arbitrators nominate an umpire who accepts the office and enters upon the reference, their power as to the appointment of an umpire is at an end, and if, after such acceptance, the parties object to the umpire who relinquishes the appointment, the arbitrators have no power of appointing another, for an authority when once executed cannot be executed again. If, however, the person so nominated does not accept the appointment the arbitrators may elect another until they get a person to enter on the umpirage.

Where the reference is to two arbitrators, and in case of disagreement to an umpire, the arbitrators cannot award as to part of the dispute and the umpire as to the residue, but the award must be made of all matters by the arbitrators or the umpirage of all matters by the umpire. Therefore, where all matters in difference were referred to two arbitrators, or in case they disagreed to an umpire to be chosen by them, by the award and umpirage it appeared that the arbitrators determined several matters, and they differing in one matter, such one matter was referred to the umpire, who determined that matter alone, the Court held that such an award was void, as it was neither an award of the arbitrators nor the umpirage of the umpire. If the arbitrators make an award, although it is bad, as not comprehending all matters in difference or the like, the umpire has no power to deal with the subject omitted. But the mere act of the arbitrators, whose authority has determined, joining with the umpire in making the umpirage does not vitiate such umpirage, for the award is, in law, the award of the umpire alone; it is no more than if mere strangers had joined in the award, which could not vitiate it. If the arbitrators hear all the evidence and afterwards disagree and state the evidence to the umpire, on which he makes his award without re-examining the witnesses, it is good, unless he is required by the parties to examine them before he makes his award. But where the umpire is required to re-hear the evidence of witnesses examined before the arbitrators he is bound to do so, and if he refuses the Court will set aside his award. The usual course adopted is for the arbitrators and umpire to all sit together and hear the evidence, and such a method is convenient, but of course the umpire is not the ruling spirit, and, in fact, has no *locus standi* unless the arbitrators have notified that they have disagreed, and when they have so notified, of course their powers are at an end and the umpire becomes the sole judge. Other methods are often adopted, but are strictly quite out of order.

(To be continued.)

THE CONCRETE INSTITUTE.

INTERIM REPORT OF THE TESTS STANDING COMMITTEE ON THE TESTING OF CONCRETE, REINFORCED CONCRETE, AND MATERIALS EMPLOYED THEREIN.

THE Tests Standing Committee of the Concrete Institute held their first meeting on January 26, 1911, and have held five subsequent meetings.

2. The Committee decided to take up for immediate investigation standard methods of testing concrete, reinforced concrete, and materials employed therein.

3. This interim report deals only with the testing of the materials and specimen pieces of concrete.

4. For the purpose of this report the materials employed in concrete and reinforced concrete will be classified under the following headings:—

(a) Coarse material. (b) Sand. (c) Cement. (d) Water. (e) Steel.

5. This report does not take into consideration, so far as applied to reinforced concrete, any coarse material which does not pass an aperture of $\frac{3}{8}$ in. by $\frac{3}{8}$ in., and which is not retained on an aperture of $\frac{1}{4}$ in. by $\frac{1}{4}$ in. The material used for coarse material generally can be classified under the following headings:—

(a) Pit gravel. (b) Pit gravel crushed. (c) River gravel. (d) River gravel crushed. (e) Sea gravel. (f) Sea gravel crushed. (g) Crushed rock. (h) Crushed brick. (i) Crushed slag. (j) Clinker and coke breeze.

Classes (i) and (j) are not recommended as suitable material for reinforced concrete.

6. This Committee is of opinion that to obtain the best results in concrete, the coarse material and sand should be properly graded.

Unfortunately the principle of grading coarse material and sand is very little resorted to, and consequently there are few data on this important subject.

This is now being considered in detail by the Committee, and a further report will be issued in due course.

7. The result of a series of tests shows that the percentage of voids in materials varies according to the different sizes and grading from 35 per cent. to 48 per cent. It should be noted that, owing to the different materials tested, the variation is very irregular.

8. This report does not take into consideration, so far as applied to reinforced concrete, any sand which does not pass an aperture of $\frac{1}{4}$ in. by $\frac{1}{4}$ in., and which is not retained on an aperture of $\frac{1}{80}$ in. by $\frac{1}{80}$ in.

Sand used in concrete work is as follows:—

(a) Pit sand (other than that of glacial origin). (b) River sand. (c) Sea sand. (d) Grit or sand from crushed coarse material.

9. It is important that all sand that is not retained on an aperture of $\frac{1}{80}$ in. by $\frac{1}{80}$ in. should be rejected. The following results of tests have been submitted to this Committee as showing the deleterious effect of allowing dust to remain in the sand:—

PROPORTION. THREE TO ONE (BY WEIGHT).

Crushing Tests.

British Standard Sand and Cement.	Crushings from Porphyritic Granite and Blue-grey Whinstone to pass 30 by 30 Sieve, including all Dust.
Per Square Inch. 28 Days.	Per Square Inch. 28 Days.
2,789 lbs.	606 lbs.

Tensile Tests.

7 Days.	28 Days.	7 Days.	28 Days.
182.2 lbs.	234.6 lbs.	53.2 lbs.	104 lbs.

10. The percentage of voids in sand varies from 23 per cent. to 40 per cent.

11. According to the various proportions of graded coarse material and sand, the percentage of voids varies from 24 per cent. to 30 per cent.

12. All cement should be tested and analysed in accordance with the Engineering Standard Committee's latest specification. The Tests Standing Committee of the Concrete Institute strongly recommends that in addition the crushing strength of the cement should be ascertained in the following manner:—

13. Cubes mixed in the proportion of 3 parts of standard sand to 1 part of cement, by weight, shall be made up and treated in all respects similar to briquettes of sand and cement for the tensile test, but the test specimens for crushing to be 3-in. cubes. The crushing strength shall be not less than ten times the tensile strength at 28 days required by the British Standard Specification.

14. This Committee is of opinion that it is not advisable to define the proportion of water to be used in making up concrete or test specimens of cement and concrete, as this quantity must be more or less dependent on the variations in the weather and the nature of the coarse material and sand used in each particular case; but it is generally considered that the concrete should be mixed to a plastic state, though not so wet as to allow any dripping of the cement, water, and sand.

15. The following tests are recommended for all steel work for use in reinforced concrete.

16. The steel shall attain an ultimate tensile strength of not less than 60,000 lb. per sq. in.

17. The steel shall withstand a stress of at least 34,000 lb. per sq. in. before showing any appreciable permanent set.

18. The contraction of area at fracture shall be not less than 45 per cent.

18a. (Or) The elongation in the case of bars of 1-in. diameter and under shall be not less than 25 per cent. measured on a length equal to eight times the diameter of the bar tested.

The elongation shall be measured in the case of bars over 1-in. diameter on a length equal to four diameters of the bar, and shall be not less than 30 per cent.

19. All steel shall stand bending cold to an angle of 180° around a diameter equal to that of the piece tested, without fracturing the skin of the bent portion.

20. The steel shall be free from scabs and flaws.

21. For the purpose of ascertaining the crushing resistance of concrete the following particulars shall be complied with:

(a) All test pieces shall be 4-in. or 6-in. cube.

(b) Number of test specimens for each test shall be six.

(c) Three cubes shall be made in the laboratory and three for each test shall be made on the works.

(d) The cement for each series of cubes shall be taken from the same consignment.

(e) All laboratory-made test cubes shall be made as far as possible on practical lines, so that the results of the tests

shall be such as can be reasonably expected from concrete in the actual work with proper care and attention.

(f) Specimen cubes from the works shall be made with concrete taken from the actual mixing platform; the concrete used for the specimen cubes shall be taken from the various batches of concrete prepared for use in the works.

(g) In all cases specimen pieces shall be made in metal moulds, and the concrete worked in by "punning" and "tamping" and afterwards gently rammed.

22. The following particulars shall be taken or ascertained of the materials used in the test specimens of the concrete:—

(a) Full test on cement as specified in Clauses 12 and 13.

(b) The coarse material and sand for the laboratory tests, which is to be taken from bulk as delivered to the works, shall be sieved to the following degrees and the voids ascertained of (1) the whole and (2) of each separate grading:—

Coarse Material.

To pass an aperture of— To be retained on an aperture of—

$\frac{3}{4}$ in. by $\frac{3}{4}$ in.	$\frac{5}{8}$ in. by $\frac{5}{8}$ in.
$\frac{5}{8}$ in. by $\frac{5}{8}$ in.	$\frac{3}{4}$ in. by $\frac{3}{4}$ in.
$\frac{1}{2}$ in. by $\frac{1}{2}$ in.	$\frac{5}{8}$ in. by $\frac{5}{8}$ in.

(c) The proportion of each grading to the whole.

(e) The specific gravity of the coarse material and sand.

(b) The exact dimensions of specimen cubes.

(c) The weight per cubic foot of all specimens immediately before testing.

(f) The testing of concrete specimens shall be conducted on three laboratory specimens, and three specimens made on the work (see Clause 21), and shall be tested at the following periods:—

<i>Minimum Tests</i>	7 days
(Recommended	28 "
as the least	56 "
that should	90 "
be under-	6 months
taken).	12 "

<i>Medium Tests</i>	7 days
(Recommended	28 "
to be under-	56 "
taken where-	90 "
ever possible).	9 months
	1 year
	2 years

<i>Maximum Tests</i>	7 days
(Recommended	28 "
for extensive	56 "
structures	90 "
and research).	6 months
	9 "
	1 year
	2 years
	3 "
	4 "
	5 "

All specimens shall be kept in air after mixing and slightly damped for the first seven days.

All cubes made up on the works shall be forwarded to the laboratory on the fifth day.

After the expiration of 7 days specimens shall be kept under cover for the purpose only of protection from the direct action of rain and direct sunrays.

23. The Committee is of opinion that for the purpose of providing for the cost of testing a provisional sum should be included in all contracts where such testing will be required, this being the most satisfactory and fairest way to all parties concerned.

24.—Members of the Institute are invited to forward the Committee particulars of any tests which they may have available.

MR. T. G. JACKSON, R.A., Honorary Fellow of Wadham College, is to receive the honorary degree of D.C.L. of Oxford at the Encenia on June 28.

OUR CONTEMPORARIES FROM OVERSEAS.

THE *American Architect* (New York) illustrates recent work of Messrs. James Purdon, Bohard & Parsson, and of Messrs. Alden & Harlow in domestic architecture. Some of Messrs. Allen & Collens' working drawings for the Ohio State University Library are also reproduced. The number also contains an interesting illustrated article on Saragossa, the city of brick.

Arkitektur og Dekorativ Kunst (Christiania) is principally filled with a description and illustrations of premiated designs for working men's cottages in two classes, farm labourers and fishermen.

La Construction Moderne (Paris) illustrates the new post office at Tarbes by Mons. Daniel Beylard, and the Jardin Roselle at Alexandria, Egypt, of which Mons. Paraskevas is the architect.

Het Huis (Amsterdam) commences an illustrated article on the ruined castle of Doornenburg, in which are included views from old engravings showing its appearance in the eighteenth century, before ruination. There is also an article on tobacco box lids engraved with scriptural and other subjects.

Engineering Record (New York) contains an account of the pneumatic caisson foundations of the Emigrant Bank Building, New York, a seventeen-storey erection with frontages to Chambers Street and Reade Street. The foundations are carried down through earth, water, and quicksand to a gravel bed 60 or 70 feet below the street level.

Berliner Architekturwelt (Berlin) is this month a monograph of the work of Herr Bruno Möhring, examples of which are given of many varieties, including the wine cellars of Julius Kayser & Co. at Traben on the Moselle, the German pavilion at the recent International Railway and Traffic Exhibition at Buenos Ayres.

Construction (Toronto) is quite ecclesiastical this month with an article on Church architecture by Mr. Eden Smith, and one on the Cistercian abbeys of South-west Scotland by Mr. Sydney H. Miller, both illustrated. Secular work described includes premises at Winnipeg for the Bank of Nova Scotia and a house in Toronto "in Tudor design."

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The Passing of the Jerry Builder.

SIR,—Reading the leading article in your issue of June 2, I have been much impressed with the writer's remarks contained therein. I quite agree with you that the Romford Garden Suburb Exhibition marks the parting of the ways, but I hardly think your remarks on the man known as the jerry builder are quite just. Twenty to twenty-five years ago, I ask you, Sir, where you could have found architects willing to design a house of the total value of 375*l.*, or even 500*l.*? Men of the position of those who have entered for this competition would then have laughed at the idea, consequently Mr. Jerry Builder provided a want, and I make bold to state by his very shortcomings has materially helped to educate these very gentlemen, who in conjunction with up-to-date builders are showing us such an object lesson as can be seen at Romford. Although I believe that the heading of this letter is a true and trite remark, let us be just to the memory of the man who first gave us a cheap house and who, with all his many failings, has done much to bring about this awakening in the architectural profession. Apologising for taking up so much of your space, I am, &c.,

A DWELLER FOR 25 YEARS IN JERRY-BUILT HOUSES.

MR. P. G. FRY, architect, Weston-super-Mare, is the architect for the church of St. Paul, about to be erected at a cost of 10,700*l.* in the parish of Emmanuel, Weston-super-Mare.

THE Winchester City Corporation have accepted from Mr. C. B. Phillips, formerly Master of Winchester College, more than a hundred drawings of the city, and a hope was expressed that with this encouragement the Corporation would consider the provision of an art gallery for the city.

FORTHCOMING EVENTS.

- Friday, June 16.
- Architectural Association: Exhibition of Students' Competitive Drawings at 18 Tufton Street. Closes June 26.
- Saturday, June 17.
- Northern Architectural Association: Students' Sketching Club Meeting.
- Manchester Society of Architects: Visit to Adlington Hall, Cheshire.
- Thursday, June 22.
- Coronation of King George V.
- Monday, June 26.
- Royal Institute of British Architects: Presentation of the Royal Gold Medal, at 8.30. "The Interleaved Heirloom Copy of the *Parentalia*, and some Notes on the Wrens," by Lawrence Weaver, F.S.A., Hon. A. Exhibition of Photographs of Wren's work.

INTERIOR FROM HOUSE AT GIDEA PARK.—Mr. M. H. BAILLIE SCOTT, Architect.

INTERIORS AT GIDEA PARK.

IN the designing of such small houses as those erected in accordance with the conditions of competition prescribed at Gidea Park, limited in building cost to £1,000 in Class I. and 375*l.* in Class II., it can hardly be expected that much opportunity occurs for striking interior effects, and it is therefore satisfactory to note that notwithstanding the limited opportunity there are not a few examples of pleasantly successful interiors to be seen in the newest garden suburb.

Where the architect has elected to follow the traditional arrangement of the middle-class house with its living-room and drawing-room as separate and distinct departments there is naturally small chance of creating a vista or framed view, and the designers of this type

of plan have necessarily found themselves restricted to, at the most, some exhibition of thought in the treatment of their staircase or of the fireplace in one or more rooms. Where, on the other hand, the more up-to-date division of the living-room accommodation into one large and one small apartment has been adopted, or where the rooms have been arranged en suite with wide openings, either permanent or capable of being closed on occasion, then interior views of a very considerable amount of pleasurable interest have been rendered possible.

Thus in the gold-medal design of Class I., by Mr. GEOFFREY LUCAS, we find a great lack of interior effect other than that of the well-designed detail of the individual small sitting-rooms, whilst in Mr. BAILLIE SCOTT'S house in the same Class I. we have a remarkable variety

INTERIOR FROM HOUSE AT GIDEA PARK.—Messrs. FAIR & MYER, Architects.

of pleasant interior effects produced by the grouping of three rooms en suite with wide openings between them. We give an illustration of one of the interior views in this house, showing the fireplace in the largest living room. Mr. SCOTT has abolished the work of the plasterer by leaving the walls pointed with a flush mortar joint and whitened or coloured in distemper, whilst the ceilings are formed by the floor-boarding of the upper rooms, the joists showing beneath unwrought, save for a rough chamfer on the edges, adze worked. These are whitewashed. The floor boards are of elm, stained dark, the doors of unstained elm, with ash ledges and wrought-iron Norfolk latches. The oak beams are adze wrought and covered with whitewash, rubbed off when dry. Thus a cottagey character is imparted which combines with the merits of the plan to form an effective interior. The attractiveness is enhanced by the antique furniture which has been supplied by BAILEYS, LTD.

Another interior, of which we give a view, obtains its effect from the provision of a large living room, 24 feet 6 inches by 14 feet 6 inches, with a carefully-designed ingle treated in revealed red brick, with white mortar joints and full of thought in detail, notably in the use of blue and white Dutch tiles and of bull-nose bricks to the fireplace arch. This is found in Messrs. FAIR & MYER's house, designed for Class I. The walls and ceiling in this case are of plaster with dark brown beams. This interior is rendered the more complete by being furnished by Messrs. HARRISON, GIBSON & Co., of Ilford.

Messrs. FORBES & TATE have contrived an effective interior with two living rooms connected by a wide opening, a peep in which we also illustrate. They have made special features of their fireplaces, which are carried out in revealed Dutch bricks and very wide mortar joints. We rather doubt the wisdom of the extremely coarse texture of this treatment for interior walls. The walls in this house have the bare brickwork covered only with

paperhanger's canvas and distemper, the use of plaster being confined to the ceilings. Thus a texture is given to the wall surface that is decidedly effective without being costly, and a little less brusque than bare brick. The house has been furnished by Messrs. HINDLEY WILKINSON.

As an example of staircase treatment we give a view from the front door of that in the house for Class I., signed by Messrs. BAMFORD & AITKEN, which is one of the most successful to be seen in the exhibition.

These examples we have illustrated may be taken as samples of the care that has been given by many of the architects whose work is on view at Gidea Park to provide not only picturesque exteriors for neighbours and passers-by but pleasant interiors for their occupants instead of the banality that marks the usual je ne sais what of the builder's middle-class villa residence.

From the plans that are given in the catalogue of the exhibition, it may be gathered that there are many other instances of highly satisfactory interior treatment, some of which, however, are even yet not complete, such as the house, No. 229 in Reed Pond Walk, designed by Mr. CECIL A. SHARP, and No. 239, also in Reed Pond Walk, by Messrs. BARRY PARKER & RAYMOND UNWIN.

One element that we see makes for pleasant interior effect when rooms open into each other is the variation of lighting that ensues from windows with different aspects, but some of the designers in striving for these effects have committed the error of putting in too many windows. This is a fault, however, that is not so apparent when the houses are unfurnished than it is when occupied, for the modern middle-class housewife with her inordinate love of curtains will very soon reduce any excessive brilliancy of lighting.

ENTRANCE HALL IN HOUSE AT GIDEA PARK.
Messrs. BAMFORD & AITKEN, Architects.

Nevertheless a point to be remembered that a small house could not be over-windowed, both for æsthetic and practical reasons. Windows on too many sides of a room destroy contrast of light and shade, and reduce all surfaces to an even flatness of illumination which is very uncomfortable. An excess of window means also an undue increase of cost alike in building, furnishing, and keep, as well as greater susceptibility to variations of the external temperature.

Whilst in a house that is to be occupied all the year and it may seem to be impossible in this country that we can have too much sunlight, we have been reminded during this present month that even in England we may, on occasion, long for shade, and thus it is scarcely wise to so plan a living room that it will receive sunlight all day, although it is undoubtedly desirable that, with the exception of one or two offices, each room should receive sunlight at some portion of the day.

We are pleased to notice that whilst ingles are not frequently introduced into the houses at Gidea Park, there is a recognition amongst our up-to-date architects that they should not be nooks, but be so arranged that radiated heat from the fireplace should extend its influence over a considerable area of the room. Thus the æsthetic value of the accentuation of the hearth, as the focus of the room is preserved without sacrifice of its utility as the source of warmth and comfort.

THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

Too many of the drawings submitted for May fail to attain the position of water-colours. They are either tinted pencil drawings and sometimes differ only by fraction from the style of everyday coloured geometrical working drawing. In a water-colour drawing it is essential for a student to steer absolutely clear of the diagram, which is the usual form of an architect's working drawing. There should be no visible lines, but only surfaces which may be distinguished from each other by variation of

£500 HOUSE AT GIDEA PARK.—Messrs. FAIR & MYER, Architects.

colour or of tone. Care must be given to prevent the surfaces being flat tints, as they would be usually in a working drawing. There must be variation of tone and tint, and in technique the student should endeavour to work with a full rather than a dry brush. Colour should be left to dry as it falls, and not dragged about and worried while it is wet. Practice will bring facility in laying on the right colour.

Mr. W. A. ROBB sends a sketch of Cullen House, Banffshire, which is a charming example of Scottish baronial architecture. In Mr. ROBB's drawing the building is framed in masses of foliage, the colouring of which is defective in values and unpleasantly hard at the edges.

"Sans Peur" is working on the right lines, as shown in the three sketches he submits of St. Mary's Church, Ponteland; an old house, Shieldfield Green, Newcastle-on-Tyne; and the entrance to the Black Gate, also at Newcastle-on-Tyne. The drawing of the church is rather low in tone, and requires more strength in the foreground. The colour in the sky has been too much worked over. The old house is better. The gateway is rather false in values, particularly in the shadows. "Sans Peur" must keep his brush full and let his colour dry without worrying it.

Mr. T. OWEN THIRTLE contributes a drawing of Bishop Hall's Palace, Heigham, Norwich, which shows promise but suffers from the conventional blue colour applied to all the windows, which is false to reality, and the hardness of his foreground, with its over-brilliant colouring of the flower borders. Mr. THIRTLE should practice the use of full untouched washes from a wet brush.

"Le Quayt" has drawn the Blind School at York, and produced a pleasant sketch, although dependent rather too much on the pencilling to be entirely satisfactory as a water-colour. The composition of his subject is good, and the general effect is pleasing as a tinted pencil sketch, but would be better for more strength in the foreground.

Mr. E. H. GIBSON handles his brush well in his drawing of Knaresborough Church, but has filled too much of his paper with the building to make a picture, as there is virtually no foreground. It should always be remembered that the "middle distance" is the proper place for the building in a picture of architecture. The drawing gives the idea of having been painted at a lengthy sitting, during which the author has been unobservant of the sun's progress; hence the lighting is false.

"Reynard" sends a view of the North Choir Aisle of St. Bartholomew the Great, Smithfield, London, which is a good piece of water-colour work, but with some exaggeration in the purple of the shadows. The drawing is a good study of light and shadow.

"Plato" contributes three water-colour drawings from Oxford, showing Merton College Tower and Corpus Christi Gateway, Magdalen College Tower and Christ Church Cathedral. These are all good examples of water-colour in a bright, high key, with due regard to composition. The least successful in colour is the drawing of Magdalen.

We have decided to divide the prize for this month equally between "Sans Peur," "Le Quayt," "Reynard" and "Plato."

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday, June 12, Mr. E. Guy Dawber, Vice-President, in the chair. The receipt of a large number of donations to the library was announced. Six Fellows and nine Associates were elected, and the nomination was announced of 397 candidates for Licentiatehip.

Mr. ERNEST RICHMOND, Licentiate R.I.B.A., then read a paper on

Building Methods in Egypt.

The manner of life in an Egyptian town or village, to which the houses give outward expression, is, he said, as far removed from modern European life as the houses themselves are ill-adapted to European requirements. The Egyptian word for house is derived from a root meaning to pass the night. The buildings look as if they were never repaired, and many of them as if anything short of reconstruction would be impossible. Their dilapidated appearance is to be largely attributed to the condition of the surface rendering of the walls.

The prevailing physical conditions of the country may be said, broadly speaking, to arise, on the one hand, from the annual miracle of the Nile flood, and, on the other, to the daily miracle of the Egyptian sun. During the flood season a building's foundations are in water or in mud; and, after the Nile has fallen, on hard-caked clay. These changes do not take place without some effect upon the foundations and superstructure. There is also an extensive range in temperature, not only between winter and summer, but between night and day, producing stresses greater than a wall can resist. Further, the atmosphere is remarkable for its dryness. The floor of Egyptian towns has not been laid down by the Nile, as is the case of the surrounding cultivated land, but has in the first instance been deposited by man, with the object of attaining a ground-level for buildings above the reach of floods. The levels of towns and villages have progressively risen through the ages. A desert site may be sandy or rocky; in the former case the watering of the gardens round the house may result in foundation settlements.

In both the ancient buildings and the mediæval monuments of Egypt the tendency was towards keeping the foundations as near the surface as possible. In ancient Egypt there can hardly be said to be any foundations at all, and no attempt was made to obtain equal intensities of pressure upon the ground or to restrict the intensity to as low a unit as possible. The foundations of the mediæval buildings in Cairo are taken well below the ground-level, but never to a depth sufficient to reach the level of permanent saturation. The depth depended, probably, on that of the surface rubbish, which, in a comparatively modern town such as Cairo was not great enough to involve much excavation. Modern

Egyptian builders also dig until they get through the surface earth and reach the naturally deposited alluvium, or, as they term it, the "black mud." In the ancient towns, to dig down to the original ground would be out of the question. For excavation in such places a rule of thumb is followed by the natives. For two-storey houses they dig to a depth of two metres and a half, and for three-storey houses three metres or three metres and a half. Buildings in the highest parts of ancient towns must necessarily stand upon foundation beds of "made" earth compacted only by time.

The original building material in Egypt was mud brick. This material is still used to a very large extent; and although, for important work, it has been replaced by stone and burnt brick, yet the traditional conception of walling derived from mud-brick construction has remained, throughout history, inherent in the Egyptian builder and it is possible to detect through all Egyptian work—ancient, mediæval, and modern—the dominating presence of those ideas which originated from mud-brick construction. The wall of a building in sun-dried brick and mud mortar is in Egypt a fairly homogeneous structure. It is otherwise with a building in stone; so stability was to be secured not by bond but by thickness, such as was given by three or more walls side by side. In modern Egypt one of the most noticeable features of native methods of walling is the absence of bond.

In native practice, the materials most generally used throughout Egypt are burnt brick and mud brick. Rubble stone is also employed, but principally in Cairo and Alexandria, owing to the proximity of convenient quarries. The tendency of an Egyptian mason, if left to himself, when using rubble stone, is to break it into small pieces approaching the size of bricks. The native-burnt brick is usually very rough; it is made of a mixture of mud and chopped straw cast in moulds, then built into clamps and burnt. The just proportion of width to length, necessary for bonding purposes, is not considered, nor is much attention paid to burning the bricks evenly. The materials used for the composition of mortars are Nile mud, fat lime, the dust resulting from crushing burnt bricks, sand, gypsum, and, lastly, "kosremil," which is the residue or ash of a fuel composed of street sweepings used for heating native baths. Various mixtures are used, depending on the locality and on the riches or poverty of the building-owner. The mortar must be prevented from drying too quickly and thereby crumbling to dust instead of hardening. The need for damp in walls built in mud mortar is exemplified by the objection on the part of many native builders to damp-proof courses.

With the materials described above thin, well-bonded homogeneous walls would neither be safe nor practicable. The Egyptian rarely, if ever, builds a wall less than half a metre thick. If rubble stone is used the masons work in pairs, one man on one side of the wall and his colleague on the other. Except that each proceeds at more or less the same pace there is little connection between their work. There is no through bond. Practically two thin walls are constructed independently, and the space in between is filled with small stones and large masses of mortar. The mortar, if it is of mud, kosremil, and fat lime, and if it keeps fairly damp hardens rather than sets. On the hardening of the mortar more especially on the outside of the joints, the stability of the wall largely depends, and, in order to fortify the outer joints and to render them as capable as possible of serving as small retaining walls, to any inferior mortar which may have turned to powder instead of hardening it is common to bed in the surface joints small pieces of stone. When fat lime and sand mortar is used the same practice is often followed, for it is recognised that this mortar sets only on the face. If the wall is constructed of brick hardly any more attention is paid to bond than in the case of a rubble-stone wall. The same mortars are used solely to provide beds on which to place successive courses of brick. A more or less systematic appearance of bond is given to the face, but the principle is not extended to the interior. Each course is constructed by laying bricks side by side about one centimetre apart; the vertical joints between the bricks are purposely left open. Native-built brick walls, like those in rubble, are rarely if ever less than half a metre thick. Such walls, whether of brick or rubble, and standing upon a foundation bed liable to frequent movements, would of course soon collapse unless the entire absence of bond in the masonry itself were not supplemented. The bond necessary for giving some degree of stability is provided by means of horizontal pieces of timber placed over and under all openings and forming lintels and sills. Ranges of these timbers are carried round the building, and similar ranges are bedded in the walls at the

levels of floors and roofs, where they form plates to receive the joints; and other timbers are placed, apparently promiscuously, in any position, independent of opening or levels of floors and roofs. The amount of timber judged necessary depends on the nature of the land built upon, more being used in buildings upon "made" soil, or in soil with an admixture of sand, than in those constructed on the black alluvium.

The surface of the wall is, when finished, provided with a rendering very generally composed of fat lime and sand, to protect the outer joints of the masonry from the destructive influence of the sun and wind. The joints would, without it, become cracked and gradually destroyed, and so prepare for the gradual collapse of the building owing to the escape of the dried and crumbled mortar in the interior of its walls, unless built so phenomenally thick as to be disproportioned to an ordinary building.

The main characteristics of a wall such as that described appear to be its elasticity and the capacity it possesses to adapt itself in a certain measure to movements, both those in the foundation bed, caused by the rise and fall of the sub-soil water, and those in the superstructure itself, caused by stresses set up by changes of temperature. But such methods cannot produce a building which will not soon after completion begin to show signs of dilapidation. To maintain it in a state of repair considered essential by Europeans or those influenced by European ideas is impossible. The defects being obvious, it is not difficult to propose remedies whereby a more solid, a healthier, and a more fire-resisting building could be erected.

Up to a few years ago it was usual to lay down a thick raft of concrete. This method is now largely replaced by driving concrete piles about three metres apart and connecting the tops with beams of reinforced concrete on which the walls are laid. Broad-spreading foundations of reinforced concrete have also given good results. The introduction of new methods is by no means an easy task, nor is the result invariably successful. It has been found that it is not easy to determine the degree of rigidity which must not be exceeded. Almost as great inconvenience may be caused by too rigidly building a wall or roof as by one which is too loosely put together. Of the boundary walls, for example, enclosing various groups of buildings erected on a desert foundation near Cairo, some were built in bricks and cement mortar, others in bricks and local fat-lime mortar. Those built in cement mortar cracked vertically at intervals of from five to 20 metres throughout their length, while those built entirely in lime mortar were undamaged. It may be added that some walls were built in lime mortar, but with the top course of brick on edge set in cement mortar wherever this was done the cracks occurred about five metres apart; the cracks extended only through the top three or four courses.

There has been, and still is, a tendency to neglect the effects of temperature changes and to design without reference to them. Modern materials and methods are not unattended by dangerous, or at least highly inconvenient, results in Egypt, owing to the temperature conditions. It is a question yet to be answered how far the modern tendency towards thinness and homogeneity of construction are applicable in that country. This question can only be answered by continued experiment and research.

In Egypt there is, as yet, no established tradition capable of providing a suitable and complete guide when building for the fulfilment of modern needs. It is not, then, surprising that European builders have met with some experiences neither happy nor expected. The problem before them is of a twofold nature. How, on the one hand, to build so as to fulfil modern requirements in regard to stability, fire-resistance, health, maintenance, and repair; and, on the other, to keep within the limits imposed by local physical or climatic conditions. To find the middle way, and to make a satisfactory harmony between local conditions and requirements of foreign origin must be an object of the architect as well as of other workers in Egypt.

Mr. R. WEIR SCHULTZ, being asked by the chairman to propose the vote of thanks, said he presumed he had been called upon to speak first because of the fact that he had the pleasure of visiting Egypt over four years ago, and very interesting it had been. The Royal Institute were fortunate in having Mr. Ernest Richmond to speak to them on Egyptian methods of construction, because there was no one better qualified. It seemed to be only the other day that one was congratulating him on a chance of going out to Egypt

in connection with some work being carried out by Mr. Somers Clarke. Afterwards he joined the department for the repair of ancient mosques; and later he went on to the War Office, where he had to deal with buildings of all classes. Finally, the Department of Public Works recognised a good man; and Mr. Richmond now acted as director. When he (the speaker) was in Egypt his visits included several to works done under the direction of Mr. Richmond; in every case the building was carried out with great care and in a manner suitable to the purposes for which it was intended. There was in them no attempt to copy forms which were of no use or to imitate appearances of old work where such would have been out of place. One of the great difficulties in Egypt was, as they had been told, the putting up of buildings for Europeans by workmen who do not understand the conditions under which Europeans live. It was a pity that Mr. Richmond had not time to talk about native craftsmanship, such as woodwork and plasterwork, for there was still a good deal done in this direction from which Europeans could learn. Craftsmanship in Egypt was very much alive. Some time after his own return he heard there had been an attempt made to promote it. In response to an advertisement a very able man, imbued with enthusiasm, went out from this country to direct the movement, and he took with him models of work done in schools in London. But shortly after they arrived they crumbled.

Professor FLINDERS PETRIE said the paper was an exceedingly interesting one as explanatory of ancient methods, as showing what were the necessities of modern times, and how successfully they have been met. They must remember that anyone wanting to build in Egypt had to deal with a people as they were, and not with European workmen. Mr. Richmond had shown the contrast between Eastern and Western methods. The native methods were certainly the most successful for native requirements. It used to be a custom to build "corrugated" walls, which got over the whole difficulty of contraction and expansion. The introduction of timber was very interesting; pieces of walling going back further than the Pyramids showed the timber inserted. He would suggest it might be worth while facing the foundations with a damp-proof course on each side.

Mr. SOMERS CLARKE said it was a great pleasure for him to join in the vote of thanks because he and Mr. Richmond had often talked over the subjects dealt with in the paper. He would like to congratulate the public, Mr. Richmond, and the Egyptian Government on the fact that the lecturer did not, like so many Europeans, consider that all natives were more or less idiots and that all their ways must be foolish. The Egyptians have a long tradition behind them extending from three or four thousand years down to our own time. A great number of things which Europeans think so clever are by no means so suitable when transported to the country of a people deemed rather silly. No reference had been made to the extreme alteration occurring in the mass of a wall by the very gradual dryness. Many of the characteristics of Egyptian building which at first sight seem dangerous are in reality safeguards. From about the twenty-sixth dynasty the Egyptians began to make very decent foundations; in some cases there were six or seven courses of masonry underneath an ancient structure. The ancients evidently were conscious of the necessity of allowing for movements below ground. The skin of the great Pyramids had abundance of room to expand and contract.

Mr. R. PHENE SPIERS said he had while listening noticed that the French authority, Monsieur A. Choisy, seems to have been struck by the same facts and to have arrived at the same conclusions as Mr. Richmond. They were all glad to know that the Egyptian Government had someone who will take care of their ancient monuments. At the time of his own visit many years ago the buildings were left to look after themselves.

Mr. GUY DAWBER, the chairman, then formally put the vote of thanks, which was carried with acclamation.

Mr. RICHMOND, in reply, said that in the case of one or two old buildings they had tried the efficacy of using a vertical damp-proof course, and so far it seems to have been a success.

At the conclusion of the meeting, Senor MARIANO E. CANNIZZARO briefly addressed the audience on the subject of the forthcoming International Architectural Congress in Rome in connection with the Exhibition, and he gave a warm invitation to his English colleagues to attend. It is hoped to conclude it with a visit to Venice where the completed Tower of St. Mark's will be seen.

THE ANNUAL ELECTIONS.

At the business general meeting the officers, Council, and Standing Committees for the ensuing session were declared duly elected, in accordance with the scrutineers' reports, as follows:—

THE COUNCIL.

President.—Leonard Stokes.

Past-Presidents.—Thomas Edward Colcutt; Ernest George, A.R.A.

Vice-Presidents.—Reginald Blomfield, A.R.A.; Edward Guy Dawber; Ernest Newton, A.R.A.; John W. Simpson.

Hon. Secretary.—Henry Thomas Hare.

Members of Council.—Walter Henry Brierley; Walter Cave; Max Clarke; William Flockhart; James Sivewright Gibson; John Alfred Gotch; William Curtis Green; Edwin Thomas Hall; George Hubbard; Arthur Keen; Henry Vaughan Lanchester; Edwin Landseer Lutyens; George Halford Fellowes Prynne; Halsey Ralph Ricardo; Sir Alfred Brumwell Thomas; Edmund Walter Wimperis; William Woodward; Percy Scott Worthington.

Associate Members of Council.—Sidney Kyffin Greenslade; Walter John Tapper; Harry Inigo Triggs; Herbert Winkler Wills; Arthur Needham Wilson; Septimus Warwick.

Representatives of Allied Societies.—Henry Clement Charlewood (Northern Architectural Association); Sydney Decimus Kitson (Leeds and Yorks Architectural Society); Edgar Wood (Manchester Society of Architects); James Jerman (Devon and Exeter Architectural Society); John Brightmore Mitchell-Withers (Sheffield Society of Architects and Surveyors); Albert Edward Murray (Royal Institute of the Architects of Ireland); William Fleming Wilkie (Dundee Institute of Architecture); Cecil Locke Wilson (Cardiff, South Wales, and Monmouthshire Architects' Society); Joseph Foster Wood (Bristol Society of Architects).

Representative of the Architectural Association.—Gerald Callcott Horsley.

Auditors.—John Hudson; William Henry Burt.

THE STANDING COMMITTEE.

Art.—Fellows: Cecil Claude Brewer; Walter Henry Brierley; Walter Cave; William Flockhart; William Adam Forsyth; Gerald Callcott Horsley; Thomas Geoffrey Lucas; Edwin Landseer Lutyens; Ernest Newton; Edwin Alfred Rickards. *Associates:* Sidney Kyffin Greenslade; John James Joass; Walter John Tapper; Harry Inigo Triggs; Septimus Warwick; Arthur Needham Wilson.

Literature.—Fellows: Frank Thomas Baggallay; John Alfred Gotch; William Curtis Green; David Barclay Niven; George Halford Fellowes Prynne; Halsey Ralph Ricardo; Charles Sydney Spooner; Sir Alfred Brumwell Thomas; Edward Prioleau Warren; Percy Leslie Waterhouse. *Associates:* Walter Millard; Herbert Passmore; Charles Edward Sayer; Cyril Wontner Smith; Arthur James Stratton; Herbert Winkler Wills.

Practice.—Fellows: Robert Stephen Ayling; Howard Chatfield Clarke; Alfred William Stephens Cross; Matt. Garbutt; Albert Walter Moore; Charles Stanley Peach; Sydney Perks; Herbert Duncan Searles-Wood; Henry Tanner, Junr.; William Woodward. *Associates:* Kensington Gammell; John Nixon Horsfield; Charles Edward Hutchinson; Herbert Hardwicke Langston; Herbert Shepherd; Harold Arthur Woodington.

Science.—Fellows: Harry Percy Adams; Max Clarke; Frederic Richard Farrow; Ernest Flint; Horace Gilbert; George Hornblower; George Hubbard; John Murray; Ravenscroft Elsey Smith; William Henry White. *Associates:* George Leonard Elkington; Charles John Marshall; Alan Edward Munby; Digby Lewis Solomon; Ernest William Malpas Wonnacott; Ernest Alexander Young.

THE CONCRETE INSTITUTE.

A TWO-DAYS' Summer Meeting of the Concrete Institute was held at Denison House, 296 Vauxhall Bridge Road, S.W., on Wednesday, the 7th inst., and Thursday, the 8th inst.

Wednesday, June 7.

At the first meeting the chair was taken by Sir Henry Tanner, I.S.O., the President. The principal business was a paper by Professor Beresford Pite, F.R.I.B.A., on "The Æsthetic Treatment of Concrete."

Simplicity of intention in constructional design may issue, he said, in a native or spontaneous æsthetic quality.

For example, an undesigned beauty reached without treatment is often attained by such a structure as the Forth Bridge or a ferro-concrete silo. Again, mediæval architecture grew up as a constructive method without æsthetic purpose, and yet achieved results of great beauty. Consequently, he asked, "Is not the opportunity given by the new process of reinforced concrete building one that could be utilised for the erection of the much-desired original and modern style of architecture? Are the new material and method together sufficient motive?" It had to be asked whether truthfulness of design to constructive purpose and elemental soundness of proportion were in themselves sufficient to provide that pleasantness to the eye which is desiderated. Four conclusions might be safely drawn: First, we have no instinctive guidance towards an unbiassed originality for a concrete architecture; second, abstract principles like those invoked of proportion are of no assistance; third, superficial treatments, as by colour, are insufficient for architectural expression, though valuable in assistance; fourth, the texture of concrete surfaces modifies and imparts special character to any forms employed for architectural purposes. Therefore, while modern considerations of utility and of novel constructional methods determine proportions, and may ultimately develop æsthetic qualities, the scholarly and critical analysis and employment of traditional architectural forms suitably modified for execution in concrete is the proper method for the æsthetic treatment of concrete. A historical review of the development of some characteristics of Egyptian, Greek, and Roman architecture furnishes proofs of the non-relation of æsthetic treatment to direct constructive facts. Idealised representations of ancient types form the basis of both Egyptian and Greek characteristics, while the Romans frankly separated the decorative from the practical purposes of architecture. In Gothic art, however, the constructive craftsman was the artist, and the development of decoration is integral with building craft. In other crafts, like wood and plaster work, motives are imitated from stonework, and illustrate the modifications produced by the texture of the material into the design of details—of this the Elizabethan ornamental plastered ceilings originating from Tudor vaultings are illustrations. Modern novelty of constructive method does not remove a necessity for study of architectural development. The latter will aid adaptation and modification, and thus pave the way for development. Modern Continental design is too eager to demonstrate that elasticity possible in employment of form in unusual architectural relations. At home we still are safely and timidly putting brick and stone fronts to concrete buildings. There is a great future before concrete building, and it deserves that close and patient architectural study which, deriving from the past, will give certainty to the future æsthetic treatment of the material.

Mr. H. H. STATHAM, F.R.I.B.A., in opening the discussion, said he had been waiting rather anxiously throughout the paper to discover to what conclusion Professor Pite meant to lead. He (the speaker) quite agreed with all that had been said about the great importance of texture in treatment. The use of a brick and stone facing might seem an easy and not very sincere way out of the great difficulty in concrete architecture; but it was the way employed by the greatest builders of all time, and there was something to be said for it. Reference had been made by Professor Pite to the origin of Egyptian and Greek architecture; but, personally, he was rather sceptical about the mud origin of the one and the wood origin of the other. The conclusion which seemed to emerge from the paper was that we might hope to originate an æsthetic treatment of concrete without altogether forgetting architectural tradition.

Mr. ALBAN H. SCOTT thought it would be rather difficult for anyone to give a direct and open architectural treatment to concrete itself—particularly in towns like London. For instance, it was not easy to see how a building such as the new General Post Office (of which their President, Sir Henry Tanner, is the architect) could have been treated in such a way. The great trouble looming in the future seemed to be a danger that the engineers would get the work in concrete instead of the architects. Speaking generally, it seemed a shame to cover up good concrete by a surfacing material. The concrete did not require such protection if it was properly treated. An exception to this rule was in the case of an elaborate colour scheme. At present the tendency should be towards simplicity by getting rid of as many mouldings as possible.

Mr. EDWIN O. SACHS, Vice-President, remarked that the paper read was above the lecture-room, and it required sitting down to and quietly thinking out. In the course of

the discussion Mr. Scott had suggested that concrete would be in a bad way if it got into the engineers' hands. With this view he begged to differ. If buildings expressed their purpose splendidly and gave an excellent idea of how the material had been used to the best advantage, it was a pleasure to look at them. The Forth Bridge is an expression of beauty, *i.e.* of something beautiful and economical. Assouan Dam was, to his mind, one of the most beautiful of structures, simple though it was; its few features which struck the eye were all utilitarian. Personally, he believed concrete architecture might find its salvation in the hands of civil engineers, especially if they did not forget to use a surface treatment. In Austria one found innumerable excellent examples of the latter. It became a little more expensive than a plain treatment, but its cost was by no means such as to render it prohibitive.

Mr. J. ERNEST FRANCK remarked that if in the future he, as an engineer, had to design buildings which would be called upon to have a kind of beauty, his aim would be to largely employ vertical lines and to avoid certain kinds of surface treatment. It might be presumed from what Professor Pite had contended that beauty was a thing which never changed. But surely that view was scarcely a correct one. Different races and different times had different standards. If this were so, it was not easy to see why the present generation should always strive after what had gone before. Rather, a new material should be allowed to bring its own ideas of beauty.

Mr. ALFRED E. CORBETT, F.R.I.B.A., thought that Professor Pite had somewhat left out the engineering side of the matter. Work in the new material should be done by an architect who had had a very thorough training in engineering, or by an engineer who had carefully studied architecture. An excellent opportunity for æsthetic experiments in concrete was afforded by buildings like warehouses, in which the client did not expect very much.

Mr. R. M. FRASER regretted there had not been a summing up at the end of the paper in the shape of a few broad principles, and also that the paper had not been on the far more useful subject of "The Æsthetic Treatment of Reinforced Concrete." Concrete without reinforcement was quite different from that material reinforced. He wondered whether some classification (like "the architecture of the bracket") could not be found for reinforced concrete, in the same way as they had the architecture of the beam and the architecture of the arch. There seemed to be no reason for regarding the use of stone with concrete as anything blasphemous, any more than its present use in London with brick was so regarded. A particularly suitable treatment for it was by the application of mosaic.

Sir HENRY TANNER, I.S.O., &c., who closed the discussion, said it seemed to him that reinforced concrete structures should be considered from different standpoints according to circumstances. For instance, one of that material in a town required to be different to one in the country. A front in pure unadorned concrete would not be suitable in a city, because people would not consider it important enough. It was that fact that had led him to adopt a stone front for the General Post Office. All the important neighbouring buildings round about had fronts of stone. Of course, one had as far as possible to use discrimination. In warehouses one came to a class of structure calling for a more visible use of concrete.

Professor BERESFORD PITE, F.R.I.B.A., before replying to some of the points raised, suggested that after the paper had been officially circulated an extended discussion might be accorded to it. When the paper was put into print and read it would be found that the conclusions arrived at were logical and definite. The positive conclusion was that a study of ancient art must be the guide in an æsthetic treatment of concrete. He entirely disputed the right of the engineering profession to attempt to æsthetically deal with the material without special training. If they knew the guiding principles he would listen to what they had to say with pleasure. But they did not know them, and there was no evidence in their work to suggest that they did. All that engineers could do was to build soundly, honestly, and naturally, and thus unconsciously make their work æsthetic. It is only when the engineer consciously strives to add beauty to his work that he shows the cloven hoof. Engineers should leave this subject alone. It was impossible to separate concrete buildings from the laws which govern all other buildings. The language one speaks, the music one hears, and the architecture one sees are all the result of a long process of evolution, and all require time and training for their mastery. On such a subject as the æsthetic treat-

ment of concrete the architect has a right to speak with authority. It had been suggested that his own remarks advocating the façade treatment were somewhat cowardly. But what he had meant was that until we progressed in the adaptation of architectural form to the new material the path of least resistance was to mask the qualities of concrete by a surface treatment. As to the General Post Office, no one would expect Sir Henry Tanner to embark upon æsthetic experiments in the heart of the City of London. There was such a thing as an ultimate standard of beauty. Undoubtedly what is beautiful to the Asiatic might not be beautiful to Europeans, and *vice versa*. But there were elements common to both. The fact that one can to-day enjoy the forms which pleased the ancient Greeks shows that there is something to grip. An engineer going into Westminster Abbey is cowed by it, without knowing why. But it was the architect's business to know why. The engineer is merely concerned with the stresses and vaults.

In the afternoon a visit was paid to the Wesleyan Memorial Hall, Tothill Street, Westminster, by permission of the architects, Messrs. Lanchester & Rickards. In the evening the first annual dinner was held at the Trocadéro Restaurant, W., the members being received by the President, Sir Henry Tanner. Among other guests of the Institute were the following:—Mr. Alexander Siemens, President of the Institute of Civil Engineers, Mr. W. Edgar Horne, President Surveyor's Institute, Mr. H. Percy Boulnois, Chairman of the Council of the Royal Sanitary Institute, Mr. R. Elliott Cooper, the Chairman of one of the Sections of the Engineering Standard's Committee, Mr. Leslie H. Robertson, the Secretary of the same Committee. Among others present were Mr. Horace Porter, A.R.I.B.A., Mayor of Holborn, Mr. W. Woodward, F.R.I.B.A., Mayor of Hampstead, Sir Alexander Stenning, Mr. John Murray, F.R.I.B.A., Mr. Osborne Smith, Mr. F. A. White, Mr. Max Clarke, F.R.I.B.A., late Mayor of Holborn, Mr. F. H. A. Hardcastle, A.R.I.B.A., Mr. T. M. Deacon, Mr. Edwin T. Hall, Vice-President R.I.B.A., and the following members of Council of the Concrete Institute:—Mr. Alexander Ross, M.Inst.C.E., Vice-President Concrete Institute, Mr. Edwin O. Sachs, F.R.S.E., Vice-President Concrete Institute, Mr. D. B. Butler, Mr. C. H. Colson, Mr. J. S. E. de Vesian, Mr. William Dunn, Mr. E. Fiander Etchells, Mr. J. Ernest Franck, Mr. C. S. Meik, Mr. H. D. Searles-Wood, Mr. Henry Tanner, Mr. E. P. Wells, Mr. F. E. Wentworth Shields, and Mr. G. C. Workman. After the patriotic toast from the Chair, Mr. Alexander Siemens, President Inst.C.E., proposed the toast of the Concrete Institute, which was replied to by Sir Henry Tanner, I.S.O. The toast of the visitors, proposed by Mr. Edwin O. Sachs, was replied to by Mr. H. Percy Boulnois, M.Inst.C.E., Chairman of the Council of the Royal Sanitary Institute. The toast of the Chairman, proposed by Mr. F. A. White, was given with musical honours, and was briefly acknowledged by Sir Henry Tanner. During the evening a programme of music was performed by Miss Olive Fox, Mr. Lorne Wallet, and Mr. Wilson Martell.

Thursday, June 8.

The report of the Reinforced Concrete Practice Standing Committee on the "Standardisation of Drawings of Reinforced Concrete Work" was presented, of which the following is an abstract:—

In connection with the scales to be used for drawings inquiry forms were sent to all the best known contractors and specialists undertaking reinforced concrete construction, but only a small number returned these forms filled in. No adequate classification of the practice among the contractors could therefore be arrived at from these inquiry forms, and the matter has, therefore, been considered from what is generally known of the practice of various specialists.

A great number of scales have been, and are, employed by architects and engineers, but only a few are generally adopted. These few can be used to fulfil almost all requirements. Of course, a scale is fundamentally chosen to suit the conditions of the extent of the job and the size of the drawing paper, having due regard to clearness. A large scale is desirable, but it must not be inconvenient. Some scales are too small, others too large, and certain scales are, therefore, eliminated from customary use.

One-tenth inch scale is applicable to decimal equivalents, but it is too small for general use, and, therefore, is seldom adopted.

One-eighth inch scale is customary among architects. It is not unwieldy for jobs of a fair size, but for very large jobs a smaller scale is naturally found advantageous, and then it is the custom to halve the $\frac{1}{8}$ -inch scale and use $\frac{1}{16}$ -inch

scale. As regards their use for drawings of reinforced concrete work, $\frac{5}{8}$ th and $\frac{1}{4}$ th scales would be satisfactory for general plans, elevations, and sections which do not show the reinforcement. They become distinctly serviceable for sketch designs and general schemes, because they conform to the architect's other drawings, and are therefore comparable.

One-eighth inch is too small for showing the placing of the reinforcements, although certain contractors have found it handy in some cases, having been able to give a clue to the arrangement of the reinforcement in floor slabs by drawing a few lines lattice-wise in a portion of each slab and writing thereon the pitch or spacing of the bars.

The $\frac{1}{4}$ -inch scale is too large for general plans, and is seldom used even for jobs of moderate size. Sometimes $\frac{1}{4}$ -inch scale can be used with advantage on large jobs for detailing in a diagrammatic way, it being possible to roughly show the disposition of reinforcements and the framing or arrangement of beams.

The $\frac{3}{8}$ -inch scale is seldom used.

The $\frac{1}{2}$ -inch scale is used by some specialist engineers for elevations and sections of beams and floor slabs, and is convenient in so far as drawings to this scale do not take up much room, but $\frac{1}{2}$ -inch scale is too small to enable details of the arrangement of the reinforcements to be shown in any but a diagrammatic way. Half-inch scale drawings for reinforced concrete are often supplemented by sections and details to $\frac{1}{2}$ -inch or 3-inch scales.

The $\frac{3}{4}$ -inch scale does not apparently meet with favour as a scale, though it represents $\frac{1}{4}$ th full size.

One inch is a very useful scale, and is generally preferred to $\frac{3}{4}$ -inch. It is sufficiently large to conveniently show a fair amount of detail, and occupies an intermediate position between $\frac{1}{2}$ -inch and $1\frac{1}{2}$ -inch scales. But the 1-inch scale is often too large for detail drawings of long beams, and takes up much time in the drawing-office, where it is as desirable to study economy as on the works.

The $1\frac{1}{2}$ -inch scale is $\frac{3}{4}$ th full size, and it is useful to remember that $\frac{1}{2}$ -inch to this scale represents 1 inch, so that we can use an $\frac{1}{8}$ th-inch scale to read off inches on $1\frac{1}{2}$ -inch scale drawings.

The 2-inch scale seems to be used by only one firm of reinforced concrete specialists, and is, therefore, not usual.

The 3-inch scale is one-quarter full size—a handy ratio—and works well for details of specially intricate work.

Half-full-size is often used for architectural details, but it is generally too large a scale for reinforced concrete work.

The following are, therefore, suggested as the best scales for standardisation for the preparation of drawings for reinforced concrete work:—

For general drawings.

Showing schemes in outline without detailing the reinforcements: $\frac{1}{2}$ -inch scale ($\frac{1}{8}$ -inch scale to be substituted for $\frac{1}{2}$ -inch scale for large jobs).

For detail drawings.

For framing plans and slab reinforcements: $\frac{1}{8}$ th-inch scale.

For elevation of beams, &c., and general detail drawings: $\frac{1}{2}$ -inch scale ($\frac{1}{4}$ -inch scale to be substituted for $\frac{1}{2}$ -inch scale for large members).

For sections of beams, &c.: $1\frac{1}{2}$ -inch scale.

For large details of intricate work: 3-inch scale.

Thus we have, generally speaking, three scales— $\frac{1}{8}$ -inch, $\frac{1}{2}$ -inch, and $1\frac{1}{2}$ -inch. These three scales, it is suggested, are sufficiently elastic for ordinary work, and for very large jobs smaller scales can be substituted as suggested above.

All dimensions should be figures on the plans, and nothing left to be scaled.

It is suggested that the size of sheets upon which drawings are made should be standardised. For general purposes two sizes are advocated, namely, 40 inch by 27 inch, and 20 inch by 27 inch. Larger sheets would be of the same depth, 27 inch, but of greater length. These are measurements within the margin line, which latter should be ruled upon the tracing cloth, and photographic prints should be trimmed to this ruled margin line. These sizes have been chosen for the reason that tracing cloth usually measures 29 inch to 30 inch wide, while photo-printing paper when trimmed is about 28 inch wide. The suggested standard sheets are therefore proportionate to the tracing cloth and to photo-printing paper. If a special marginal line is required on a photographic print it should be drawn inside the ordinary marginal line referred to above, which line constitutes the full size of the sheet when trimmed.

As regards the indication of reinforcements upon the plans it is suggested that it will be found convenient generally on $\frac{1}{2}$ -inch scale drawings to show main bars by means of thick

solid lines, secondary bars by means of lines of medium thickness, and the outlines of the concrete and other work by means of thin lines. Working with this small scale it may often be found an advantage to omit the reinforcements in adjoining members, as, for instance, the bars in floor slabs when drawing elevations of T-beams, as otherwise the main reinforcements may be obscured.

In $1\frac{1}{2}$ -inch and 3-inch scale drawings it will often be found advisable to show bars, when not of very small size, by means of double lines. The lines should, however, be strongly drawn.

Sections will often require picking out. Hatching is often employed, but if adopted it should be very open, for it should be recollected that if the drawings are reproduced and reduced in size by photographic means, which may very possibly take place, and should be provided for, the closely-placed lines will run together. Many draughtsmen prefer, however, to indicate the concrete by marks intended to show stones, as it is claimed that hatching takes longer to do and requires great care to ensure the lines being spaced regularly apart, without which the appearance is not good. There seems justice in this contention, and such marking for showing concrete is advised.

Reinforcements shown in section should always be blacked in. It is better to do this even on the largest drawings, because the drawings are made much clearer thereby, and too much emphasis cannot be given to the reinforcements, as the drawings are specially intended to indicate them.

Shading of bars should not be employed on anything less than half-full-size drawings.

It is inadvisable to colour drawings for reinforced concrete, and in drawing details, except of large size, i.e. 3-inch scale or half-full-size, it is not advisable to dot in the concrete in any way, as if at any time these are reproduced in catalogues or newspapers the great reduction that must occur will run these closely-spaced marks together and clog the work or perhaps make a solid patch of ink.

Titles should be put in the lower right-hand corners of all drawings, together with serial drawing numbers, this position being best for reference when drawings are kept either in rolls or flat in drawers.

As regards the lettering upon drawings, this should be large and open.

The report also recommends certain conventional signs for methods of terminating ends of bars and recognised abbreviations for descriptions.

(To be concluded.)

ILLUSTRATIONS.

WINDOW FROM THE OLD ASHMOLEAN MUSEUM, OXFORD.

THE old Ashmolean museum was built in the year 1682, and is popularly ascribed to Sir Christopher Wren. Authorities, however, differ on this point, and it is said by some to be the work of a local architect, named Wood. Before the removal of its original contents to the new museum it contained many priceless relics, including the collection of the two Tradescants, men of extensive knowledge in botany and natural history. It was restored in the year 1830 by the brothers Duncan and Professor Phillips. The drawing, by "Lot," was awarded a prize in "The Architect" Students' Sketching and Measuring Club.

THE RADIUM INSTITUTE, LONDON.
NEW OFFICES FOR THE ANGLO-AMERICAN OIL COMPANY,
QUEEN'S ANNE'S GATE, LONDON.

WE illustrate these two buildings as good examples of modern London architecture. The architect of the former is Mr. T. P. Figgis, F.R.I.B.A., and of the latter Messrs. Ernest Runtz, F.R.I.B.A., & Son.

OXFORD COLLEGE SERIES.—WORCESTER.

WE complete this week our series of views from Worcester College.

ARCH IN BOTANIC GARDENS, OXFORD.

THIS is the principal of the three gates designed by Nicholas Stone in 1631 for the Physic (now the Botanic) Gardens at Oxford. The commission was received from the Earl of Danby, whose bust is in the centre of the pediment, and who instituted the gardens "with a view to the general improvement in learning, and especially to the faculty of medicine." The figure to the left is no doubt Charles I., and that on the right is Charles II. An account of the gateway, with a detail drawing and plan, appeared in the course of an article entitled "Nicholas Stone's Work at Oxford," in *The Architect*, September 3, 1909.

COAL SMOKE ABATEMENT SOCIETY.

THE twelfth annual general meeting of the Coal Smoke Abatement Society was held on Tuesday, June 13, at the Royal United Service Institute, Whitehall, when Mr. William B. Richmond, K.C.B., R.A., D.C.L., the president, occupied the chair. Among those present were: Bernard Shaw, Esq., Dr. and Mrs. Harold DesVoeux, Mrs. Cloudesley Brereton, Lady Stanley of Alderley, Hon. Annetia Stanley, Professor Meldola, F.R.S., Lord Newton, Mr. Menzies, Dr. Lloyd Tuckey, Rt. Hon. Farquharson, Mr. F. Brodie, F.R. Met. Com., Mr. H. O'Reilly Stephens, Mr. and Mrs. King, Mr. Joseph Hurst, Mr. Alexander Ritchie, J.P., Mr. R. W. Granville Smith, J.P., L.C.C., and Mr. Lawrence W. Chubb, secretary.

Letters of apology for non-attendance were received from Messrs. Webster, Dr. Dudfield, Dr. Lessing, Mr. E. D. Simon, Mr. Wm. Nicholson, Principal J. W. Graham, Mr. Samuel Elliott, Mr. J. Jowett, and Mr. J. B. C. Kershaw, F.I.C.

Sir W. B. RICHMOND, in proposing "that the report and statement of accounts, as submitted, be adopted," spoke as follows:—

Again we meet to offer the report of the Coal Smoke Abatement Society. As in former years, so in this, we are able to report progress. The committee is able to ask for full confidence from subscribers and from the general public. Not only has the Society made its mark in England as thoroughly trustworthy, scientific, and therefore based upon no fads, but it is acknowledged as an authority in Denmark, Austria, Germany, France, Belgium, the United States of America, India, Japan, and Australia. A number of inquiries have been sent, during the last year, addressed to the Coal Smoke Abatement Society for advice and information from the above-named foreign countries. The evil we combat is widely spread, and there is evidently an awakening of public opinion going on over the civilised world, that a nuisance, and a very serious one, which can be abated and in time perhaps more than checked, is receiving serious attention. This movement in the shape of public attention to the subject is due to the great efforts made by our Society in the first place; a Society which has but a small income, of which every penny is cared for and is well spent. At the outset we are bound to tell you that to make the Society as efficient as it might become we need more subscribers; in short we need more money.

The progress made by the Society is being reported, and I beg not only this audience, but the public at large, to read carefully the report for this year, which is most reassuring and convincing. We also beg the Press to help us by the publication of our report, and if possible to give us leading articles in the principle daily papers.

Mr. Lloyd George, a *bête noire* to the inactive, has recently said:—"There is nothing more marked in this country—in most countries—than the contrast between the carelessness and the rigour with which the laws of property are enforced and the slackness and sluggishness with which the laws affecting the health of the people are administered. These health committees will be administered by the men themselves. It will be a great lesson in self-government. It will be the first time the workers of this country have been really federated for the purpose of administering affairs which are essential to their happiness and comfort."

This is a hopeful outlook. But will coal smoke and sulphuric acid ever come under the title of insanitary elements? Certainly not until the people listen to the medical profession, who say that they are, and to authorities with no aesthetic claim; that absence of light is not only depressing to the body but injurious to the mind. The public is hard to move, stubborn to the status quo, and to the immobility of the doctrine that what was good enough for our fathers is good enough for us, a maxim which leads to unprogressive stagnation in politics, in art, science, and all intelligent tendencies to progress which have in a measure relieved us from savagery and promoted what even yet is an incomplete civilisation.

The Coal Smoke Abatement Society has done, and is doing, a great work; perhaps I ought not to say so, but I do, not in view of any work other than initiatory that I may have done, but owing to the energy of our officers, Dr. DesVoeux, our treasurer, to Mr. W. H. Booth, who has been responsible for the training of stokers, and to Dr. John S. Owens, who has conducted numerous tests for the Society, to our admirable Inspector, Mr. Petty, who, practically single-handed, has done inestimable work, difficult and unpleasant at times, with energy and pluck, and last, not least, to our secretary, Mr. Chubb, do we owe many words of thanks—not

only we, but the public at large, for his tact, his application, and continuous initiative and wise supervision.

Our income is small, yet I doubt if any existing society makes the money at its command go further, or bases expenditure upon a more economical principle. Upon finance it is not for me to touch. Dr. DesVoeux will speak to you on that subject presently, when I fear you will hear that the Society is in great need of funds to carry on a work which is purely *pro bono publico*, has no axe to grind, no advertisers to promote, and no fads to encourage. Everything is hopeful save our financial condition, but I feel sure that when our subscribers and the public in general read this year's report we shall find ourselves next year able to report as much or more progress, and find ourselves with more money at our command, hence able to extend our work and necessary appliances towards greater completeness. When our crusade was started the clauses in the Public Health Act were practically in abeyance, the responsibilities of their enactment had been removed from the police and put into the hands of the L.C.C. and borough councils. The energetic action which the Society took in a measure caught on. The L.C.C., once cold to us, is now our warm friend who helps us as we help it. The borough councils in the majority of cases are doing their duty. We wish we could report the same energy on the part of the Local Government Board, but perhaps that body may in time be awakened by public opinion to a sense of its duty and carry out the responsibilities which Parliament has ordained it. Our motto is "More Light." Now let us see if that has been a successful selection.

The statistics of the Meteorological Society show that the average amount of winter sunshine in the Metropolis exceeds that available before the question of Smoke Abatement was seriously taken in hand. The increase of sunshine is no less than 60 per cent. The decrease of dense fogs is remarkable; you can read the account of it in detail in the report before you. This result is not alone due to the suppression of smoke from factories and trade concerns, but also to an increase in the use of gas for heating and cooking purposes, to the adoption of electricity and smokeless fuels such as anthracite, carbo, chavco, coalite, and coke. The principle gas companies supply of gas stoves, fires, &c., now exceeds 1,300,000.

Within the area of London there are 35,000 factories and workshops. When the Society began operations the large majority of these emitted black or destructive smoke. It is becoming otherwise now, for most manufacturers have learned that it is economical to consume and not to waste their coal. While this is so, and during the supervision of inspectors, ours and others, the smoke diminishes in quantity, but directly observation is withdrawn carelessness follows and fresh outbreaks are reported, and the whole game has to begin again, showing that strict observation has still to be kept if we are not again to lapse into a state of darkness—the result of carelessness or apathy. But there is a bad blot still to be wiped out. West Ham is the plague-spot of smoke. Outside the jurisdiction of the L.C.C. West Ham is still the great offender. The question arises, why is this? We can find no answer.

The neighbourhood of Greenhithe, a centre of cement industry under the control of the Dartford Rural Council, is under a constant pall of destructive smoke, which causes grave difficulties of navigation on the Thames.

During the year 1910 the Inspector of the C.S.A. Society reported 1,094 cases of nuisance; in several of these cases the manufacturers have paid attention to the Society's reports and have diminished the excess of smoke. But not all. West Ham remains actively defiant. We now come to perhaps the most important item of our efforts. If London is to be cleared of factory smoke the word "Black" will have to be deleted from the clauses in the Public Health Act. It must be done sooner or later, because public opinion will demand it. In 1910 the L.C.C. made a brave effort to this effect, which met with strenuous opposition on the part of the London Chamber of Commerce, the West Ham Corporation, and the electric light companies, for what reason they know best. That all smoke from factories and such like is preventable is now a truism. I have three within the vicinity of my property in Hammersmith which now emit no smoke whatever except upon rare occasions. When these occur I promptly write to the companies a complaint and details of times and duration of the nuisance, an answer arrives immediately, and the nuisance stops, the nuisance having been invariably due to careless stoking or change of coal. The companies are invariably courteous and thank me for my objection. This fact demonstrates beyond dispute that all smoke, not only black, is preventable. If it is so, the deletion of the word

"black" is in no sense unjust; it will only oblige companies to exercise more care, and, moreover, will save them money in the long run; therefore, what their excuse is is surely enigmatical. The experience of the celebrated decision of a magistrate in the Lots Road, Chelsea, case and the deterrent effect of it upon borough council's operations, demonstrates an imperative necessity for strengthening the law, only to be accomplished by the deletion of the word "black."

The emasculated clause approved by the Committee of the House of Commons authorises the County Council to take proceedings at the request of sanitary authorities, and in lieu of them to take proceedings. But until the word "black" is deleted there can be no real power in the Act, because black smoke is difficult to prove, for at different times of the day and in varying conditions of light what is in reality black may appear pale brown, grey, red, or even light against a storm cloud, and no patterns supplied to inspectors can be of direct or certain service. The C.S.A.S. intends to continue an agitation as far as possible for the deletion of the word "black," and the L.C.C. will doubtless in time find it imperative to support it. When it becomes law that all smoke is prohibited from factories half our labour will have been accomplished. The C.S.A.S. has taken part in conferences of the British Institute of Social Service; meetings also took place in Edinburgh, Glasgow, and Sheffield. The subject of smoke abatement has been brought before the Royal Institute of British Architects, and was ventilated at the British Association. Both of these powerful institutions are keenly alive to the necessity of strong legislation. The Right Hon. John Burns received a deputation from the Smoke Abatement League in 1910, and in his speech stated that "as an engineer he considered smoke to be useless, dangerous, and that it ought to be abolished; further, that a smoky chimney was a sign of waste, an evidence of defective consumption, and a proof of bad stoking." Such a strong expression of opinion coming from so practical an authority must carry weight with the public, and should do so also with all authorities from the House of Commons to the borough councils, and we firmly believe it will do so, if energy and vigilance in the cause are not relaxed, and with the help of the public we intend not to relax but redouble our observations and reports. Public opinion is roused, but not enough. We must go on repeating facts and instructing the public—slow to learn, and to move, but not hopeless—and the time must come when citizens shall say, "Why did we allow a preventable nuisance to take two centuries to overcome?" The power of the Press is of course enormous; it is in a sense the voice of the people which, when unanimous or even general, must be listened to by those in high places, who are there to carry out the wishes of a sensible democracy.

It is to public opinion that we appeal. We ask:—Do you like dirt better than cleanliness, darkness more than light, depression more than joy? We know what the answer is: No. Then why in the name of common-sense do you not unite and make a bold front with us and with all those who have at heart the general good of the community, making up your minds that a nuisance proved from every point of view, æsthetic, practical and sanitary, immoral in its effect on the poor, inconvenient to the rich as well as to the working classes, and say, "We will have no more of it"? Not saying only, for words without acts are useless, but acting not defiantly but strongly and persistently so that you *shall* and you *will* win. I conclude with a quotation from Evelyn's *Fumilogium*: "The hellish and dismal cloud of sea coal which is perpetually imminent over this august and opulent city, making it rather resemble the suburbs of Hell than an assembly of rational creatures and the imperial seat of our incomparable monarch."

Dr. H. R. DES VOEUX (Hon. Treasurer), in seconding the resolution, said that it was to the public the Society had to look if they were to see that the existing curse of smoke was removed from our cities. But the Society had also to look to the public's pockets, and he personally felt he could do a very great deal of good if he was allowed to put his hands deep into them. The statement of accounts showed one extremely unsatisfactory item, viz., a debit balance of 11. 17s. 9d. But that was incorrect (although he had signed them as correct), for the real deficit was something like 87l. The actual condition of affairs was that they were nearly bankrupt; and for them there was no Bank of England coming forward with a guarantee of 10s. in the pound. One of their prominent members had told them at a committee meeting that, owing to the state of its finances, the Society had no right to continue, and he had proposed a resolution that they should shut down. It was certain that the Society could not continue their campaign without assistance, and it

would be impossible to go beyond the present year without more money. It was difficult to believe that if those present gave 5l. each they would seriously miss it. He only wished that towards the end of the meeting some lady would get up and inform the audience how much the dirt of London cost her a year. In his own house he believed it was 100l. per annum. During the past twelve months the Society had been conducting experiments to determine the difference between the amount of smoke falling in London and in the country. Those experiments were not yet completed, but the difference was probably 90 per cent. It is smoke that causes the dirt of London, and if there were no smoke London would be a clean city. As matters now stood it was impossible to imagine London with all its buildings clean. And yet it might be. He wanted them to take to heart the fact that if the public did not give them money the Society would not go on next year. But they were confident, and they had made certain arrangements for next year which he had long been anxious to make, and that was for the holding during a fortnight of a large exhibition in the Agricultural Hall of smoke abatement appliances. It was important the inhabitants of London should have brought before them all that has been and is being done in this matter. If they could keep going he believed the exhibition would be the largest and best of its kind ever held.

Mr. F. J. BRODIE (Royal Meteorological Office) remarked that as a professional meteorologist of forty-two years' standing he had always taken a keen interest in the state of the atmosphere. Twenty years ago he had been successful (unhappily) in proving that during the previous two decades fog had increased very much both in density and frequency. Fifteen years later, when he had occasion to read a second paper, he was able to show that fog had decreased almost as rapidly as it had previously increased. The efforts of the Coal Smoke Abatement Society had certainly not been in vain. Assertions as to the improvement in the London atmosphere are amply borne out by the records of the Meteorological Office. For the past twenty-five years there has been a steady decrease going on. It was indeed doubtful whether London, with its proximity to the Thames, will ever be much freer from fogs than it was now, though they may become less dense and not last so long. Many of those present would remember a time when a fog lasted a week on end without any sign of a clearance. If there was less fog there ought to be more sunshine. That was borne out by a chart he had prepared showing quinquennial periods from 1885 until 1910. In 1885-90 the mean allowance of winter sunshine in London was 38 minutes per day. In the latest period it stood at 1 hour 11 minutes, or practically double. The days with fog were then 31 in number, now they stand at seventeen. In 1885-90 the mean number of hours of sunshine in the winter was 57, while from 1905 to 1910 it averaged 103 hours. For practically the entire period there has been a continuous increase in the annual amount of bright sunshine and a decrease in the amount of fog. That result was most satisfactory and it was impossible to explain it otherwise than by saying they are due in a very large measure to the work of the Society. The Coal Smoke Abatement Society had done a very good work; and all he would say to them was "Go on!"

Mr. G. BERNARD SHAW proposed the following resolution. "That this meeting, recognising the harmful effects of coal smoke on life and property, pledges itself to support the efforts of the Coal Smoke Abatement Society in diminishing the evil." He said he would like to make a few remarks of the nature of genius. The audience might say that genius had nothing to do with smoke abatement and that it was not what they had come to listen to. But he himself knew little about smoke, which was a common thing, and every thing about genius. He was in that line himself. A man of genius was not a man who saw more than other men did. On the contrary, it was very often found that he was absent minded and observed much less than other people. If you met a man of genius in Whitehall and asked him what had passed up that thoroughfare while he had been there you would probably find that he would be reduced to a condition of stuttering imbecility, but if you asked the nearest policeman, who might or might not be a man of genius, he would tell you a number of useful facts. That being so, what good was a man of genius; where does he come in? Why is it the public have such an exaggerated respect for him—after he is dead? The reason is that the man of genius understands the importance of the few things he sees. William Blake, whose genius was perhaps more beyond dispute than that of any other Englishman, saw a quite common thing, and wrote of it in language which they would probably describe as monstrously exaggerated. He wrote, in his

aries of Innocence, of a linnet in a cage which "puts Heaven in a rage." An ordinary man would never have thought of that. The ordinary man only saw a linnet in a cage, and looked on Blake's lines as one of those absurd things which men of genius say. He (Mr. Shaw) rubbed this in use he himself was always being accused of exaggeration. To the ordinary inefficient mind there is one thing which can be seen over and over again without any importance being attached to it, and that was a smoking chimney. No importance used to be attached to it until there came along an man of genius who began bombarding the local authorities with spirited drawings representing smoking chimneys—and occasionally there were details on them as to how long they had been smoking. The artist was evidently representing something. Some members of the local authorities apparently included these sketches were intended for their portfolios, and began to collect them. But it began to be apparent that the man who did these drawings believed that it was extremely important for England that smoke should be put an end to. The man was Sir William Richmond. That was the beginning of the movement, and the extent to which it would progress would depend upon the number of men of genius in the community. If anyone present would send a cheque for five guineas to the treasurer he would to that extent give that he was a man of genius. There is no use in expecting an ordinary person to do anything. The affairs of the world must be directed by men of genius. The few people who see these things will have to become centres of propaganda, and will have to back the movement up in very many ways. They must wake up the common man to things which he has hitherto taken as a matter of course.

Some time back Sir Almoth Wright delivered a scientific address in London containing a great deal of valuable matter. The Press took no notice of that valuable matter; but Sir Almoth having casually let fall a remark that he was rather sceptical of the value of washing, they read everywhere, "Distinguished physician says we should not wash ourselves." (Mr. Shaw) sympathised with Sir Almoth Wright, because they were both fellow countrymen. One has to be an Irishman to understand the antipathy and instinctive dislike that every Irishman has to washing. Anyone going to Ireland would understand the feeling. The fact of the matter was that washing was not a natural function. Sir Almoth had often remarked that some of his patients removed a considerable portion of that skin which nature intended should ward off germs, and he had suggested that we should be careful to preserve that outer layer. But in a soft climate such as Ireland's it was very disagreeable to put cold water on the skin; and as for hot water, one had only to look at the people who took hot baths to see that they were the only people who looked incurably dirty. Personally, he did not think he had really washed himself—except as regards the visible portions of his body like his face and hands—since the day when somebody else did it for him. It was true he had got into the habit of taking a cold bath; but that was not washing. He did it as a stimulant, and he often thought he would better have taken to whisky. When he first came to London one of the first things he noticed was that everybody wore gloves. Where he came from only a few wore them occasionally as a tribute to their superiority. But before he had been here many days he discovered that he must do so. According to any decent standard everyone ought to be cleaner than they are.

The real secret of healthy cleanliness was to have a clean atmosphere and clean clothes, and until they get rid of the dirt they can never have a clean atmosphere. A clean atmosphere would prolong their lives and enable them to save money. They talked about the saving in coal by preventing smoke; but there would also be an enormous saving in soap. There was no doubt about the saving; in fact, if it were possible for a commercial company to realise that particular profit for themselves the whole place would be flooded with prospectuses of new joint-stock companies for coal smoke abatement. Unfortunately it was not realisable as a commercial asset. All they could do was to rely on individuals and on public opinion. They should cut all those persons who had smoky chimneys. They should refuse their invitations to dinner, alleging as the reason: "I have seen black smoke proceeding from your kitchen chimney." Coal smoke is not like original sin, a thing they were obliged to put up with.

It was said once that dust could not be done away with on public roads. He himself had driven a motor-car amid the execrations of the populace. Now dust was almost abolished. If every motorist would now make it a point of honour to drive at a reckless speed in order to stir up any

dust there was remaining, and would also make a point of driving rapidly through a pool whenever he saw a Bishop near, those two pests, dust and mud, would soon become things of the past. And, with a similar object in view, he suggested that those who wanted to get rid of coal smoke should make a practice of carrying about a bag of soot and throwing it over people's collars and shirt fronts, in order to convince them of the evils of smoke.

Mrs. CLOUDESLEY BRERETON, in seconding the resolution, spoke on the subject from the modern woman's point of view, for the domestic chimneys as well as the factories were responsible for the smoke nuisance. Solving the soot problem would, she said, go a long way towards solving the servant problem. In flats and small houses where rent is dear the space now required for storage of the solid fuel necessary for old-fashioned kitcheners and grates could be better utilised for other purposes. The use of smokeless fuel, so far from being expensive, was, according to her own experience, both labour-saving and money-saving, and not only does it affect the pocket of the harassed housewife, but also private and public health. In her own house there was not a single coal fire, and the kitchener was heated by gas. There were three ways in which women might help in the movement: they could subscribe to the funds of the Coal Smoke Abatement Society, they might talk about it, and they might see that their own houses did not offend.

The resolution was carried.

Professor R. MELDOLA, F.R.S., proposed "That the present elected President, Vice-Presidents, Council and officers of the Coal Smoke Abatement Society be re-elected." He said he had been associated with the Society since its foundation, and he knew they could congratulate themselves upon the zeal and the efficiency of the officers and particularly upon their distinguished President, Sir William B. Richmond, who was not only the founder of the Society, but had nursed it ever since. The work carried on was by no means of a light character, and it involved a large amount of correspondence.

Mr. A. RITCHIE, J.P., seconded the resolution, and it was carried.

Mr. R. W. GRANVILLE SMITH, L.C.C., J.P., proposed a vote of thanks to the chairman, which was passed with acclamation.

Sir W. B. RICHMOND, K.C.B., R.A., having briefly acknowledged the vote of thanks, the meeting closed.

ARBITRATORS AND THEIR AWARDS.

(Continued from last week.)

THE authority of an arbitrator to determine the differences of individuals in point of law is precisely similar and governed by the same rules as any other power or authority given by one person to another. Thus, where a reference is made to several arbitrators, they must all join in making the award.

Where the reference is to three arbitrators, enabling them or any two of them to hear the case and make their award, although two have jurisdiction over the case, yet they only have jurisdiction in conjunction with the third, and where he has had notice so that he might have attended the meetings and participated in the proceedings if he so determined, under such reference the Courts would undoubtedly set aside an award made by two out of three arbitrators. In one case where there was a reference to three arbitrators, and it was provided that any two of whom might make the award, and one of the three declined during the hearing to have anything more to do with the matter, whereupon a draft award was prepared by the other two and sent to the third arbitrator, who stated his objections thereto, the other two arbitrators subsequently executed an award differing from the draft award so previously sent to the third, without again submitting the amended draft to or consulting the other arbitrator, the Court decided the award was bad, as the third arbitrator should have been consulted on the final form of the award before it was agreed on.

Where there are three arbitrators with power for any two to make an award, although an award made by two is good, yet it must be the result of the judgment by these two; thus where on a reference to three arbitrators, two of whom were laymen, the third a legal arbitrator, with power for any two to make an award, the two lay arbitrators agreed to be bound by the decision of the legal arbitrator on a point of law, which he decided, and one of the lay arbitrators and the legal arbitrator signed the award, the Court set it aside as being a

delegation of the question of law by two to the third arbitrator.

Any reservation of future power by the arbitrators in their award, if it affect the whole of the justice of the thing awarded, would render the award totally void, as, if the arbitrator reserves to himself the power of settling a security or of appointing counsel to settle a conveyance, or the power of explaining any doubt that may arise on the meaning of any part of the award, or the power of altering a part, or the whole of the award, this would be such a reservation of the arbitrator's power as would render the whole award void.

A delegation of authority by an arbitrator to a third person has been always held to be void: thus, if an arbitrator ordered that the parties shall stand by the award of a third person, the award would be bad. An arbitrator may delegate his power over a ministerial, but not over a judicial act. It is not easy to say what is to be considered a judicial and what a ministerial act. I can, however, give an instance when it was decided that an award was good, which directed that one of the parties should pay a certain sum of money to the other for every acre, to be measured by an able measurer, in the presence of the arbitrators, at the rate of so many yards to the pole; for this is only a ministerial act, to ascertain the quantity of the land. On the other hand, in a case where the questions on what terms a lease was to be renewed was referred, it was decided that an award directing one party to put the premises in repair to the satisfaction of a certain surveyor was void, as being a delegation of the authority of the arbitrators. In some early cases, where it was awarded that the manner in which a legal part of the award should be carried into effect should be according to the advice of counsel, the awards were held good. An award of costs to be settled by a stranger would be clearly void, as being a judicial act. It was decided by Lord Hardwicke that an award, amongst other things, of a release, the form of which was to be settled by one of the Masters of the Court, in case the Court should be pleased to give directions for that purpose, was good; and his lordship is reported to have said upon that occasion that "to lay it down as a general rule that arbitrators must particularly point out the method in which their award should be carried into execution would be too nice, and such a rule would overturn a great number of awards."

It has been said that an arbitrator is liable to an action if he misconduct himself, but I cannot find any case in which such an action has ever been brought. In two cases, at different times, it was decreed in equity that an arbitrator should pay costs where he had declared he would make one party pay the costs, in one of which cases one arbitrator said he would consider and judge on plain facts, and the other said "he should not mind facts; that, being convinced that one party has misused the other, and having it now in his power, he would mulct his representatives." The Lord Chancellor highly approving of a former precedent (where the arbitrator having been made defendant to a bill in equity, Lord Macclesfield had inverted the arbitrator's threat and decreed that he should pay costs) made a similar decree. The Courts, however, will always be disposed to view an arbitrator's conduct in the most favourable light, and unless a clear case of corruption and partiality be made out against him, there is no liability on his part for negligence or incompetence. Where money was deposited by a bankrupt, before he committed an act of bankruptcy, in the hands of an arbitrator, who was to decide to whom it belonged, the arbitrator, before the commission issued, and after an act of bankruptcy but without knowledge thereof, paid the money over to the person whom he thought entitled to it, it was held that the trustee in bankruptcy was not entitled to recover it from the arbitrator.

An arbitrator may be called as a witness to prove facts which occurred or came under his cognisance during the reference. He, however, cannot be admitted or called on to give evidence of any concessions made by one party during the reference for making his peace, although as to proving regular admissions by the parties there is no objection to his testimony.

In my opinion, the capability of an arbitrator and the most important part of his work is to draw up and publish his award.

The award is the judgment of the arbitrator, and it is in its preparation that the arbitrator most frequently fails. To prepare an effective award requires a great deal of consideration and not a little technical and legal training.

The object of the arbitrator should be to settle the disputes between the disputants who have referred the questions to the arbitrator for the very purpose of avoiding litigation,

but if the arbitrator issues a badly drawn award, instead of putting an end to litigation he will in all probability commencing it and, usually, in a more aggravated form.

We assume this afternoon that the arbitrator has been properly appointed, has conducted the arbitration in accordance with the necessary legal forms. Those of you who have taken an interest in the publications of your Institute will have received a copy of my lecture on "Arbitration Procedure," which I delivered to your Institute last November when I was unable to deal with awards fully on account of the limited time at my disposal.

The arbitrator will have clearly before him the definite questions which he has to decide by means of written statements prepared by the respective parties. He will have the evidence he has taken of the witnesses called before him and will have taken notes of all arguments and questions which have been submitted to him by both sides relative to the matters to be decided, and will have made full notes of any legal question which has been discussed and which he has to decide.

How is he to set about the preparation of this documentary decision?

He will, of course, know and bear in mind that his award can be brought before the Court and that the Court has power to set aside a bad award or to remit it to him for reconsideration, and he will also in the interest of the parties remember that such a proceeding will undoubtedly cause litigation and expense. Therefore, the first thing he must know is on what grounds the Court will set aside or remit the award. If a layman refers to the Arbitration Act, he will find that the statute provides that, where an arbitrator has misconducted himself or an award has been improperly procured, the Court may remove the arbitrator or set aside his award or remit the same to him.

That may seem quite plain, but the arbitrator must know how he can misconduct himself, because that is the word used and it has a meaning far wider than the average man might expect. The Courts look upon misconduct as everything which will legally make the award bad. For instance, if the arbitrator proceeded with the arbitration in the absence of one of the parties without giving clear notice of his intention of so doing, if he decided contrary to law, if he published his award before either party has had an opportunity of submitting his whole case, if he failed to decide all the questions submitted to him, if he examined a witness privately in the absence of the opponent, if he refuses to state a case for the opinion of the Court where a proper application had been made and refused to delay his award until an application could be made to the Court to compel him to state a case, if he refuses to adjourn a meeting to give one of the parties time to instruct counsel where the other side appeared by counsel and in numerous other cases.

The award itself, to bind the parties, must be

- A. (1) Certain.
- (2) Mutual.
- (3) Final.
- (4) Consistent.
- B. The thing awarded must not be
- (5) Unreasonable.
- (6) Illegal.
- (7) Impossible.

But I must mention in passing that a defect in some of these requisites does not necessarily make the whole award bad; it may only be bad in part if the good and bad parts can be clearly separated without injustice to either party, as we shall see later on.

In the early cases the construction of awards by the Court was subtle and difficult to reconcile, but of late years the Courts have been more consistent and reasonable in their decisions, and we may take it that there are certain general rules which guide the Courts in constructing awards.

Firstly, the Court assumes that all questions submitted to the arbitrator have been settled by him and are covered by the award.

Secondly, that he has not exceeded his authority, but if the parties have submitted definite questions to him and requested definite answers, a general award would hardly be held to be sufficient.

Thirdly, the Court will hold that an award comprising anything beyond the submission is void, at least certainly for that part.

Fourthly, an award directing a stranger to the submission to do a certain thing would be construed as bad unless a party to the submission had agreed to obtain the performance of

act, in which case the party so undertaking might be able to an action for the non-performance of the award.

A short time ago I mentioned a list of requirements. Let us consider each point very shortly.

As to the question of certainty—

If there be an ambiguity in the words used in the award the Court will place upon them such construction as will best coincide with the apparent intention of the arbitrator, and the Courts will restrain general terms in an award to apply to particular words in the submission; they will connect the particular thing awarded with the general words of the submission.

The power and authority of an arbitrator is derived entirely from the submission; he must therefore make his award strictly in pursuance and in conformity with the submission. He must not, in his award, go beyond the submission in things, in person, or in time, nor exceed the power given to him by the submission in the particular case. And an arbitrator must make his award of all things submitted to him.

It is a general rule that unless the arbitrator makes his award of all matters submitted to him the award is entirely void. Where the submission is of several specific questions, if it does not appear that the arbitrator has made his award of each matter submitted to him, the award is void. The defect in these cases, and in others of the same kind, would be apparent on the face of the award; consequently the award would be set aside on motion, or the defect would be an answer to an action on the award. But where the submission is of all matters in difference, or of all disputes, without specifying them, the arbitrator need only make his award of such things whereof he has notice; if there be other things in controversy not included in the award, but of which the arbitrator had not notice, the award is good. If, however, the arbitrator does not make his award of all matters within the submission, of which he has notice, the award is void in toto. And on proving to the Court that such matters were laid before the arbitrator, and not included in the award, the Court would undoubtedly set aside the award on motion. But it must clearly be proved the arbitrator did not take such claim into consideration, and include it in his award.

Thus, where a cause and all matters in difference was referred, and the award disposed of the cause, in order to impeach the award, it was decided that the parties must show that there are other matters in difference, and also that the arbitrator had not taken them into consideration before the award would be set aside.

Nevertheless, every award to be binding must be certain, for the object of the parties in submitting their disputes to arbitration is to make an end of litigation; if the award were uncertain, instead of putting an end to litigation, it would be only a fresh source of dispute between the parties, but the uncertainty to invalidate the award must expressly appear on the face of the award.

An award that directs the payment of money generally is sufficient without assigning a time and place for that purpose.

A general distinction prevails between an award of an act to be done by a stranger, and an award of an act (as the payment of money) to be performed to a stranger: in the latter case the award would be good, if the award showed that the money to be paid, or the act to be done to the stranger were for the use or benefit of one party, as if it appeared in the award that the stranger, to whom the money is to be paid, is a trustee for one of the parties, or that the money is to be paid to the stranger for the use or benefit of one of the parties.

Where it is referred to an arbitrator to ascertain facts for the purpose of raising a question of law, such questions should be set out clearly and with certainty. An arbitrator who finds facts to raise a question of law should find them with such certainty that the Court may draw their conclusion of law; he should not leave any fact to be ascertained by the Court.

Everything will be construed to make an award certain. Where the arbitrator finds the rule by which the money which he awards to be paid is to be assessed, but does not assess the amount, the award is perfectly good and certain, for the amount, after the rule of calculation is ascertained, is only a matter of addition or subtraction. Where an arbitrator awarded interest from "the last settlement," which date was not a matter in dispute, the Court held the award sufficient certain.

(To be concluded.)

THE WORSHIPFUL COMPANY OF PLUMBERS.

THE delegates from the United Operative Plumbers' Association of Great Britain and Ireland, representing about 200 cities and towns, were received at the Guildhall by the Lord Mayor, the Master of the Worshipful Company of Plumbers.

In welcoming the delegates the Lord Mayor referred to the cordial co-operation of the representatives of the plumbing trade with the Company in fostering the education and training of plumbers in connection with the movement for the National Registration of Plumbers.

Mr. Robert Bogan, representing the Labour Exchanges Department of the Board of Trade, attended the meeting. Mr. W. D. Coröe, architect to the Ecclesiastical Commissioners, and Past Master of the Plumbers' Company, took the chair on the Lord Mayor leaving to attend an official engagement. The delegates discussed various matters relating to the working of the plumbers' classes in various districts and the working of the Labour Exchanges Act in connection with the joint memorandum of the President of the Board of Trade and the President of the Board of Education making provision for co-operation between Labour Exchanges and local education authorities.

Delegates expressed the opinion that by the addition of representation of plumbers on the central and local Advisory Committees the technical training of lads entering the plumbing trade and the employment of qualified men might be better regulated. Mr. Bogan undertook to represent these views to the Department.

On the motion of the Manchester delegate it was resolved:—

(a) "That the principle of apprenticeship for plumbers, combined with sound technical education, should be systematically advocated and adopted in connection with the National Registration of Plumbers."

(b) "That the education authorities of the kingdom should recognise the value of this principle as necessary to sound industrial training, and should provide facilities for the further extension of plumbing classes in all centres where the plumbers of the locality are prepared to co-operate with the authorities in securing a sufficient number of student plumbers working at the trade and dealing with other practical questions to ensure the successful working of the classes."

(c) "That the Board of Education should duly recognise these classes for the purpose of grants made by the Board, and the Board should further recognise in connection with these classes such examinations as may be prescribed by the central body for the National Registration of Plumbers and approved by the Board."

(d) "That the local health and water authorities and architects should co-operate, as far as possible, with the local plumbers in furthering the work of the District Councils for the National Registration of Plumbers, especially in setting up and maintaining a sound standard of work executed by plumbers."

The system of marking the work of registered plumbers with a distinguished mark was discussed at length. On the motion of the Oldham delegate, seconded by the Cambridge delegate, it was resolved:—

"That the delegates of the United Operative Plumbers' Association of Great Britain and Ireland heartily approve the principle of marking the work of registered plumbers when it complies with the standard of efficiency required by the regulations of the Plumbers' Company and the Board of Trade, and the meeting recommends it to the sympathetic consideration of the members of the Association in their respective localities."

AMERICAN ARCHITECTURE.

By FRANK M. ANDREWS.

(Concluded from last week.)

THE system, as developed, is a simple one in principle, consisting of supporting columns of steel or cast-iron, braced in all directions and riveted or bolted to the horizontal girders and beams, which not only support the floor construction but, more important still, also carry, storey by storey, the outer walls of the structure, which thus cease to have constructive value, becoming a thin screen of material that serves to enclose the building and to protect the steel fabric from exposure.

The outer walls being but screens, the masonry supporting nothing, their piers were in consequence easily reducible to a minimum surface width, and the area of glass could thus be largely increased, thereby giving a maximum lighting to the interior, a device rendered necessary by the generally increased height of our buildings fronting upon streets that could not be increased in width. The effect of this condition is manifest in the earlier treatment of the architectural design of these structures, and has become typical of them in the work of the present day.

The walls, being non-supporting, could be reduced to a minimum thickness, thus providing an important addition to the interior area of each floor, and materially increasing the earning power of the building; an imperative necessity because of the rapid rise in ground value in central business districts.

None of this development would have been possible, however, if it had not been for the American type of elevator, which was promptly developed in response to this new demand, and has kept pace with it ever since by evolving new principles of construction and operation necessary to cope with the constantly-increasing height of buildings and the enormous increase in service, both as to speed and volume of traffic.

These foregoing advantages, meeting our conditions and requirements, led to the general widespread adoption of this system, resulting in the development of remarkable contracting and building skill and organisation, of which we have every right to be proud, and which has produced amazing results as to speed of construction, quality of work, and economy. With our high ground values and the necessarily great earning power of these structures, the saving of time in their erection became a matter of momentous importance, and this necessity led to the creation of the skill and organisation referred to.

This type has come to stay because of its attributes of structural endurance, safety, economy in first cost and of upkeep, and its general suitability to our modern conditions.

While it has belonged to the domain of the architect, becoming the accepted type for our huge hotels, apartment houses, and commercial structures, and under his direction is fast becoming a thing of grace and beauty from a beginning of sprawling ugliness, nevertheless it must be said in all fairness that these structures could not have been devised without the skill and genius of our mechanical and structural engineering professions, the builders and the skilled mechanics, whose trades have become specialised and developed by this demand, all united in effective co-operation with the architect.

The question is frequently propounded: "Are these structures beautiful, or can they be made so, and thus enter the realm of artistic thought?" In my opinion, the answer is emphatically yes. It is no conclusive argument to decry them because in certain communities people live and pursue their vocations in such a manner as to make this type of building unnecessary, or because, since they have thereby been enabled to restrict the height of all buildings to a lower level, producing a uniformity of general effect, they can then point to Paris as the grand example of this sort of thing, and claim her artistic virtue as their own. Beauty of this sort is the outgrowth of suitability to local conditions, plus the artistic thought that may be apparent in the means adopted, but it is, after all, only one kind of beauty. There is beyond question the beauty to be found in truthful picturesqueness, when it is a natural outgrowth of conditions inherent to the people, and it can be made quite as respectful of architectural law, and the result of individual effort being made to regard the effect of the whole, while working in this freedom of spirit, as though it were hemmed in by ironclad restrictions as to height, &c., that are characteristic of certain communities.

The development of the exterior treatment of the tall building, architecturally, has been exceedingly interesting, and in the time and space afforded to me in this discussion cannot be described in detail. The stereoptical views and the comment thereon, which I have to present, will illustrate the subject in a more effective manner.

Briefly stated, our fundamental principle in design seems to have become established by treating the tall structure as a column with its base, shaft, and capital. In all of the best and most pleasing examples of the later work this element appears, and we find the lower storeys grouped in a single architectural composition supporting a long vertical and shaft-like series of storeys grouped into a simple treatment that carries the eye upward without interruption

to the crowning feature of the entire design, which again is a series of storeys combined into the capital, as it were, of the mass. The pleasing variety of thought in the handling of this scheme of treatment is one of the best features, and, generally speaking, is now characterised by a sober refined self-control and a truly architectural spirit. In the Classic feeling of the Italian Renaissance the municipal building of New York is unquestionably one of the best solutions of the problem on these lines that we have, while in the West Street building and in the Woolworth building, both in New York, we have equally good examples of the application of Gothic feeling and detail. Considering its extraordinary height and unusual mass, the design of the Woolworth building is, in my judgment, an architectural achievement of the highest order. I have referred to these buildings not only because of their architectural merit, but also for the reason that they represent the two broad schools of design which seem most suitable to the problem presented by the tall building, and are, I believe, typically representative of our lines of future development.

In pointing out the consummation of this century and a half of architectural growth in my country, I would have you enter the harbour of the city of New York on a trans-Atlantic liner, and from that point of view for the first time observe the buildings of the lower end of Manhattan Island with their towering and amazing sky-line and mountain-like mass of architectural grouping, picturesquely artistic and truthfully expressive of the spirit of our lives and activities.

I believe that it will grip the imagination of any observer, whether he sees it for the first or the hundredth time, and that he will experience from it that flow of thought and impression which is produced only in the presence of some great and inspiring thing. To me it illustrates the quality and the character of our people, their aspirations, and their peculiar genius in terms of architecture, as do our mountains and valleys, our lakes and rivers, the physical character of our land. Prosperity, wealth, and power we are surely possessed of, and we are as surely acquiring from the artistic wisdom and traditions of Europe that which is useful and good for us to have, and are applying it intelligently to our needs. As a people we are learning to respect and revere Art, and to value its uplifting influence, and with these fundamentals to build upon, and with the artistic forces that are ever active amongst us, the future of American architecture will be worthy of high regard.

At the conclusion of Mr. Andrews's paper Sir ASTON WEBB, C.B., C.V.O., R.A., Vice-President of the Society, proposed the vote of thanks from the chair, and said that they had had an absorbingly interesting paper on American architecture. It seemed wonderful to think that in 1873-4 Americans were still without any manner of their own, or any decided leanings in architectural design. In the last forty years they had developed the wonderful work about which they had just heard and which had been extensively illustrated on the screen. When he had come to the meeting he did so thinking he knew something about American architecture; but he now found he was altogether out of date as three or four years had elapsed since his visit. The tall buildings of that date had been eclipsed, and the 700 feet structures had been erected since then. He was bound to say that he did not think that Americans themselves were quite sure as to the possible final success of these buildings, and they were always asking Europeans what they really thought of them. Personally he never had the least hesitation in replying he thought them extremely fine; but he often believed that those to whom he said it thought he was chaffing. The effect of the buildings on him was very strong; and when the streets were fuller of them the effect would be better still. When he was there the tall buildings were only occasional, and the effect was a little "jumpy." To look down the streets of New York then reminded one of the streets of Genoa and of many other old Italian towns. The New York streets were wider; but the higher buildings and the great overhanging cornices gave very much the same effect of deep shadow at the bottom and brilliant light at the top. But he did not think our admiration for them would ever lead English architects to imitate them here, where the atmosphere and requirements were so different. The public in America took the keenest interest in architecture and architectural problems. Over here the public take no interest in such matters. The reason for this difference was that Americans had a new problem to solve, while here the problems had been solved most excellently in days gone by and we were nervous about starting new ones. In America architecture was a topic of

conversation and of general interest. That was a great encouragement to the artists working in brick and stone—an advantage which English architects envied them and which they congratulated them upon possessing. Another advantage was the unified action in that country. There all were working on the same lines, though not necessarily in the same style; but the buildings were so huge the detail on them was a comparatively small matter. The buildings were designed for great effect; a great base, a great shaft, and a great cap. But each architect was trying to produce the same effect in his individual way. A similar sort of co-operation was found in all the great traditions of the past. Whenever a people were working together on the same lines and with the same aims success followed. This showed that architecture was an associated art, and that a Copyright Bill was scarcely necessary. What architects required was to work together and to assist one another in developing something which should be not only satisfactory to themselves, but should bring honour and repute to the countries in which those buildings were erected. The history of America was now being very largely, nobly, and grandly built by American architects. He (Sir Aston Webb) had the great pleasure of knowing Mr. MacKim, one of the most charming, modest, and refined men who ever stepped. At the time of his visit that architect had just completed the library attached to Mr. Pierpont Morgan's residence. A New York City man had told him that he often went out of his way for the pleasure of going down the street and enjoying the elevation of that library.

Mr. H. H. STATHAM, F.R.I.B.A., in supporting the vote of thanks, said he had received a very new light upon the actual conditions of American architecture. His feeling about the buildings was to admire them in a sense as being the natural outcome of the conditions. But it was impossible not to feel a certain dissatisfaction with the idea that they were buildings of which the whole exterior more or less imitated a construction which was not the real construction of the interior. There should be some effort made to design the exterior so that it actually conveyed the idea that it was only a skin and not a solid stone structure. He wondered if it was possible to carry out these buildings in concrete-steel, so that the exterior represented the actual construction. To Europeans, accustomed to regard architecture as buildings in stone and brick, that idea of an outer skin went against one's prejudices. His feeling with regard to many of the buildings was that the base was not strong enough (architecturally speaking) for the immense structure above it. Probably there was also the question of light; but if the architects could manage to have large piers in the basement it would have a better effect. Finally, he was rather inclined to think that American architects had given themselves too much to the Ecole des Beaux-Arts. They might have tried to evolve a style of their own.

Mr. JOHN SLATER, F.R.I.B.A., mentioned that three years ago he had had the pleasure of going to New York, and he had felt the imposing effect mentioned of the high buildings when seen from the river. The facts that the gaps between them were now being filled up was a good feature, because to stand in one of the narrow streets and look over a low building at the side of one of the lofty structures was one of the most depressing things which could be imagined. He could not help saying that in the purely utilitarian structures not sufficient attempt was made to emphasise the corners. In one building it was positively alarming to look at the thinness of its corners. If these structures had to be put up it might be possible to give a greater apparent strength to the corners. It was interesting to hear about the stimulus towards artistic appreciation coming from the artist to the people. There could be no doubt from what was known about the spread of architectural education in the States, and the way in which the various colleges and municipalities were providing for the education of art students, that the intelligent appreciation of architecture was greater in the States than here. That was a matter upon which the Americans were to be congratulated, while we in this country must deplore the lack of it for ourselves.

Mr. FRANK M. ANDREWS, in reply, said he hoped that the paper would help them whenever they saw work from the United States to understand what it was, with all its faults and virtues. He would not wish to see any of those high buildings in any part of Europe, because they would be an entire misfit. But they belonged to America, and were not freaks there. The freakishness would be eliminated from them by educating the landlord and the public. The time might come when they would not have to carry a thirty-storey building on sheet glass.

[The Editor will not be responsible for the opinions expressed by Correspondents.]

The King Edward National Memorial.

SIR,—As a member of the King Edward National Memorial Council, which has for its object the saving of the Crystal Palace to the nation and Empire for ever, and particularly in view of the fact that the Palace is for sale at the Receiver's hands, and otherwise might suffer an unfortunate end or become a standing disgrace to our national pride, I wish to make an appeal to my fellow Freemasons to support the excellent scheme known as the King Edward National Memorial, and thus help to save the Palace and its grounds as a fine centre for recreation, amusement, and education, and to enable us by our adoption of business-like and up-to-date methods to transform the Palace failure into a creditable success.

If each Freemason will send something the result is assured.

The Council are giving a free life admission ticket to the Crystal Palace to every contributor of one guinea, whilst a contribution of 1,000*l.* entitles the donor to vote in the appointment of managers. Full particulars may be obtained from, and cheques, crossed "Lloyds Bank, St. James's Branch," should be addressed to the Right Hon. the Earl of Kinnoull, D.L., the King Edward National Memorial Offices, 26 Shaftesbury Avenue, W., or may be paid into almost any bank throughout the country, some thousands of which are receiving subscriptions.—Yours faithfully,

June 7, 1911.

W. P. TRELOAR.

Coronation Celebrations and Fire Precautions.

SIR,—The danger of fire in connection with the impending Coronation celebrations, as far as the public are concerned, are considered by this Committee to be so grave, largely on account of the growing habit of cigarette smoking, carelessness with matches, and the use of highly inflammable materials in garments that the following notice is being issued by this Committee to-morrow regarding fire precautions, and we would very highly esteem it as being in the public interest if you could find space to publish the notice in question, which also includes some hints as to safeguards for the stands, decorations, illuminations, fireworks, &c.

Any possible efforts to impress on the readers of your widely-read journal the necessity of simple precautionary measures will, in the opinion of this Committee, materially reduce the risk of loss of life or injury from fire.—Yours truly,

For the British Fire Prevention Committee,
EDWIN O. SACHS, Chairman.

June 9, 1911.

FIRE PRECAUTIONS ON JUNE 22, 23, AND 29.

A.—Matches, Smoking, and Wearing Apparel.

1. The lighting of matches and smoking should be avoided by persons standing or moving in a crowd, and should be prohibited by owners of stands, balconies, &c.
2. The wearing of garments of muslin, voile, and flannelette should be avoided, and celluloid articles should on no account be worn.

B.—Decorations, Stands, Balconies, &c.

1. The use of highly inflammable decorative materials such as paper roses, muslin, cotton wool borders, unless properly treated, and celluloid decorations should also be avoided.
2. Exits and stairs should be kept clear for all stands, balconies, rooms, &c., used as points of vantage, and buckets of water in good number, thick cloths, portable steps and knives for cutting down draperies should be at hand.

C.—Illuminations, Fireworks, &c.

1. Illumination devices must be fixed firmly with metal fastenings, *i.e.* not with string or cord and on no account placed on window ledges, balcony rails, or the like, overlooking public thoroughfares without being properly secured.
2. Curtains, hangings, &c., should be removed from around windows where open lights are to be used and away from temporary wiring, fuse boxes, &c.
3. Buckets of water should be provided, also boxes of dry sand where electrical illuminations are employed.

4. Fireworks, especially rockets, should on no account be let off from property adjacent to thoroughfares, and where used should be handled by adults of some experience.

For the British Fire Prevention Committee,
EDWIN O. SACHS, Chairman.
ELLIS MARSLAND, Gen. Hon. Secretary.

Building Stones.

SIR,—May I be allowed through the medium of your columns to draw the attention of those interested in the supply, use, and preservation of building stones to the efforts of an International Committee to collect information in order to determine the various causes producing decay in stone, more particularly the effect of mortar as influencing deterioration?

The committee, which is composed of members of the International Association for Testing Materials, and the labours of which are officially recognised by the Royal Institute of British Architects, held a meeting last October, under the presidency of Professor van der Kloes, and made some careful investigations of the stonework of many important buildings, including Cologne Cathedral, under the guidance of its architect, in Holland and Germany. As a result of this meeting a series of questions has been circulated among those interested with the object of collecting such information as may lead to a proper understanding of the problems connected with the decay of stone under varying conditions.

Many of your readers must possess information gained by experience which would be of great value to the committee, and I venture, through your courtesy, to appeal to them to give any particulars which may be at their disposal or to preserve the list of questions appended, with a view to the possibility of future assistance.

It is only by the collection and subsequent digestion of a great number of facts that satisfactory theories can be formulated, and without private assistance in a matter of this kind it is almost impossible to get the requisite information, which is necessarily largely in private hands. I may add that the response to a similar appeal abroad has been very encouraging.

The following are the questions, to which answers, even of a fragmentary nature, will be of value:—

1. Nature of building.
2. Situation (e.g. address, nature of surroundings, aspect).
3. Material (e.g. kind of stone or brick).
4. Date of building (or part under discussion).
5. Mortar used (e.g. composition, proportion of sand, analysis, or means of obtaining the same).
6. Nature of defect (e.g. incrustation, surface scaling, efflorescence, loosening, bulging of half-brick thickness).
7. Suggested cause (e.g. percolation of water, frost, defective stone, brick or mortar, old bond timbers, smoky atmosphere, action of sea water).

Any details (which will be treated as confidential if so desired) should be sent to the President of the Committee, who has long been an enthusiastic worker for the benefit of stone users, Professor A. J. van der Kloes, Delft, Holland, to me, or, with your permission, to you, Sir, for publication.

ALAN E. MUNBY,

Hon. Sec. R.I.B.A. Sci. Com.

Old-Time "Travellers' Rests."

SIR,—The "travellers' rests," at one time to be met with in many parts of the country, are fast disappearing, as the need for them has disappeared long since. Some of these rests were rough slabs of wood or stone—there is one such now standing a few miles this side of Reading at the junction of three turnings. It bears the inscription:—"Rest and be thankful"; but, given fine weather, the bank at the opposite side of the road would be a far more luxurious couch. Others are more pretentious, as, for instance, the one on the road between Worthing and Arundel. This structure stands in a turning off the main road, and might not be noticed by a passing traveller. The writer discovered it when he sought shelter from the rain under some near-by trees. It consists of a small round wooden house with an umbrella-shaped roof, which, however, is not now waterproof. A seat runs round three sides of the building, which might accommodate eight or nine persons at a pinch. It is evidently the work of a skilled craftsman. On one side of the wall is an inscription, but it is now undecipherable. Some of these old structures have been removed by local authorities and preserved as mementoes of a past that was very different from our present hurrying age; others have disappeared under the continued

effects of wind and rain, whilst others, where they fell into decay, have been taken away piecemeal at a time by villagers to be used as firewood. The vandal with the pocket-knife has not been idle on his visits to the rest on the Worthing road, and the seat is criss-crossed with initials and dates.—Yours, &c.,

WAYFARE.

The Passing of the Jerry Builder.

SIR,—In your issue of June 9 a writer, under the *nom de plume* of "A Dweller for 25 years in Jerry-built Houses," takes the profession to task for not providing the general public with houses costing from 375l. to 500l. Might I remind him that an architect is not a speculative builder, does not design houses on a speculative basis, and would only do so on request by a client? He further suggests that a year or two back it would have been impossible to find an architect willing to carry out such an undertaking. This is absolutely incorrect. I, personally, and many others, would have been only too glad to have received such commissions daily. The impression is quite an incorrect one, as although I admit the work is not the most remunerative, yet the small plums are sweet, and an architect never can tell how and where the important building may not follow the small commission. At any rate, this is my own personal experience. The small client of to-day may become the large and important one of to-morrow. The gentleman of 25 years' experience might by now have been the proud owner of several houses, in preference to renting a place, not one brick of which presumably is his own. For the obvious reason that I do not desire to be thought as advertising myself, I refrain from signing my name, but enclose my card.—Believe me, yours very truly,

A.R.I.B.A.

SIR,—I think your correspondent signing himself "A Dweller for 25 Years in Jerry-built Houses" is quite wrong in calling architects to account and blaming them for the shortcomings of the inferior and cheap dwellings which existed until the present happy new state of architectural education which middle-class tenants are learning to so much appreciate. To say that architects would not have been willing to design a small house twenty-five years ago is absurd. I can quote from my own experience. My father was an architect, and, I know, thirty years ago he designed numbers of small houses. I do not say they were often the style of the present modern bungalows or cottages now so much sought after, but rows of small houses and terraces on new estates, which had been used for orchards and agricultural purposes, &c. Nor was he asked to superintend the building of them; he was simply asked for designs and plans, and it happened that when he died I lived in one of these small houses myself with my family. I know he would have been only too pleased to have gone on designing these small houses, as well as large ones. He was very frequently asked to advise as to the best materials to be used in the building, which advice he always gave gratuitously. Your correspondent seems to forget that, if the architect had more often been allowed to superintend the erection of these small houses of his own design, no cause would probably have arisen to speak slightly, as so often is done, of the "jerry builder."—I am, Sir, yours faithfully,

AN ARCHITECT'S SON.

SIR,—Your correspondent does well and justly in his excuse for the existence of the much-abused "jerry builder," who is but the natural outcome of those who want a shilling's worth of work for sixpence, and then, when too late, find that "what costs nothing is worth nothing." He is hardly, perhaps, quite as just to the architect. Many years of experience tell me that he has rarely in the past been invited to do what the change in public sentiment now craves of him. Had such been the case, he would have been only too glad to respond to the call.

From my personal knowledge as a designer of many houses, both small and large, I have again and again been assured that the house-hunter has hitherto preferred "a brick box with a slate lid" to a homely house, and, with good models, both old and new, about him, has never appeared wishful to imitate them in plan or convenience, and still less in their quiet æsthetic tuition. If we poor architects never before did such things it was simply and solely because we never had the chance, especially among those who preferred shams to realities. To pay rent for a room rarely if ever used (or in some cases usable) seems to be the acme of folly, but it has taken some time to find it out.—Yours faithfully,

E. SWINFEN-HARRIS, F.R.I.B.A.

FORTHCOMING EVENTS.

Monday, June 26.
Royal Institute of British Architects: Presentation of the Royal Gold Medal, at 8.30. "The Interleaved Heirloom Copy of the <i>Parentalia</i> , and some Notes on the Wrens," by Lawrence Weaver, F.S.A., Hon. A. Exhibition of Photographs of Wren's work.
Tuesday, June 27.
Incorporated Municipal Electrical Association: Annual Meeting at Brighton, June 27—30.
Wednesday, June 28.
Institution of Civil Engineers: Conference on the "Education and Training of Engineers."
Thursday, June 29.
Royal Institute of British Architects: Final and Special Examinations, June 29—July 7.
Institution of Civil Engineers' Annual Conversazione at the Royal Albert Hall.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

Of the architect-Associates of the Royal Academy, Mr. REGINALD BLOMFIELD is represented by two drawings only. No. 1649 is a "Bird's-eye view of new gardens, from house to canal, Mellerstain, N.B." This shows a succession of sunk gardens with raised terrace walks around, rising as the ground rises from the canal to the house, thus affording opportunity for the designing of steps from one level to another with architectural adjuncts. This is quite the right treatment of a formal garden, which loses much of its effect if its plan cannot to some extent be seen from a higher level. Pattern-planning of gardens as in towns is very much of an absurdity when everything is on a dead level. If the pattern can be seen, well and good; but if not, then the designer's efforts should surely be directed to the vistas. No. 1667, Mr. BLOMFIELD's other drawing, shows Sidney College, as ordered to form the Holbourne Gallery, Bath, and is reminiscent of JOHN WOOD, with whom Mr. BLOMFIELD is probably more closely in sympathy than any other architect of the day. How much is alteration and how much original the drawing does not express, so completely does the new blend with the old.

Mr. ERNEST GEORGE has three drawings in the Architectural Room. No. 1515 shows the interior of "The Concert Hall, Royal Academy of Music," looking towards the platform and organ with orchestra seats around. We should hardly venture on such a ceiling as is shown, with a high pitched ellipse rising from a deep cove, the top of the ellipse pierced with what seem like high light wells, and the cove intersected by circular groins. We hope this will be all right for orchestral concerts, but we doubt if solo singers will be pleased. No. 1516 is "No. 17 Grafton Street" for Messrs. BARRARD, which has an ornate doorway with ornamental window over, the remainder very simply treated. In the drawing the proportions of the doorway seem uncomfortable. No. 1529 is a drawing showing "The Ombrium of the Crematorium, Golder's Green," in external perspective and a sectional perspective of the prior of a square tower treated in a quasi-Romanesque manner. Altogether we cannot say that Mr. GEORGE this year represented by some of his best architectural work. Mr. GEORGE has also contributed to the Water-colour Room a charming drawing from "Pisa."

Mr. ERNEST NEWTON, the latest of the architect-Associates, has four drawings exhibited, all water-colours of domestic work. No. 1553 is entitled "Four Acres," Epsfield, Middlesex, and shows a white plastered house with a tile roof, in which are blank gabled dormers, justified from the absurdity which many young architects have by the heads of the windows beneath them rising slightly above the level of the main eaves. Thus an intense feeling of simplicity and sobriety is attained in

masterly fashion. No. 1554 is a characteristic ERNEST NEWTON house in red brick with stone and plaster bays, tile roof with wooden dormers, and a big white cornice. This is a "House at Ewhurst, Surrey: Garden Front." No. 1563 and 1568 are both views of a house at Hambleton, Surrey, the former showing the garden porch and the latter the general view. This house also is in brick, apparently purple for the main walling and red for the dressings, surmounted by a tile roof. The garden porch is a semi-circular one with columns carrying a flat roof that forms a balcony to the upper floor, protected by a very simple but effective iron railing. The general view shows that the front entrance also has a stone porch with a circular hood. The whole design is full of reserve and a character of homelikeness.

Amongst other domestic work in the present exhibition there are many varied examples justifying the claim that we in England make for the high position that is held by our present-day house designers. Mr. FRANK M. ELGOOD's "No. 22 New Cavendish Street, W." (1483), is a dignified and yet interesting town house with a central entrance and two-storeyed bays on each side. Mr. ELGOOD is fortunate in not being obliged to carry up this building more than three storeys and a roof attic. Mr. W. HENRY WHITE, in his "No. 89 Harley Street" (1488), has one of his characteristic narrow-fronted town houses with bay window and side door on the ground floor and tiers of three windows in a row above. Mr. WHITE in this instance has been able to adopt eminently satisfactory proportions to his windows with good detail.

Mr. EDWARD J. MAY contributes a sheet of "Interiors, Webbington House, Somerset" (1506), drawn by Mr. RAFFLES DAVISON, which indicate a striking variety of treatment in the different parts of the house. The drawing room has an ornamental plaster ceiling, and panelled walls also apparently in plaster; a corridor at top of the stairs is treated with quaint woodwork and a high segmental barrel ceiling with decorated plaster ribs cut across by wood beams, whilst what we take to be the hall has an admixture of wood and stone.

MESSRS. HORACE FIELD & SIMMONS, in their drawing of "Two Houses, Westminster" (1508), show that they have been able to produce what appears to be one building at the corner of two streets out of two houses, not even a tell-tale party wall being shown. This is hardly in compliance with the principle of truthful expression in design, though the temptation is great. "Bunch Cottage, Haslemere" (1528), by Messrs. READ & MACDONALD, with a stone lower storey, tile hanging and tile roof above, is a very pleasant example of art—full simplicity in design, attained by much thought. Mr. P. LESLIE WATERHOUSE's "House at Hampstead" (1522) is of the modern picturesque type in plastered walls with just a little brick for plinths, chimney stacks, &c.

"The South Court, Ewelme Park, Swyncombe, Oxon" (1530), by Mr. L. STANLEY CROSBIE, is shown in a gay water-colour which depicts a manor house type of dwelling with a long range of half-timbered first floor framed by projecting wings with plastered walls—a very satisfactory treatment. There is much skill displayed in the handling, particularly of the half-timber work. Mr. OSWALD P. MILNE gives us a good example of the value of balance in design in his drawing of "Drakestone, Stinchcombe, Gloucestershire" (1534), a stone-built house with square-headed, straight-arched windows, in which the local feeling of the Stroud Valley is well maintained. Pleasant lightly tinted pencil drawings by Mr. A. WINTER ROSE show "The Entrance and the Billiard Room Doorway, Millfield, Brentwood" (1535), which suggest studies of the Renaissance period in Holland, combined with a "Wilton window" that rather mixes the flavour.

NOTES AND COMMENTS.

THE House of Commons has refused to approve the present scheme of the Corporation of London for St. Paul's Bridge by ordering the recommittal of the Bill before the House. It is gratifying to find that the æsthetic amenities of London are recognised by the Legislature as worthy of careful consideration, and the *Times* and Professor BERESFORD PITE are to be congratulated and thanked for the part they have taken in educating public opinion as to the value of architectural considerations in connection with a scheme for a bridge which might be a great artistic improvement to the City of London.

It has been proved to the satisfaction of the House of Commons "that the Corporation have not considered this matter from an architectural standpoint." Thus the House has shown that this assertion, which Mr. DOMONEY, the chairman of the Bridge House Estates Committee, styled a fallacy in a letter to the *Times*, is, in its opinion, a verity. Mr. DOMONEY, in his letter, gives away the case of the Corporation when he says "the Corporation could not have given fuller opportunity to the representatives of the Institute of British Architects to express their views than they have done. By the Common Council, the Bridge House Estates Committee, and myself, as the Chairman of that Committee, deputations of eminent artists and architects have been received and their views discussed and considered on many occasions from the inception of the scheme."

THIS is the crux of the whole matter. The "eminent artists and architects"—the distinction is typical—say that the Corporation ought to have the advice of expert architects upon their scheme; the Bridge House Estates Committee hold that their decision is sufficient and reliable without any advice from artists, whether architects or not. They consider themselves competent to decide what is best for the beauty of London without following the course recommended by the members of the Royal Academy, Mr. ERNEST GEORGE, Sir GEORGE FRAMPTON, Mr. REGINALD BLOMFIELD, Mr. JOHN S. SARGENT, Sir LAWRENCE ALMA-TADEMA, Sir THOMAS BROCK, and Mr. JOHN BELCHER, who urged that the approval of architects of recognised experience should be added to the evidence of two engineers and a surveyor before a scheme for the bridge could be considered worthy of the present opportunity.

WHEN one comes to investigate the case for the Corporation's scheme the only arguments in its favour that have been put forward seem to be that it will facilitate a through tramway connection between north and south London, it will enable the police to hold up all road traffic between north and south, and between east and west, for half of every working day at yet one more point, and it will cost a million pounds less than

one scheme proposed by somebody else. As we have before said in these columns, it is more than doubtful whether there is any necessity for a through tramway route between North and South London. It is indeed an open question whether the improvements in motor traction are not within measurable distance of giving the *coup de grace* to tramways.

THEN it has never been even suggested that the Corporation scheme is better than, or even as good as any other possible scheme from any one point of view—tramway, general traffic, architectural, or financial. It is unfair to condemn any alternative scheme because it will entail a higher initial capital expenditure, without taking also into account the question of recoupment. A scheme costing five millions instead of the Corporation's two and a half might be very much cheaper in the long run. Professor PITE's suggestion has been set up as a Aunt Sally for Mr. DOMONEY's stick of an extra million but the Professor is quite justified in his reliance on recoupment to reduce this to one year's income of the Bridge House Estates Committee, and Mr. DOMONEY's only answer is that Professor PITE has over-estimated the present income of the Bridge House Estates. It may be remembered that Messrs. CROSS and HUBBARD suggested a scheme that would cost even more than Professor PITE's, but, as we said at the time, it would bring a splendid recoupment. There are many possible ways of planning a St. Paul's Bridge that would be better than the Corporation's scheme, æsthetically, practically, and financially, and it is therefore wise that it should be recommitted by the House of Commons.

THE close proximity in point of time between the unveiling of our national monument to Queen VICTORIA and that of the Italian memorial to King VICTOR EMMANUEL II. at Rome naturally invites a comparison of the two, and we can hardly help feeling eclipsed by the greater magnificence and costliness of the Italian tribute to a great ruler. It is significant of the different attitude towards Art, if not of the depth of gratitude and respect that exists in the Latin nation as compared with ourselves. The Victor Emmanuel monument has been in progress since 1884: our own has been completed within ten years, and the difference in time fairly represents the difference in magnitude of the two memorials.

THERE need be no fear on the part of the public that the many stands which will be occupied this week by sight-seers of the Coronation processions are lacking in strength. Their construction has been critically supervised by the District Surveyors of London, and is undoubtedly superabundantly strong. But the danger of fire is quite another matter, and the British Fire Prevention Committee deserve public gratitude for the timely recommendations issued by them and published by us last week for minimising not only this danger but also that of panic which an alarm of fire in such combustible structures might readily excite.

THE *City Press* recently printed an interview with Mr. PAUL WATERHOUSE on the subject of arcing for London streets, which is well worthy of the careful attention of our local authorities. Our foot traffic as well as the vehicular is, in the heart of London, becoming a very serious problem, and arcades or colonnades would be of material assistance in reducing the congestion. Their use would also be of benefit rather than otherwise to shopkeepers, and increase considerably the amount of window space at their disposal for the display of their goods. Needless to say, such an innovation would greatly tend to the improvement of London's street architecture.

THE restoration of the Old Brig of Ayr has been completed by the insertion of two bronze panels, commemorating the work. The inscription on one reads "In admiration of ROBERT BURNS and his immortal

poem, 'The Brigs of Ayr,' this brig was during 1907-10 restored by subscriptions received from all parts of the world.—R. A. OSWALD, chairman of the Preservation Committee"; and on the other: "The Auld Brig of Ayr. Erected in the thirteenth century. Preservation work, 1907-10. Reopened by Lord ROSEBERY, July 29, 1910.—JAMES S. HUNTER, Provost of the Burgh of Ayr."

PARTICULARS of sale of the freehold residential, manorial, and sporting estate known as "Addington Palace," formerly one of the archiepiscopal residences of the Archbishop of CANTERBURY, have been prepared in view of the sale by auction on July 11 by Messrs. DOUGLAS YOUNG & Co., and contain not only an interesting historical account of the manor and palace, but good photographic views of the architectural treatment of the existing Georgian mansion with the various additions made since its first erection, including the grand salon and ball room carried out from the designs of Mr. R. NORMAN SHAW, R.A.

MR. ARTHUR HARSTON, in a letter to the *East London Observer*, calls attention to the cause of the decay of the Victoria Fountain in Victoria Park, which he attributes, probably correctly, to the scraping of the surfaces of the stone, thus removing the indurated quarry sap, which with many stones forms a protective coating. It should be remembered by the custodians of all stone buildings that cleansing by scraping is a risky proceeding.

It is difficult to credit in these days that such a condition of hygienic defect can exist in any schools as is described in the latest annual report of the Medical Officer for Cumberland, who finds that many schools in the county have insufficient window lighting, defective air supply, inefficient warming arrangements, and cloak-rooms "little better than cells or enlarged sentry boxes."

THE CONCRETE INSTITUTE.

(Concluded from last week.)

THE proceedings on the second day opened with a poor attendance to hear a paper by Mr. Alfred E. Corbett, F.R.I.B.A. (of Messrs. Woodhouse, Corbett & Dean, architects), on "The Y.M.C.A. Building, Manchester." He pointed out that, hampered by a small site and rigid limitations of height, it was not a simple problem to meet the requirements of a modern Y.M.C.A., including such varied accommodation as a large hall to seat over 900, and a small hall to seat 150, with ante-rooms and separate access to the public, four shops and cellars, a large gymnasium with a 24-lap running track, two fives courts, a swimming bath, café and kitchen, billiard-room for four tables, smoke-room, large lounge or common-room, offices for staff, eleven class-rooms, two photographic dark-rooms, juniors' common-room, locker-rooms, shower baths, lavatories, &c.

Special Reasons for Adoption of Reinforced Concrete.

The original working drawings were made with a view to brick walls and skeleton steel construction; and the decision, when they were nearly completed, to make it a reinforced-concrete structure was largely due to two parts of the building which seemed peculiarly suited for such construction.

The swimming bath, 60 feet by 21 feet, on the top floor of the building, might have been constructed as an iron tank, lined with asphalt and glazed brickwork, but the initial cost and maintenance would be considerable. Reinforced concrete seemed much the simplest method to adopt for this tank.

The other special construction was the method of spanning the large hall, a 50-feet span, without columns. The floor above the hall consists of class-rooms, and was so arranged that the division walls between the class-rooms would form trussed girders 12 feet deep and 50-feet span, supporting the floors of the class-rooms, and of the gymnasium immediately over them. These trusses were designed in steel, with the intention of enclosing them in solid concrete walls for preservation, but it seemed more reasonable to use the concrete for constructional as well as protective

purposes by reinforcing it with about one-sixth of the amount of steel required in a steel truss.

These special considerations, allied to the ordinary advantages, induced the architects to carry out the work in reinforced concrete; and now that the work is finished they are convinced that the right decision was come to, in spite of the difficulties which they had to surmount.

Approval by Local Authority.

The first and most serious difficulty was with the Corporation. At that time the material was not recognised in the Manchester by-laws, and although powers to deal with it were being applied for, the architects were too early to get a ready consent to their proposals. In fact, until the building was actually started, they did not know whether they should have to thicken the walls up to the by-laws' standard for brick, in spite of a five-months' delay by the Corporation before passing the plans. Eventually approval of the plans was given, subject to no external wall being less than 9 inches thick.

Partly to this delay, and partly to the elevations having been designed for brick walls in the first instance, is due the thickness of the walls in some places. The elevations cannot be claimed as the logical outcome of a reinforced-concrete structure; but they are not grossly inconsistent with such a structure; and there was not time to attempt to entirely recast them.

Schemes were invited from five firms of specialists, accompanied by tenders from contractors nominated by the specialists. The complete work was divided into two separate contracts, the first contract embracing reinforced concrete, excavating, drains, terra-cotta, and asphalt, *i.e.*, the whole of the work required for a complete "carcase"; and the second contract embracing joinery, plastering, and all other "finishings" required.

Specification Clauses.

A specification was supplied to each firm of specialists with some unusual clauses.

The floor load throughout the building was to be 2 cwt. per sq. ft., in addition to weight of floor. This high load was adopted at the request of the city authorities.

Provision was made for testing steel and cement before use; and for tests of portions of the flooring two months old with a super load of 3 cwt. per sq. ft., the deflection not to exceed $\frac{1}{100}$ of the span. This is probably much too lenient as regards deflection, and $\frac{1}{100}$ of the span would be a reasonable limit.

If the results of compression tests of sample cubes of concrete showed the strength of concrete to be less than 95 per cent. of the strength allowed for in the calculations the architects could require all work done from the batch in question to be replaced by fresh concrete at the contractor's expense.

The architects might also select any member or portion of the structure to be tested to destruction twenty-eight days after moulding. If the pieces tested failed under a load of less than four times the calculated safe load, the corresponding part of the actual building was to be strengthened to the architects' satisfaction, and the whole cost of such strengthening, and of the test, shall be borne by the contractor. If the piece did not fail the net cost of the piece and the cost of the test was to be borne by the proprietors.

It was also specified that provision should be made for skilled supervision during erection, and consequently one of the specialist's engineers was resident on the work.

Comparison of Schemes.

The competing specialist firms were asked to supply sufficient particulars to enable the architects to check the strengths of the respective schemes, and four out of the five complied. It was, of course, impossible to check the entire design, but the architects selected typical members throughout the building and calculated their strength in accordance with the Report of the Joint Committee on Reinforced Concrete appointed by the Royal Institute of British Architects, and tabulated these as a percentage of the strength required.

The scheme on which the lowest tender had been submitted did not come very creditably through this examination, and was set aside.

The next two schemes were very satisfactory in point of strength, although in each case certain parts required strengthening to come up to the R.I.B.A. standard.

It was decided to accept the tender of Messrs. J. Bentley & Co., of Bradford, for the scheme submitted by the Trussed Concrete Steel Company, Ltd., on the "Kahn" system, which was next to the lowest in price. An important con-

cession was made during the negotiations, viz., that in developing the working drawings every member should be calculated to the R.I.B.A. standard, the drawings and calculations being referred to Mr. C. F. Marsh, M.Inst.C.E., for him to decide if this was the case; his fee to be paid by the specialists. This was of great value in getting the approval of the Corporation.

Cement and Concrete.

In defining the concrete to be used, instead of specifying materials and proportions, it formed part of the contract that the concrete at twenty-eight days old should have a crushing strength of 154 tons per sq. ft., this being the standard given in the R.I.B.A. Report.

A very interesting series of tests was then undertaken to ascertain the most suitable local materials and their proportions (published in the R.I.B.A. *Journal* for November 12, 1910). Finally a mixture was adopted of 1 of Earle's Pelican cement (by volume), 2 of a half-and-half mixture of Runcorn river sand and Openshaw pit sand, and 4 of a coarse sandstone, known as "Bolton granite"; or, in other words, 1 cwt. of cement, 3 cubic feet of sand, and 6 cubic feet of stone, the stone passing a $\frac{3}{4}$ -inch mesh. This gave the required strength in the preliminary tests.

Retaining Walls.

The foundations were on fairly hard red sandstone, on which a pressure of 7 tons per sq. ft. was allowed. The retaining walls were designed as beams subjected to a horizontal load, and supported at each end by a stanchion, instead of either depending on a sole piece for stability or acting as a vertical beam against the floor.

The Corporation would not allow the whole site to be excavated at once, on the ground of risk of settlement in adjoining streets; and the work was done a bay at a time. The soil was a stiff clay, and nearly all the retaining wall was formed by removing a portion of the timbering at a time and casting the concrete solid against the clay, thus removing all possibility of settlement.

It was first intended to trust to the concrete wall for resisting damp, but the Corporation insisted on a cavity wall, which we formed by means of a 3-inch brick-on-edge wall in cement inside the retaining wall. They also insisted on connecting the cavities by $\frac{3}{4}$ inch of rock asphalt over the backs of the piers where the retaining wall rested against them.

Terra-cotta Facing.

The building is cased externally with Burmantofts "Marmo" ware of a chocolate colour for the ground storey, and Burmantofts "Vitreous Buff" terra-cotta for the upper storeys. It had been intended to have a more interesting colour scheme of "Marmo" ware throughout, with a green base and cream upper part, but the committee reversed their decision.

The terra-cotta is only $4\frac{1}{2}$ inches on bed, and has no structural function except to provide an impervious facing from which the Manchester soot can readily be removed. The back of each block was hollowed out with dovetail-shaped hollows, and the blocks were built up in cement to a height of 2 feet or so, forming a $4\frac{1}{2}$ -inch wall or skin outside the steel reinforcement. Inside the reinforcement was a face of wooden centering, and the concrete was deposited between this temporary inner centering of wood and the permanent outer centering of terra-cotta, the dovetailed hollows of which it completely filled, making a perfect bond between concrete and terra-cotta. Projecting cornice blocks were secured by stout wire or thin rods.

The method appears to be entirely successful, and there is not a suspicion of a crack in any part of the facing.

Air Inlets.

The system of ventilation required a number of air inlets through outer walls, and these were made by running 4-inch glazed drain-pipes through the wall beams, at or below the neutral axis, and masking the outer ends by decorative pierced panels of terra-cotta. A more important device for ventilation occurs in the cantilevers supporting the gallery in the large hall. An inlet air flue of 5 sq. ft. area was required between the floor of the gallery and soffit under same, and this flue was carried through the cantilevers, between the compression and tension members of a triangulated truss.

Gallery Cantilever Test.

One of the larger cantilevers at the back of the gallery was tested eight months after construction with a super load of 2 cwt. per sq. ft. The greatest deflection was $\frac{1}{10}$ inch, or $\frac{1}{100}$ of the length of cantilever, of which deflection

one-half disappeared on removing the load. Stout supports were erected to within 2 inches of the soffit to prevent damage in case of a collapse or undue deflection.

Swimming Bath.

Perhaps the most interesting part of the building is the fifth floor swimming bath, in which over 180 tons of water have a surface 57 feet above the street; though the interest may be due rather to comparative novelty than to any actual difficulty of construction.

It is simply a rectangular box, 60 feet by 21 feet, and rests on transverse beams varying in depth from 3 feet to 6 feet 6 inches and 26 feet span; the thickness of bottom being $7\frac{1}{2}$ inches, and the sides being from 5 inches to $6\frac{1}{4}$ inches thick.

It was carefully considered whether to line it with asphalt or similar lining, and finally it was decided to trust to the concrete alone, simply lined with glazed tiles set in cement.

The various holes required for steam and water pipes, electric tubing, &c., were nearly all cut out afterwards, because of the difficulty of getting them in the exact positions if they were formed while casting the concrete.

Holes for Pipes.

Many pipe holes were avoided by the provision of two chases from roof to sub-basement, large enough for a number of pipes and for access to same.

Tiling and Terrazzo.

The walls in some of the principal rooms and stairs are tiled with Chance's "Vitreous Tiles," and in the lavatories and kitchen, and round the swimming bath, are covered with marble terrazzo mosaic. Terrazzo was also used in the convenient form of reinforced slabs, $1\frac{1}{2}$ inches thick, for w.c. or shower-bath divisions.

Area Whitewashed.

The internal light area was intended to be tiled; but cement rendering, which is to be periodically whitewashed, was ultimately substituted.

Hollow-tile Floors.

The bulk of the floors throughout are constructed with hollow tiles separating 4-inch reinforced-concrete joists, to prevent transmission of sound.

Cost per Cubic Foot.

It is not possible yet to give the cost as finally adjusted, but it is believed this will be very close to the original amount stipulated, viz., 35,000*l*.

The cost per cubic foot, measured from under side of concrete foundations to top of roof, works out about as follows:—

	Per ft. cube.
Complete reinforced-concrete structure, including walls and floors and filling to terra-cotta; excluding excavating ...	3.0 <i>d</i> .
Terra-cotta facing, including fixing ...	1.1 <i>d</i> .
All other trades together ...	5.1 <i>d</i> .

Total approximate cost ... 9.2*d*.

Various circumstances combined to make this a very cheap building, and it would probably cost more to duplicate it.

Time of Building.

The first slab of concrete was laid on April 29, 1909, and the concrete structure was completed on September 15, 1910, so that the complete concrete and terra-cotta shell occupied $16\frac{1}{2}$ months in erection, which was considerably more than we expected.

Mr. W. G. PERKINS (District Surveyor, Holborn) said he had been struck by the unreasonableness of some of the requirements of the Manchester Corporation. In the Y.M.C.A. building in London just the same problems had had to be faced as in the new Y.M.C.A. building in Manchester, and much the same construction adopted.

Mr. G. C. WORKMAN remarked that he was previously aware of the tremendous difficulties with which the architects of the building had had to deal, because he had been concerned in getting out a preliminary scheme. He would very much like to hear why the swimming bath was put upon the fifth floor, as he should have thought it preferable to have it in the basement. It seemed to him that great praise was due to the architects for their pluck in boldly designing a huge building such as the Manchester Y.M.C.A. in reinforced concrete while they were aware that there were no by-laws at the time recognising the material. A great many architects similarly placed would have turned round and said they did not see their way to using the material because it would mean delays and difficulties. Mr. Corbett

s quite right in asserting that such a high floor load throughout the building as 2 cwt. per sq. ft. (in addition weight of floor) was unnecessary, and far more than was needed. It would be interesting to know if the actual by-laws of the Manchester Corporation were going to make such an absurd requirement. It was a pleasure to hear that although in the specification provision was made that in parts of portions of the flooring two months old with a per load of 3 cwt. per sq. ft. the deflection was not to exceed $\frac{1}{800}$ of the span, Mr. Corbett thought that much lenient, and that $\frac{1}{800}$ of the span would be a reasonable limit. The permissible deflection of a beam ought strictly to be calculated in each case, as it varies with a whole lot of circumstances and is very elastic. It had been mentioned Mr. Corbett that in the test on one of the larger cantilevers at the back of the gallery stout supports were erected within 2 inches of the soffit to prevent damage in case of collapse or undue deflection. That plan was an excellent one, because in his own practice it always seemed to be his (the speaker's) duty to stand underneath the part tested. The architects for the Y.M.C.A. building at Manchester had used five specialist firms to send in competitive schemes. That method was open to objection; the better way seemed to be for the architect to investigate the different methods and then to invite the one he liked best to quote a price. The prevalence of the other way meant a very serious state of things for the various firms of reinforced concrete engineers, to get flooded with demands for schemes from architects all over the country. The firms do not like to give offence by refusing to comply with the requests, but they would very much prefer the architect to make up his mind from the start as to the method he wants to adopt.

Mr. H. E. YEATMAN also spoke in favour of the provision for emergency supports during tests. If a test was made at which it implied the possibility of failure, and against that possibility provision should be made. He could quite sympathise with the difficulties of competing tenderers who did not know whether to scamp their designs or by declining to do so to run the risk of not seeming as cheap as the others. In his opinion an engineer should be employed to decide not which is the cheapest scheme but which of them will give the best results.

Mr. S. BYLANDER said it was very pleasant to find the amount of information Mr. Corbett had imparted to them. He had let them see his working drawings, and given complete details of all his difficulties. That was what they, as engineers, wanted to know. One of the specification provisions was that there should be skilled supervision during erection, and, consequently, one of the specialist's engineers is resident on the work. It would be interesting to hear what that expert was paid. In his (the speaker's) opinion, such an engineer should be paid for by the client. The presence of such an expert seemed to be more important than the selection of a particular system, for most of the defects have hitherto been due to a careless carrying out of the work rather than to ignorance on the part of the architect or of the draughtsman. As to tests, it seemed to him that the part to be tested should really be the column.

Mr. E. P. WELLS, J.P., the Chairman, closed the discussion, and proposed the vote of thanks.

Mr. A. E. CORBETT, F.R.I.B.A., then replied to some of the points raised. There were not, he said, yet any by-laws of Manchester dealing with reinforced concrete. Each case must be submitted on its own merits to the city authorities, and against their decision there is no appeal. The Corporation possess the power to draw up by-laws, but have not done so yet. The placing of the swimming bath on the fifth floor was simply a matter of light and air. He believed it was largely due to that arrangement that they won the competition. In its present position it was almost like going through the exercises in the open air. And he did not think the cost would have been very much more than if they put the bath in the basement. With regard to competitive schemes, it was only in exceptional cases that an architect would go to a specialist firm direct. Payment of the resident engineer was in the Y.M.C.A. building contract made by the specialist firm whose scheme was adopted. The testing of the columns as advocated could only have been carried out by the expenditure of a small fortune.

THE Arts and Crafts Committee of the Governors of Robert Gordon's Technical College, Aberdeen, have under consideration the sketch plans of Mr. J. A. Ogg Allan for the reconstruction and extension of the School of Art at an estimated cost of 35,000l.

ARBITRATORS AND THEIR AWARDS.

(Concluded from last week.)

AN award in the alternative, namely, that one party shall do one thing or another, is not subject to the objection of being uncertain; for when such party has performed one of two things, he has performed the award; even where the award is in the alternative, and one of the things awarded to be done is impossible, or uncertain, the party can and is obliged to perform the other alternative.

An award to be binding on the parties must be final and determine all matters contained in the submission.

Any delegation or reservation of authority by an arbitrator vitiates an award, for an award would not be final that left anything to the future judgment or power of the arbitrator.

Where part of the matter in dispute is excepted for future litigation, the award is not final.

Where, on a dissolution of partnership, the arbitrator directed that a matter arising as to a liability on a promissory note should not be affected by the award, the award was held not to be final.

Where it was awarded that a certain sum was due from the defendant to the plaintiff, and that the defendant should pay the sum due, unless he shall within twenty-one days make an affidavit as to certain receipts, and if so, a certain sum was to be deducted from the sum awarded, the award was held not final and, therefore, bad.

An award depending upon certain subsequent facts is entirely void.

Another point regarding awards is that they must be *mutual*, that it must not be entirely of things to be performed by one party, without such things being in satisfaction of the matters in difference. The application of this rule seems to have been fatal to many awards in former times. The rule to be collected from the old cases on this subject is, that if the award was merely that one party should do an act without anything awarded to be done by the other party, if it were not alleged to be made of and upon the premises, or of the matters in controversy or like, then the award was void; but if it appeared by recital or otherwise, on the face of the award, that the award was made of all the controversies submitted, then the award was good, although the matters awarded to be done were entirely on one side. But the good sense of modern times has, in a great measure, exploded this distinction, and the Courts will now decide that the award is made of all things submitted, unless it appear to the contrary; and it is always presumed that money awarded to be paid, or a collateral thing ordered to be performed, is a final arbitrament of all matters submitted on both sides. It is, however, quite clear that an award must be mutual; therefore, whenever the arbitrator has omitted to decide on all the matters submitted to him, the award is not final or mutual, as the whole matters on both sides have not been determined. In cases where the thing awarded on one side is bad for uncertainty or otherwise, and that part forms the consideration of what is to be done on the other side, and void for want of mutuality, so where there are demands on both sides, if the arbitrator make his award of those only on one side, here the award of all things submitted to him and consequently the award is not mutual.

An award of something impossible, illegal, or of no advantage to either party, is bad. Thus, unless awarded in the alternative, where a party is awarded to do an act which he has no power to perform, it is not obligatory upon him; as that one party shall deliver up something which is not in his custody or power, or that one shall procure a stranger to be bound with him, have been severally held to be a bad award, the things awarded not being in the power of the party to perform; but if it be awarded that a person shall pay a sum of money, or enter satisfaction on a particular judgment, and there never was any such judgment, the award is good, for the party has the alternative to pay the money.

An award must be reasonable; several instances are reported where awards have been held void for being unreasonable. Whether an award be reasonable or not depends, of course, upon the particular circumstances of each individual case. The Courts, at the same time, must have a very strong case made out before they will refuse to enforce an award for being unreasonable.

It has been decided that an award was bad where it was awarded that a party (a lessee for years) should make some alteration on the demised premises, which in him would have amounted to waste, and the performance of the award would subject the party to an action. So an award that a

party should do an act which would amount to a trespass is void. An award must be advantageous; if the thing awarded cannot by any possibility be of any advantage to either party, the award is void; also, if an award is manifestly inconsistent or absurd, the award will not be enforced in a court of law.

In all these cases of an award directing an illegality or impossibility to be done, if it awarded in the alternative as that the party shall pay a sum of money, or do such illegal or impossible act, he is bound to pay the money.

It remains to consider to what extent an award is vitiated by an award of something that is uncertain, illegal, or beyond the submission. In olden times it was always held that an award that was bad in any of its parts was bad for the whole; but afterwards the Courts began to decide that if the breach was not assigned on the bad part of the award, and if that part did not affect the whole matter awarded, then the award was only bad for that part; and it is now quite clear that an award may be bad in one part, and yet good and binding in another part. The rule may be laid down to be that, if the bad part of the award be not distinct and independent of the rest of the award, or if by the nullity of the award in any part, one of the parties cannot have the advantage intended him as a recompense or consideration, the award is void in the whole. But if a thing be awarded to be done is bad for uncertainty, or as being beyond the submission, or for any other objection, and this part does not form a consideration for the performance of the matter awarded on the other part, and is distinct and independent thereof, then the award is only void for so much. A distinction in this respect prevails between an award of several things, some of which, as we have seen, may be bad but not so as to vitiate the whole of the award, yet where one entire thing is awarded which is not in its nature divisible it cannot be apportioned. As where one sum is awarded to be paid in an action at law brought to enforce the award, the Courts cannot enter into the question as to what part of the sum is, and what part is not, within the submission; but if the arbitrators have exceeded their authority in awarding any part of an entire sum, the award cannot be enforced at all. However, on a motion to set aside an award, if it can be ascertained how much of one entire sum is ill-awarded, the Courts would apportion the sum, and support the award for so much as was within the submission.

In all cases where an award, void in part, may be supported for the residue, it must always be understood that it does not appear that the arbitrator had omitted to make his award of some matters submitted to him; for in that case, if the void part was one of the matters in controversy, and that bad for uncertainty or otherwise, the award would be void in toto, as the arbitrator had not made his award upon all matters referred to him. The principle upon which it is so held is that the consideration for which the party submitted was that the arbitrator should make an award of all matters in difference, and which consideration has failed. And so, wherever the void part of an award is the consideration or recompense of the thing awarded on the other side, the award is entirely void. So, wherever there is a good award standing alone, but in a subsequent part there is reservation or delegation by the arbitrator of his authority, which runs over the whole award, this latter part vitiates the whole award.

With the foregoing knowledge an arbitrator should be in a position to prepare his award, the details of which I have not time to further go into. I can only add that I shall be pleased to answer any question which may be submitted to me, and I trust that what I have said may be of assistance to some of you who have to prepare awards as arbitrators or who may have to consider the question of the legality of awards that have been made for or against clients.

COMPETITION NEWS.

BRADFORD.—Mr. Keith D. Young, F.R.I.B.A., the assessor, has now announced his awards in the New Infirmary competition, which are as follows:—First prize, Mr. Wm. A. Pite, London; 2nd prize, Messrs. F. E. Halford & A. E. Cutler, London; 3rd prize, Messrs. Arthur Marshall, P. D. Prior & W. A. Smith, Nottingham.

MANCHESTER.—The City Council, on the advice of Mr. Reginald Blomfield, A.R.A., in conjunction with the City Architect, have selected ten designs prepared by the following competitors to take part in the final competition for the proposed library and art gallery on the Piccadilly site:—Messrs. H. Percy Adams & Charles H. Holden, 28 Woburn Place, Russell Square, London, W.C.; Mr. Robert Atkinson, 2 South Square, Gray's Inn, London, W.C.;

Messrs. Bradshaw & Gass, and Mr. Arthur J. Hope, 1 Silverwell Street, Bolton; Messrs. Cooper & Slater, 13 Richmond Terrace, Blackburn; Messrs. Crouch, Butler & Savage, 39 Newhall Street, Birmingham; Mr. R. Fielding Farrar, 10 Park Row, Leeds; Messrs. A. Graham Henderson & John R. Hacking, 144 St. Vincent Street, Glasgow; Mr. Frank W. Simon, May Buildings, North John Street, Liverpool; Messrs. Warwick & Hall, 13 South Square, Gray's Inn, London, W.C.; Messrs. Thomas Worthington & Son, 4 Brown Street, Manchester.

WALLSEND.—At a meeting of the Wallsend Education Committee on Thursday it was reported that twenty sets of plans for the proposed new elementary school had been received, and on the recommendation of the President of the Royal Institute of British Architects, Mr. A. W. S. Cross, M.A., F.R.I.B.A., of London, had been selected as assessor.

ILLUSTRATIONS.

SONNING, WESTCLIFF-ON-SEA.

THIS house is a fair example of the type of residence that has been built in the London suburb at the mouth of the Thames. The architects were Messrs. Cabuche & Hayward.

A SUMMER COTTAGE.

IT is not easy to reconcile an interior designed in obedience to modern ideas on the heights of rooms, the size of windows, and so on, with an exterior treatment expressing the restful simplicity which is so important a factor in the charm of old cottage architecture. An attempt to do so has been made in the design illustrated, attention being drawn to the points of interest by the suppression of all unnecessary features and a simple grouping of parts. The plans show on the ground floor a large dining and general room, 15 feet by 20 feet; a morning-room, 14 feet 6 inches by 12 feet 9 inches, with roomy kitchen accommodation and offices, and on the first floor one bedroom, 15 feet square, two bedrooms, 13 feet 6 inches square; dressing and bathroom; and a liberal proportion of cupboards. The design is by Mr. M. E. Walker, A.R.I.B.A., and Mr. A. W. Harwood.

A CORONATION FIREPLACE.

THIS mantelpiece is designed for erection in a manor house of Tudor type as a memorial of the Coronation of King George V. As shown in the drawing, the hood and its supports are in oak, with marble slips around the fireplace opening. The design has been prepared by Mr. I. Swinfen Harris, F.R.I.B.A.

DESIGNS FOR STAINED GLASS.

DESIGNS for stained glass by Mr. William Glasby and Mr. Arthur A. Orr are pretty regularly represented in the Architectural Room of the Royal Academy, and the drawings we now reproduce are exhibited there.

THE foundation-stone will shortly be laid of extensions to Bedlington Church. A north aisle or additional nave, 68 feet by 28 feet, with open timber roof, will be built in place of the present apsidal building. The plastered ceiling will be removed, and boarding with moulding, &c. (at a higher level) will be inserted. Gothic windows will be provided in place of the sash windows. Dilapidations throughout will be made good. Vestries (with sliding partitions between them, 15 feet 6 inches by 14 feet and 13 feet 6 inches by 14 feet) and an organ chamber 15 feet by 14 feet will be added to the north of the chancel, and with heating chamber and coal store under. The contract has been let to Messrs. R. & G. Brown of Amble. Mr. A. B. Plummer, F.R.I.B.A., Newcastle, is the architect.

THE Board of Education have informed the Woking Urban District Council of their approval of the plans submitted by the Surrey County Council for a boys' secondary school and technical institute. The secondary school consists of eight classrooms, accommodating 200 boys, masters' room, waiting room, dining room, common room, library. The following rooms are common to the secondary school and technical institute: Assembly hall for 550, physical laboratory for 40, chemical laboratory (with preparation and balance room) for 25, elementary art room for 26, life room for 20, modelling room for 17. The following are to be used exclusively for the purposes of the technical institute: Four classrooms (two for 25 and two for 30), four workshops, masters' room, secretary's office, cloak room and offices, caretakers' rooms on the second floor.

THE HERALDIC YALE OR JALL.

AT a meeting of the Royal Archæological Institute last week in the apartments of the Society of Antiquaries, Burlington House, W., an interesting and exhaustive paper, accompanied by a number of lantern slides, was read by Mr. G. C. Druce, which he called "Notes on the Heraldic Jall or Yale." Of this we are able to give the following greatly condensed report.

It is not often, he said, that so much interest is aroused in a heraldic detail as has lately been the case through the resurrection, if that term may be used, of the heraldic Jall. The animal came to light in the course of researches by Mr. Ernest Law at the Record Office, who found it mentioned in entries of accounts relating to the building of Henry VIII.'s bridge at Hampton Court Palace in 1535-36. One of them, under the heading of "For Makying of Beestes for the Ston Brydge," after recording the payment for six of the beasts, proceeds: "Also paid to Ryed. Rydge (a-foresaid) for lyke cutting, carrying, fienesshing and makynge of VI. beests of the Kyngs and Quenys and jall and Innecome, a dragon, a lyan, a greyhonde, and a pantt' baryng the Kyngs arms and the Quenys standing upon the Kyngs brydge a-foresaid at lyk pryse" (i.e., "26s. the pece"). There are other entries relating to beasts to set upon the fountain in the Inner Court and the garden in which Jalls occur; so that there seem to have been a good many altogether.

The bridge, after having been obscured by the pulling-down of the parapets in 1691 and filling-up the moat, is now open to view again, and new beasts have been set upon it. The Jall may be thus described: It has a head and body resembling a horse, with a goat's beard and large boar's tusks, ringed horns curving backwards and outwards, with coarse corrugations on the top, tufts of hair and spots on the body, cloven hoof, and a tufted tail. The new beast on Hampton Court bridge being presumably a replica of the early heraldic Jalls, takes us back to the fifteenth century—the time when, as far as we know, it started as a heraldic device.

The Garter-stall plate of John Beaufort, Duke of Somerset, at Windsor, shows perhaps the finest representation of a Jall, and is c. 1440 in date. Its body resembles that of a horse, with short-tufted tail, hairy legs, and feet which give no indication of being cloven. It has a fine mane, goat's beard, and large boar's tusks. Its horns extend forward and backward with considerable curvature, and have coarse corrugations. It is covered with large spots. The animal appears (with variations) in the seal of John Beaufort's daughter, Lady Margaret, also in coats of arms over gateways of buildings with which she was connected, such as Christ's College, Cambridge; the judicial seals for the counties of Carmarthen, Cardigan, and Pembroke of the time of Charles I.; as a supporter of the shield of Baron Hunsdon in Westminster Abbey, who died in 1596; and the seal of the Custos, or Master, of Christ's College, Cambridge. The latter shows the Jall lying down; it has a body and head resembling an antelope, with mane and beard. The attitude of the Jall in this seal is the nearest approach to what may be called the ecclesiastical type, i.e., what we should expect to find in church architecture, and which we so find in the case of the heraldic antelope. There is no reason for its entire absence in church sculpture, because the Bestiaries were heavily drawn upon for details in that direction, as may be shown by the medallions on the twelfth-century doorway at Alne (Yorks), and also at Souvigny, in France.

The history of the Jall prior to its introduction into heraldry is somewhat involved. The old Heralds went to the mediæval Bestiaries for their birds and beasts, both for ideas as to their composition and also for their significance in heraldry, which was supplied by the text. Although there does not seem to be any mention of the Jall in any early heraldic treatise, it came from the Bestiary all the same, where it occurs under the Latin name of "Eale." In the recent correspondence on this subject in the *Times* there was some anxiety to derive the English name of "Yale" from an Arabic source, because there happens to be a goat there with a somewhat similar-sounding name. There seems to be no necessity for going so far, for the name "Yale" or "Jall" would appear to be but an anglicised form of the Latin "Eale."

With one small but very important exception the text of all the Latin Bestiaries is substantially the same, and runs thus: "There is a beast which is called Eale, as large as a horse, with a tail like an elephant's, of a black colour, with jaws like a wild boar, and bearing horns unusually long and adapted for compliance with any desired movement. For

they are not stiff, but are moved as the requirements of fighting dictate. Of which the one is extended in front when it fights, and the other is folded back, so that if the point of one gets blunted by any blow the other sharp one is used in its place." Some of the MSS. read "with the jaws of a goat (caprinis)" instead of "with the jaws of a wild boar (aprinis)." This no doubt affected the illustrations, as they were usually done after the text. In the MSS. where the reading is "aprinis" the Eale has no beard, but where it is a "caprinis" it has a goat's beard. The presence of tusks does not appear to coincide with any particular reading.

The heraldic Jalls, when used as supporters, were, of course, much conventionalised; but they are generally horse or antelope-like in shape, and have horns pointing forward and backward. That the horns are more curved than those of the Eale in the Bestiaries is probably due to heraldic requirements. The Heralds may not have liked the long, straight horns sticking out in such an ugly way, and seeing in so many MSS. that the Eale had "jaws like a goat," they not only adapted the goat's beard, but gave it curved and ringed goat's horns as well.

The account of the Eale in the Bestiaries was copied from Pliny's account of the beast in Book VIII., chapter 21. It is as follows: "Among the same people (the Ethiopians) there is also an animal which is called Eale, of the size of a river-horse, with an elephant's tail and of a black or tawny colour, having the jaws of a wild boar and horns more than a cubit in length, moveable (horns) which it raises alternately in fighting, changing their direction so that they sometimes point straight forward, sometimes aslant, as opportunity requires." The author of the Bestiary did not follow Pliny literally by substituting "as large as a horse" for "as large as a river-horse," i.e., a hippopotamus. Perhaps this was done out of consideration for the artists, who would never have seen a hippopotamus.

The question of the identification of Pliny's Eale with any natural beast has been raised. It is suggested that it is the same as the antelope gnu. But to this there are several objections, and it is doubtful whether it can be identified with any living animal at all. In the Chapter 21 quoted above Pliny deals with monstrous forms of animals, many of which were composite beasts. Very probably Pliny considered the Eale as a cross between the hippopotamus he describes in a later chapter and some other large-horned animal.

In addition to beasts of the Jall type, there are those of the antelope type. The heraldic antelope appears both as a supporter and also in ecclesiastical architecture. A seal of Humphry, Duke of Gloucester, dated 1422, shows gorged, antelope-like beasts as supporters, the dexter with good serrated horns pointing backwards, the sinister with what appear to be ringed horns. They have cloven feet and long tufted tails turned over the back. At St. George's Chapel, Windsor, we find these beasts as supporters to the arms of Henry VI. on a boss in the south-choir aisle. They have serrated horns, good tusks, projecting tongues, cloven feet, and are spotted. They are gorged and chained. Their attitude is not graceful, being affected by their confined position in the circular panel. Close by, another of Henry VI.'s beasts appears in window glass; it has a goat's beard and tufts of hair on the body as on the Jalls at Hampton Court, serrated horns which fall over the back, tusks and spots.

The first and most important of the ecclesiastical examples of this type are those in Henry V.'s chantry chapel at Westminster, and about which there has been much discussion. These beasts are, of course, on a different footing to the supporters. They are lying down—a usual, but not universal, attitude. They have serrated horns, pointing backward, cloven feet, tufted tails, and well-defined boar's tusks. One of each pair appears to have its mouth slit further up than the other. They have sashes or banners tied round their necks, with the Fleur-de-lys and Lions of France and England. Other examples occur on the porch of Cirencester Church and on a corbel on the north side of the nave at Tring. There are also good examples on misericords. It is probable that King Henry's beast at Westminster set the fashion for these antelope-like beasts. In all these instances the horns approximate. They are not natural antelope horns, but the horns of the antelope of the Bestiary.

The name in the Latin Bestiaries in Antalops, with variations of spelling. The description is practically common to all, with more or less elaboration of detail. It runs as follows:—"There is an animal which is called antelope of such exceeding swiftness that the hunter cannot possibly approach it. It has moreover long horns after the semblance of a saw, so that it is able to cut down lofty and great trees

and cast them to the ground. But when it is thirsty it goes to the great river Euphrates, and there is a bush which is called in the Greek language heather, having tender and wide-spreading shoots, and it begins to make play with its horns in the bush, and while it plays it catches its horns in the shoots. The hunter, hearing its cry, comes up and kills it. So also art thou, O man, who strivest to be sober and chaste and to live a spiritual life; whose two horns are the two Testaments by which thou wilt be able to cut off and destroy all vices bodily and spiritual. Beware of drunkenness, lest thou be entangled in luxury and vice and be destroyed by the devil."

Ecclesiastical carvings of this story are scarce; but at Manchester there is a misericord which shows the antelope sawing down a tree or possibly with its horn entangled. Upon a bench-end at Sefton (Lancs.) are two antelope-like beasts; the larger one with horns is feeding on a bush, the other skips about behind. At Ripon upon another misericord there are two good antelopes in a very excited state.

Unlike the Eale, it is as yet apparently impossible to carry the history of Antalops back beyond the Bestiaries. Pliny says nothing about it, although he refers to antelope's horns.

The old Heralds adopted the system that was employed in the Bestiaries, but extracted from the story a heraldic instead of a religious or moral signification. Thus Sir Wm. Cummys, who was Lyon King-of-Arms in 1512, in his "*Liber Armorum*," says:—"The antelope is so nimble by his swiftness he is called the flying one, and is right brave, so that no man may overtake him, for his horns are so great and in the manner of a saw which shears and breaks all nets and cuts the great trees. But sometimes it happens that he goes to drink in the flood of the Euphrates, where there is a bush. . . . And this signifies that the knight that bore him was foremost in arms and was strong, light, and virtuous, and of his might, so that evil had no domination above him. And there was neither subtilty nor force where through his enemy might vanquish him; but when he took his nouriture and drinks that was convenient till him, he occupied him to put away from him weak folk and not mighty in which he was so demoralised that he was taken, and then his enemies ran on him without pitie or regard reasonable." This taught the lesson that a brave knight should seek worthy foes or he will degenerate and come to grief.

Taking the points of the two beasts as a whole, there is much in common between the two. Both more or less resemble antelopes; both have boar's tusks, and do not have them; both have spots and no spots, the triple-ended tail is found on both, likewise tufts on the body. The principal difference is in the horns. The heraldic antelope was not intended for a natural beast, quite the contrary. In composing it the Heralds gathered up such details from both Eale and Antalops of the Bestiaries as they thought would make up a beast which would be distinct from any other heraldic beast, antelope or otherwise. The result is that we have a common body with a combination of the horns of Antalops and tusks of Eale. How did the Jall's name drop out so completely? When you concoct a composite beast out of two or more you may be sure that you will not have equal parts of each. Now in the case of the heraldic antelopes the horns are a much more prominent feature than the tusks, and this, coupled with the preconceived ideas of the Heralds that both were antelopes, would cause the antelope element to outdo the Jall element, and they would naturally be called heraldic antelopes. This tendency would further operate against the Jall, for the carvers, not understanding the source of the tusks, got to regard them in many cases as superfluous appendages, and left them out altogether.

Although there does not seem to be anything about the Jall in any heraldic treatise its reputation is clearly established by the correspondence between the Beaufort Garter-stall plate, seals, and the Beaufort arms over the gateway of Christ's College, Cambridge, and the illustrations and text of the Bestiaries; in other words, it is the same as the Eale. As to the antelope-like beasts with tusks such as are in King Henry's Chapel and elsewhere, it may be inferred they have Jall blood in them, and that they got their tusks from that quarter.

THE President of the Royal Society of Antiquaries of Ireland, Dr. Robert Cochrane, I.S.O., F.S.A., F.R.I.B.A., Inspector of Ancient Monuments for Ireland, had the honour to receive, and has accepted, the invitation of the Earl Marshal to be present at the ceremony of His Majesty's Coronation in Westminster Abbey.

THE TESTING OF PAINT AND VARNISH.*

IN giving a paper before a Society like the Paint and Varnish Society, which embraces amongst its members men who make, men who sell, and men who use paints and varnishes, it is most difficult to choose a subject which will appeal to each of the three sections of the trade.

If one treats the subject from a chemist's point of view it would be incomprehensible to the ordinary master painter whilst on the other hand, if looked at from the point of view of the user, it would, to say the least, be uninteresting to the manufacturing chemist. In my remarks this evening I shall endeavour to take the middle course, and my hope is that something in this paper may be found of interest to all present.

It has been said that it is a pity that the master painter was not an analytical chemist so that he can detect the wrong in the materials that come to him—but if he were such he would likely command too high a salary to be content to remain a painter, besides not having the time to devote to analysis in his business.

A great number of the large corporations and railway companies now employ a qualified chemist whose duty it is to draw up specifications for everything used in the paint line, and manufacturers must conform to these, regardless of their own experienced practical painter's opinion.

I consider that the results are no better in these cases, and instances are not wanting where absurdities occur. If the chemist is the painter's assistant then all is very well, but if he is his dictator, he has dangerous power. The chemist's analysis usually can only relate to the small sample before him. The next lot from the same source may be altogether different. He can only determine the percentage of adulteration by dissolving the solids, or by getting at the nature of destructive liquids. So far, so good; but does he look at the sample from the progressive painter's practical point of view? He can tell you what the sample contains, but in most cases knows nothing of what the article will or will not do.

If the users of paint and varnish were to see that they obtained their goods from first-class firms I do not think that they need have much fear but what they get good value for their money. Unfortunately, there are a number of painters and decorators who are always trying to get something for nothing, and their continual cry is "Haven't you got something cheaper?"—and you can hardly blame the manufacturer if he is induced to cater for this demand. What the purchaser seems to lose sight of is that in most cases where he gets the price of an article lowered he also has a reduction in the quality.

I think that a thoroughly experienced painter can safely be left to himself to determine whether an article is good or bad. He must use his five trained senses, namely, sight, feeling, hearing, taste, and smell, and best of all, his common sense. There will be use for all these. There will, of course, be much for him to see. He will also feel under the brush how a paint or varnish works better than anyone else can describe it; he can feel grit in his putty or paint, and if he will rub some on a piece of glass, he will hear it. He can taste linseed oil for purity, and if he detects nothing that way he may smell fish oil and resin oil if he warms it slightly. He may smell benzine in paint and varnish, and by comparing notes on all these things with sober reflection devoid of prejudice, he may be trusted to arrive at a safe conclusion. After all, it does not matter a little bit to him as to what the paint or varnish contains so long as it does what he requires it to do.

Many things are now used in the manufacture of paint and varnish which a few years ago were thought to be detrimental, and only to be used as adulteration. Barytes and resin, I think, are perhaps the chief. To-day these articles are amongst the most useful that a manufacturer has to handle. Science has shown how to use them, and in the case of resin, when properly treated so as to get rid of the free acid, you cannot have a more useful gum. A number of very useful varnishes on the market to-day contain a large percentage of this article, and in Germany especially, even high-class varnishes now depend on resin instead of such gums as kaurie. This has largely been brought about by the introduction of Chinese wood oil, and I am myself to-day making varnishes with this oil which have been proved to stand as well as, if not better than, those made on the old lines; but I am afraid I am getting rather wide of my subject.

Tests for determining the relative merits of painting

* A paper read by Mr. W. F. Nicholson, on June 15, before the Paint and Varnish Society.

materials may naturally be divided under three general heads, namely, chemical, mechanical, and physical.

Chemical Tests.—I have already endeavoured to show that it would not help the master painter if he were able to analyse his paints and varnishes, so that this heading is of interest to the manufacturer only, whose chemists are trained for that purpose. There is no reason, however, why any right young foreman painter, with leisure moments, may not master some useful chemical tests of paints and colours. He will find plenty of these set out in the numerous text books that are published.

Varnish, however, is locked up in its manufacture beyond the reach of chemical dissolution to determine its component parts. Here his sight and sense must come into play as he examines and works it.

Some chemists recommend the polarimeter as a test for the presence of resin oil in varnishes—its high power of right handed rotation contrasting with the inertness of mineral oil and fatty oils shows that, with the exception of croton oil and resinous oil, the only dextro-rotations are produced by sesame and olive oil—all others, including linseed oil, being either inactive or having a slight laevo-rotatory power.

Another instrument used is the refractometer, by the aid of which even small quantities of resin, resin oils, metallic sesquiterpenes, and mineral oil can be detected.

Mechanical Tests.—The skilful painter can make these as well as, if not better, than anyone else. One whose eye, hand, and arm are skilled by use can determine the working qualities of paint and varnish as no one else can. Manufacturers realise the importance of this, and usually employ men in their works, or on the road, a thoroughly practical painter in order to obtain those results for which they seek, for the working qualities must be had whether an article is pure or not.

It is of the utmost importance that wood, iron, steel, and other surfaces to be painted should be in a fit condition to receive the paint, in order to determine the merits or demerits of an article of paint to be used upon it. Atmospheric and other local conditions must also be taken into account.

A mistaken idea seems to prevail amongst some painters that if they put a sample of paint on a piece of tin and leave it to dry, and the paint does not crack on the tin being bent backwards and forwards it must be good. They should know, and everybody else by this time, that any paint will do that while it retains its elasticity. Any paint not mixed with gold size and turps can be bent backwards and forwards on tin without cracking or flaking for some time after it is dry, out of course the longer when mixed with boiled oil, because it retains its elasticity longer.

A good mechanical test is to apply paints side by side on glass to get at their fineness, comparative covering and drying power. Used carefully in the same proportions and held up to the light, the glass will reveal their covering strength, and if the paint will dry there where there is no absorption, it can be relied upon to dry anywhere.

Liquids also applied on glass and allowed to dry will reveal something of their nature, whether brittle or tenacious. I have found glass used in this way to be a valuable aid in looking into the practical nature and worth of materials for the painters' use.

Physical Tests.—By this is meant tests by exposure to the destructive forces of the weather, light, darkness, &c., or to any agencies that paint or varnish must meet with in its use, that tend to shorten its life, such as acids, or alkaline gases and vapours. Comparative tests on small plates of steel are often very unreliable, because a painter can hardly gauge his work fine enough with all kinds of materials, and then unless a separate and clean brush is used for each brand of goods to be tested, the test is worthless.

It is easy to tell whether a paint is waterproof or not, but such tests only settle its ability to exclude water from the outer surface on that which it is intended to protect. Should water enter wood from the back a waterproof paint will blister and peel, while a non-waterproof paint will not. Besides, a paint may be perfectly waterproof when first put on, but it has recently been proved that electricity in the atmosphere has a very great effect on paint, causing it to contract, and leaving very fine pin holes into which the wet eventually finds its way.

I will now endeavour to deal shortly with some of the chief articles used by the painter, and I think perhaps linseed oil could be considered first.

Owing to the present high price of linseed oil, a great variety of substitutes made from mixtures of various oils have been put upon the market. They have a certain field of usefulness in the manufacture of cheap low-class paints

and compositions, but are not to be compared with genuine linseed oil for certainty of drying and durability when applied in the form of paint. I am purposely omitting any remarks on Chinese wood oil, soya bean oil, &c., as these are comparatively new oils, and, being somewhat difficult to handle, are used only by a small number of manufacturers and those who have found out how to manipulate them guard their secrets very closely.

It is well to examine all so-called linseed oils, and to determine their purity; this can be accomplished in several ways.

A simple test is to heat some oil in a glass retort, and if on examination it has become of a greenish tint, it may be assumed that the oil is pure. Another simple test for the presence of resin or mineral oil is to boil a small quantity with an alcoholic solution of caustic potash until it is completely saponified, then pour the solution into water; if the oil is pure a clear mixture will be obtained; if it contains either of the oils named, it will be cloudy and turbid.

The specific gravity of linseed oil is a most useful indication of purity. It may be determined with a hydrometer, or more accurately by means of the specific gravity bottle or chemical balance, or an instrument called Westphal balance. The latter two methods can only be conveniently used by chemists in the laboratory, as the instruments are expensive.

Linseed oil has a specific gravity varying from .930 to .937, according to the different methods of extraction and locality from which it comes. If the gravity is less than .930, adulteration with fish, seed, or mineral oils would be indicated, while if the gravity exceeds .937 then a mixture with resin oil is very likely. Again, boiled oil has a specific gravity averaging about .945; if much heavier than this it is quite likely that resin oil has been mixed with it, while if below .940, then other fatty or mineral oils may be looked for.

(To be continued.)

MANCHESTER SOCIETY OF ARCHITECTS.

THE luxuriant and wooded country of North Cheshire is extraordinarily rich in domestic architecture of that prolific timber-building time, the fifteenth and sixteenth centuries, and has also some interesting examples of a vernacular of church building all its own of the same period. Fine as the half-timbered halls are, the later Georgian halls, of which there are not a few, vie with them in interest and often surpass them in real architectural qualities.

During two visits made last week by the Manchester Society of Architects each type has, as it were, undergone review. On Tuesday Wilmslow was visited. The church has a typical Cheshire tower, and the interior possesses a dignity which seems due largely to the simplicity of the stonework and to the ranges of squareheaded windows with their deep internal splay, as well as to the stateliness of the rood screen by Bodley; this and the rich old roof contrast finely with the crude stonework. Hawthorn Hall, with its multitude of gables and its quaint octagonal turret on the roof, makes a striking group, and some good Georgian panelling and a fine staircase were found inside.

On Saturday Adlington Hall was visited. The older half-timbered portion, forming two sides of the main quadrangle, contains the great hall, with its splendid open timber roof, its huge mullioned windows, and the beautiful eighteenth century organ upon which Handel performed. The organ case and gallery is of exquisite workmanship and design. The later Georgian wing, a vast addition made in 1741, has all the breadth and symmetry of its period, but though the handling of the masses is clever, there is a touch of awkwardness that suggests an amateur rather than a master hand; but even the stiling of the columns of the great portico in a manner which ruins their proportions is to some extent compensated for by the beauty of the colouring, and the smaller stable building, as a piece of formal architectural composition, surpasses the more ambitious hall.

THE EDWARDIAN WALLS AND ELIZABETHAN RAMPARTS OF BERWICK-ON-TWEED.*

BERWICK-ON-TWEED is the best walled town in England, the only stronghold in the United Kingdom with the curtain-and-bastion system of defence, and the sole fortification in the world with the open quadrangular areas known as flankers. The nation is fast realising that the strenuous

* Address given by the Rev. James King, M.A., B.D., at a general meeting of the Northumberland County Association of the National Union of Teachers, held at Berwick-on-Tweed, on June 10.

military episodes in the stirring history of the sister kingdoms of England and Scotland may largely be found written in her decaying walls and famous ramparts; causing Berwick to take rank as one of the most interesting towns of the land. The colossal fortifications are the outcome of the Scottish wars of independence, the religious upheaval of the Reformation, the Jacobite rising of 1745, and the threatened invasion of the French in 1804. The illustrious personages, therefore, who caused the town to assume its present form were David I., the most pious and the most beloved of the long line of Scottish kings; Edward I. of England, the greatest royal statesman, and mightiest of the Plantagenet dynasty; Mary Stuart, Queen of Scots, the ill-fated rival of Queen Elizabeth; Charles Edward Stuart, the Bonnie Prince Charlie of Jacobite song; Napoleon Buonaparte, the world's greatest warrior, and the dread of Europe for twenty years. The proud words of the Hebrew bard—"walk about Zion and go round about her, tell the towers thereof, mark ye well her bulwarks, consider her palaces that ye may tell it to the generation following"—are peculiarly appropriate to this ancient fortress, which more closely resembles Jerusalem than any other place in the kingdom. The town is hoary with the age of eight centuries, being first mentioned about the time of the Norman Conquest. In Saxon times the territory of Bernicia extended from the Tyne to the Forth; and for 400 years Bamburgh continued to be the royal capital of this extensive district. About fifty years before the Norman Conquest, namely, in 1018, Malcolm II., the Scottish king, gained a victory at Carham over Eadulph, Earl of Northumberland, and, according to a treaty made after the battle, the Merse and Teviotdale were assigned to Scotland, and the River Tweed became the southern boundary of the Scottish nation; and, amid all the changes and vicissitudes of time, this noble stream, extending from Carham to Berwick, has continued to be the dividing line between the sister kingdoms for 900 years. The castles of Wark, Norham, Bamburgh, &c., soon rose to be fortresses on the south side of the river, while Berwick first emerges from the darkness as a boundary town on the north bank, with a stronghold on Castle Hill, a spot subsequently much noted in the history of the two nations. The Norman Conquest of 1066 affected the history of Scotland, for when the Saxon struggle for freedom ceased by the onward victorious march of the Conqueror many Saxons took refuge in Scotland. Among them was Edgar Atheling, heir of the Saxon dynasty, together with his mother, Agatha, and his royal sisters, Margaret and Clementina. Malcolm III., known as Malcolm Canmore, welcomed the royal exiles to his palace at Dunfermline, and becoming enamoured of the princess Margaret took her to wife, thus knitting together in closer friendship the Saxons and the Scots. All historians bear testimony to her exalted character. Freeman says:—"It was a good day for Malcolm and for Scotland when she became Queen, for she was the mirror of wives, mothers, and queens, and none ever more worthily earned the honours of saintship;" while Skene testifies "there is, perhaps, no more beautiful character recorded in history than that of Margaret." She was afterwards canonised, and St. Margaret became the female patron saint of Scotland. King David I. was her son, and seems to have inherited both the piety of his mother and the generous spirit of his father. In youth, he spent many years at the English court of Henry I., who had married his sister, Matilda, a circumstance that had a refining influence on his character, and brought him into contact with many Norman nobles. He thus became acquainted with St. Bernard of Clairvaux, a most saintly man, and the prince of monastic hymn writers, who earnestly proclaimed the high honour and deep devotion that ought to be paid to the Blessed Virgin Mary. David was much impressed with his teaching, and on his becoming Prince of Lothian he built a church near his royal residence at Berwick and dedicated it to St. Mary; probably the first sanctuary dedicated to her in the north, and still represented by St. Mary's Church in Castlegate. He became King of Scotland in 1124, and his long, prosperous reign extended over nearly thirty years. Like his Hebrew namesake, David, the sweet singer of Israel, he had an ardent desire to worship God in the beauty of holiness by building religious edifices throughout his kingdom. Thus, in this district, the grand old abbeys of Jedburgh, Kelso, Melrose, and Dryburgh, the decaying ruins of which are now the chief glory of the Scottish Borders, were founded in his reign and dedicated to the Virgin Mary. From David's reign, Berwick continued to grow in size and importance for 150 years, and attained to such high commercial prosperity that it was accounted the greatest merchant city of the north. With the accession of Edward I., however, dark days

were in store for Berwick. In 1286 Alexander III., while riding in the dark on the rocky shore of Fife, his horse stumbled, and he himself was thrown over a cliff and killed on the spot. The heiress to the throne was his granddaughter, Margaret, who was married to Eric, King of Norway, and known as the Maid of Norway. On her sudden death in 1290 there sprang up twelve claimants for the Scottish throne; and Edward I. of England was appointed arbiter, and heard their claims on the haugh by Tweedsid opposite Norham Castle. Subsequent meetings were held at Norham church and the Dominican chapel by Berwick Castle. The ambitious king made the competitors take an oath that they would acknowledge him as feudal superior or overlord of Scotland. At length John Balliol and Robert Bruce were selected as the most eligible candidates, and were accordingly summoned to the final meeting, held in November 1292, in the great hall of Berwick Castle, where with royal pomp and in the presence of the Scottish parliament and the aristocracy of the two kingdoms Edward gave his decision in favour of John Balliol. No such scene of royal splendour has since been witnessed in Berwick, and no meeting has produced such momentous issues on the welfare of the town and the destinies of the Scottish nation. Balliol did homage to Edward as his vassal "for the whole kingdom of Scotland," but after an inglorious reign of four years, being highly indignant at the repeated arrogance of his Lord Superior, he determined to withdraw his allegiance, and aid his subjects in throwing off the English yoke. On hearing of Balliol's defiance, Edward, in great rage, thundered—"The felon fool! If he will not come to us, we will go to him;" and forthwith, with a large army, marched northwards to punish the rebellious Scots. In March 1296 he besieged Berwick-on-Tweed, then the greatest sea-port in Britain, and the "Alexandria of the North." The defences of the town on the land side consisted of merely a stockade and a ditch so low and narrow that Edward leaped over both on his horse, Bayard, and, full of fury, entered the town at the head of his army, and, according to tradition, butchered 8,000 of the unresisting citizens. A terrible blow was inflicted on the place, and Green, the historian, says:—"The town was ruined for ever, and the greatest merchant city of northern Britain sank from that time into a petty seaport." For the defence of the town Edward determined to dig a deep and wide fosse around its eighty feet broad and forty feet deep. Balliol made an object submission, resigned his crown, and was sent prisoner to the Tower of London. The English king then took possession of the Scottish castles, swept over the country with his plundering forces, and carried back with him to England the crown, the sceptre, and the famous Lia Fail, or "stone of destiny," on which for four centuries the kings of Scotland had been crowned in the abbey church of Scone. This ancient relic was sent to Westminster Abbey and fitted into a chair, which has ever since been used as the Coronation chair of the kings of England. For ten years, from 1296 to 1306, there was no Scottish king, although a seven years' conflict was waged against the revolting Scots under William Wallace; and it was at this period that Edward constructed the fosse, vallum, and defensive walls of Berwick, his mightiest stronghold in the north. The king was not only a successful conqueror, but also a shrewd statesman, and historians regard him as the mightiest of the Plantagenets. His treatment of Wallace is, however, a blot on his memory, for that patriot was barbarously put to death, his head fixed on London Bridge, his body divided into four quarters, which were sent to be exhibited in Berwick, Newcastle, Perth, and Stirling.

In March 1306 Robert Bruce, Earl of Carrick, was crowned King of Scotland. The crown was placed on his head by the Countess of Buchan, for which offence she was afterwards exposed in an iron cage on the walls of Berwick Castle. Edward swore to take vengeance upon Bruce, and, marching in haste northwards with a large army to ravage the patrimony of Bruce, and take vengeance on the rebels, he died suddenly at Burgh-by-Sands on Solway Water, within sight of Scotland, on July 3, 1307. Edward II., son and successor, was a weak, frivolous prince, with none of his father's mettle. Bruce was almost everywhere successful; but twice he attempted to take Berwick without success. Here the king assembled an enormous army of a hundred thousand men, who lodged in tents in the fields outside the town, and on a bright morning in June 1314 marched out of Berwick in battle array; but a few days after, this mighty force, through the consummate skill of Bruce, was completely defeated at the battle of Bannockburn. Edward rode with speed to Dunbar without halting, and thence took ship to Berwick, which continued to remain in the hands of the

English. It appears from the Lanercost chronicle that in 1166, two years after the battle, King Robert Bruce, with Scottish army, approached Berwick and attacked the town on the river side between the Bridge House and the Castle, where the walls were not yet built; from which statement it is evident that the masses of masonry on the steep bank overlooking the Tweed were not the work of Edward I. Two years later, in 1318, the Scots successfully attacked the town, and Bruce resolved to preserve Berwick as his chief border fortress, and for its better defence strengthened and heightened the Edwardian walls. He probably also built the walls on the river bank, large decaying fragments of which still exist. The accession of Edward III. to the throne of England was the harbinger of a dark era for Berwick.

Bruce died at Cardross in 1329, and was buried at Dunfermline, while his heart was laid to rest before the high altar of Melrose Abbey. His son, David II., was only a child, and Edward Balliol, son of John Balliol, claimed the throne, and, his claim being supported by Edward III., an English army moved northwards to attack Berwick. The Scots met them at Halidon Hill, near the town, but, rashly attacking them on a rising ground, were completely defeated in July 1333. Edward, greatly elated with the victory, devoted 20l. a year to the Cistercian Nunnery of St. Leonards at the bottom of the hill. After the battle the town capitulated, and the Earl of March, keeper of the castle, took the oath of fealty to Edward, and was received into royal favour. Henceforth Berwick virtually became a permanent possession of England. Throughout his long and prosperous reign, extending over half a century (1327-1377), Edward III., distinguished as a great military monarch, regarded Berwick as his chief fortress in the north, and much time was devoted to the extension and strengthening of its fortifications. The water tower by the Tweed, and fragments of strong masonry, lately exhumed by the old post office, probably belong to his period. For more than a century the history of the town is of little importance, but it again rises in fame as a border fortress on the accession of the stately Tudor dynasty.

A minute survey of the old walls was made in the reign of Henry VIII. in 1545, and a report, made in 1547, shows that they were much in need of repair, and during the six years of Edward VI.'s reign vast sums were spent on the fortifications, and the restoration was carried on also in Queen Mary's reign. On the accession of Queen Elizabeth in 1558 the work was pursued with renewed vigour, for the following reasons:—The Pope had opposed the divorce of Katharine of Arragon from Henry VIII., and the King's marriage with Anne Boleyn was declared to be null and void. Elizabeth, the offspring of the forbidden wedding, was proclaimed by the Pope to be illegitimate, and Mary Stuart, Queen of Scots, was recognised as having a valid claim to the English throne. Mary, therefore, assumed the title of Queen of England, and Elizabeth, on hearing of this, became greatly alarmed. Engineers and workmen were forthwith despatched to Berwick to carry on with renewed energy the strengthening of the fortifications. After carrying on the work for two years the engineers came to the conclusion that the effectual restoration of the decaying walls, extending as they did two-and-a-half miles, was too gigantic a task, and as the northern part of the town (now St. Mary's parish) was sparsely peopled, they suggested to Elizabeth's government that the old Edwardian walls should be abandoned, and a new system of fortifications introduced, enclosing a smaller enceinte than formerly. The suggestion received royal sanction, and two Italian civil engineers were sent to Berwick to view the situation, and help in determining the circuit of the proposed defensive works. The abandoned walls must have furnished an enormous amount of stonework for building purposes, for they extended for two-and-a-half miles, were 22 feet high, and strengthened by nineteen towers. The Edwardian masonry was entirely composed of sandstone of various tints, from deep red to pure white; and much of the sandstone ashlar stonework found in the present masonry probably belonged originally to the Edwardian masonry, such as the stones of the masonry of the eight flankers, &c. The new fortifications, known as Queen Elizabeth's ramparts, were carried on with much vigour, for there existed great dread of a national revolution in consequence of the Reformation, which caused a change of religion from Roman Catholicism to Protestantism. The Italian system of fortification, known also as the "bastion-and-curtain system," was adopted, and the work completed in the course of six years—from 1560 to 1566. A bastion is a projecting pentagonal fort at the corner of a rampart, with two sides, called faces, opposite the enemy, and two sides, called flanks, facing the fosse. The small bastions of Verona,

built in 1523 A.D., are regarded as the oldest extant. The name curtain is applied to that part of the ramparts between two bastions, and is derived from Latin—*cortina*, a court, and is so named because it forms with the flanks of the bastions a kind of court or enclosed space. In Berwick the exterior masonry of the curtain wall has now a pronounced slope or batter. The masonry is good, well jointed ashlar work, and, having been renovated from time to time, is now in good condition, and shows little symptom of decay. The Berwick ramparts consist of three bastions, two demi-bastions, a shallow fosse, and a strong curtain wall, backed and surmounted by a huge earthen mound. The terminal bastion, facing the Tweed, is called Meg's Mount, perhaps named in honour of St. Margaret, Scotia's favourite queen, or from the Greek—*mega*, big, as in Mons Meg, a big gun in Edinburgh Castle. The Middle Mount Bastion, facing northwards, is mid-way between Meg's Mount and the Brass Mount. It is called the Cumberland Bastion, probably from the Duke of Cumberland, who defeated Prince Charlie at Culloden in 1745. The Windmill Bastion, fronting the sea near the barracks, is in excellent condition, mounted with guns, and used as a practising battery by the Militia. The King's Mount, facing the cricket field, the terminal bastion on the seaward side, was formerly called Hunsdon's Mount, from Lord Hunsdon, cousin to Queen Elizabeth, and Governor of Berwick when the fortifications were made. Vauban, Marshal of France under Louis Quatorze, was one of the world's greatest military engineers, regarded as the highest authority in the science of fortification. The Berwick walls were completed a century before he reached the summit of his fame, although they bear a striking resemblance to his system, the Italian method known as the "curtain-and-bastion" system. In the pursuit of his studies he probably visited Berwick, the only bastioned town in the kingdom, the defences of which were reared under Italian engineers about one hundred years before Vauban published his great work on fortification. Flankers is a local name applied to the open quadrangular areas found in the Berwick ramparts at the corners where the bastions approach the curtain wall. They, however, find no place in his methods, and the question arises for what purpose were they constructed in our walls. With the exception of the Italian towns of Lucca and Verona, which possess somewhat analogous open areas, the flankers of Berwick are unique, and ought to be regarded with special interest. James I., Charles I., and Cromwell visited Berwick, and showed much interest in her walls. The barracks were built after the first Jacobite rising in 1715, and the Town Hall after the second Jacobite rising of 1745 under Bonnie Prince Charlie. William Temple, the then Mayor, was grandfather of the late Archbishop Temple. From 1761 to 1770 the walls were almost completely rebuilt, including the quay walls and gates, together with the saluting battery. During the French revolution the flankers were converted into batteries, and the present pier was finished in 1821.

The famous towns of antiquity were often built on hills for defensive purposes, and further fortified by encompassing walls. "O thrice and four times happy they who had the good fortune to die before the lofty walls of Troy." Ancient Athens reached its highest glory under the famous Pericles, who built its Long Walls; and of the eternal city of Rome Cassius exclaims: "When could they say that talked of Rome that her wide walls encompassed but one man?"—while the colossal fortifications of the Holy City are the theme of the lofty language of the Hebrew bards—"Pray for the peace of Jerusalem: they shall prosper that love thee; peace be within thy walls, and prosperity within thy palaces." The view of the eastern wall of Jerusalem, facing the Mount of Olives, as seen from the Garden of Gethsemane in the Kedron valley, greatly resembles the view of Berwick's lofty ramparts as they appear from the valley of the Tweed. No hills stand around our borough, but encompassed as it is by Tweed's fair stream and the blue waters of the ocean, "this precious gem set in a silver sea" is beautiful for situation; and begirt as it is by the crumbling Edwardian walls and the colossal Elizabethan fortifications, Berwick-on-Tweed can boast of being the best-walled town in the United Kingdom.

THE Bishop of Exeter recently consecrated the Lady-chapel built from plans by Mr. W. D. Caroe of a new church at Stoke Damarel, Devonport. The Lady-chapel is the first section erected of the church, and with it are included two large vestries and a sacristy. This section has cost about 5,000l.

German Friendship.

SIR,—In connection with the Annual Conference of the Institution of Gas Engineers, now being held at Glasgow, an exceedingly pleasing incident at the luncheon in the City Chambers, over which the Lord Provost, the Hon. A. McInnes Shaw, presided, was the presentation of a beautifully designed and mounted president's hammer and striking board, sent by the German Association of Gas and Water Engineers, with a letter, of which the following is a translation.

The gift was received with great appreciation, and was suitably acknowledged.

The President and Council of the Institution would feel very glad if, by your courtesy, the letter could be inserted in your next issue.—Yours faithfully,

WALTER T. DUNN,

Glasgow and West of Scotland Secretary.

Technical College, Glasgow:

June 14, 1911.

COPY OF LETTER.

GERMAN ASSOCIATION OF GAS AND WATER ENGINEERS,
Karlsruhe, June 7, 1911.

Mr. Alexander Wilson, President,

The Institution of Gas Engineers, Glasgow.

At the end of the Institution year, the German Association of Gas and Water Engineers remembers with pleasure and gratitude the visit made by eighty of its members to the British Brother Association—the Institution of Gas Engineers—in October 1910.

We have acquired valuable knowledge in the department of our professional activity from the brilliantly conducted gasworks of London, Edinburgh, and Glasgow, which take a high rank in technical efficiency. The days we were together showed us how strong were the feelings of friendly relationship between our two great technical societies, and they emphasised also the friendly relationship between the citizens of our two great nations. We separated with the firm resolve to contribute our part to the further exchange of technical knowledge and to the ever-growing good understanding between our nations.

At festive gatherings we have become acquainted with the British custom of striking the table with a hammer to call for silence for the expression of serious, festive, friendly, or humorous ideas. So when we endeavour to give formal expression of our thanks for all the kindness offered us by the Institution of Gas Engineers by sending a president's hammer with plate, made by the Karlsruhe artist, Professor Hoffacker, it is our wish that the hammer may always secure attention for words that will contribute to the peaceful greatness of the nation, to the advance of our great gas industry, which is a benefit to all, and will also awaken the recollection of friendly relations with our German Association of Gas and Water Engineers. We request you, Mr. Alexander Wilson, the esteemed President of the Institution, to accept this offering and to hand it to the Institution of Gas Engineers at their meeting, along with our greetings and our sincere thanks.

By order of

The German Association of Gas and Water Engineers,
the Committee of Management.

(Signed) H. PRENGER, President.

HANS BUNTE, Honorary Member of Committee.
KARL BUNTE, General Secretary.

Old-Time "Travellers' Rests."

SIR,—Your correspondent "Wayfarer" has roused in me no little vexed interest, for in his letter which appeared in your last issue he gives a detailed account of an old "Travellers' Rest" on the Worthing to Arundel road capable of seating eight or nine persons. Now, I consider myself on the strength of a twenty-odd years' acquaintance fairly intimate with this corner of West Sussex; but that small, round building in a turning off the main road has hitherto eluded me. And not only myself, but other people also, who often use that delightful road from Arundel to Worthing, are equally unable to say at what point along those ten or twelve miles it is to be found. One shelter along it I certainly know. It is about mid-way, and stands picturesquely just up a side road, but within view of the main highway. This, however, is more old-time in suggestion than in fact. The cross on the apex of the wooden roof, together with the

shield bearing a mutilated cross on the outside of a cross timber, give it something of a mediæval look, though it is a spurious one. For here is the inscription:—"In thankful memory of the recovery from a serious illness in the soft Worthing air of one who was too (good) for this world, and had no greater fault. This shelter was placed here in 1884." (The curious adjective is clearly decipherable, though erased.) The straight bench would be incapable of accommodating more than four people, and the roof is not umbrella shaped like that described by "Wayfarer," but pointed. It certainly bears one resemblance, viz. the number of names and dates which have been foolishly inscribed on it. There are a good sprinkling of travellers' rests along the road in question, but they bear such names as "The Horse and Groom," "The Fox" (this surely commemorates a unique occasion when the Horsham and Crawley Hounds actually discovered a fox in this part of their country), "The Woodcutter's Arms," and so on. However, the existence of these and their like in such numbers all over Great Britain has removed the necessity for and alas! destroyed the love of Old-Time "Travellers' Rests."—Yours sincerely,
June 18, 1911. WEST SUSSEX.

SIR,—I feel much interested in "Wayfarer's" letter in to-day's *Architect*, because it was only last Sunday, in a drive from Mundon to Cold Norton (two little villages in the south of Essex) that I came across one of these seats upon which is carved "Rest and be thankful." It was rather gruesome, though, for it was placed round an old dead tree, with its withered extending branches, making a remarkable contrast to the beautifully foliaged trees all round. It stands in the middle of four cross roads, and this tree is the old gibbet. It struck me as being rather funny to invite people to sit under the branches of this gruesome thing, and "Rest and be thankful." One almost wonders if the poor gibbeted creatures were invited to be "thankful" for the ignoble rest into which they were so suddenly hurled.—Yours faithfully, ANOTHER WAYFARER.

Garden Suburbs: A Warning.

SIR,—As a member of the Garden Cities and Town Planning Association and a strong supporter of the Town Planning movement, I should like to point out a great danger into which those may fall who are in other respects so ably contributing to the realisation in practice of Mr. Howard's ideals.

If we are not very careful, the rush of modern business—I mean the tendency of the modern man to rush a thing through—will take us by the scruff of the neck and dump us into the pit of disaster. We must exercise great caution in dealing with our land, lest the development of it result in a mere jumble of well-planned and well-built houses. A thoughtless and hurried mixture of units, however well designed in themselves, will only produce a feeling of restlessness and destroy the dignity of the whole. Unless care and thought is given to the relation of each particular unit to the whole, the result will be a botch. Let us work as business men, but let us not allow consideration, care, and the sense of fitness to lapse totally into oblivion.—Yours, &c.
O. NEWBOLD.

The Passing of the Jerry Builder.

SIR,—Will you permit me to take a liberty with Shakespeare?

I come to bury Jerry, not to praise him,
The evil that men do lives after them;
The good is oft interred with their bones;
So let it be with Jerry. . . .

There is many a Brutus ready to prove his own virtues by pointing out Jerry's grievous faults; and grievously hath Jerry been punished.

(For Brutus is an honourable man,
So are they all, all honourable men.)

It is easy, certainly it is respectable, to hold the jerry-builder up to scorn, to paint him as a thieving incompetent, as a gross octopus whose tentacles squeezed out the artistic life of craftsmanship. Sir, he was no worse than a mirror of the times, an answer to contemporary demands, a man trying like you and I to make a livelihood (even to establish a competence), and often and often did he sorely fail. His line of least resistance towards success was to give the public what they were accustomed to, and what they seemed to want. His percentage of profit was usually too meagre to allow an architect to have a slice. The jerry builder needed education, so did we all. The builder needs it still, so do we.—Yours,
H. F.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000*l.* Prizes of 1,050*l.*, 700*l.* and 440*l.* will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

BRADFORD.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith Young, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.*, which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2*l.* 2*s.*, which will be refunded on receipt of a bona-fide design or if the particulars are returned within fourteen days of receipt. Mr. Geo. Sutton, town clerk, 10 Hay Lane, Coventry. (For further particulars see advertisement, November 18.)

DEPTFORD.—Jan. 18.—The Deptford Borough Council invite architects practising in the City or County of London who are willing to submit designs for the Deptford Central Library, to send not later than Jan. 18, particulars of similar work carried out by them. Premiums of 50*l.*, 30*l.*, and 20*l.* will be awarded in the subsequent competition among twelve selected architects. Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross Road, S.E. (For further particulars see advertisement, Jan. 6.)

THE LATE JOHN HOWARD COLLS.

THE news of the death of Mr. Howard Colls, on the 29th ult., at Buenos Aires, will be received with deep regret by a very large number of our readers. His prominent activity, not only as one of the foremost and best respected contractors of the City of London, but in charitable work, in the political circles and social life of architecture and building, made him well known not only to his friendly rivals in the building trade, but to a large number of architects and surveyors. He was a beneficent friend of all the charitable societies connected with the building trade as well as of others outside that sphere, and his connection with these societies took the form not only of patronage but of hard personal work and organisation. Hence everybody knew Howard Colls, and had for him the sincerest good feeling and affection.

Mr. Colls conferred a great benefit on architecture and building by the decision on the law of ancient lights that he obtained in the House of Lords, after a protracted and expensive series of law suits, in the case of *The Home and Colonial Stores v. Colls*, a decision that has rendered this the leading case on the subject. The benefit thus conferred was recognised by the presentation to Mr. Colls of his portrait, painted by Sir W. Q. Orchardson, R.A., which is now exhibited in the winter exhibition of the Royal Academy.

The following is a list of the various institutions with which the late Mr. Howard Colls was connected:—Joint chairman of the firm of George Trollope & Sons and Colls & Sons, Ltd., director of the Builders' Accident Insurance Company, director of Hobbs, Hart & Co., Ltd., Associated Member of the Institute of Civil Engineers, member of the Tariff Commission since its inception, member of the following City Companies: Carpenters' Company, Fishmongers' Company, Gold and Silver Wyre Drawers' Company.

President of the Institute of Builders 1887 and 1888, president of the London Master Builders' Association 1890 and 1891, trustee of the London Master Builders' Association Reserve Fund since 1902, president of the Builders' Benevolent Institution 1888, treasurer of the Builders' Benevolent Institution since 1899, trustee of the Builders' Benevolent Institution since 1899, president of the National Federation of Building Trades Employers of Great Britain and Ireland 1889 and 1890, president of the Builders' Clerks' Benevolent Institution 1883, member of the Coleman Street Ward Club since 1877 (hon. secretary for over 30 years and treasurer since 1904), on the committee of the Evelina Hospital, president of the Camberwell and Dulwich Pension Society, and president of the North Camberwell Conservative Association.

THE REGISTRATION OF PLUMBERS.

THE Board of Trade, under the powers enabling the Board to allow the registration of special trade marks where the Board deem it to be to the public advantage, have granted to the Worshipful Company of Plumbers the registration of a *standardisation* trade mark to be used in connection with the work of registered plumbers.

The regulations prescribed by the Board for the use of the mark provide that it shall be used as far as admissible in connection with water pipes and fittings complying with the standard specifications of the Incorporated Joint Committee on Water Regulations.

Certificates issued by the Company to plumbers desiring to execute orders for marked work contain the following chief conditions:—

(1) The plumbers authorised to mark the work in manner prescribed by the Company shall be registered under the provisions in force for the national registration of plumbers.

(2) The certificates shall be renewable annually and shall not be assignable.

(3) The holder of the certificate, or, if he be an employer, his authorised employé, shall be responsible for the soundness and efficiency of the work executed.

(4) The certificate is liable to cancellation in default of the holder's compliance with the conditions.

The names and addresses of registered plumbers holding certificates for the current year are required to be notified to the Board of Trade.

The Worshipful Company of Plumbers have issued the following notice as to employment of registered plumbers:—

The health and water authorities and the architectural and medical professions of the United Kingdom have approved and aided in establishing the national registration of plumbers in the interests of the public health and welfare.

The registration is carried out by the Worshipful Company of Plumbers, acting through London and Provincial Councils composed of the representatives of the master and operative plumbers and the architects, engineers, and other officially and professionally concerned in the specification and regulation of plumbers' work.

Every registered plumber is required to produce, when desired, a certificate of his registration, bearing the number thereof and the date of the current year, if produced *after* March, or the date of the previous year if produced *before* March in any year.

Every registered plumber is liable to the cancellation or suspension of the certificate entitling him to describe himself, or to work, as a "registered plumber" in the event of his doing any act which is found upon inquiry to be contrary to the integrity of the trade or injurious to the public.

Any person employing a registered plumber, or having work carried out for him by a registered plumber, who has cause to complain of the work executed by such plumber, is entitled to require such complaint to be investigated by the Company, and the result of the investigation to be reported to him, provided the complaint be made in writing and includes the following preliminary particulars:—

(1) The nature of the contract, agreement, or arrangement under which the registered plumber was employed.

(2) The name and address or registered number of the plumber.

(3) The nature of the work he was employed to carry out—*i.e.* whether connected with hot or cold water service, bath, lavatory, or other appliance, and whether new or repairing work.

(4) The nature of the defects found in the work complained of—*i.e.* whether in respect of sanitary efficiency, soundness, suitability, or otherwise.

(5) It should be further stated whether the complainant would be prepared to pay such expenses as might be arranged for making an examination of the work in the event of the Company considering these preliminary particulars rendered such examination or further inquiry necessary or desirable, it being understood that in the event of the Company finding the complaints to be justified any expenses incurred in examining the work would be borne by the Company or recouped to the complainant by the Company.

Description of the Mark.—The figure of St. Michael the Archangel, which forms the crest of the Plumbers' Company, typifies the Destroyer of Evil, to represent the work and aims of the Company.

Note.—The space above the figure is provided to receive the number of the registered plumber who executes the work which is intended to be marked with the Company's standardisation mark, and also the letters R.P. (signifying "Registered Plumber") and an alphabetical letter signifying entry in the register kept by the Company under regulations prescribed by the Board of Trade.

MESSRS. F. BOREHAM & SON, architects, of 73 and 75 Finsbury Pavement, have taken into partnership Mr. Alfred Gladding, A.R.I.B.A., of Birmingham, and the firm will in future practise at the same address under the title of F. Boreham, Son & Gladding.

In the concluding article on "Petrol Air-Gas" by Professor C. A. M. Smith, which appeared in our issue of December 30, a printer's error occurred in the paragraph on page 426 dealing with the author's opinions as to the best systems. The sentence in question should read:—"While not in any way disparaging as bad many other systems, we should give preference to either a plant made by the Safety Light Company, the National Air-Gas Company, or the 'Solux' plant made in Edinburgh."

RUISLIP MANOR TOWN PLANNING COMPETITION.

Précis of Report accompanying Second Premiated Design by
Mr. GEORGE HORNBLOWER, F.R.I.B.A.

OPEN spaces are provided for both use and effect, whilst large playing-fields suitable for cricket, football, &c., are in proximity to the smaller houses, and open playgrounds where children will be within view of the houses. Adequate grounds are shown for croquet, tennis, bowls, &c., adjoining the sites for large houses.

It is felt that the retention of large, unpoliced areas of woodland is undesirable, and likely to be a nuisance at holiday times. The alternative was consequently adopted of devoting the woodland areas to larger houses on larger plots, where the bulk of the trees might be saved to preserve the character. Where land can be had on terms so favourable, plots 150 feet in depth can be afforded even to smaller houses, and none are shown less in depth.

Comparatively little planting would be necessary along the roads; large plots of the site have well-grown timber which would be preserved.

Part of the Copse Wood area, owing to the small stream which traverses it and becomes swollen in winter, is unfit to build upon. A small park or ornamental garden is provided here. Considerable areas on either side of the River Pinn, and also on either side of the smaller stream near Northolt Junction are liable to be flooded. These areas, with other land adjoining, are set apart as open spaces. The River Pinn is a considerable stream with the banks in parts prettily wooded, and would form an attractive feature in the park where, by an enlargement, a lake could be formed as suggested.

The character of the higher ground, owing to undulations and beautiful timbering, should render it very attractive to people of means, and a strong effort should be made to keep the building plots large. Obviously more plots than shown could be arranged without altering the scheme.

The factories and workshops are placed at the lower end of the site. The design of such buildings is being more and more studied, and it is felt they need not be inartistic. Instances could readily be cited of both old as well as new which are suitable additions to the appearance of a town. Generally, however, they would especially need to be controlled as to design and treatment.

Economy in road formation has been a principal consideration, as the following table shows:—

	Acres.
Area devoted to building plots	994
Area devoted to open spaces	137*
Area devoted to roads	145
Approximate total area	1,276

The roads are planned as far as possible to run north and south, the departure where a diagonal treatment gives direct access to Ruislip making the laying-out interesting as well as useful. Convenience of access to all parts of the estate has been well considered, and, as a means of transit, electric tramways are suggested along the main roads.

The sites for places of worship are provided where due quiet should be secured. Shopping and business centres are arranged in central positions, including a desirable one for the Copse Wood area. Motor garages are needed in three or four places, and suitable positions are indicated. Sites for public buildings, clubs, &c., are shown for convenience of access near the main avenue and suggested tramways, and the suggested positions for schools have been carefully considered.

Though it is quite possible to develop the estate without having recourse to a scheme under the Housing and Town Planning Act, a scheme under the Act is recommended.

MESSRS. SPRAGUE & CO., LTD., the lithographers, have issued the forty-second annual edition of their neat pocket diary. The new matter includes a list of the officers and fixtures of the Royal Institute, and of other societies connected with the architectural profession. This diary has long been favourably known for its usefulness.

MR. HOWARD CHATFIELD CLARKE asks us to note that through the action of the authorities in amalgamating Bishopsgate Street Within with Bishopsgate Street Without (to be known as Bishopsgate) his address has now been altered to No. 102 Bishopsgate, E.C.

* As already explained in regard to open spaces, where trees occur large plots are allotted to superior houses.

DIARIES, REFERENCE BOOKS AND YEAR BOOKS.

MESSRS. HUDSON & KEARNS, LTD., have sent us four of their general and professional diaries, viz.:—No. 9, which is for universal use, and gives two days to each page; No. 11, *The Builder's Diary*, which incorporates No. 9 with several extra sections and a considerable amount of trade information and tables; No. 12, *The Architect's Diary*, has a whole page to each day, but the size is not increased, as the tables, &c., are omitted from the end, though the opening 205 pages are intact; No. 13, *The Architect's Diary*, is the bulkiest, because two pages are devoted to each day's diary of appointments, details of business transacted, and cash columns. The diaries of Messrs. Hudson & Kearns have become by now as indispensable in many offices as their blotting pads, and their non-appearance at the opening of a new year would produce dismay.

Who's Who (A. & C. Black) grows year by year in size and in importance. The terse introductory note does not indicate how many fascinating thumb-nail biographies are included, but we should venture to estimate the number at twenty thousand. If the best study of mankind is man, *Who's Who* should prove an invaluable text-book; for the skeleton outline given of many eminent careers is ample food for thought. The architectural profession appears to be fairly well represented, though some few names are omitted which would be of great interest. Perhaps these gentlemen's modesty prevented their inclusion. The book is too well known to need further comment. From the same publishers come *The Englishwoman's Year-book and Directory* and *The Writers' and Artists' Year-book*. The former is a mine of information and instruction concerning the careers open to women, and the multitudinous interests which affect them. The latter is a guiding hand to aspiring writers.

Whitaker's Almanack has seen many rivals appear during the forty-three years of its existence, but it has not yet been ousted out of its front-rank position, nor is it likely to be. From cover to cover it runs to practically a thousand pages, and of the 850 odd devoted to editorial matter it may be said that not an inch is wasted. The type is necessarily small to allow of the requisite amount of material, and the letter-press is succinct for the same reason. But both are clear and eminently readable. Regarded as value for half a crown, it is nothing short of wonderful. As a complement to the *Almanack* we can equally praise *Whitaker's Peerage*, which has reached its fifteenth annual issue.

COMPETITION NEWS.

BERNE.—The Secretary of the Royal Institute of British Architects has received the following letter from the Postmaster-General:—"I am directed by the Postmaster-General to inform you that no suitable design having been submitted in connection with the recent competition for the erection of a monument at Berne to celebrate the foundation of the International Telegraph Union, it has been decided to hold a further competition, for which designs must be sent to Berne by August 15 next. I am to enclose three copies of the programme for your information. From the Report upon the recent competition made by the International Jury who considered the designs it appears that out of the ninety-two designs submitted no less than seventy were either clearly inadequate or had no relevance to the idea which they were intended to represent. The Jury wish to emphasise the importance of fully realising the idea which the monument is to commemorate, and of submitting only such designs as could be carried out under the conditions set forth in the programme, and it is considered desirable that the attention of intending competitors should be specially called to these requirements." The three copies of the programme alluded to above are now in the Library of the Royal Institute.

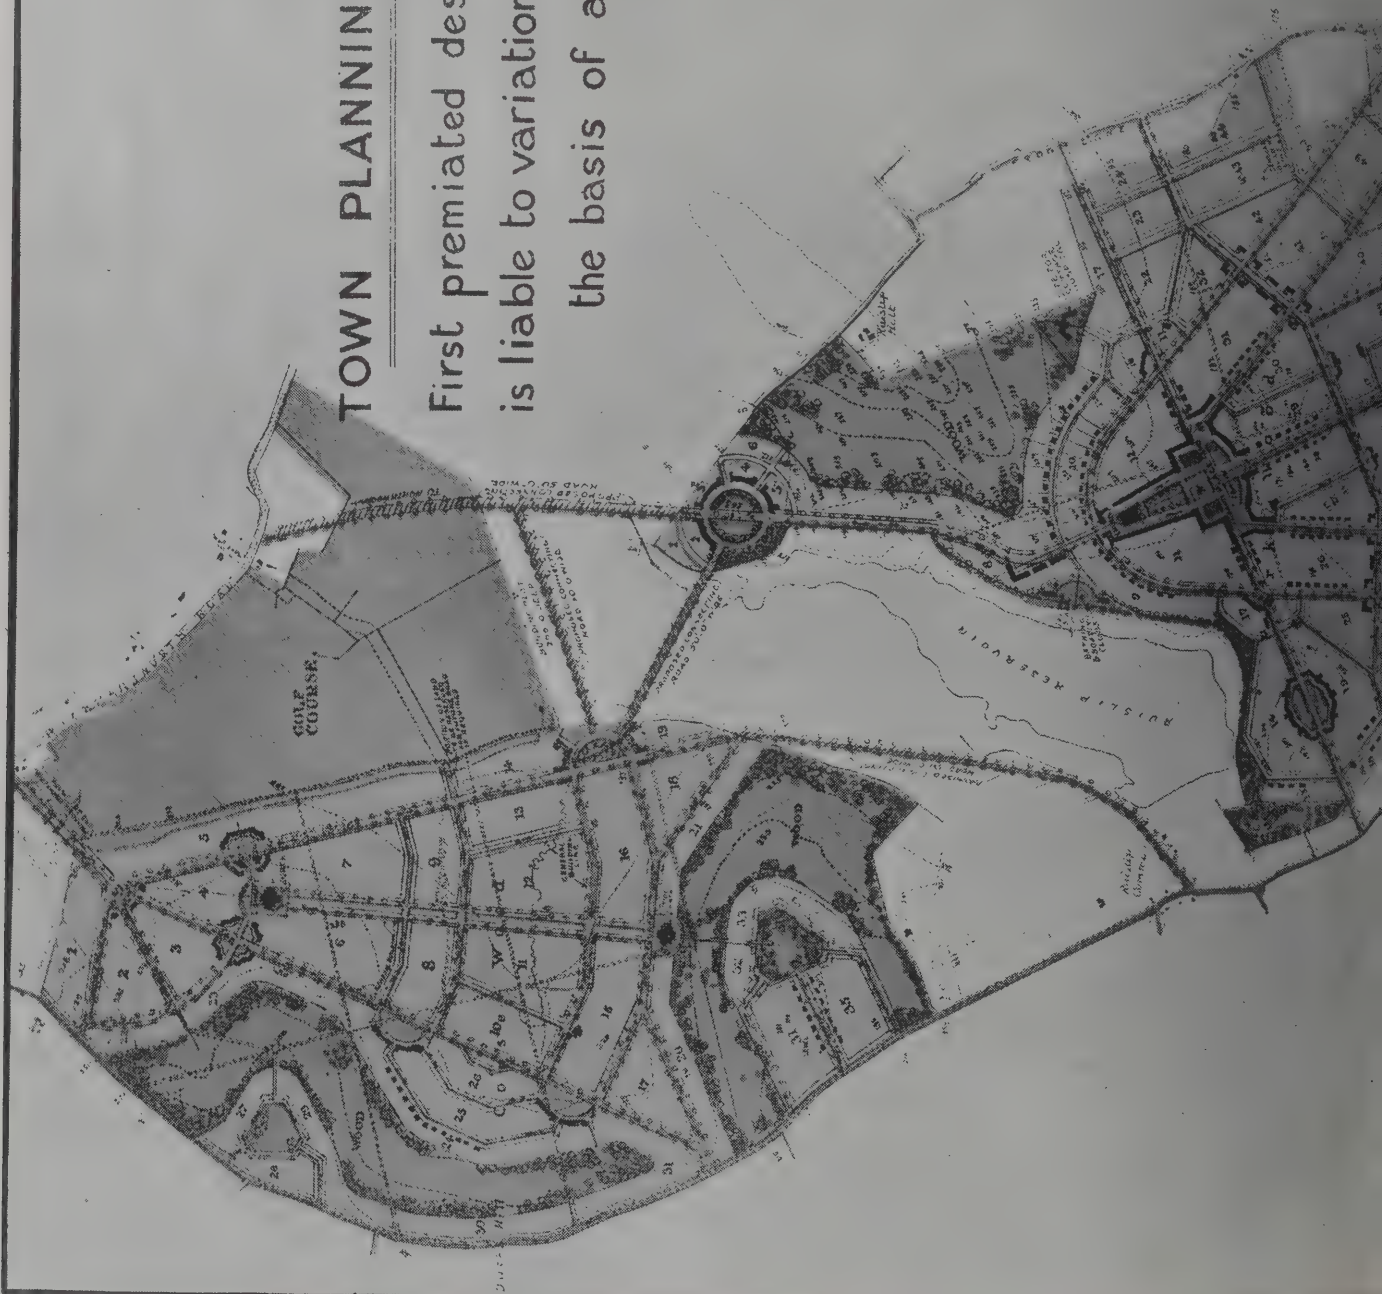

LLANDUDNO.—Mr. R. T. Beckett, architect, Chester, has been placed first in the competition for designs for a church at West Llandudno. The second premium of 10l. has been awarded to Mr. H. L. North, architect, Llanfairfechan. Mr. W. D. Caroe acted as assessor.

SOUTHAMPTON.—The Council of Hartley University College have adopted a recommendation that an open competition should be held for designs for new college buildings. The entire scheme is for a building for 400 students, to be erected at a probable cost of 100,000l. Towards this amount the Council have in hand not more than 13,000l. It is proposed to begin with the Arts block. On the recommendation of Mr. Leonard Stokes, F.R.I.B.A., the Governors have engaged Mr. H. T. Hare to act as assessor.

RUISLIP MANOR COMPETITION.

TOWN PLANNING COMPETITION

First premiated design which, if adopted, is liable to variation and is not to form the basis of any contract.

Selected Design by Messrs. A. & J. Soutar.

THE LAYING OUT AND DEVELOPMENT OF BUILDING ESTATES.

At the Law Society, on Tuesday, Mr. E. J. Naldrett gave the first of a series of four lectures on Local Government Law, in which the powers, &c., of local authorities and the rights, &c., of owners in connection with the laying-out and development of building estates will be considered.

Sir HOMEWOOD CRAWFORD, Solicitor to the City of London Corporation, who was in the chair, said that the law relating to local government was a speciality in itself, and one which is of extreme importance at the present day having regard to the very rapid growth of local government, especially in connection with the extended powers which are so readily given by Parliament to municipalities. Therefore it behoved all of them, and particularly those connected with the legal profession, to make themselves absolutely up to date with the various changes which were taking place so rapidly. The course of lectures which Mr. Naldrett had so kindly arranged covered a very large area. The first would deal with the laying-out of building estates and with the law applying to that, both inside and outside the Metropolis. Then it was proposed to have a lecture on the 5th inst., another on the 10th, and the final one on the 12th. He hoped that in the third lecture the lecturer would be able to solve the knotty problem as to what is really a drain as distinguished from a sewer, and *vice versa*. The final lecture would deal with the Town Planning Act of 1909, which was a very important matter. At this present moment there was a proposal to lay out about 5,000 acres in the immediate neighbourhood of the Metropolis, taking advantage of the provisions of this new statute.

Mr. E. J. NALDRETT said that in delivering these four lectures on behalf of the Society it was proposed to deal in a more or less practical way with some of the legal considerations which arise in the laying out of a building estate and its subsequent development—i.e., the questions which arise between the owner on the one hand and the local authority on the other. Before doing so, however, he referred in brief outline to our present system of local government, mentioning all the important statutes from the Highways Act of 1835 to the Housing and Town Planning Act of 1909, and pointing out more particularly the functions of borough councils, urban district councils and rural district councils in the provinces, and the relationship between the London County Council and the borough councils in London.

The necessity for contracts entered into by municipalities to be under seal was referred to. In the case of urban district councils it was laid down by statute that all contracts exceeding 50*l.*, and in the case of London borough councils contracts exceeding 10*l.*, should be under seal. In the case of *Lawford v. Billericay R.D.C.* (1903), 1 K.B. 772, it was held that the absence of a contract under seal was no answer to an action brought in respect of work done or for goods supplied.

For some reason the Metropolis had been furnished with a separate and distinct code of local government law, as compared with the provinces, and although in some respects the two codes contained similar provisions they were derived from different statutory sources. The most important exception was the recent Housing and Town Planning Act, to which he would refer in a later lecture. Outside the Metropolis, the Act to which attention should be specially directed is the Public Health Act of 1875, with the subsequent amending, qualifying, and extending statutes, which dealt with many matters concerned with sewerage, drainage, streets, buildings, &c., of great importance in the development of building estates. There were also the adoptive Acts, which enabled local authorities to obtain certain additional powers without being obliged to go to the expense of promoting special Acts of Parliament for the purpose. It was extremely important to become acquainted with the local Acts in force in any district in which it was proposed to commence building. All authorities had powers to make by-laws, and such by-laws, when properly made, had the same effect as an Act of Parliament. It was often overlooked both by local authorities and owners, that by-laws cannot be waived by the authority making them, unless the by-laws give a dispensing power or discretion. In the case of *Yabbicom v. King* (1899) it was expressly held that a local authority empowered to make by-laws relating to buildings has no power to sanction plans contravening such by-laws.

Except in the Town Planning Act of 1909, in no statute was a local authority given the right to determine how an owner was to develop an estate. Their powers were confined to the laying-out of the streets, sewerage, erection of

buildings, and so on. The Local Government Board had framed a model series of by-laws for the guidance of local authorities, and these had lately been revised in order to make them more elastic in their requirements, and some of the provisions of the revised regulations were as follows:—Principal streets with carriageways to have a minimum width of 36 feet; but, as a fact, by-laws nearly always required 40 feet streets. All principal or front roads over 100 feet in length must be carriage roads. Secondary or back roads must have a minimum width of 16 feet if over 100 feet long, or, if shorter, a width of 13 feet. He also referred to sections relating to plans, penalties, &c., and indicated the class of information that a local authority requires, but which varied in the different districts.

By-laws in regard to sewage in new streets have not yet been embodied in the model series, the reason given by the Local Government Board being that such by-laws are so dependent upon the varying conditions of each locality that the authorities have ample powers under existing Acts to deal with this matter. This referred to powers conferred by section 150 of the Public Health Act, 1875, and the Private Street Works Act 1892, which enabled the local authority to require the owners to pave and sewer a street. As to plans submitted, the lecturer emphasised the point that the duty of a local authority is to approve or disapprove, and they cannot take exception on points such as the title of the land, or that the proposed building is unsuitable to the locality and would tend to depreciate the character of the surrounding property. If a local authority refused consent to plans which complied with the by-laws, the owners could take proceedings for a *mandamus*. It was, however, almost impossible to obtain a *mandamus* to compel an authority to pass plans, as there were so many points in connection with streets and buildings in respect of which a local authority may contend that they have exercised a bona-fide discretion, and this contention had been successfully put forward as an answer to proceedings for a *mandamus*. This point was raised in *Smith v. Chorley R.D.C.* (1897). Here, although a jury found for the plaintiff, judgment was entered for the Council on the ground that they had in good faith refused to pass the plans, and that no action would lie to compel them to pass the plans.

The question of "What is a new street?" within the true meaning of by-laws made under section 157 of the Public Health Act 1875 was discussed. Section 4 of that Act defines it as including any highway, public bridge (not being a county bridge), any road, lane, footway, square, court, alley, or passage, whether a thoroughfare or not. This, said Mr. Naldrett, was capable of a very wide interpretation. In the case of *Robinson v. Barton Eccles L.B.* (1883), L.R. 8 App. Ca. 798, Lord Selborne said that the interpretation of a clause of this kind was not meant to prevent the word receiving its ordinary appellation; and that the natural and popular sense of the words "new street" would include a roadway with buildings on either side, perhaps not necessarily continuous. It would seem, therefore, that if an owner in laying out an estate brought into existence a way and dedicated it to the use of the public, or if he made any roadway, footway, or passage, whether a thoroughfare or not, he was bringing into existence a new street, and as such it must be constructed in accordance with the local by-laws. But there was another way of bringing a new street into existence, and which frequently happened. Take the case of land proposed to be dealt with for a building estate, and that it had an existing way over it which was repairable by the local authority. Assume it was a narrow road or lane less in width than was required by the by-laws for new streets. As the building estate develops it may be intended to erect buildings abutting upon it. The carrying out of this intention had the effect of completely changing the character of the old road or lane, and it had been said that in these circumstances you would be laying out the old road as a new road within the meaning of the by-laws, and therefore the owner came under an obligation to make it of by-law width. The leading case on this subject was *Robinson v. Barton Eccles Local Board*, already referred to, and which was finally determined in the House of Lords. Mr. Robinson proposed to build on land abutting on such a lane, and one of the questions asked the Court was as to whether the part upon which he proposed to build was a new street within the meaning of the term as used in the Public Health Act. The House of Lords held that the lane in question had become a new street. The result of this decision was that it remained a question of fact in each case as to whether what had been done had converted an old road into a new street or not. Cases of this character were frequently before the Courts until 1903, but as the result of a

judgment by Mr. Justice Joyce in *Devonport Corporation v. Ozer* (1903), 1 Ch. 759, the number had diminished. This judgment was of the utmost importance to the owners of estates as well as to local authorities. In this case the owners of an estate purchased a piece of land in the shape of a triangle, two sides of which were bounded by public highways, neither of which were of by-law width, and erected upon certain houses. But they did not remove the fences which bordered the roadway, and left openings here and there for the occupants of the houses to come and go. They did not attempt to alter or interfere with the roadway in any manner. It was held that the owners by what they did were not laying out a new street. Lord Justice Romer, in the Appeal Court, said that the by-laws contemplated something to be done in the nature of a physical laying-out and not a mere metaphorical laying out, on the land which it was said would be a street. This decision has been followed in other cases.

In his final remarks the lecturer dealt with the *Metro-polis* in regard to depositing plans of streets, consents, &c., all of which is given in detail in the *London Building Act*, which he referred his audience. He also briefly described the constitution and functions of the *Tribunal of Appeal* which came into existence under the *London Building Act*.

Sir **HOMEWOOD CRAWFORD**, in proposing a vote of thanks, asked the lecturer to refer to the *Michael Angelo* Taylor's Act in a subsequent lecture. He said that at the present moment the *City Corporation* were engaged in widening *Fleet Street* and *Bishopsgate Street*, and he was amazed at the ignorance of certain members of his own profession in dealing with that Act. Some of them were not aware of its existence. It was very important to know that under this Act many widenings could be carried out without seeking further Parliamentary powers. In the *City* this was being done and property was being acquired.

In answer to a few questions, Mr. Naldrett said that the responsibility for providing sewers rested with the local authority. In regard to the *Devonport* case, owners were now very careful to shelter themselves behind the words of Lord Justice Romer and not to do anything in connection with their buildings which might be regarded as a physical tying-out of land as a street, unless it was an advantage to them to do so. In the case of a local authority wishing to set back a building after it is pulled down outside the *Metro-polis*, compensation might be payable.

TRADE NOTES.

A BOLD guarantee of 500 years is given in the advertisement in our columns of the bricks that are being used at *Quarr Abbey*, near *Ryde*, and of which *Shanklin Catholic Church* and the churches of the *Jesuit Fathers* at *Leeds* and *Tamford Hill* are being erected or completed, and which are also used in several other buildings up and down the country. The severe tests to which the bricks have been submitted by the *Belgian Government* prove them to be of almost everlasting durability, and many houses and public buildings have been erected and old structures restored with them in *Belgium*. These bricks have won eleven prizes out of twelve in a first competition—the first five and the last six—and all twelve in a second competition—fifty-nine competitors. For public works the bricks are all that can be desired.

THE electric-lift equipment at the new *Post Office* at *King Edward Buildings*, *Newgate Street*, is of a specially important character. We give on another page a report of the paper describing the building read by Sir *H. Tanner*, *S.O.*, on Monday last at a meeting of the *Royal Institute*. These buildings are fitted with the most up-to-date machinery appliances. The lift equipment has been carried out by Messrs. *R. Waygood & Co., Ltd.* There are twelve large lifts in the various departments. The special feature of the installation is that it is worked from three-phase alternating current produced at the generating station of the *General Post Office*. One of the lifts is a passenger lift capable of raising a load of 20 cwt. a height of 94 feet at a speed of 200 feet per minute; and of the remaining principal lifts five are arranged for loads of 30 cwt. and two for 10 cwt. at the same speed, while the biggest lift takes 5 tons at 60 feet per minute. The cages of the big goods lifts average about 8 feet square, and are very strongly constructed with steel angle framing and steel channel suspension bars. All the cages are fitted with *Waygood's* special passenger safety gear, arranged underneath the cage so as to take the whole of the weight in case of failure of suspension ropes. The larger lifts are fitted with four steel wire sus-

pension ropes connected to cage and four separate steel wire ropes connected to counterbalance weight, the lighter lifts having two ropes instead of four. Among the special features introduced by Messrs. *Waygood & Co.* are the controlling system, the motors, a new slowing-down arrangement for the heavier lifts, and the worm and wheel gear. The counterbalance weights are, of course, specially heavy, and these, as well as the cages, are fitted with safety gear. The whole of the apparatus was subjected to severe tests by the engineers to the *Post Office*, and the work was carried out to their satisfaction.

MESSRS. *SHAW & SONS*, 7, 8, and 9 *Fetter Lane*, *E.C.*, rightly claim to be experts in furnishing and fitting offices with all time-saving modern appliances. Their right to the title is borne out by their "Catalogue of Office Furniture and Supplies." In the "Facile" vertical filing system the correspondence is filed either numerically, alphabetically, or geographically. It is offered to professional and business men as the ideal method of dealing with correspondence. The "Eureka" loose leaf account book is worked by a simple mechanism on the screw-lever principle, which gives a firm grip of the leaves, while they can be easily added or taken away when the locking device is released. Another speciality to which attention may be drawn is the "British" file, enabling letters to be easily removed or inserted without disturbing the papers already on file. The catalogue includes a large number of other aids to the scientific and successful conduct of business.

VARIETIES.

SOME weeks ago we mentioned that a dispute as to prices between granite merchants and agents for *English* and *Colonial* markets had seriously interfered with the *Aberdeen* granite-cutting and polishing industry. Prices had been cut to a very fine point, and the agents, complaining that the workmanship produced was not up to the former standard, endeavoured to still further reduce prices. The *Aberdeen Granite Association* resisted this, and the agents stopped placing orders. The merchants were firm, however, and at a meeting of the *Association* last week a list of prices for the home and colonial markets was approved. In the meantime a similar dispute with *American* and *Canadian* agents has been practically settled, and orders to the extent of about 10,000/. have been placed in *Aberdeen* during the past three weeks. It is expected that early next month all the orders for spring delivery will be in the hands of the merchants.

UNDER the instructions of the *Bank of England* and of the trustees of the will of the late Mr. *Robert Jackson Bates*, Messrs. *Field, Sons & Glasier*, of *London Bridge* and *Waterloo Place*, have effected a sale to the trustees of a fund for the housing of the working classes of the extensive island site in *Rodney Road*, *Walworth*, which occupies a ground area of over 61,000 feet, and has frontages of over 1,000 feet to *Rodney Road* and the contiguous streets. It will be remembered that the property was submitted at auction by Messrs. *Field, Sons & Glasier* in July last, when it was bought in on behalf of the vendors at the sum of 22,000/. From information supplied by the secretary of the fund we understand that according to the present intentions of the governors it is proposed to develop the site by the erection of nine blocks of artisans' dwellings, containing each 20 tenements, and affording accommodation for over 600 persons. As the property is within a close radius of the large *Tabard Street* area, which the *London County Council* are about to clear, it is hoped that these new dwellings, when erected, will assist in solving the re-housing problem which will be presented by the *Council's* demolition scheme.

THE *Glasgow Corporation* have under consideration a scheme for the reconstruction and enlargement of the premises occupied by the *Royal Glasgow Institute* of the *Fine Arts*. A sketch plan prepared by the *City Engineer* shows that the proposed scheme involves the demolition of the back portion of the buildings and three of the tenements on the south side of *Renfrew Street* recently purchased by the *Corporation*, and also the erection of new buildings upon the cleared site, providing a suite of nine large intercommunicating galleries. In the proposed new premises the total floorage space, including the basement, will be 20,280 square feet. The estimated cost is 20,000/.. The cost of the three tenements to be demolished is stated at 5,725/., and the value of the portion of the site occupied by the present galleries is given at 5,700/.. If the scheme is adopted the premises will be let at a rental of 1,050/. a year to the *Royal Glasgow Institute*.

NOTICE TO ADVERTISERS.

In no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000*l*. Prizes of 1,050*l*., 700*l*. and 440*l*. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000*l*. A first prize of 800*l*., and a second prize of 320*l*. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith Young, F.R.I.B.A., will act as assessor. Deposit 3*l*. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2*l*. 2s., which will be refunded on receipt

WORTHING.—Jan. 17.—For erection of an ambulance shed at the Corporation Yard, High Street. The Borough Surveyor, Municipal Offices, Worthing.

TENDERS.

BIRKENHEAD.

For carrying out the works in connection with the removal of peat from the site of the Alwen Reservoir, and the construction of the reservoir and masonry dam, embankments, &c., for the Birkenhead Town Council.

MCALPINE & SONS, Victoria Street,
Westminster (accepted) £186,153 15 3

CLACTON-ON-SEA.

For construction of 550 feet stone wall on the West Beach, for the Urban District Council.

Webb & Co.	£4,531 14 1
Muirhead & Co.	4,500 0 0
Cochrane & Sons	4,187 16 11
Wimpey & Co.	3,893 0 0
G. Bell & Sons	3,698 0 0
May	3,642 15 2
W. Bell & Sons	3,634 0 0
Gradwell & Co.	3,586 4 10
Brebner & Co.	3,526 0 0
PEDRETTE (accepted)	3,277 11 2

LONDON.

For the erection of stabling, rear of 3 Perry Vale, for Messrs Edwards & Sons, dairymen. Messrs. NORFOLK & PRIOR, architects, Catford Bridge.

Christmas	£260 0 0
Bliss Bros.	257 0 0
Walker	223 16 0
WATT (accepted)	220 0 0

For alterations and additions to the steward's offices at the Northern (Convalescent) Fever Hospital, for the Metropolitan Asylums Board. Mr. W. T. HATCH, M.I.C.E., M.I.M.E., engineer-in-chief.

Jewell	£362 0 0
Reason	349 0 0
Nightingale	319 0 0
Stevens & Sons	298 0 0
Kazak	252 0 0
Eyles	243 0 0
ORAM & SON, Waltham Abbey (accepted)	229 10 0

NEWTON ABBOT.

For the erection of additional wards at the Workhouse Infirmary. Mr. SAMUEL SEGAR, architect, Newton Abbot.

Pollard & Co.	£4,160 0 0
Parker Bros.	4,150 0 0
Blake	4,070 0 0
Yeo & Sons	3,939 0 0

Zealley	3,755 17 0
Coles	3,700 0 0
Mills	3,499 0 0
Stacey	3,496 15 0
Rowse & Co.	3,402 0 0
Wilkins & Sons	3,295 0 0
Bovey & Son, Torquay (accepted provisionally)	3,074 0 0

SCOTLAND.

For carrying out the new Cameron Burn water scheme for the St. Andrew's Town Council.

Contract No. 1.—reservoir.

KINNIBURGH (accepted) £15,063 6 0

Contract No. 2.—supply of iron pipes.

McFARLANE, STRANG & Co. (accepted) 2,107 10 6

Contract No. 3.—laying pipes.

BRYCE (accepted) 517 10 11

WIRRAL.

For the making-up of Prospect Road, Prenton, Chester, for Wirral Rural District Council. Mr. T. DAVIES, surveyor, Heswall.

Davies & Gaskell	£1,080 11 9
Marr & Son	943 17 1
W. F. Chadwick, Ltd.	893 2 5
Harris	873 5 8
Warren	872 10 7
Devaney	850 12 0
Ratcliffe	836 2 0
MEIKLE, Liverpool (accepted)	785 11 4

VARIETIES.

New police stations are to be erected by the East Riding authorities at Walton, Brough, and Market Weighton.

It is proposed to build a Conservative and Unionist Club at Reeth, Yorkshire, near the Buck Inn. The site has been purchased and a working committee formed.

THE Worthing Town Council have arranged a loan of 2,600*l.* at 3½ per cent. for the purchase of Gloucester Lodge as a site for municipal buildings.

PLANS have been passed by the Coatbridge Dean of Guild Court for an extension of the cookery school in Kildonan Street, the estimated cost being 1,500*l.*

THE Blackburn Town Council have approved a draft Parliamentary Bill for the construction of two additional reservoirs to increase the town's water storage by 30 days' supply.

A COMMITTEE has been formed with the object of erecting a church hall at Holyhead at an estimated cost of 2,000*l.* Of this sum there is already 900*l.* in hand, and over 100*l.* promised.

IN the recent competition held for the York Road schools, Battersea, the designs submitted by Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C., have been placed first, and the work is to be proceeded with at once.

THE designs submitted by Messrs. George Baines & Son, 5 Clement's Inn, Strand, London, W.C., have been adopted for the proposed Congregational schools and institute at Reddish, the estimated cost being 2,600*l.*

It is proposed to form a company to be known as the Long Sutton Tenants, Ltd., and to erect some fifteen houses at a cost of 3,000*l.* on land which has been already secured for the purpose at Long Sutton, Lincolnshire.

THE Institute of Metals, which now has a membership of over 550, will hold a two-days annual general meeting on Tuesday and Wednesday next. The business will be done and papers read at the Institution of Mechanical Engineers, Storey's Gate, S.W.

THE Local Government Board have sanctioned the loan by the Carnarvon Town Council of 2,400*l.* towards extending the Institute Building, in which is the free library, and which when completed will also include public baths and a council chamber.

A LOCAL GOVERNMENT BOARD inquiry was held last week at the County Offices, Chester, into an application of the County Council for consent to the borrowing of 19,414*l.* for the purchase of property for the purposes of the Upton pauper lunatic asylum. It is proposed to purchase the Bache estate of 87 acres, including Bache Hall.

THE Hull City Council have adopted a scheme for extending the electricity undertaking at a cost of 99,322*l.* Of this sum the estimate for buildings is 19,808*l.*, for machinery 37,297*l.*, for main extensions 20,188*l.*, for high-tension main 14,243*l.*, and for motors to let on hire 4,996*l.* It is proposed to ask for a seventeen years' loan for 91,536*l.* of the amount.

THE Cannock Urban District Council, Staffordshire, have arranged a limited competition in order to obtain plans for a new school at Bridgtown. The following architects are to be invited to send in plans for a school for 150 girls and 150 infants, with provision for adding a boys' department, if necessary—namely, Messrs. G. Wormal (Stafford), Bailey & McConnell, and Hickton & Farmer, and Mr. Evans (of Walsall), and H. Horton (of Cannock).

THE contracts for making No. 2 and No. 3 sections of the new water supply for Fraserburgh, placed recently with Mr. James Kinniburgh, contractor, Glasgow, have fallen through owing to the Town Council's terms in regard to security. Contracts Nos. 1 and 3 have, subject to further negotiations, been placed in the hands of Messrs. H. M. Murray & Co., and contract No. 2 with Messrs. Casey & Darragh. The total of the three contracts is 43,682*l.* Mr. W. Allan Carter, Edinburgh, is engineer.

THE Sanitary Inspectors' Association held a meeting in Carpenters' Hall, London Wall, on Saturday last, when Mr. Sidney Sharpe read a paper on the Amalgam system of plumbing. The lecturer claimed that with one exception this system complied with all the by-laws in force, that the work when finished had a better appearance than that now in vogue, and could be executed at a considerable reduction in cost. At the conclusion of the paper the pipes joined by this method were subjected to hydraulic and torsion tests, which amply proved that the joint was distinctly stronger than the other portion of the pipe; a selection of joints and plumbers' work was on exhibition, and was greatly admired by the members present. An animated discussion followed, during which the general trend of opinion expressed was distinctly favourable to this new system.

ART AND REGISTRATION.*

THE future of art in architecture and the professional welfare of its exponents are to a great extent in the hands of the present generation, and two policies are put forward for consideration as ameliorations of the present unsatisfactory state of affairs in art and professional practice.

The registration of architects, as has been proved by several plebiscites, is supported by the great majority of architects, who appear to consider that the reorganisation of the profession is necessary; and architectural copyright is brought forward by a section which professes to more particularly study the future of our art while protecting the interests of professional men.

The policy of registration is particularly worthy of the notice of this Society, for this Guild is described as "the only Society formed and organised by architects' assistants to protect their interests," and it is apparent that the object of this body is to ensure some sort of security to assistants in the architectural profession.

Security, that most precious jewel of civilisation, is entirely the work of law. Without law there is no security, and consequently not even a certainty of subsistence; and it follows that if this Society is not prepared to support the logical measure which will give security to the architectural profession and its individual members, it will fail in its apparent object, in one direction at least.

It has been said that registration will limit the liberty of the architect and be opposed to the welfare of art; but this contention does not appear to be well founded. Sir James Mackintosh, the eminent lawyer and essayist of the earlier portion of the last century, said: "The description of liberty which seems to me the most comprehensive is that of *security against wrong*. Liberty is, therefore, the object of all government." The registration of architects means the ultimate government of the profession by the profession to ensure *security against wrong*; but it is not only in the personal protection of the members of the profession that the policy of registration is worthy of consideration, and the probable effects of such a policy on art must be studied.

Art in architecture is acknowledged by the majority of our most prominent architects to be in a very unsatisfactory state; and the introduction of an Architectural Copyright Bill at first sight appears to be a necessary measure for the protection of the personal property and standing of the architect; but a reference (at the risk of being personal) to the published opinions of some of our leading architects on the present state of architectural art may be helpful.

The symposium on architecture recently conducted in *The New Age* by Mr. Huntley Carter is a valuable collection of opinions, which should be of great interest to all architects and artists who look at architecture and art widely; and more particularly to those who, through registration, hope to see the mistress art take a proper place in our social life. The opinions of the eminent contributors to this symposium show a general despondence as regards the progress of our art, and Mr. Mervyn E. Macartney, F.S.A., F.R.I.B.A., and Mr. Edward Warren, F.S.A., F.R.I.B.A., who contribute interesting articles, are both of the opinion that the present unsatisfactory state of art and architecture is due to the ignorance and apathy of the public.

Mr. Macartney says: "Little more can be done by architects themselves until the public expresses some sort of approbation," and also, "In London we accept all kinds of vulgar fripperies from stockbrokers turned architects."

Does it not follow that the public very naturally expresses little approbation of the vulgar fripperies of stockbroker-architects? And does it not also follow that, if "architects themselves" confine the energies of stockbrokers to stockbroking, art and architecture will benefit, and the public express some kind of approbation for the works of a profession which is a definite profession?

Mr. Macartney further says: "It would, however, have to be conceded at the outset that the general taste in this, the mistress art, is at a lower ebb than at any time even of the eighteenth century"; and, "In England up to the middle of the eighteenth century taste in architecture was fairly general. Every gentleman understood its principles, and several of them were not without ability in its practice." So that in this, the twentieth century, although we know that "the mistress art is at a lower ebb than at any time even of the eighteenth century," we have stockbrokers, auctioneers, and certificated bailiffs as ex-

ponents of the mistress art, and supplying "all kinds of vulgar fripperies" acceptable to the greatest city in the world, and this in place of the favourable atmosphere which existed in the first half of the eighteenth century.

No true architect whose desire is the welfare of his art objects to a stockbroker, auctioneer, or bailiff becoming an architect, provided that the gentleman is qualified by nature and attainments to practise the profession in keeping with the canons of art and professional etiquette; but every architect with a soul above the mere utilitarian routine of business must object to the unnecessary degradation of architecture by the works of the individuals who have given our streets their vulgar fripperies in such profusion.

The registration of architects would not necessarily make every building in our streets a work of art, but it would undoubtedly, in future years, prevent the utterly unqualified and ignorant man from practising as an architect. Mr. Macartney truly says: "A tradition in architecture cannot be built up in a day"; but, as public approbation is necessary to the progress of tradition, it is reasonable to expect that by gaining public approbation and notice through a non-controversial Registration Bill, approved by the public through their elected representatives in Parliament, further public approbation, understanding, and appreciation of the profession and its aims would follow.

Mr. Macartney says: "It is only the great gullible public who think that painters alone are capable of producing art, so they muddle along, and when they want a bit of 'art' they buy it from the painter. The assumption that painters can do architecture is doubtless based on this feeling that 'art' may be obtained in sample and applied to building—a square foot or a yard at a time."

In the first place, it is obviously the duty of architects to see that the public are not gulled, and even before "the public expresses some sort of approbation," it is possible for "architects themselves" to do much towards gaining that approbation. It is also due to the art of architecture from its exponents that approbation should be gained, and as in politics measures are supported because of the sincerity and through the personalities of their originators and supporters, so must public approbation of architecture be gained by sincerity and whole-hearted and businesslike action by its practitioners, and by keeping the importance of architecture continually in the public eye.

Architects may not advertise for their own personal benefit; but architects as a body can surely advertise the importance of their art by drawing public attention to it on every possible occasion. The Town Planning Conference has done much to convince the public of the importance of the architectural profession; but it must be remembered that the subject of town planning owes its present prominence very largely to the fact that it has been brought to the public notice through political channels, the Town Planning Bill having been commented on by every journal of importance, and the subject having all the prominence of a political measure.

It is obvious that the introduction of a Bill for the registration of architects would also attract notice and convince a large proportion of the general public of the importance of the architectural profession.

The public apathy which Mr. Macartney and Mr. Warren deplore may be in some measure due to the fact that there is no obvious care of the public interest taken by architects as a profession. The public looks after its own interests through local by-laws and surveyors, whose functions are supervisory of the architect's work; and although this is necessary, and probably always will be necessary, it has a tendency to an antagonistic feeling which is regrettable and might be somewhat relieved.

In the medical profession the diploma of public health (D.P.H.), held by so many doctors, has convinced the public that public health is made a serious study by medical men; the profession is looked up to, and the public interests in that sphere are felt to be safe in its hands.

The institution of a diploma in civil architecture might well fill a corresponding place in the architectural profession, and have the same effect in convincing the public that architects are solicitous for their well-being, by endeavouring to give them artistic and suitable as well as sanitary and well-built buildings; but such a diploma could be of little use so long as the professions of stockbroking and architecture are interchangeable.

Public approbation is necessary to the progress of art; but the public cannot be forced to appreciate art and architecture, therefore it must be led to that appreciation; and the first step likely to convince at least a large section of the public of the importance of architecture would be the initia-

* Abstract of a paper read before the Guild of Architects' Assistants, on January 10, by Mr. H. Guicharde Todd, F.S.A.Scot., M.S.A.

ion of the policy of registration, and the consequent access of dignity and standing in the public eye which that measure would confer on the members of the profession.

The benefits of such a consummation are obvious and would be twofold—beneficial to the profession and to the public; for the interests of the public, the profession and the art which it professes are inseparable. The public would be safeguarded against the practice of irresponsible or altogether ignorant practitioners, architects would have a professional standing to lose, and if this were once appreciated by the public the importance of good architectural work would be recognised.

The responsible architect, in keeping with the definition of security already given, can only be the architect who has something to lose, and under registration that would be his professional standing. At the present moment any architect guilty of unprofessional conduct, however gross, provided he keeps within the limits of the law, would only lose his standing in the eyes of his professional brethren, and could not be prevented from describing himself as an architect and a member of an honourable profession and training pupils to any number; but under registration, as generally understood, any such person found guilty of serious professional malpractice would no longer be able to describe himself as an architect or recover professional fees at law.

The registration of architects would make it possible to obtain reliable statistics regarding the profession and all matters concerning it; and, as an executive force, the local influence of the provincial societies would be most valuable, as under a wise measure of registration their standing would be enhanced by their official connection as educational bodies with the central authority; and through the whole of this and societies working in the interests of art and architecture would be supervised to some extent by a central body, possibly similar to the Central Council suggested in the Architects' Registration Bill.

The Central Council hitherto provided for in that Bill would consist of architects of the highest standing, elected to represent the various existing architectural bodies, Metropolitan and provincial, in numbers proportionate to the importance of the bodies which they represented, and inclusive of representatives of architects qualified for registration who are unattached to any professional society.

This Council would administer the code of ethics of the profession, and it is hard to imagine how such an arrangement could be prejudicial to art in architecture.

In addition to this comprehensive policy, a Bill to protect architectural copyright is proposed, a Bill which should be of great interest to this Society and its members, as well as to the profession generally; to the members of this Guild, as assistants, because it is conceivable that their ideas in many cases will automatically become the copyright of their employers; and to the profession generally, because the promoters of this policy are prepared to hand over, quite unnecessarily, the management of purely professional matters to members of the legal profession, who can hardly be judges of what constitutes originality in architectural design.

It is amusing to find that the first great proposal for many years, professedly in the interests of architects, should be so obviously in the interests of the legal profession, and such a Gilbertian position can only bring ridicule on architects and give the public cause to believe that architects cannot manage their own affairs. Under registration the names of practitioners guilty of the malpractice of unjustifiably copying plans or elevations to the detriment of their professional brethren could be removed from the registration list, and this action would be a parallel to being struck off the rolls in the legal and medical professions. Lawyers and medical men have wisely kept the management of their own affairs in their own hands, and it cannot be said that it presses unfairly on the members of these professions, as only in the case of aggravated malpractice is the power of ejection exercised.

As architects can be the only judges of what constitutes infringement of architectural design, the elevation of some eminent architect to the Bench to deal with all cases under the Architectural Copyright Act would appear to be necessary, in conjunction with an arrangement whereby architects might take silk and plead at the architectural Bar on matters of art. This may appear to be merely fantastic, but, given an Architectural Copyright Bill to protect originality in art in architecture, it appears to be a logical necessity.

An Architectural Copyright Bill in conjunction with an Architects' Registration Bill is more attractive; but architectural copyright under existing conditions does not appear to be in the best interests of architectural progress.

Registration, on the other hand, would appear to tend towards architectural progress. Mr. Reginald Blomfield,

A.R.A., in his contribution to the symposium already mentioned, says that "only a trained architect can be an architect," and as under registration in the next generation all architects would undergo some approved training and their pupils would be also trained it follows that a profession trained to some extent would be the result.

Registration could not produce genius, or even tend towards the production of genius; but it would tend towards a reduction of the production of utterly bad works of architectural art, while it would not in any way hamper the practice of gentlemen who are specially qualified to produce works of outstanding merit and originality.

The registration of architects, by binding the members of the profession together, by enforcing a statutory qualification, by emphasising the necessity for the study of architecture as an art, and, through the power it would have as a united and definite profession able to speak with one voice, could only have the effect of furthering this ideal of carrying our tradition forward and proving to future critics that this generation was solicitous for the well-being of that art which is undoubtedly the truest index to the culture or civilisation of any age.

Italy, Spain, Russia, several of the United States of America, the Transvaal, and some of the Canadian provinces have successfully adopted registration; while Germany and Hungary compel all public architectural officials to have a Government diploma; and from none of these countries do we hear that the spirit of design in architecture has died in consequence.

Registration stands for statutory qualification, which depends upon architectural education; and architectural education, in whatever light we view it, must appear the most important subject that can engage the attention of the architect, and it is most important that he should now support the policy of registration if he wishes architects to control the necessary qualifying examinations and those second-rate colleges which profess to turn out architects ready to practise after very short periods of tuition, and who simply swell the crowds of badly trained assistants. Statutory qualification, to be really satisfactory, should be managed from one fountain-head, and no body should be allowed entirely independent powers of examination or registration, and the anomalies which exist in other registered professions should be avoided. In the medical profession, particularly, it is possible to practise with qualifications which are very different in standing.

The public have a right to know if every professional man working in such a way has had a proper architectural training, and is held officially responsible for his professional probity. Registration would provide an official register of names and qualifications, which would be an effective check on the abuse of professional titles or the use of titles which have little or no bearing on the profession practised. In short, it is claimed that the statutory qualification of architects would provide an educated and responsible profession, would benefit the progress of architectural art by convincing the public of the importance of the profession and its work, would make it immediately possible to get statistics on which to base proposals for the improvement of the position of the assistant, and generally raise the profession to that standing which it ought to have in the public estimation.

The progress of art depends upon public support, and the public is always impressed by strength. Miligias said: "If massive columns are close to each other they appear more massive still; and slender columns when wide apart appear slenderer still." It is surely easy and natural for architects to apply this architectural maxim to their professional affairs. Every architect is a column in the structure of the profession, and if architects bind themselves together under registration, in the interests of their art as well as in the public interest, the tendency will be for the public to respond by showing appreciation of architectural refinement and excellence, and condemning the vulgar and inartistic.

THE King has commanded that henceforth the Society of British Sculptors shall be known as the Royal Society of British Sculptors.

THE superintendent of works to the George Heriot's Trust, Edinburgh, has been directed by the governors to prepare the working drawings for the proposed science department at George Heriot's school.

THE Duke of Norfolk, speaking at a meeting of the Sussex Territorial Association held at Brighton, urged that there should be inserted in all builders' contracts a clause giving preference to local workmen who are Territorials. It was decided to take the question into further consideration.

THE LAYING OUT OF A BUILDING ESTATE.—II.

ON Thursday evening Mr. E. J. Naldrett, barrister-at-law, delivered the second of the course of lectures, arranged by the Legal Education Committee of the Law Society, on Local Government Law in connection with the Laying-out of a Building Estate. Mr. W. Trower presided.

Mr. Naldrett said that in his first lecture he referred to the meaning of the terms "street" and "new street," which, both in the Public Health Act of 1875 and the Metropolitan Act, had a very wide meaning indeed, and included any highway, bridge (not being a county bridge), road, lane, square, court, alley and passage, whether a thoroughfare or not. The next question which arose was as to how a street became a highway—i.e., a way over which the public had the right of passage. He was speaking of a highway quite irrespective of any liability for repair, because the two things were quite distinct. If an owner had formed a road or way over his land for use by the public, and the public so used it, the owner thereby dedicated it as a public highway. Such dedication did not necessarily involve any formal act on the part of the owner, and in most cases such dedication was presumed from the fact of the public using it. An important case governing this point was that of the "Greenwich Board of Works v. Maudslay" (1870), whilst "Fisher v. Prowse" (1862) was another case dealing with the question. The owner might give a right-of-way across land without giving away the ownership of the soil; but it might be laid down as a general rule that once a highway always a highway. Then came the question of liability to repair such highways. Up to the coming into force of the Highways Act of 1835 all highways were repairable by the inhabitants of a parish at large; but since that Act highways made across a building estate had ceased to become repairable by the inhabitants at large. The elaborate machinery provided by the Act of 1835 might be used for the purpose of making them so repairable; but these powers were seldom resorted to. Then the owner was not liable to repair a highway simply because he made it across his land, and the result was that since 1835 many highways had come into existence which neither the local authority nor the owners creating them were liable to repair. He strongly recommended them to read the judgment of Mr. Justice Wills in "Eyre v. New Forest Highway Board" (1892) on this point, for it was most helpful with regard to the law of highways. In urban districts highways which were repairable by the inhabitants at large were vested in the Urban District Councils; whilst under Section 25 of the Local Government Act, 1894, Rural District Councils were liable to repair highways repairable by the inhabitants at large within their districts. Main roads vested in the County Councils were, of course, excepted. They had now to consider what the powers of the local authority were in relation to highways not repairable by the inhabitants at large, in which class were included newly made highways across a building estate which had been laid out in accordance with the requirements of the by-laws. The important section dealing with this was Section 150 of the Public Health Act, 1875, which provided that if such highway was not sewered, levelled, paved, metalled, flagged, channelled, and lighted to the satisfaction of the urban authority, the authority might give notice to the owners and occupiers of premises abutting on the street, requiring them to execute such works within the time specified by the notice. Before giving notice the local authority had to cause plans and estimates of the cost of the work to be prepared, which were to be open to the inspection of the owners. If the owners themselves did not do the work, then the authority could execute it and recover the cost in such proportions as might be settled by the surveyor to the authority, or, in the case of dispute, by arbitration, or the Urban Authority might declare the expense to be private improvement expenses, and recover them as private improvement rates. Section 150 of the Public Health Act concluded with the provision that the same proceedings might be taken and the same powers exercised in respect of any street or road, although a part might be a public footpath or repairable by the inhabitants at large, as fully as if the whole of the said street or road was a highway not repairable by the inhabitants at large. This section, although referring in terms to an urban district, might by an order of the Local Government Board be applied to a rural district. The word "street" in this Section 150 was used in a wide sense, for it had been held that the definition of street in Section 4 of the Act must be read into it, which he had already referred to. An interesting case was that of "Richards v. Kessick" (1888). Mr. Richards was the joint owner of a strip of land 3 feet wide alongside an existing highway. The strip of land was dedicated as a footpath, and Mr.

Richards built houses behind the footpath and facing it. The local authority gave him notice to make the strip up and it was held by the Courts that this strip was a street within the operation of the last paragraph of Section 150 of the Public Health Act. The local authority, however, must make up the street as they found it, and had no power under the section to alter the respective proportions of the footway. A case bearing on this was "Robertson v. Bristol Corporation" (1900). If a street had once been sewered to the satisfaction of the local authority, the sewer would vest in the authority, and they could not require the owners to aggrander the street. It did not, of course, follow that every sewer laid in a street was laid to the satisfaction of the local authority, but where a sewer had existed for a time, and the local authority had known of its existence and had expressed no dissatisfaction with it, it would be inferred that it was sewer laid to their satisfaction. This was governed by the cases of "Bonella v. Twickenham Local Board" (1887) and "Wilmslow U.D.C. v. Sidebottom" (1906). The reason for this finding was that sewers as soon as they came into existence vested in the local authority, and under the Public Health Act there were certain statutory duties put on the local authority to maintain sewers. The position with regard to paving, levelling, channelling, and so on was different, because the local authority might require the frontagers to do such work as occasion required until the street was declared to be a highway repairable by the inhabitants at large. Liability on the owner only attached if his premises adjoined or abutted on the street in question and in the case of "Williams v. Wandsworth Board of Works" it was held that the owner of a strip of land only 4 inches wide adjoining the highway was liable for the work and that no liability attached to the owner of the land behind the 4-inch strip. An owner might dispute the apportionment of the expense of making up a street, and, until the dispute was settled by arbitration, no proceedings could be taken against him to recover the cost. The jurisdiction of the arbitrator was, however, so limited that it was rarely found advantageous to resort to this procedure. The last paragraph of Section 150, which he had referred to, called for further comment, because if there was a public footpath repairable by the inhabitants at large running across a building estate, and an owner formed a new street along the line of the footpath, then the whole of the street, and not merely the added portion, might be dealt with by the local authority. In other words, the local authority might require it to be made up at the expense of the frontagers. This was laid down in the case of "Evans v. Newport Sanitary Authority" (1889). It had never been determined to what extent an old highway might be added to in order to bring the whole street within the operation of the clause, for in the Newport case it was simply a footpath absorbed by the new street, and it was held that the local authority was right in making up the whole street and charging the whole cost to the frontagers. A recent case of interest was that of "Portsmouth Corporation v. Hall." The owners of the estate there had an ancient highway about 30 feet wide repairable by the inhabitants at large, and they agreed with the Borough Council that when the estate was laid out they would straighten and widen the road to 40 feet, and the agreement recited that it was entered into for the purpose of settling the question which had arisen as to the extent of the public rights over the road. When the whole of the road had been laid out in accordance with the agreement the Council made it up under the provisions of Section 150 of the Act of 1875, and they sued the owners of the premises abutting on the road to recover the cost. Liability was denied, and the Court held that the conditions to the road being made were part of a bargain with the Council, and the road must be treated as being repairable by the inhabitants at large. It was held that the result of the bargain was that the added strip was put into the same position as the existing highway, and was therefore repairable by the inhabitants at large. The alternative procedure to Section 150 of the Public Health Act was the Private Streets Works Act, 1892. The Act followed to some extent the wording of the Public Health Act, but the local authority, in settling the provisional apportionment might have regard to the greater or less degree of benefit to be derived by premises from the work to be undertaken and the value of the work already done, and might include premises having access to a street although not abutting upon it. The Act also enabled questions to be raised before the works were carried out, and thus differed from Clause 150 of the other Act. By adopting this Act local authorities surrendered some of their powers, because their decisions in connection with a street were subject to review by the Justices if the

owners raised any of the objections set out in the Act. It was of the utmost importance, however, for owners to give notice of objection within the prescribed period, for otherwise they were bound to pay the charges imposed on them. Under Section 19 of the Public Health Amendment Act, 1907, the local authority might require owners of land and premises abutting on a street to execute repairs in order to obviate danger to passengers or vehicles; but the owners might then requisition the local authority to deal with the street under the Public Health or the Private Streets Works Act. Dealing next with the laying out of streets in the Metropolis, the lecturer pointed out that all highways vested in the City or Borough Councils, and under Section 112 of the Metropolis Management Act a "new street" had a particular meaning. The cases of "*St. Giles, Camberwell, v. Crystal Palace*" (1892), "*Pound v. Plumstead Board of Works*" (1871), "*Property Exchange, Ltd. v. Wandsworth Board of Works*" (1902), and "*Reg. v. Hackney Board of Works*" (1873), were all leading cases with regard to the Metropolis. Mr. Naldrett proceeded next to describe the technical procedure which must be followed in order to stop up or divert a highway, and went on to deal with the Public Health (Building in Streets) Act, 1888. This Act, which dealt with the building line of streets, had become a fruitful source of litigation, but a number of facts had been established. For instance, a local authority was not entitled to make a charge for giving consent to an application, while a house which abutted on two streets might be in both streets for the purposes of the Act. In the case of the "*Attorney-General v. Edwards*" (1891), Mr. Justice Romer laid it down that, in considering which was the front main wall of a building in a street where a building was in course of erection, all the circumstances of the case must be taken into consideration, and the building must be looked upon as a whole—its character, position, and distance from the building being erected or brought forward in alleged contravention of the section. A particular wing or other projection must not be treated as the front main wall, which was to give the governing line for another building.

Answering questions put by different members of the audience, Mr. Naldrett said that in the case of a diversion of a right-of-way, it must be done by an arrangement between the owner and the local authority, and of course the local authority would not move unless the owner agreed to terms. By law an old highway could not be diverted until a new highway was made. If a sewer was laid in a road and was acquiesced in by the local authority, it would not be competent for them at a later date to require the owner to put in a separate surface-water sewer in addition to the soil sewer.

On Tuesday Mr. E. J. Naldrett, barrister-at-law, gave his third lecture at the Law Society on Local Government law in regard to the laying out of and development of a building estate.

Mr. Naldrett, touching first on the matter of buildings, pointed out that both within and without the Metropolis the local authorities were armed with very large powers for dealing with new buildings, and either by statute or by by-law they could exercise control over almost every detail which could be imagined in connection with buildings. By Section 157 of the Public Health Act of 1875 authorities outside the Metropolis could make by-laws with respect to the structure, walls, foundations, and chimneys of new buildings for securing stability, for the prevention of fires, and for purposes of health; also with regard to the sufficiency of air-space about buildings, ventilation, drainage, the closing of buildings unfit for habitation, and so on. There were also powers to require the depositing of plans, &c., by persons intending to erect buildings and to enable the local authority to remove buildings erected in contravention of the by-laws, and so on. There was a saving provision for houses erected before the passing of the Act, and in respect of railway buildings. By Section 23 of the Public Health Acts Amendment Act (1890), which was an adoptive Act, as he had previously explained, other matters were brought within the scope of the authorities for the making of by-laws. These related to various matters for preventing buildings erected in accordance with the by-laws being altered, the flushing of water-closets, the area of rooms for human habitation, the paving of yards, &c. The by-laws made under this Act affected buildings already erected. The Amendment Act of 1907 still further extended the powers of the local authorities in the making of by-laws. Local authorities had very freely exercised their powers to make by-laws with regard to buildings, and in every district they found a code enforced based very largely on the model clauses issued by the Local Government Board. It did not follow, however, that the by-laws of

different districts were the same, or that they always followed the model clauses, so that every owner would require to get a copy of the by-laws of the district in which he intended to carry on building operations. A rural district council might be invested with powers to make by-laws by order of the Local Government Board. This raised the question of what constituted a new building within the meaning of these by-laws. Clearly, a building erected for the first time fell within the meaning, but the term had a much wider application. There was no exhaustive definition of the term, but there was statutory authority for saying that the re-erection of any building pulled down to or below the ground floor, or of any frame building of which only the framework of the lowest storey was left, or the conversion into a dwelling house of a building not originally constructed for human habitation; or the conversion into more than one dwelling house of a building originally constructed for one dwelling house were all to be considered as coming within the meaning of the term new building. The Act of 1907 further extended the meaning of the term, and therefore he need not quote cases, but by the cases brought by the Southend Corporation against *Archer and Romaine* in 1901 it was decided that temporary structures were not new buildings. In consequence the local authorities experienced considerable difficulty until the Amending Act of 1907, but now there was a provision which made it incumbent on the owner to apply to the local authority for permission to erect such buildings, and to deposit plans and particulars, and approval might be given with conditions attached as to sanitation and fire protection. In an urban district a new building could not be erected over a sewer without the permission of the local authority, notwithstanding the fact that it might be on private land, and further, in the case of a building erected at the corner of two streets the owner might be required to round off the building, subject to being paid compensation for any loss sustained. Coming next to the question of drainage, Mr. Naldrett emphasised the importance of distinguishing between a drain and a sewer so as to enable proper consideration to be given to the rights and duties of the owner on one hand and of the local authority on the other. According to Section 4 of the Public Health Act (1875), which applied to districts outside the Metropolis, a drain meant any drain used for the drainage of one building only or premises within the same curtilage, and made merely for the purpose of receiving the sewage of the building. A sewer included sewers and drains of every description, except drains to which the term drain as thus referred to applied. In Section 19 of the amending Act, however, there was a provision which enabled in certain cases that which was a sewer according to the definition in the 1875 Act to be treated as a drain. In the Metropolis Management Act the meaning given to the terms drain and sewer was very similar to that given in the Public Health Act of 1875, but the term "combined drain" was introduced. The Act said: "The word drain shall mean and include any drain if and used for the drainage of one building only, or premises within the same curtilage and made merely for the purpose of communicating with a cesspool or other like receptacle for drainage or with a sewer connecting the drains of two or more places or premises occupied by different persons and shall also include any drain for draining any group or block of houses under a combined operation." It was also provided that the word sewer should include sewers and drains of every description except drains to which the term drain as aforesaid applied. In substance the definition of a drain and a sewer outside the Metropolis and inside the Metropolis was alike, but outside the Metropolis they had to consider what was meant by a "single private drain," which was referred to in the Act of 1890, whilst inside the Metropolis they had to deal with what was known as drainage by a combined operation. The conflicting decisions of the Courts raged round these two points, but, speaking quite generally, it might be said that the effect of the definition was that that which received the drainage from one house or premises in the same curtilage was a drain, and that that which received the drainage of two or more houses was a sewer. The question of what was considered to be premises within the same curtilage was considered in connection with the Lowther Arcade, where the different premises were drained by a drain running down the middle of the Arcade to the main sewer in the street outside, and in this case it was held to be a sewer and not a drain. Until 1894 a pipe on private land, although receiving the drainage of more than one building was generally regarded as a private drain and not as a sewer vested in the local authority, but in that year the matter came before the courts in the case of *Trevis v. Uttley*. Mr. Uttley built three cottages, and provided

a pipe for the drainage of the three, which ran under one house, to the public sewer. The question arose as to who was liable to repair the pipe, and it was held that it was a public sewer and repairable by the local authority. The definition he had mentioned was applied to the case because the pipe received the drainage of more than one house. Mr. Justice Wright, in giving judgment, said it was an absurdity that that which was really a private drain should so vest in the local authority, but that the language of the section was plain. This decision still stood, and has been followed in many cases since. Two semi-detached buildings might be considered one building in some cases, and it was held so in *Hedley v. Webb* (1901). In *Humphrey v. Young* (1903) the justices found that two semi-detached buildings were separate buildings, and that therefore the pipe was a sewer and not a drain, and the decision was upheld. The owner of a building estate must deposit a plan showing the course of an intended new sewer along a new road. In the case of *Turner v. the Handsworth Urban District Council* (1909) it was proved that a sewer was laid under these circumstances and passed by the local authority, but no houses were built facing the sewer. It was held that the line of pipes, immediately after it had been approved and covered in, was a sewer which vested in the local authority, and that the authority had power to connect it with other sewers. The definition of "sewer" did not include a cesspool, as was decided in *Meador v. West Cowes Local Board* (1892), but in the case of *Swanston v. Twickenham Local Board* (1879) a manhole covering the entrance to a sewer was held to be part of it. A pipe which was a sewer and received the sewage of two houses did not cease to be a sewer if one house was disconnected. This was decided in the case of *St. Leonard, Shoreditch v. Phelan* (1896). In the case of *Vowles v. Colmer* (1895) land was shown to have been laid out as a building estate, and the owners constructed a sewer in the roadway on one side. Building plots were disposed of from time to time, and the purchasers were required to make a payment for connecting the premises they erected with the sewer. The owner of a house on the other side of the roadway opposite the building estate claimed the right to connect his drains to the sewer without payment to the owners of the estate, and an action to prevent him doing so failed. It was the duty of local authorities to keep in repair all sewers belonging to them, and to cause such sewers to be made as were necessary for the effectually doing their duty. In the case of *Regina v. Tynemouth Rural District Council* (1896) the facts were that Lord Hastings proposed to lay out a building estate, and he deposited plans which showed that each of the houses was to be drained with a separate drain ending in the middle of one of the proposed new streets. The local authority refused to approve of the plans unless the owner undertook to construct the sewers to which the drains should communicate and also the necessary main outfall sewer. The Court held that the local authority were not entitled to attach such a condition, and that it was their duty to deal with the sewage in their district. Local authorities could not be compelled to make sewers in regard to future requirements, or to assist a landowner in the development of his estate, and thus where a building estate was laid out the owner would have to provide a cesspool if there was no outfall. Where, however, houses were built to such an extent as to necessitate a scheme of drainage the duty would rest upon the local authority to make the necessary sewers. Local authorities could require a new street to be sewered under the Private Streets Act of 1892, as he had explained in his previous lecture. It was now a well established rule that if the local authority once allowed a drain to be connected with their sewer they could not deprive the occupier of that right, and this was laid down in the case of *East Barnet Valley Urban District Council v. Stallard*.

Mr. Naldrett concluded by explaining the decisions in the cases of *Bradford v. Eastbourne Corporation* (1896), *Jackson v. Wimbledon Urban District Council* (1905), and *Wood Green Urban District Council v. Joseph* (1907), all of which touched on the complicated subject of drain and sewer. In the last case there was a row of houses belonging to three different owners, and each pair of houses was drained into a line of pipes laid on private land, and this line of pipes conveyed the sewage to the public sewer. The Courts held that the line of pipes was a single private drain, and the decision simplified matters somewhat, because it laid it down that they could not have a sewer discharging into a single private drain and then the private drain discharging into a sewer.

TRADE NOTE.

AN erroneous impression having arisen from the fact that Messrs. Diespeker, Ltd., Holborn Viaduct, London, have gone into voluntary liquidation, the company state the creditors are being paid in full, and the company are now conducting their business under practically the same auspices. The following is a list of a few of the principal works the company have recently carried out, and in progress:—King Edward VII. Post Office, 'Sir Henry Tanner, I.S.O.; The Palladium, Messrs. Frank Matcham & Co.; Alhambra, Paris, Mr. Bertie Crewe; General Assurance Buildings, Aldwych, the Alhambra, Glasgow, and the Western Infirmary, Glasgow, all by Dr. J. J. Burnet; Napsbury Asylum extensions, and Royal National Orthopaedic Hospital, Mr. Rowland Plumble; Berkshire County Council Offices, Reading, Messrs. Warwick & Hall; Kingsway House, Aldwych, Messrs. Gordon & Gunton; Wandsworth Infirmary, Mr. J. S. Gibson; Town Hall, Hull, Mr. E. R. Cooper; Elton Schools, Bury, Mr. F. S. Biram; Vickers Buildings, Great Chapel Street, for the Westminster Trust, Ltd.; Aberdeen Infirmary, Messrs. Kelly & Nicol.

PLANS are being prepared for the erection of a masonic hall near the Municipal Buildings, Johnstone, N.B.

MESSRS. WARE & BAILEY, architects, have prepared plans for a commodious Masonic Hall to be erected with a frontage on Oliver Street, Birkenhead.

THE Bolton Urban District Council have received the consent of the Local Government Board to borrowing 9,475*l.* for the purpose of erecting as an experiment forty-eight houses.

At the last meeting of the executive committee in connection with the King's statue for Aberdeen, specifications were submitted by the sculptor, Mr. Drury, A.R.A., showing that the total cost of the work would be 3,500*l.*

THE building trade at Worthing is enjoying considerable activity. At the last meeting of the Town Council plans were passed for the erection of twenty-eight houses. The plans for eighteen of these were submitted by Mr. J. E. Lund, architect, and six by Messrs. Hyde & Son, M.S.A., architects.

THE Doncaster Corporation have summoned a town planning conference for Monday next, of local authorities and others interested in the expected development of the district. It is calculated that 120,000 people will be brought to the neighbourhood through the increase of colliery work.

It was reported to the monthly meeting of Dunfermline Parish School Board that Lord Elgin had approved of the plans for a new school at Limekilns, to meet the development of the works at Rosyth. The feu adjoins Broomhall policies.

THE Inverkeithing property committee have applied for warrant to lay out new streets in the vicinity of Church Street. It is proposed to erect eight tenements of four storeys each, and six shops at a cost of 15,000*l.* The accommodation is needed by the workers at Rosyth Dockyard.

THE estimate of Messrs. P. & W. Anderson, Ltd., 64 Douglas Street, Glasgow, has been accepted for the erection of the new Hutchesons' Girls' School on the vacant ground at Calder Street and Kingarth Street, Govanhill. The cost will be between 25,000*l.* and 30,000*l.* The erection of the barricades and the excavation of the foundations began this week, and the building is to be ready for the reassembling of the school after the holidays next autumn.

AMONG the plans submitted to Dunfermline Dean of Guild Court last week was one by the Federal Property and Estates Trust, Ltd., Glasgow, for seven tenements of workmen's houses proposed to be erected in the Brucefield district. A plan was also submitted for a similar number of tenements in the same district by Messrs. John M'Lean & Co., Glasgow. Warrant was granted in the latter case, conditional on the building line being kept back 30 feet from the centre of the roadway.

MOUBRAY HOUSE, a historic dwelling situated near John Knox's house in the High Street, Edinburgh, has been secured for the benefit of the public for the sum of 1,150*l.* There is no definite record as to the exact date when the house was built. The title-deeds did not take them further back than 1703. Some of the ceilings were probably between 1650 and 1670.

THE Belgian Consul at San Francisco reports that, owing to the rapid development of the town of San Diego, there is great activity in the building trade there, and consequently a large demand for reinforced concrete. About 750,000*l.* was spent on building operations during 1910. Work will be begun shortly on three more large buildings, viz., a railway station, a theatre, and an hotel, the total cost of which is estimated at nearly 300,000*l.*

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

of a bona-fide design or if the particulars are returned within fourteen days of receipt. Mr. Geo. Sutton, town clerk, 10 Hay Lane, Coventry. (For further particulars see advertisement, November 18.)

CUBA.—April 15.—An international competition has been arranged for a Presidential Palace to be erected at Havana at a cost of about 205,000l. Premiums of 10,000 pesos and 5,000 pesos will be awarded. Conditions may be seen at the Cuban Legation, 3 Grosvenor Mansions, Victoria Street, S.W., or the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

GLASGOW.—Jan. 31.—The Corporation invite plans of a proposed branch library at the corner of Saracen Street and Allander Street, Possilpark. Premiums of 50l., 30l. and 25l., will be awarded. A plan of the site and conditions may be obtained free from Mr. A. W. Myles, town clerk, City Chambers, Glasgow.

HULL.—Feb. 1.—The Guardians of Sculcoates Union invite competitive designs for a suite of offices in Margaret Street, Hull. Premiums of 10l. 10s., 6l. 6s., and 4l. 4s. will be awarded. Mr. J. H. Wild, clerk to the Guardians, 12 Harley Street, Hull.

LEICESTER.—The Corporation invite architects practising in Leicester to supply plans, designs, and estimates for a public hall to be erected adjoining the Victoria Park and Regent Road. Premiums of 100l., 50l., and 25l. will be awarded. Deposit 1l. 1s. Mr. E. G. Mawbey, M.Inst.C.E., Town Hall, Leicester.

LLANDRINDOD WELLS.—The Urban District Council invite competitive plans for a pavilion in the recreation ground. First and second premiums will be awarded by an assessor. Mr. D. C. Davies, clerk, Llandrindod Wells.

MANCHESTER.—March 31.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes March 31. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester. (For further particulars see advertisement, January 6.)

PENISTONE.—Competitive plans and specifications are invited for a "Carnegie" Free Library. The Clerk to the District Council, Penistone.

ROMFORD.—The Town Planning and Modern House and Cottage Exhibition at Gidea Park, Squirrels Heath, in the Romford Garden Suburb, summer 1911. Class IV.—Town plan of Gidea Park—prizes of 100l. and 50l. Class VII.—Open to builders. For excellence of workmanship and construction in the erection of a cottage in Class I. or II.—first prize, gold medal and 100l.; second prize, 50l. Final dates for designs; Class IV., March 31, 1911. Mr. Michael Bunney, A.R.I.B.A., hon secretary, 33 Henrietta Street, Strand, W.C.

SALE.—Jan. 21.—The Sale and Ashton-upon-Mersey District Administrative Sub-committee for Education invite architects practising within a radius of twenty miles of Manchester to make application by Jan. 21 for a limited competition for a proposed higher elementary school at Sale to accommodate about 250 children. Mr. W. Taylor, clerk, Public Free Library and Technical School, Sale, Cheshire.

SOUTHAMPTON.—The Council of Hartley University College invite designs for the proposed new buildings. Mr. H. T. Hare, F.R.I.B.A., will act as assessor. The deposit of 1l. 1s. with the application will be returned if the conditions are returned within fourteen days. Mr. D. Kiddle, registrar, Hartley University College, Southampton.

CONTRACTS OPEN.

ADWICK-LE-STREET.—For factory buildings at Adwick-le-Street, Doncaster. Send names to Mr. W. H. Wagstaff, C.E., architect and surveyor, 4 Priory Place, Doncaster.

ALDERSHOT.—Jan. 31.—For erection of a secondary school, for the Aldershot Urban District Council. Messrs. Kingham & Kingham, architects, Bank House, Grosvenor Road, Aldershot. Send 2l. 2s. deposit by Jan. 31, to Mr. W. E. Foster, clerk, Municipal Buildings, Aldershot.

BARNOLDSWICK.—Jan. 26.—For the various trades required in erection and completion of seven dwelling houses at Barnoldswick for the Barnoldswick Co-operative Industrial Society, Ltd., 5 Manchester Road, Barnoldswick, via Colne.

BINGLEY.—For the several works required in erection of a detached residence. Send names to Messrs. Nunns & Bracewell, architects, Bank Chambers, Bingley, Yorks.

BIRMINGHAM.—Jan. 31.—The Commissioners of H.M. Works and Public Buildings invite tenders, by schedule of prices, for the reinforced concrete work at the telegraph stores building (block C), Bordesley. Deposit 1l. 1s. The Controller, Telegraph Stores, Fordrough Lane, Birmingham, or Mr. E. Cropper, architect, 22 Carlisle Place, Westminster, London, S.W.

BLACKBURN.—Jan. 26.—For alterations and additions to the County Court. The Registrar, County Court, Blackburn.

VARIETIES.

THE Blyth Education Authority propose to borrow 10,000*l.* to erect a new secondary school at Blyth.

THE Local Government Board have sanctioned the borrowing of 3,433*l.* for the purchase of a site for the proposed new training college at Bolton.

THE Bowling United Free Church, N.B., is to be enlarged at a cost of 1,000*l.*, from the plans prepared by Mr. W. F. M'Gibbon, F.R.I.B.A., Glasgow.

A SITE has been purchased for the erection of a new police court in Epsom almost immediately opposite the present building.

THE Halifax Town Council at its next monthly meeting will consider a recommendation of the Highways Committee that tenders be obtained for the construction of percolating filters at the Salterhebble Sewage Works at an estimated cost of 10,000*l.*

THE interment took place on Tuesday, at Whitby Cemetery, of Mr. Edward H. Smales, A.R.I.B.A., vice-chairman of the Whitby Urban Council, who died suddenly in the grounds of his residence, Arundel Howe, on the 13th inst., from heart disease.

THE total estimate of the Town Improvement and Streets Committee of the Newcastle-on-Tyne Corporation, under the heading of streets and sewers, is 40,328*l.* (exclusive of "desirable works," 10,228*l.*, and suggested paving loan, 19,322*l.*), as against last year's estimate of 32,608*l.*

HARTLEPOOL Guardians, after repeated representations on the subject of children's homes from the Local Government Board, have submitted a scheme for the erection of buildings adjoining the workhouse to accommodate 150 children. The estimated cost is 10,000*l.*

THE Estates Committee of the Birmingham City Council last week considered the question of erecting a verandah around the Town Hall. The committee viewed the suggestion sympathetically, but found difficulty in formulating a plan which would not mar the architectural features of the building, and no definite decision was come to.

MR. J. B. DUNN, F.R.I.B.A., architect, Edinburgh, has prepared plans, which were passed last week by the Dean of Guild Court, for the erection of the Charteris Memorial Church, at the corner of the Pleasance and Brown Street, Edinburgh. It is proposed to take down two tenements and to erect the church, a hall and offices, a caretaker's house, and a surgeon's house in connection with the Deaconess Hospital.

THE Carpenters' Company has again issued particulars of a course of lectures to be delivered in their hall on the Arts Connected with Building. The names of the lecturers are a sufficient guarantee for their excellence. These lectures have been inaugurated by this company to complete, as far as may be, the series of lectures given by them, bridging, as it were, the gulf between their popular lectures and their highly technical ones on Carpentry and Building Construction. The first lecture will be given on the 25th inst., at 7.45 p.m., by Mr. T. Raffles Davison, the subject being "Truth in Craftsmanship."

THE Aberdeen Granite Association have agreed upon a new scale of prices for English work, which came into operation this week. The prices are graded according to the different varieties of work, and while in the case of merchants who have been cutting rates keenly the minimum decided upon is on an average 10 per cent. of an increase, in other instances, where manufacturers have insisted on their own figures, the new rates are slightly down; and an important feature is that no preference will in future be given to agents. They are to be placed on the same footing as direct customers, and by this step it is hoped to secure the abolition of the middleman in the granite trade. Some time ago similar action was taken in connection with American and Canadian orders, prices being considerably advanced.

THE principal linings granted in Glasgow Dean of Guild Court on the 12th inst. were:—Mr. J. Allan, engineer, 10 Cadogan Street, to erect workshops in Cadogan Street; Messrs. Brown, Stewart & Co., Ltd., Dalmarnock Paper Mills, 296 Springfield Road, to erect a pulp store; Messrs. J. P. M'Phun & Co., timber importers, 40 Mill Street, Bridgeton, to extend their works; Messrs. Reeves, Ltd., 14 Appold Street, London, E.C., to erect buildings on the east side of Stamford Street and the north side of Barrowfield Street; the Cathcart School Board, 104 West Regent Street, to erect public school buildings in Cathkin Road, Langside; the Glasgow Corporation, to erect sanitary slaughter-house, offices, &c., in Hill Street; Mr. J. Porter, house factor, 577 Dalmarnock Road, to erect tenements of shops and dwelling-houses on the north-east side of Dalmarnock Road.

THE LAYING OUT OF A BUILDING ESTATE.—III.

Thursday evening, at the Hall of the Law Society, Mr. J. Naldrett delivered his fourth and concluding lecture on Local Government Law affecting the Laying-out and development of Building Estates. Dealing with the law relating to sewage matters in the Metropolis, he said that in any respects it was similar to that outside the Metropolitan area, but it was derived from different sources. The main sewers were subject to the jurisdiction of the London County Council, and all other sewers, which might be referred to as local sewers, were under the jurisdiction and control of the Metropolitan, City, and Borough Councils. The local authorities were, however, subject to orders and laws made by the London County Council for their guidance and control on matters relating to sewerage and drainage. The duty was imposed on the borough councils to maintain and repair the sewers vested in them, and for this purpose they could carry sewers through streets and other places and through or under any private lands, paying compensation in the latter case for any damage done. Similar power was conferred on the County Council with regard to main sewers. No new sewer could be made without the approval of the County Council, but existing sewers could be discontinued provided that the Council made a new sewer. If mains were interfered with, other drains equally effective must be substituted for those destroyed. No sewer or drain could be branched into a sewer of either the County Council or a borough council without consent of the respective authority. Since 1856 the local authority could recover the cost from the owners of land and buildings fronting a street in laying a sewer in such street. An owner must be very careful to obtain the necessary consent and to comply with all the regulations before branching into a sewer, or he could render himself liable to penalties. Where a house was built and was not sufficiently drained to the satisfaction of the local authority, and there was a sewer available within 100 feet of the building, the authority could by notice require the owner to drain into such sewer, and if the owner failed to comply, then the authority could do the work and recover the cost, or they might proceed against the owner for penalties. Within the Metropolis the local authority had power to inspect drains, and if they were found to be in bad order they could call on the owner to do the necessary work, and if he failed to do it, then they could themselves carry it out and recover the cost. An owner might construct sewers himself, subject to the consent of the authority and in conformity with the regulations, and the borough council might contribute to the cost. Section 74 of the Metropolis Management Act, 1855, dealt with sewerage by a combined operation, and it was laid down that, if it appeared to the authority that a group or block of houses could be drained more economically and advantageously by a combined operation, it should be lawful for them to approve of such a system. If made before 1848 a pipe receiving the drainage of more than one house would be a sewer, but if made since 1848 it might be treated as sewerage by a combined operation, and the owner might be required to keep it in proper repair. The burden of proving that such a system was best rested upon the local authority, but a formal order authorising a combined operation was not necessary. It was sufficient if a local authority gave their approval to a scheme of drainage, and approval might be inferred from the surrounding circumstances; but in the case of "Hugh v. Billings" it was decided that a local authority could not delegate its powers of approval to an official. In the case of "Holland v. Lazarus" (1897) it was held that the fact that a rainwater pipe was introduced into the system made the combined drain a sewer. In "Green v. Newington Vestry" (1898) it was proved that four houses were drained by a combined operation under the approval of the local authority, and subsequently, without the knowledge of either the local authority or the owner of the four houses, a drain from another building was constructed and connected with the first drain. It was held that this had the effect of converting the combined drain into a sewer for which the local authority was responsible. It was quite clear from this and other decisions that such a system of drainage, in order to sustain its status as a drain, must be made as sanctioned by the local authority, and there must not be any departure from the plan in any material particular. It would be a material departure if a system for four houses were sanctioned and one of the group of four was left out and two others were brought in ("Bullock v. Reeve"). At the same time, it had been held in the case of "Wilson and Music and General Printing Co. v. Finsbury Borough Council" (1910) that a person could

not take advantage of his own wrongful act, as in the making of an unauthorised connection. Proceeding to touch on the London Building Acts, 1894, 1898, and 1905, Mr. Naldrett said he could only briefly indicate the matters dealt with, because the principal Act of 1894 contained nearly 200 sections and schedules. The Act was divided into sixteen parts. Part II. governed the formation and widening of streets, and Part III. dealt with the important matter of the lines of building frontage. Without the consent of the County Council no building could be erected beyond the general line of buildings in a street, place, or row of houses in which it was situated in case the distance of such line of buildings from the highway did not exceed 50 feet, or within 50 feet where the line of building was 50 feet or more from the highway. This was necessary notwithstanding that there were gardens or vacant spaces between the line of buildings and the highway. The section did not apply to the re-erection of a building or a site lawfully occupied, but when a projecting building was taken down the Council might require the new building to be set back and the owner might be entitled to compensation. Part VI. dealt in great detail with the construction of buildings, but it was useful to note that the London County Council General Powers Act, 1908, contained provisions in relation to the erection of large buildings of the warehouse class. In many parts of the Metropolis land was so costly that neighbouring owners agreed to have one wall instead of two for the superstructure of a building, and this was called a party wall. The rights of owners in relation to such walls were regulated by the provisions of Part VIII. of the Act. The Metropolis was divided into districts, for which district surveyors were appointed, and extensive powers were in the hands of the County Council in relation to these districts and surveyors. Speaking generally, every building and all matters in relation to the width and formation of streets, the general line of buildings, the provision of spaces about buildings, the height of buildings, and so on, were subject to the supervision of the appointed district surveyor. These district surveyors were persons having statutory duties, and they were not the servants of the London County Council. The Act of 1898 contained a few amendments of the earlier Act, whilst the Act of 1905 was directed generally to the provision of means of escape in case of fire in connection with buildings. By means of the Public Health Acts and other Acts relating to the Housing of the Working Classes, the Legislature had from time to time effected important improvements in the dwellings of the working classes, particularly in populous districts where insanitary conditions prevailed. These Acts, however, had been mainly directed to the removal of existing evils, but with the passing of the Housing and Town Planning Act a new departure had been made. The object of the town-planning provisions as described by the Local Government Board was to ensure by means of schemes, which might be prepared either by the local authority or by the landowners, that in future land in the vicinity of towns should be developed in such a way as to ensure proper sanitary conditions and to have regard to the amenities and convenience of the neighbouring lands. Hitherto the conflicting interests of different owners and the absence of any power on the part of the local authority to guide and control such development had resulted to a considerable extent in the development of estates with a sole regard to the immediate interests of the particular estate and without regard to the amenity and convenience of neighbouring lands. The Town Planning Act involved a material difference in the relations between the owners of land and local authorities, and enabled each party to co-operate with the other in promoting the general interest. The importance of such co-operation was fully recognised by the Act, and Section 56 provided for securing this co-operation by conferences and otherwise. He thought it might safely be assumed that land in the course of development as a building estate fell within the town-planning part of the Act. Mr. Naldrett proceeded to refer briefly to the different sections of the Act, and pointed to the fourth schedule as showing the large number of matters which might be dealt with under a town-planning scheme. The Local Government Board had issued regulations which were of a somewhat complicated character, but which anyone who intended to proceed under the Act ought to very carefully study. The President of the Local Government Board was very hopeful about the Act, and it was stated that thirty-one local authorities were taking action under its provisions. The machinery was necessarily of an elaborate character, but the proceedings were certainly of a very elastic kind. The central authority was invested with powers over owners and their property of a far- and wide-reaching description,

and its decisions were often final and could not be revised by a Court of Law. The authorities entrusted with the administration of the Act would be face to face with the persistent difficulty of harmonising conflicting interests. If there were any present who aspired to become successful town planners they would have the opportunity of exercising their best abilities, and he thought the widest experience might be turned to profitable account. There would be an opportunity of developing hygienic principles and of exercising a great deal of diplomatic skill in reconciling various conflicting interests. Still, he thought the Act must be recognised as embodying a praiseworthy attempt to prevent evils arising such as in the past it had been found extremely difficult and costly to remedy.

IRON: ITS WORKER AND A PORTION OF HIS WORK.*

If we look in a standard dictionary for the word "smith" we find it defined as "one who forges with a hammer," and we learn, further, that in derivation it is akin to "smooth"—Anglo-Saxon "smoethe," "flattened with a hammer." Thus, in the earliest times in our own country, the skilled character of smithcraft was sufficiently recognised among the people for a word, at first associated with the trade, to pass into the language conveying the idea of smoothing or finishing carefully.

But, of course, we only refer to the Anglo-Saxon for the origin of the word. For the origin of the trade itself we need to go very much farther back in the world's history. In fact, it is impossible to say definitely when and where the smith first plied his trade.

Probably iron had been discovered in its rarest form (that is, in the free state) and worked in small quantities centuries before the first smelted iron was extracted from its ore. We know that meteors are constantly falling into the atmosphere from outer space. These are generally of considerable size, and being heated to incandescence in their terrific plunge earthwards, they are seen to burn themselves out as falling stars at night-time. In rare cases, however, these wandering bodies are large enough to reach the earth unconsumed, and when examined, are very often found to consist of iron, practically pure, or alloyed with nickel.

In this form, however, iron can be looked upon as a precious metal, and as such is hardly in the scope of our present sketch. Suffice it to say that it was used by the ancients for articles of adornment, such as finger-rings, the meteoric origin being proved by the presence of nickel.

In the earliest days of smelted iron, the smith's treatment of the metal was chiefly for utilitarian purposes, his efforts in ornament being almost entirely confined to bronze, copper, gold, &c.

The knowledge of smelting and working iron, like most other arts, comes from the East. Iron was specially valued for purposes of war, of which, indeed, it was regarded as the symbol, being poetically called "Mars" by the Romans. It is interesting to note, in passing, that the Romans associated other metals with the characteristics of their gods. Thus, lead was sometimes called "Saturn," and copper "Venus," whilst one instance of this Roman nomenclature has actually survived to our own time, quicksilver still being called "Mercury."

We can only conjecture how the art of smelting iron was discovered. Who first applied fire to the ore and made it plastic no one can tell.

Robert Mushet, in his "Papers on Iron and Steel," says that it is probable that the discovery was made through the accidental burning of a wood in Greece. "For," says he, "if a mass of iron ore were accidentally dropped into the middle of the burning pile during a period of neglect, or during the existence of a thorough draught, a mixed mass, partly earthy and partly metallic, would be obtained, and, if the ore were rich in iron, this mass might be of perfectly malleable iron."

Later researches tend to show that iron was used in the age of the Mycenaean civilisation, which preceded that of Greece by a thousand years, and belonged chronologically to the Bronze Age; whilst if we can trust Chinese historical documents, we must believe that one Fuh-he accidentally smelted iron when destroying a forest by fire, and made use of it for weapons, exactly as in the Greek tradition, but some two thousand years earlier.

And again, Tubal Cain, seven generations in descent

* Read before the members of the Incorporated Clerks of Works Association on January 9 by A. Percy Witchell.

from Adam, is referred to in Biblical history as "an instructor of every artificer in brass and iron."

However, the metal and its uses once discovered, many attempts would be made to give to that which had probably been the result of an accident, the permanence of a definite process, and the fact remains that the knowledge of its treatment in a greater or less degree is found in all parts of the globe.

The low conical furnaces employed at this day by some of the tribes of Central and Southern Africa are, perhaps, very much the same in character as those adopted by the early smelters of all countries when iron was first used. Small openings at the lower end of the cone to admit air and a larger orifice at the top would, with charcoal, be sufficient to produce the requisite degree of heat for the reduction of the ore. Blasts of different kinds follow as inventiveness grows.

The simpler the smelting, the better appears to be the iron. Dr. Livingstone found the natives on the Zambesi refuse English iron, preferring their own, a sample of which was pronounced by a skilled British smith to strongly resemble the modern Swedish iron, whilst the famous "Wootz" or steel of India, from which Damascus sword blades were made, possesses qualities which no European steel can surpass.

Captain Cook, in his voyages, however, discovered islands in the South Seas where iron was unknown. After expressing surprise at the eagerness which the natives displayed for iron, he says that "a nail would buy a good-sized pig, and for iron tools everything upon the Freewill Islands that could have been brought away might have been bought. One native lurked about for days watching the opportunity to steal a coal rake, and an Otaheitan chief, who had given two nails, received no small emolument by letting out the use of them to his neighbours for the purpose of boring holes when their own methods failed."

Dr. Eric Marshall, of the British Expedition now exploring hitherto unknown parts of Dutch New Guinea, says, in a letter published last month, that he came across a race of pigmies whose only metal tool consists of a small wedge-shaped piece of iron, 1 inch by 2 inch, inserted into a wooden handle, answering the purpose of an axe. With this alone they had made a 20-acre clearing from an apparently impenetrable forest, many of the trees of which were at least 12 or 15 feet in circumference, "and," says he, "none but those who have worked and toiled in this dense jungle can really appreciate the perseverance and patience necessary to accomplish this." Dr. Marshall further tells us that these valuable scraps of iron were bartered to the inhabitants by coast-trading natives in exchange for one or more of their women per piece. Evidently, we have here a state of society not yet advanced from the age when iron was considered a precious metal.

The early history of iron in Britain is necessarily very obscure. It appears to have been worked before the time of the Romans, although the stories told of ancient British chariots armed with swords and scythes must be taken to refer to bronze weapons, as iron certainly was not worked in sufficient quantities for equipping armies, or, at any rate, its existence to that extent is not borne out by contemporary facts. The Romans themselves frequently had recourse to weapons of bronze, as they could not obtain iron in sufficient quantities. According to Cæsar, the British used as their only money pieces of brass and iron reduced to standard weight.

In commenting on this latter fact, in his "Wealth of Nations," published in 1776, Adam Smith said, "There is at this day a village in Scotland where the workmen carry nails instead of money to the baker's shop or the ale-house."

Remnants of the earliest form of iron-smelting survive in the cinder-heaps of the Forest of Dean and in parts of Sussex, notably at Maresfield. In the latter place coins of A.D. 69 have been discovered among the heaps, affording indication of very early workings.

No mention of smelting in Sussex is made, however, in the Domesday Book, which circumstance points to the fact that its manufacture there ceased, for the time being, at the Conquest.

Very early in the Middle Ages we find the smelting and working of iron being carried on in other places widely separated, in many instances under the supervision of monks and sometimes with their active co-operation. Did not St. Dunstan have a forge even in his own bedroom at Glastonbury and, when the Devil came to tempt him, did he not seize his Satanic Majesty with red-hot pincers, so that he fled in pain and terror?

Another monk, Anketil by name, of St. Albans in the

fifteenth century made work of such excellence that it was consecrated to St. Peter, and, being presented to the Pope, the means of obtaining high ecclesiastical distinction for the Abbey at St. Albans.

In the thirteenth and fourteenth centuries, however, the iron industry revived in Sussex, which eventually eclipsed all other iron-producing districts of the country in its output. In the neighbourhood of Ashburnham from Ashburnham to Crowborough supplied both iron and the timber for working it; and these works remained the most important in the country until the discovery of iron smelting by pit-coal.

Simon Sturtevant, in his "Treatise of Metallica," published in 1612, says that the whole number of iron-mills in England and Wales numbered 800, of which 400 were in Sussex, Kent and Sussex.

John Norden, in his "Surveyor's Dialogue" (1607), reports that Sussex alone contained nearly 140 hammers and furnaces for iron, each of which consumed every twenty-four hours from two to four loads of charcoal, "which," he remarks, "amount to an infinite quantity in a year."

Probably the largest contract executed in Sussex was the casting of the iron rails which enclose St. Paul's Cathedral, in the early part of the eighteenth century. This work was distributed among several contractors, but the principal part of the casting was carried out at the Gloucester furnace at Tunbridge Wells, the owner of which, John Legas, made a large fortune. These railings cost over £1000.

During the sixteenth century timber had been growing in Sussex, for it was still being used for domestic purposes, as in the case of pit-coal was thought poisonous when burnt in dwellings. So in 1581 an Act was passed to restrict the consumption of wood for smelting purposes within fourteen miles of the Thames, and forbidding the erection of new ironworks within twenty miles of London.

This Act caused a migration of smiths to South Wales. The Sussex iron industry dragged on, however, till the middle of the seventeenth century, when the statutes regarding consumption of fuel were once again rigorously enforced. About the same time the division of Cromwell's army under Waller led to a systematic destruction of all works belonging to royalists, and the combination of hostile conditions practically ended iron smelting in Sussex.

Only eighteen furnaces remained in use in 1664, ten in 1700, and in 1788 there were only two. The last to survive was that at Ashburnham, where, though the furnace was blown out in 1811, the forge was not abandoned till 1822.

The Simon Sturtevant before mentioned seems to have been the pioneer of smelting by coal. At all events, he secured a patent for his process. But although he was, perhaps, correct in theory, his application of it proved a failure.

It is, therefore, to the year 1620 that we must look for the most important step in the history of iron in this country. That year Lord Dudley obtained a patent for thirty-one years for a process suggested by his son, Dud Dudley, and the latter successfully worked it out in the neighbourhood of the town of Dudley and also at Cradley.

His manufacture of iron by coal smelting caused quite a roar among his rivals, who tried unsuccessfully, first to have his patent set aside, and then to ruin him.

Dud's perseverance in the face of opposition, law-suits, calamities and misfortunes was remarkable. His rivals continued to leave no stone unturned to harass him, and eventually got him imprisoned. Charles I. took pity on him, and for a time he carried on his work under the protection of that monarch; but the royal patronage was not to avail him long, and having sided with his King during the Civil War he eventually suffered further imprisonment and the confiscation of his estates.

Nevertheless, as the sole possessor for more than a generation of the secret of successfully smelting iron by coal, the name of Dud Dudley stands out prominently in connection with the history of English ironwork.

About the year 1656 others solved the problem or secured the secret, and thus the treatment of iron by coal developed on its own time.

We have to remember, however, that at this period, as well as in more modern times, much of our iron was imported and only smelted, principally from Sweden.

(To be continued.)

THE "PALLADIUM" ELECTRICAL INSTALLATION.

THERE has just been completed at the recently opened Palladium Theatre of Varieties, Argyll Street, Oxford Circus, W., an electrical installation, which in some respects is unique, and quite in keeping with the reputation of Messrs. Siemens Brothers. The building was erected from the designs of Messrs. Frank Matcham & Co. at a cost of about 250,000*l*. The features of the electrical stage equipment consist of an electric lift, "bunch lights" and proscenium lights, in all 2,400 electric glow lamps, mostly in three different colours. In addition there are eighteen arc lamp projectors, nine being on the stage and nine in the auditorium. In accordance with the scheme of decoration throughout the house the firm designed and made at their Dalton works fittings of the Georgian type. The auditorium is lighted from the roof by means of two 50-light handsome brass electroliers, each 12 feet high and 9 feet in diameter, as well as by a large number of smaller fittings. Holophane reflectors play a large part in the distribution of light. All the glow lamps, of which there are no less than 4,000, are of the Siemens "Tantalum" and "Onewatt" metal-filament types, giving an illumination of about 100,000 candle-power. In addition to the electric lighting there are also several telephone systems and electric bell circuits. The wiring work was sublet to Messrs. Rashleigh Phipps & Co., of Oxford Street.

The stage switchboard is probably the largest of its kind that has yet been installed in this country, and it controls incandescent lights and arc lamps, taking approximately 2,100 amperes at 110 volts. Arrangements have been made by means of "block-out" switches to obtain the necessary scenic effects, and nearly the whole of the lights can be switched on and off simultaneously. The supply is from the three-wire system of the St. James and Pall Mall Co., at 110 to 220 volts, with a small alternative supply for the house lighting. Adequate precautions have been made against the danger arising from a short circuit by the introduction in each of the 90 circuits of double pole fuses of the Siemens "Zed" type and a single-pole knife switch.

The complete regulation of the stage lighting in respect of colour, dimming, and illumination is effected by the stage regulator, the most important electrical part of a theatre installation. This apparatus centralises the whole of the stage lighting fittings, and permits of producing in each separate group of lamps entirely in accordance with the will of the operator, all desired variations and combinations of light intensities and colours. The dimmer resistances used here differ in construction from those usually employed, metal resistances being substituted for liquid resistances. The total current arranged for on the Palladium stage regulators is 1,140 amperes.

A portion of the stage floor, 20 feet by 10 feet, is being arranged as an electrically driven lift, capable of sustaining a load of 20 tons. It is operated by a Siemens electric motor.

This arrangement facilitates the removal of scenery and properties to the basement, and provides for special scenic effects. A complete suction cleaning service is installed all over the auditorium, saloons, corridors, &c. The "Vortex" cleaner machine in the basement is directly driven by a 5 horse-power 220 volt continuous current motor, and the dust, &c., is passed through a mixing chamber directly into the drains. A number of "Lightning" arc lamps are provided. These lamps are connected to a multiple way switchboard. This switch is of the rotating type, and when the handle is moved round rapidly the lamps are switched on in rapid succession and a forked "lightning" effect is produced.

To assist in the ventilation of the auditorium typhoon fans to the number of fifty are to be mounted on the ceilings under the balconies, and a number of table fans are provided for the saloons, &c. As previously mentioned the main boards are equipped with "Zed" fuses. These boards are the last word in goods of this kind. The board cases are of hand polished teak, or sheet or cast iron, and are asbestos-lined glazed with plate-glass and fitted with circuit labels and strong lever locks, in accordance with the architects' specifications, although the cases have been asbestos-lined in deference to former practice. This is superfluous in view of the absolute safety which the "Zed" fuse guarantees. There is also an adequate installation of telephonic communication between the various parts of the house.

It is stated that a large new music-hall is to be shortly erected in the centre of Bristol by the syndicate headed by Mr. Oswald Stoll.

The Medway Guardians have adopted plans for extensions of the infirmary to cost 1,350*l*.

THE LATE MR. ANDREW MURRAY.

WE regret to announce the death of Mr. Andrew Murray, F.R.I.B.A., of 9 Marlborough Hill, N.W., the late surveyor to the City of London. Mr. Murray was seventy-two years of age, and was in the Corporation employ for fifty years. Entering at the Guildhall as a lad, he completed fifty years' service and retired in 1905. No surveyor of the Corporation had a better knowledge of the City estates. Buildings designed by him included the City of London Court, various buildings at the Stone Asylum, Dartford, Kent; City of London Girls' School on the Embankment, the extensions to the Guildhall School of Music, and numerous smaller buildings in connection with the Corporation.

NEW CATALOGUES.

A most commendable spirit of co-operation between architect and manufacturer is shown in the "Book of Gates" issued by E. C. White, of the Canal Wharf, Basingstoke. The book is artistically produced and contains twenty designs for wooden gates which have been made by Mr. A. Jessop Hardwick, F.R.I.B.A. The illustrations that have appeared from time to time in our columns of that architect's work show it to be refined, especially in its details. That same spirit is exemplified in the single and double gates shown in the small booklet. Each design possesses distinction while still retaining an air of restraint. Any one of the gates, with their hand-made ironwork, would be an ornamental accessory to a house. The book gives the necessary dimensions, and the net price in oak and deal. Mr. E. C. White is ready to quote special estimates for variations in sizes in any of the patterns, for customer's own designs or for lots of six sets and up.

THE latest booklet issued by the Old Delabole Slate Co., Ltd., is more concerned with the present than the past. For with the exception of one or two occasional references there is little stress laid on the notable fact that the quarries are the oldest in the country, having been opened in 1555. Such letterpress as there is, however, does not omit to point out that while immortality is claimed for artificial roofings on the strength of a few years' experience, Old Delabole slates which were laid a couple of centuries ago are still in excellent preservation. But the main purpose of the booklet is to prove the quarries' popularity among contemporary architects and the slate's suitability for the most exacting needs. This is chiefly done with the aid of very interesting photographs showing different jobs on which they have been more or less recently used, and by the inclusion of an imposing list of important Government, public, and private buildings which testify to the quality of "Old Delabole" slate. Delabole was the first quarry in the British Isles to make a speciality of the rustic, random, and diminishing course roof, and the proprietors have always sought to make their slates compatible with artistic effects.

MESSRS. JOSEPH GRIGGS & CO., LTD., timber importers, &c., Loughborough, have issued a new 56-page catalogue of mouldings and prepared joinery, which should prove of value to prospective customers. The mouldings turned out by this firm are manufactured from best seasoned red deal and perfectly finished off by hand after leaving the machines. The greater number of the pages are illustrative of these mouldings as made for purposes like architraves, panels, skirtings, and handrails. Towards the end of the book, however, room is found for windows, doors, entrance gates, newels, balusters, and wood-block flooring. Messrs. Griggs & Co. are contractors for every description of wood-block flooring and paving, and are prepared to execute any design in any description of soft or hard woods.

RATNER SAFE CO., LTD., are able to keep pace with the ever-increasing resource of the scientific burglar and safe-breaker, as well as to successfully resist the attacks of fire. Their latest catalogue affords an instructive insight into the means taken to render Ratner twelve-corner-bent steel safes fire, fall, and thief resisting.

MESSRS. JOHN RUSSELL & CO., LTD., have issued an illustrated price-list of their incandescent gas-light fittings, burners, globes, and accessories. In addition to having numerous standard patterns the firm are willing to carry out an architect's design or to submit special designs to harmonise with the general effect. The firm have a number of patent lamps of their own, including the "Graetzin" and "Colston." Their manufactories are at Birmingham, Wednesbury, and Walsall, and they have several depots in London and the provinces.

TRADE NOTES.

A LARGE clock has just been fixed at Ashington Church, Essex, as a memorial to His Majesty the late King Edward VII. The work has been carried out by Messrs. John Stiles & Sons, Midland Clock Works, Derby, who have also restored and refixed the large clock and chimes in the tower of Ilkeston parish church.

IN the list of contracts recently executed by Diespeker Ltd., given in this column last week, we incorrectly included work at Kingsway House, Aldwych (Messrs. Gordon & Gordon, architects).

THE Board of Guardians of the Gateshead Union, having decided to improve the arrangements for the escape of inmates in case of fire, has just purchased a new specially designed fire escape of Merryweathers' "self-supporting" pattern. It has three telescopic ladders extending to a height of 40 feet, and its great feature lies in the fact that it can stand entirely self-supported, with a man at the top of the ladders, without resting against a building and without the aid of props and poles. The ladders are strengthened with the makers' patent bow-spring girder truss which imparts great rigidity and strength to the ladders without materially adding to the weight. The machine can be run and worked by one man if necessary, and is claimed to be the lightest and handiest self-supporting escape extant.

THE Local Government Board has sanctioned the application of the Ashington Council to borrow 2,628*l.* for the Council offices, and 252*l.* for its furnishings.

THE Three Towns Tenants, Ltd., propose to acquire five acres at Ernesettle, St. Budeaux, for a garden city. A scheme for developing the estate has been prepared by Mr. Leigh Fouracre, A.R.I.B.A.

A SCHEME for relaying the drainage system at Berry Wood Asylum, Northants, is under consideration. A report recently prepared by Mr. J. A. Gotch, F.R.I.B.A., and Mr. Tindale, M.Inst.C.E., severely criticising the existing arrangements. The cost will be nearly 2,000*l.*

THE Southampton Town Council have adopted a competitive design (No. 3) for the proposed tea-house on the Common. Detail plans are to be prepared and tenders invited previous to the Local Government Board inquiry into the application for the necessary loan.

THE Mount Park Estate, Bexley Heath, Kent, is being developed on the lines of a garden suburb according to a scheme prepared by Mr. E. Box, architect, Bexley Heath. The estate comprises 92 acres.

Two fine etchings have been given to the Victoria and Albert Museum, one, Mr. D. Y. Cameron's "The Chancel of Amiens," and the other, Mr. Frank Brangwyn's "The Rebuilding of the Victoria and Albert Museum," presented by the artist.

MR. J. T. BLACKWELL, architect, Kettering, has prepared the design for the proposed church of All Saints at Kettering. The entire scheme is estimated to cost 9,000*l.* A start will be made when about half that sum has been collected with the first portion, consisting of nave, north and south aisles, and transepts.

A SERIOUS fire took place on Wednesday morning last at the timber yard of Messrs. Ashworth, Kirk & Co., in the London Road, Nottingham. The yard, which covers some five acres of ground, is one of the largest in the Midlands and adjoins the Midland and Great Northern Railway. The damage is estimated to be about 50,000*l.* The heat was so intense that the railway lines buckled, disorganising the local train service.

THE Association of Midland Local Authorities, at a meeting last week agreed that plans and estimates of cost for the construction of the proposed main road from Birmingham to Wolverhampton, including the "ring" road in Birmingham, be prepared by the city engineer of Birmingham, the borough engineer of Wolverhampton, and the surveyors of Dudley, Coseley, Tipton, Rowley, Oldbury, and Smethwick. The Road Board have offered to contribute 30,000*l.* towards the cost, which is calculated at about 100,000*l.*

THE Bolton Corporation have under consideration a plan prepared by Mr. E. L. Morgan, the borough engineer, for the erection of a block of nine workmen's dwellings at a cost of 100*l.* each. The accommodation downstairs would include a large kitchen 17 ft. 2 in. by 14 ft.; and leading off from there would be a small scullery. Two bedrooms would give a superficial space of 109 ft., and cubical 931 ft., and 100 ft. superficial, 841 cubical respectively. The kitchen floor would be wood block on concrete.

ENTRANCE, FARNLEY PARK, NEAR OTLEY.

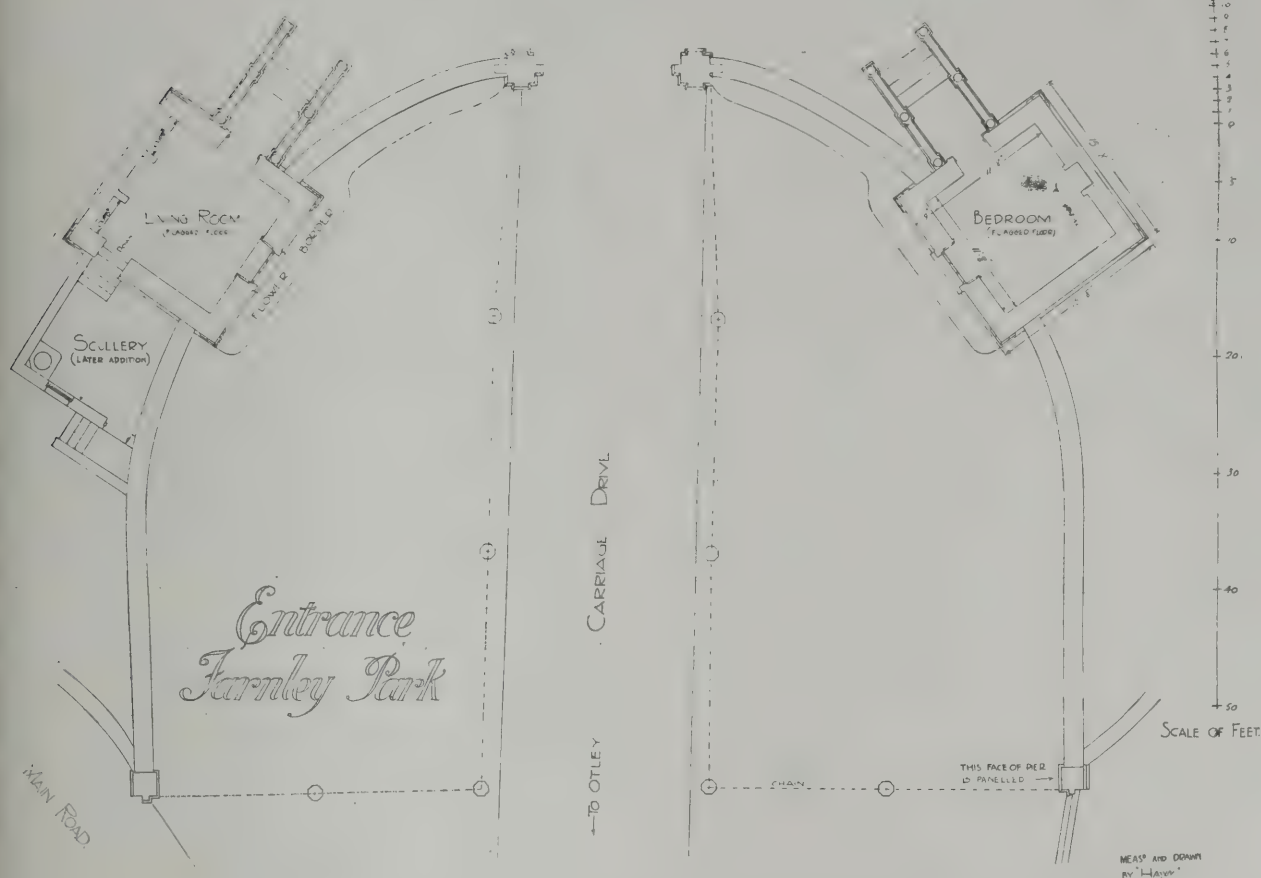

THIS is one of the entrances to Farnley Park, and so forms one of the approaches to Farnley Hall, a beautiful house of the Elizabethan period, which has been added to in later times.

The entrance consists of lodges, boundary wall, and gate piers. There is an iron gate between the main piers, but as it is of recent date and not of very good design it has not been shown on the drawings. The whole, as shown, is of local sandstone, the quoins and dressings generally being tooled, and the walling being of punched stone. Both lodges are treated alike, and over the doors and windows we find a panel containing a coat of arms, a figure of a hawk—the crest of the Fawkes family, in whose possession the estate is—and the date. The coat of arms and the hawk, on inspection, prove to be wood. The date—in stone—is 1618. Local stone slates have been used in roofing, in conjunction with stone ridging on hips—the whole being surmounted by a stone finial. The chimney in each case seems to be of later date than the rest, and the scullery (shown on plan) is also quite modern, and is kept low so that it does not show above the boundary wall. Internally, there is very little of interest. The rooms are each 10 feet 6 inches high, with plain walls and ceilings, and have flagged floors. The fire range in the living room is not the original one, but at the back of the fire, in a good state of preservation, is an iron plate with traces of a very refined ornament, somewhat of an Adams type. The bedroom fireplace has also an Adams feeling about it.

THE fourth abstract of Foreign Labour Statistics, issued by the Board of Trade, includes a table giving the percentages of total occupied population for the principal groups of occupations in seven foreign countries and in the United Kingdom. The figures relating to "Building and Works of Construction" are as follows:—France, 4.20; Germany, 6.99; Austria, 2.96; Hungary, 1.48; Italy, 5.02; Belgium, 7.28; United States, 4.43; and the United Kingdom, 6.77.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

FARNLEY PARK

THE INSTITUTION OF CIVIL ENGINEERS.

At an ordinary meeting of the above Society, Mr. Alexander Siemens, president, in the chair, the papers read were "The Strengthening of the Roof of New Street Station, Birmingham," and "The Reconstruction and Widening of Arpley Bridge, Warrington," by Wm. Dawson, M.Inst.C.E. The following are abstracts of these papers:—

The roof of New Street Station, erected in 1852-3, is the prototype of the one formerly existing over Charing Cross Station, and is of the bowstring girder type, of 212 feet span. Having regard to the results of the Board of Trade inquiry into the failure of one of the tie-rods of Charing Cross roof, it was deemed advisable, as a precautionary measure, to fix auxiliary tie-bars to the principals, especially as they were of somewhat lighter construction than accorded with modern practice. The tensile stress in the main tie-rod due to dead load, painters' scaffolding, and a horizontal wind-pressure of 40 lbs. per square foot was 6.93 tons per square inch, whilst the corresponding stress in the arched rib was 3.07 tons per square inch, and it was therefore considered that the former alone need be strengthened. Auxiliary tie-bars were accordingly fixed to each principal, by means of scaffolding suspended directly from the arched ribs of the principals by wire ropes, so as to avoid all interference with the traffic on the lines or platforms below. This scaffolding was moved forward from principal to principal as the work proceeded, without being lowered to the platforms. In order to avoid placing additional stress on the existing tie-rods owing to the weight of the scaffolding, temporary steel hawsers were secured to the feet of the principals and stressed to an amount which counteracted the effect on the tie-rod of the weight of the scaffolding. The auxiliary tie-bars were formed of two 6-inch by 3-inch steel bars placed on edge, and in order that a certain definite amount of relief might be given to the existing tie-rods an initial stress was put in the auxiliary tie-bars and accurately measured by means of calibrated springs. While this work was in progress the principal was lifted and suspended clear of its bearings by means of a derrick, so that the full tensile stress might be developed in the tie-bars, and not be partly absorbed in tending to draw over the head of the column on which the principal rested. The new tie-bars were secured to the existing principals by means of 2½-inch diameter pins, which passed through the shoe of the roof principals.

The London and North-Western Railway Company's line, over which the heavy traffic passes between Liverpool, Garston, and the Manchester and Yorkshire districts, crosses the river Mersey at Warrington by a girder bridge of 180 feet span, erected in 1853 from designs by the late Mr. John Lister.

The bridge formerly consisted of three main girders with a suspended timber floor to which the permanent way was directly attached, and as the working of the goods traffic necessitated the use of a heavier class of engine than had hitherto been employed, it became necessary to strengthen the bridge and at the same time to widen it, so as to provide the clearance between the girders required by the minimum construction gauge.

Various schemes for this purpose were considered, bearing in mind the necessity of maintaining the railway traffic across the bridge and avoiding interference with navigation below. It was ultimately decided to substitute new girders for the existing face girders, and by means of overhead girders connected with the top booms of the new girders to transfer to the latter a portion of the load that would otherwise be carried by the centre girder, which was already overloaded. A new steel floor was also to be provided.

The method of carrying out the work at site is perhaps the most interesting feature. This was accomplished by first closing one of the lines over the bridge and erecting the new face girder on the existing floor, all traffic being meanwhile worked over the other line.

After the first girder had been completed, the portion of the floor on which it was built was cut away, and the old face girder was removed in the following manner: One end was placed upon a trolley, and barges, on which a suitable stage had been built, were floated underneath the other end at low water. The rising tide lifted this end off its bearings, and it was then pulled on to the opposite abutment by a locomotive running on the ordinary line of rails.

The new face girder was next placed in its final position, and the first half of the new steel floor was fixed, after which the permanent way was restored and all traffic was diverted over the strengthened portion of the bridge. The other half of the bridge was dealt with similarly. When this work had been completed steps were taken to relieve the old centre girder permanently of such an amount of load as would ensure that under no conditions of traffic would the stress in the bottom flange exceed 5 tons per square inch.

INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING, AND REPAIRING OF CHURCHES AND CHAPELS.

THIS Society held its usual monthly meeting on the 19th inst. at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair.

Grants of money were made in aid of the following objects, viz.:—Building new churches at Forest Town, Notts, 80l.; Higham Hill, St. Andrew, Walthamstow, Essex, 150l. for the first portion; Langley Mill, St. Andrew, Derbyshire, 90l.; Hanley, All Saints', Staffs, 200l.; and Sneinton, St. Christopher, near Nottingham, 100l.; rebuilding the churches at Blackrod, St. Katharine, Lancs, 80l.; and Rochdale, St. Mary, Lancs, 150l.; and towards enlarging or otherwise improving the accommodation in the churches at Camberwell, St. Bartholomew, Surrey, 40l.; Chobham, Holy Trinity, Surrey, 5l.; Kingston Hill, St. Paul, Surrey, 50l.; Letchworth, Herts, 15l.; Pirton, St. Mary, Herts, 25l.; Somersham, St. John the Baptist, Hunts, 20l.; Ilkeston, St. John the Evangelist, Derbyshire, 70l.; Ilkeston, St. Mary, Derbyshire, 70l.; and Llanddewi, St. David's, Denbigh, 20l. A grant of 25l. was also made from the special Mission Buildings Fund towards building a mission church at Sandwith, St. Bega, Cumberland. The following grants were also paid for works completed:—Pendleton, St. Ambrose, near Manchester, 130l.; Ewood, St. Bartholomew, near Blackburn, 100l.; Whiston, St. Mildred, Staffs, 35l.; and Penrhiwceiber, St. Winifred, Glam., 30l. In addition to this the sum of 396l. was paid towards the repairs of 21 churches from trust funds held by the Society.

The appointment of Mr. Walter Tapper, A.R.I.B.A., as a member of the Committee of Honorary Consulting Architects of the Society was confirmed at this meeting.

LONDON MASTER BUILDERS' ASSOCIATION.

The usual monthly meeting of the Council was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, the 19th instant, under the chairmanship of Mr. Leonard Horner (President). Deep regret was expressed at the death of the late Mr. John Howard Colls, Past President of this Association, and a prominent supporter of all the building trade organisations. Sincere sympathy was felt for the members of his family. Mr. William Shepherd was elected a trustee for the reserve fund, in place of Mr. Colls. It was decided to hold the annual dinner at the Whitehall Rooms, Hotel Metropole, on Thursday, February 23 next, and the annual general meeting at Koh-i-Noor House on Monday, February 27. The draft of the annual report was submitted, amended, and approved.

OPENINGS IN JAPAN.

THE British Acting Commercial Attaché at Yokohama (Mr. R. Boulter) has furnished particulars of the Japanese Budget for 1911-12, from which the following items are extracted, in the *Board of Trade Journal*:—

Railway Special Account:—Extension works, 2,340,000l.; improvement works, 2,840,000l.

Department of Agriculture and Commerce:—Extension of Wakamatsu iron and steel works, 180,000l.

Department of Finance:—Construction of new parliamentary buildings, 40,000l.; construction of customs piers at Kobe, 20,000l.

War Department:—Reconstruction of military schools and other institutions, 52,000l.

Home Office:—Improvement of Shimonoseki Straits, 50,000l.; construction of explosives warehouse, 25,000l.; river improvement, 75,000l. (an additional expenditure of 500,000l. on this work is stated to be probable, to be defrayed out of existing funds).

Department of Justice:—Construction of four new law courts, about 50,000l.

A HIGHER elementary school is to be provided for 150 scholars in the Clay Cross district by the Derby County Education Committee.

THE Goole Urban Council last week adopted the plans and estimates prepared by Mr. Midgley Taylor, civil engineer, of a new sewerage scheme, which is estimated to cost 35,000l. The work will be carried out in sections.

DIARIES, REFERENCE BOOKS, AND YEAR BOOKS.

The Practical Electrician's Pocket Book (London: S. Rentell & Co., Ltd.) has again been thoroughly revised and enlarged for 1911, the duty of checking each section being, as usual, relegated to an expert in the particular branch of the subject to which that section refers. There are several improvements on last year's thirteenth edition. The particulars of central stations now include the names of the resident engineers-in-charge. The winding and repair of armatures is exhaustively treated in a practically written section. The chapters on arc lamps and telephones have also been revised. The diagrams throughout the book are excellent. Finally, there are Lundbergs' latest switch wiring diagrams to solve many an apparently difficult wiring problem. The very compact Pocket Book and Diary for 1911 caters more than ever before for the requirements of the electrical fraternity in general.

Messrs. Pinchin, Johnson & Co., Ltd., have issued an exceptionally neat combined diary and notebook under the title of the "Minerva." Its appearance may fairly be described as handsome, and it is at the same time essentially a practical pocket diary. The only possible criticism would seem to lie in the slip-on rubber band, which would be liable to get lost. The Diary includes some useful information concerning the firm's varnishes, colours, paints, and other productions. A copy of this compact Diary may be obtained by any bona-fide architect, builder, or decorator, who sends his card.

The Wouldham Cement Co., Ltd., have again printed their Gargantuan hanging calendar, with its bold 9-inch numerals, which might be read at the far end of a good-sized office.

The *Ironmonger Diary* makes a volume of more than 600 pages. The diary portion is interleaved with blotting-paper, and gives three days to each page. It is preceded by fifty pages of literary matter of trade interest.

IRON: ITS WORKER AND A PORTION OF HIS WORK.*

(Continued from last week.)

HAVING dealt with the metal let us now turn to its worker.

We have seen that his early connection with iron was mainly in the manufacture of arms, and, in consequence of his close connection with the implements of war and the making of tools, the smith plays an important part in the world's history. Indeed, his trade has never been looked upon as an ignoble one, and his industrial position has always ranked high.

In Anglo-Saxon times "the smith a mighty man was he" in more than one sense. He made and mended weapons used in the chase and in war; he forged the coats of mail and the cuirasses of the chiefs, and welded their swords. We read that his person was protected by a "double penalty." He was treated as an officer of the highest rank and awarded first place in precedence. He sat at table with the King and Queen, next to the domestic chaplain, and even in that early day there seems to have been a hot spark in his throat which needed quenching, for he was "entitled to a draught of every kind of liquor that was brought into the hall."

William the Conqueror owed to the smith no small share of his victory at Hastings. We read of Henry de Ferrars, one of the officers supervising William's farriery, being created an Earl, and the coat of arms of his descendants contained six horseshoes indicative of their origin.

In the latter part of the Middle Ages our friend's work became more varied. He was "the rivet that held Society together." Nothing could be done without him. For building, trade and husbandry his aid was sought. In remote parts we find him combining the duties of farrier, tool maker, agricultural implement maker, veterinary surgeon, dentist, and sometimes those of parish clerk.

Shakespeare, in "King John," intimates that he was the recipient of news and the news-monger of the time:—

I saw a smith, holding his hammer thus,
The whilst his iron did on the anvil cool,
With open mouth, swallowing a tailor's news.

Mention of the smith as parish clerk carries the mind to more modern times and reminds us of the famous smith of Gretna Green, to whom eloping couples repaired to be married. The ceremonies were carried out by the side of the anvil, and what could be more fittingly symbolical of the welding of two lives into one?

* Read before the members of the Incorporated Clerks of Works Association on January 9 by A. Percy Witchell.

Later, naturally, our craftsman began to specialise in particular branches of his work, and these specialists kept to their various districts. Thus swords, tools, bits and nails were made in and around Birmingham, knives at Sheffield and so forth. Chaucer, who died in 1400, speaks of a "Sheffield Whittle."

This segregation led to the smiths being named according to their various specialities, such as arrowsmiths, shoemsmiths, &c., a tendency which would seem to have persisted to the present day, as an advertisement recently appeared in a daily paper for a "perambulator smith," a delightful instance of modern developments in this direction, if the "specialist" was required to do no more than forge the far from intricate ironwork to be found in a most useful domestic article.

With all these branches of smithcraft, it is not surprising to find the word passing into surnames in a multitude of ways. Thus we have the Smiths and Smythes of England, and the Gows, Gowans and Cowans of Scotland, the Nasmyths, Spearsmiths, Arrowsmiths, &c.

We have all of us at some time or other read statistics, funny or otherwise, relating to the number of Smiths in various directories, what might happen if all the people of that name were to suddenly become of one mind and act conjointly, together with other far-fetched speculative ideas. Well, when we consider that in 1620 there were 20,000 smiths in and around Dudley alone, it is not surprising to find that this year's Kelly's "Directory of London" gives 2½ columns of Mr. Smiths engaged in various businesses in London and its suburbs.

Was it not Mr. Chesterton who wrote somewhere or other, "The brute repose of nature, the passionate cunning of man, the strongest of earthly metals, the weirdest of earthly elements, the unconquerable iron, subdued by its only conqueror, the wheel and the ploughshare, the sword and the steamhammer, the arraying of armies and the whole legend of arms, all these things are written, briefly indeed, but quite legibly, on the visiting card of Mr. Smith"? The pride of the Smiths should be immense!

From medieval times to the present day the usefulness of the smith is apparent in such a great variety of ways that it would be useless and at the same time impossible to attempt a comprehensive survey of the subject, and we can only deal briefly with his artistic work and his connection with ornament generally.

Here again we are troubled with the magnitude of our subject, and in a short sketch like the present it will be better to keep to a particular section, and to consider, say, the origin of bar- and scroll-work with the embellishments and decorations thereon, showing how by the invention of machinery and the development of processes, what was originally the work of the hand-hammer has now become that combination of manual craft with machine-rolled and stamped "raw material" (if such it can be termed), which is known as "Ornamental Ironwork" at the present day.

In accordance with the limitations just laid down, it is fair to exclude specifically consideration of cast iron, though we may not be prepared to agree entirely with Ruskin in his "Seven Lamps of Architecture" where he says:—"I believe no cause to have been more active in the degradation of our national feeling for beauty than the constant use of cast-iron ornaments. The common ironwork of the middle ages was as simple as it was effective, composed of leafage cut flat out of sheet iron and twisted at the workman's will. No ornaments, on the contrary, are so cold, clumsy and vulgar, so essentially incapable of a fine line or shadow, as those of cast iron . . . and I feel very strongly that there is no hope of the progress of the arts of any nation which indulges in these vulgar and cheap substitutes for real decoration."

Such was Ruskin's sweeping condemnation of cast iron. But that there is an art and a delicate art in cast iron stands without doubt. Splendid specimens of the most dainty jewellery of cast iron, for instance, can be seen in a wall case in Room 31 of South Kensington Museum, dated as of the "early nineteenth century."

To study the progress of ornament in iron through a nation's history is almost to watch the progress of that nation's civilisation.

The earliest history of ornament in iron in our own country is obscured by lack of examples, and for this we must blame the unfavourable character of our climate as much as the perishable nature of our metal.

Some few specimens of work done in the Romano-British period remain, several small articles crudely ornamented—such as candlesticks—having been unearthed in excavating,

and these must be considered among the first specimens of native work extant. Examples may be seen at the Guildhall Museum.

We are able, however, to trace the elementary inspirations of the smith, which suggested decoration combined with utility, in his treatment of door hinges, than which no ancient object wrought in iron is more frequently preserved. They probably escaped destruction on account of their being firmly fixed to the wood, and, being always before the eye, were protected from rust by tinning, gilding or other surface decoration.

Early examples of these hinges are interesting, and to follow their elaboration, first for the purpose of protection and then for ornament, is to discover considerable ingenuity in the smith of the period.

The hinges themselves would be hidden behind the stone-work and the straps placed on both sides of the door, being fastened through the wood, thus giving a strength sufficient to withstand an enemy bent on pillage or slaughter such as might, at any time, assail the church or castle.

For illustration of our early bar-work, let us take some of these hinges. First, there is the simplest form, consisting of straight or crescent-shaped straps such as still exist at Stillingfleet Church in Yorkshire. Then the more elaborate hinges from St. Albans Abbey, two of which are now in South Kensington Museum, Room 24.

The strap consists of two sets of spreading scrolls, three on each side of a central stem. The scrolls terminate in rudely formed masses, perhaps intended to imitate the head of a lizard. The central stem divides into four roughly forged leaf shapes, whilst a small bull's head is fashioned at the base of the stem, part of which is missing. An extra strap, at right angles to the main one, strengthens it near the hinge, and all the work is ornamented with cross hatchings of chisel cuts.

The elaboration to which this ornamenting of hinges developed is to be seen on the doors of Durham Cathedral. Here the whole of the door is covered with iron strapwork. The hinge straps themselves are of "C" shape, with a straight stem issuing from the centre, and dividing into several scrolls. There are two on each door and they are connected by geometric form of design consisting of a diamond, with quatrefoil centre, divided laterally and vertically by stems continuing to scrolls, each junction of scrolls also containing a tongue or leaf-shaped ornament.

These examples all date from the twelfth century, those at Durham being regarded as existing since 1135.

Although curved in design, we do not find in early hinges specimens of scrolled iron in the general modern acceptation of the term.

(To be continued.)

VARIETIES.

PLANS for the extension of Batley Boys' Grammar School have been passed. It is proposed to spend 6,000*l.* in making provision for 200 boys.

NEGOTIATIONS are proceeding between the Sunderland and South Shields Councils with a view to arranging for an extension of the Sunderland Asylum.

THE Canadian Society of Civil Engineers, comprising 3,000 members, opened a four days' session at Winnipeg, commencing on January 24. The Society is organised on the same basis as the Institution of Civil Engineers of London.

THE Board of Education approve the plans submitted by the Warrington Education Committee of a proposed elementary school in Parr Street to accommodate 1,260 pupils. It is proposed to erect places at first for only half that number.

THE Nobels Explosives Co., Ltd., are applying to the Linlithgow Town Council for consent to the establishment on ground at the East Low Port of a new factory, consisting of an additional magazine, two mixing-houses, and a boiler-house, for which the Home Secretary had already granted a draft licence.

GREENOCK Dean of Guild Court have passed plans for an addition to the Corporation Electricity Works at Dellingburn Street. Only one turbo-generator is to be constructed, but floor space will be provided for two additional sets, which it is anticipated will be required in two or three years' time.

MESSRS. PATMAN & FOTHERINGHAM, LTD., builders, have been awarded the contract for the erection of warehouse premises in Kingsland Road, N.E., for Messrs. John Carter & Sons, Ltd., and another large contract is the additions and reconstruction of Nos. 42-46 Fore Street, E.C., for Sir Richard Stapley and Mr. H. Smith.

MR. HUGH GAVIN, architect, Arbroath, has been instructed by the directors of the Arbroath Infirmary to prepare a report on the proposed reconstruction of that institution, with special reference to the recommendations of Dr. D. J. Mackintosh, of Glasgow.

HIS EXCELLENCY THE EARL OF ABERDEEN, K.T., has consented to act as Patron of the twenty-sixth annual Congress of the Royal Sanitary Institute, to be held at Belfast from July 24 till 29, 1911. The Right Hon. Lord Dunleath, D.L., J.P., has consented to act as President of the Congress. The public meeting to inaugurate arrangements for the Congress will be held at the City Hall, Belfast, on Tuesday next.

At the monthly meeting of the Withington Committee of the Manchester Council, the surveyor reported that 664 dwelling-houses had been certified for habitation during the past twelve months. This is the highest number recorded in the area which formerly constituted the Urban District of Withington.

MESSRS. APPLETON & SON, architects, Torquay, have prepared plans for a provided school to be erected at an inclusive cost of 8,000*l.* on the Homelands site, Torquay, and accommodating 450 children. The plans, which have been approved by the local education committee, are to be submitted to the Board of Education.

THE Stretford District Council on Tuesday resolved to accept the offer of the Rylands trustees to sell the Rylands Hall estate for the sum of 14,500*l.*, for the purposes of a public park, subject to a poll of the ratepayers and the sanction of the Local Government Board. The estate is 63 acres in extent. The Council propose, however, to sell as building plots an area approximating to 11 acres, which it is estimated would largely reduce the cost to the ratepayers.

MR. P. MACGREGOR CHALMERS, F.S.A., I.A., of Glasgow, has prepared plans for a Romanesque church about to be erected at Corstorphine, near Edinburgh. It is proposed to build at first only the church (which will be seated for 675 worshippers), the vestry, session rooms, and the base of the tower to the height of 27 feet, which really forms the vestibule of the church. The estimated cost of this is 6,250*l.*, the greater part of which has already been raised.

At Edinburgh Dean of Guild Court last week there were eighteen cases on the roll, and eleven of the applications were either granted or remitted to the Burgh Engineer. In several cases Lord Dean of Guild Carter remarked on the unsatisfactory and incomplete nature of the plans presented by builders and others, and asked that in future more consideration might be shown the Court. The plans, he said, should always be clear and distinct.

THE Society of Engineers (Incorporated) announce that for the next three years "The Status Prize" is offered for the best paper on "How to Improve the Status of Engineers and Engineering, with special reference to Consulting Engineers." In 1911 the prize will consist of books and (or) instruments to the value of 6*l.* 6*s.* The essays, which should contain between 4,000 and 6,000 words, must be sent in to Mr. A. S. E. Ackermann, the secretary, by May 31.

THE Chester Refuse Destructor Committee, after the visit of a deputation to the refuse crusher at Southwark, have decided that they could not recommend such an installation for Chester on account of the improbability of securing a daily sale of the crushed refuse at a remunerative price, and on account of the noise of the machinery. They have received four tenders for the erection of a refuse destructor at the sewage works.

THE Special Committee of the Liverpool City Council which, since its creation three years ago, has been considering the abattoir question, finally decided on Monday to recommend the Council to take over and work the public abattoirs, and to erect new abattoirs, dead meat market, and live cattle market on the Love Lane site of 13½ acres, near the Stanley Dock. The cost of the Love Lane scheme is estimated by the majority report at 160,000*l.*, and by the minority of six members, who recently issued a separate report, at 200,000*l.*

THE Lancashire Education Committee on Monday agreed to the renewal of the grant of 1,000*l.* for temporary assistance to the county architect for one year, and that the allowance for the architect's permanent staff be increased from 2,700*l.* to 3,000*l.* per annum. In increasing the allowance for the permanent staff, the Committee say they feel it to be desirable to appoint a surveyor rather than an architect, someone to inspect school sites, obtain information with regard to them, and assist the local committee in their selection and purchase.

THE Edinburgh Town Council last week had under consideration a recommendation that in the next Provisional Order powers be asked to have all staircases in new tenements placed next the outer walls. It was agreed to remit the matter to the Streets and Buildings Committee. Notice of motion was given that it be remitted to the Lord Provost's Committee to consider as to the expediency of an exhibition illustrative of town planning being held in Edinburgh at an early date, and that they communicate with the Local Government Board for Scotland and ascertain the probable cost to the Corporation.

PLANS were passed in the Edinburgh Dean of Guild Court on the 19th inst., and warrant granted to the North British Electric Theatres, Ltd., for alterations at 18 and 20 Nicolson Street and 3 Hill Square, so that a theatre might be constructed. The existing hall on the site will be entirely cleared away. The main hall of the new theatre will have an internal area of 55 feet by 40 feet. There will be seating accommodation on the ground floor for about 500 persons, and in the dress circle for about 80. The north elevation of the building fronting the College of Surgeons will be treated architecturally. The architect is Mr. Hippolyte J. Blanc, R.S.A.

THE monthly report of the Amalgamated Society of Joiners and Carpenters returns the membership at 56,831, made up as follows:—Forty-eight thousand two hundred and twenty-seven ordinary section, 271 junior section, and 1,501 Australasian trade section, added for the first time. There were 4,763 members unemployed, 1,476 in receipt of sick benefit and 2,641 on superannuation. The new financial scheme recommended by the General Council had been adopted, the voting figures being—in favour, 10,957; against, 5,495; majority in favour, 5,462. This, the General Council state, will remove what has been one of the most formidable hindrances to organising work.

THE Tenants' Co-partnership Association held a meeting on Tuesday, with a sub-committee of the Newcastle Corporation, on their proposed lease of the Corporation's Walker Estates. The price the Association offered was 1*d.* per square yard over the whole of the 300 acres, which price included land for street-making. This works out at an annual rental of 30*l.* per acre. The association undertakes to develop the land at the rate of 20 acres per annum. Otherwise, if the demand should meet their expectation, the scheme might be developed in a much quicker period. The system of leasing to be adopted will be the 99 years' principle. The full scheme provides accommodation for between 20,000 and 25,000 persons, upon town-planning lines, averaging from 12 to 15 houses per acre. The site is in close proximity to the works that Messrs. Armstrong, Whitworth & Co. are providing at Walker.

TRADE NOTES.

MESSRS. DOULTON & Co., LTD., Royal Doulton Potteries, Lambeth, S.E., have added to their many honours that of potters to his Majesty the King.

MESSRS. THOMAS CRAPPER & Co., LTD., Marlborough Works, 120 King's Road, Chelsea, S.W., are again the recipients of Royal favour, having been honoured by a Royal Warrant of appointment as sanitary engineers to His Majesty King George V.

THE PATENT CHIMNEY POT Co., LTD., have devoted an illustrated booklet to their "Champion Chimney Pot" and "Champion Ventilator." The pot is all in one piece, and is made in fire-clay and terra-cotta at very moderate prices. No less than 100,000 of them are already in use all over the country. The principle is as sound as it is simple.

OZONAIR, LTD., 96 Victoria Street, S.W., have issued a short pamphlet descriptive of their Ozonair system of water purification. This firm, who have already several orders in hand for installations, are the sole manufacturers of such apparatus in this country. In the Ozonair sterilising system the water (previously freed from all suspended matter) is first atomised in presence of a stream of ozone within the upper portion of the apparatus, the minutely divided particles of liquid being allowed to fall upon the upper part of a pile of glass spheres through the interstices of which the stream of ozone is caused to ascend whilst the liquid, already partially ozonised and sterilised, descends over the surfaces of the spheres in a very thin film. On reaching the bottom of the pile the water is allowed to fall into a tank through which the ozone is forced upwards in fine jets, the water being retained in the tank and subjected therein to this third ozonising process for any predetermined length of time according to requirements.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

To Architectural Students.

Back Volumes of **THE ARCHITECT** will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C., between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples, is 12s. 6d.

WALES.—Feb. 9.—For erection of new house, at Bryn'refail, Cwmvglo. Mr. Evan J. Williams, 2 Orwig Terrace, Bryn'refail.

THE LATE MR. H. N. HAWKS, I.S.O.

By the death of Mr. Henry Nicholas Hawks, I.S.O., which took place on the 30th ultimo, His Majesty's Office of Works has sustained a severe loss.

Mr. Hawks entered the Department in 1877, and was attached to the Scottish Branch of the Office in Edinburgh. After serving there as architect and surveyor for some years, during which time he was identified with the erection of many important buildings in Scotland, he was promoted to be architect and surveyor in charge of public buildings generally in the provinces. During this period of his service he designed and supervised the erection of the following buildings amongst many others:—Custom House, Post Office and Inland Revenue Office, Southampton; County Courts at Croydon, Swansea, and Cardiff; and the Royal Naval College, Osborne. In 1907 he was placed in charge of the Royal Palaces and most of the public buildings in London, with the exception of post offices, &c.; and whilst holding this post he has been responsible for the erection of the new melting house at the Royal Mint, the Patent Office extension, and many large works of alteration and improvement to buildings of national and historical importance such as the Tower of London. But the most notable works entrusted to him during this period have been the extension and fireproofing of the National Gallery and the erection of new offices for the Board of Agriculture. Unhappily in neither case has he lived to see the successful issue of his labours.

The National Gallery works will not only provide much-needed additional galleries, but the fireproofing of the previously existing galleries will ensure the adequate protection of the national works of art. The Board of Agriculture will be one of the finest Government buildings in London. Its intricate construction presented problems in connection with the foundations which were happily solved by Mr. Hawks.

In recognition of his services in designing and supervising the building of the Royal Naval College at Osborne, which in point of rapidity of construction was a remarkable feat, and in preparing the residence of the late Queen Victoria at Osborne for use as a convalescent home for officers of the Navy and Army, King Edward VII. appointed Mr. Hawks a Companion of the Imperial Service Order.

MR. ERNEST H. BIRD, of 26 Clare Street, Bristol, has been appointed Bristol agent for the London Asphalte Company, Ltd.

SUBWAYS IN TRAFALGAR SQUARE.

THE following statement has been prepared by the Improvements Committee of the London County Council with regard to the suggested construction of subways under Trafalgar Square, Charing Cross, &c.

The construction of subways for foot passengers at Charing Cross was originally provided for by the Baker Street and Waterloo Railway Company's Act of 1899. This system of subways was designed to commence on the western side of Charing Cross near Drummond's Bank, crossing thence to the eastern side of Charing Cross near the junction of Charing Cross with Northumberland Avenue, thence under Northumberland Avenue to the Grand Hotel, thence under the Strand to Charing Cross Post Office and under the roadway of Trafalgar Square to a point near the Havelock statue. The company subsequently abandoned their intention to construct the station under the carriageway of Charing Cross, as they had come to an arrangement with H.M. Office of Woods, &c., to place the station under the footway paving of Trafalgar Square and the subways described above became unnecessary as approaches to the station.

In 1905 the company introduced a bill which proposed to abandon the subways except the portion between Charing Cross Post Office and the Havelock statue, and sought to authorise new subways commencing near the Nelson Monument and crossing the roadway of Charing Cross to the footway opposite the Phoenix Fire Office. It was also proposed to repeal section 43 (5) of the Act of 1899, thus abandoning the continuation, which had been provided for by the late Vestry of St. Martin-in-the-Fields, of the subway from the south side of Northumberland Avenue to Drummond's Bank. The bill was opposed by the Westminster City Council on the ground that the substituted subways sought to be authorised thereby would necessitate the removal by the city council of a public convenience and the construction of another convenience in its place, and that no similar provision to section 43 of the Act of 1899 was inserted as regards the substituted subways. Protracted negotiations were carried on between the city council and the company, and finally on June 16, 1905, an agreement was made between the parties. The principal terms of this agreement, as stated by the city council in its petition against the company's bill of 1909, were

as follows: The company were to construct at their own cost a subway for foot passengers from their station in Trafalgar square to the south side of Charing Cross as shown on a plan attached to the agreement; the city council was to alter, enlarge or reconstruct, on either side of the subway, the public conveniences, the sewers, &c., affected being diverted at their own cost. In consideration of the agreement the company agreed to pay 6,000*l.* to the City Council in discharge of all liabilities, and the City Council agreed to support the bill. The Council petitioned against the bill of 1905 and obtained various protective clauses. The bill duly passed into law.

In 1909 the company introduced a bill providing, *inter alia*, for the abandonment of the subways authorised by the Act of 1905 and for the cancellation of the agreement dated June 16, 1905, with the City Council. The Bill was opposed by the City Council, and a petition was also deposited by the Council objecting to the abandonment of the subways on the ground of the increasing traffic in the neighbourhood of Charing Cross. We understand that it was subsequently decided by the Parliamentary Committee to co-operate in the opposition of the City Council. The report of the Home Department on the bill stated that, in the opinion of the police, the subways were particularly desirable, as the crossings in Trafalgar Square were some of the most dangerous in London.

According to the minutes of the City Council of April 29, 1909, a conference was held between the City Council and the company at which it was urged by the then chairman of the company (Sir George Gibb) that such passenger subways as had been constructed were of no practical benefit either to the company or to the public, and that the subways to be constructed by the company were not required for the purposes of the railway or the convenience of passengers using it. He contended, therefore, that the company should be released from the obligation to construct the subways, in return for which they were prepared to pay a substantial sum as a contribution to any other subway the City Council might desire to construct. The City Council subsequently stated to the Council that, in view of the uncertainty as to what would be the most advantageous position for the permanent site of the convenience in Trafalgar Square when the proposed alterations had been completed, it had agreed with the company to abandon its opposition to the cancellation of the

agreement of June 16, 1905, on payment by the company to the City Council of 10,000*l*. The City Council further stated that of this sum 6,000*l*. would be expended upon the necessary removal of the convenience and the remaining 4,000*l*. would then be available for the construction of such subways communicating with the convenience or for such other public purposes as might seem to be indicated for the benefit of the public. The Parliamentary Committee accordingly decided to withdraw the opposition to the Bill as far as the subways were concerned, but in May, 1909, they intimated to the City Council that, while they were of opinion that adequate provision should be made for the protection of foot passengers at this very dangerous crossing, they relied on the City Council to do what was necessary in this respect.

The Bill of 1909 was, however, withdrawn by the Company immediately before it would have been considered by the Committee of the House of Commons to which it had been allotted. The arrangement between the City Council and the company appears to have been contained in certain heads of agreement which were sealed by the parties, and the 10,000*l*. was thereupon paid by the company.

A PICTUREDROME FRONT.

The rapid erection of cinematograph palaces under various aliases has brought a new problem. Our illustration shows a treatment which has given the greatest satisfaction. The exterior was coated with "Zingessol"—the perfected water paint—immediately after the plasterers had finished. The effect has been much admired, and it is believed that several other erections are to be similarly treated. The interior was also most successfully decorated with "Zingessol." This paint is the latest production of Mr. J. B. Orr, and is manufactured by Orr's Zinc White, Ltd., at Widnes, Lancashire.

MR. E. SEWARD v. CARDIFF CITY COUNCIL.

MR. M. MUIR-MACKENZIE, High Court Official Referee, gave judgment on February 1 in the action of Seward v. the Lord Mayor, Aldermen, and Citizens of Cardiff, the evidence given at the protracted hearing having already been reported in *The Architect* in December and January issues.

On November 10, 1910, the formal agreement embodying the terms of settlement came before the City Council for consideration, and, after considerable debate, it was approved.

There are now no Parliamentary powers for the construction of the works, as the time limited by the Act of 1905 for the construction of the subways expired on August 4, 1910.

We are advised that the powers conferred on the company by their Act of 1905 were purely permissive, and that the company could not have been compelled to exercise them. The Council has no knowledge of the terms of the agreement between the company and the City Council other than such heads of the agreement as have been mentioned in the communications or public documents of the City Council, and it is therefore not possible to say to what extent, if any, the City Council is bound to construct any, and if so, what subway or within what time any such work should be completed.

THE Executive Committee of the fund for providing a statue of the late Queen Victoria, to be erected in the forecourt of the new Municipal Buildings at South Shields, have selected the designs submitted by Mr. F. W. Doyle Jones, of West Hartlepool and London, and Mr. Albert Toft, of London, for final decision.

The Official Referee, in the course of his judgment, said that the claim of the plaintiff, as formulated at the trial, was substantially for remuneration for work done for the Corporation as the architect for the purpose of a scheme for establishing a Welsh museum of a national character in Cardiff, and for damages for breach by the Corporation of an agreement under seal by which the plaintiff was appointed architect for the scheme. The amount of money claimed by the architect was very large, amounting in all to between 6,000*l*. and 10,000*l*., and, put in untechnical language, was based on the fact alleged by him that if the agreement had been carried out he would have been architect for the Corporation in the designing and carrying out of a building to cost about 150,000*l*., on which he would have been entitled to a remuneration of 5 per cent.

The defendants, continued the Official Referee, had paid into Court 1,000*l*. and a further sum of 500*l*., wholly denying liability; therefore the total sum paid into Court was 1,500*l*.

The Official Referee went on to say that he could not award the plaintiff compensation on anything like the scale he claimed. On the other hand, he thought it his duty to have regard to the fact that the plaintiff was undoubtedly employed to do a large amount of work under the contract, and a larger amount than he would otherwise have done had the circumstances been different. Taking all the facts into

consideration, he found that the 1,500*l.* the defendants had paid into Court was an adequate and proper remuneration to the plaintiff. He therefore gave judgment for the defendant Corporation, with the general costs of the action, the plaintiff to have the 1,500*l.* paid into Court. Plaintiff would have the costs on the question of liability.

IRON: ITS WORKER AND A PORTION OF HIS WORK.*

(Continued from last week.)

Whether grilles of scrolled iron were used in English or in French churches first is not known, but the fully developed Norman cathedral called for the extensive use of grilles and screens.

The earliest type known in this country is at Winchester, dating 1090 or thereabouts. The design is monotonous, mainly consisting of three vertical scroll groups to each door or grille, divided laterally in the centre by a bar, making six panels. These panels are again sub-divided into two sets of six "C" scrolls, three lying one within the other and being placed back to back with other three. The terminals of these scrolls are all finished in cinquefoil.

A reproduction of part of this work is in the Ironwork Gallery at South Kensington, and a study of the detail leads me to suppose that the original was repaired on more than one occasion, and that the new additions did not exactly match or fit in with the old work.

At Lincoln Cathedral grilles of later period (circa 1200) are still preserved, although these panels are very simple in style, being merely a collection of "C" scrolls. The ancient appearance of this specimen is now spoilt by a cresting of more modern cast iron, totally out of character with the original work.

Canterbury and Chichester Cathedrals also contain work of this century. Specimens of grilles from these buildings can be studied with ease at that treasure-house of technical art, the Victoria and Albert Museum, South Kensington, which is constantly referred to in this paper, and at which every facility for gathering information is offered by the officials.

We find here two panels from Chichester, one labelled "13th Century," and the other "Early 15th Century." In the earlier one, which is in a dilapidated condition, the majority of the design is of quatrefoils, though a portion of the work is of totally different style, for the scrolls here finish with crude stampings, the size and shape of a chestnut, which bear a fleur-de-lys design on one side and a six-petalled rosette on the other. We have evidently to consider this work as a later repair, and a bad one at that.

The fifteenth-century panel is interesting on account of the regularity of the design as a whole and in detail. It consists of a framework of squares, each square containing a single quatrefoil, and all the iron is of the same section. The bars are neatly half-jointed at their intersecting points.

The various religious dissensions in our country have been responsible for the destruction of the early grillework which no doubt adorned most of our great cathedrals and abbeys.

With the development of Gothic architecture in the thirteenth century design in ironwork received considerable advancement in style. Ornaments such as stampings and foliage of a crude kind began to be introduced, the vine being largely used as a pattern in design.

Where repetition in detail warranted it, the smith would carefully prepare dies and beat the hot iron into them, obtaining, of course, exact reproductions of form.

The preparation of these chilled iron dies was certainly in vogue early in the thirteenth century, but it was not until its closing years that any great use was made of them. Thomas de Leghton (who was associated with Leighton Buzzard) was largely responsible for their popularity.

His most noted work is the so-called "Eleanor grille" in Westminster Abbey. In this grille we can, perhaps, trace the origin of scroll embellishment to France, similar characteristics being found in French grilles of the period, indicating that De Leghton had probably been to France and had brought back with him fresh and up-to-date ideas from across the Channel.

The Eleanor grille is an elaborate piece of work, consisting of eleven panels rivetted to a rectangular frame curved outwards, with a cresting of trident spikes. Nine of the

panels are alike in idea, that is, of close scroll design with vine-leaf stamped ornaments, the other two panels being stiffer and less flowing in their treatment. Crude bulls' heads of hammered and chiselled work appear in places. The grille was made in 1294 at a cost of 180*l.* in modern money. The work was carried out at Leighton Buzzard, as we read of an extra of 15*l.* for carriage and sundries.

After the death of De Leghton the fashion in ironwork appears to have changed, and he himself does not seem to have passed on his secrets or appliances to any successor.

With the beginning of the fourteenth century a new development was introduced, and the old simple blacksmithing, by which is meant work with hammer and chisel, gave way before it.

All work considered up to the present was produced by the use of these implements alone, joints being made by welding, and scrolls in grille work being fastened together chiefly by collars or else by punching holes through the hot iron and inserting rivets.

To appreciate the beauty of the ancient work is difficult in these days of ready-rolled bars of all shapes and sizes, until we consider that our early smith had to beat his bars and scrolls from rough lengths of very indefinite shape. Such poor material produced one advantage at least. It gave variety to even the most monotonous of designs.

Prior to this point heat had always been considered necessary in working iron, but in the fourteenth century we find the coming of the "cold-iron" smith, with his vice, drill, file and saw. Sheet iron is now brought into use, and tracery work added. Flowers and leaves are cut or beaten as requirements demand. The smith would even go out of his way to copy architectural forms not altogether suitable to his material.

It was the much closer contact with Eastern peoples which followed upon the Crusades that led to this advancement, for the West has ever been glad to adopt forms of art which were primarily Eastern, and here, no less than in the more primitive working of iron, the East once again had something to teach.

Much greater scope was imparted to the craft by the use of these new methods, and ironwork was introduced in many new ways. Window grilles of tracery work, lock plates and other door furniture may be mentioned as examples, the smith being enabled to get much richer effects with far less labour than hitherto.

In grille work we find a wave of fashion for geometrical designs passing over the country from the fourteenth to the fifteenth centuries. We get rectangular panels filled in with a network of bars, with a border of sheet iron pierced in quatrefoils, and similar set designs, some of the work being halved, lapped and rivetted much in the same way as a joiner would treat wood.

One of the earliest of these geometrical grilles formerly shielded the shrine of St. Alban, in the abbey dedicated to his memory, and was made at the beginning of the fourteenth century. It is still in the same abbey, but now stands in front of the tomb of Humphrey, Duke of Gloucester, in the Saints' Chapel. It consists of forty-two panels, fourteen in a row, the panels being bars crossed and rivetted, alternately of square mesh and diamond. A small rosette covers the rivet at every crossing.

In the chantry of Henry V. at Westminster Abbey is another specimen of a grille of this period, made in 1428 by Roger Johnson, of London.

Nevertheless, we find examples of the more conventional forms of smithcraft still occurring during this period in tomb railings, and many elaborate enclosures of the time still exist.

The fifteenth century and the beginning of the sixteenth in England were rather the age of the locksmith than of the scrollsmith, with whom we are endeavouring to keep as closely as possible, but one famous Belgian family of the period kept scrollwork before the public eye, and, for this reason, a brief mention of foreign work, hitherto studiously avoided, must be made.

The Matsys family lived in Louvain, and the head of the family, Josse, occupied in his own person the three important posts of architect, clockmaker and blacksmith to the township. The famous well cover against Antwerp Cathedral is probably the work of this man, although it has been attributed to Quintin Matsys the painter. The latter, however, was a mere child at the time, the work being dated 1470.

There was a Quintin Matsys who became famous for his ironwork, but this man was the son of Josse and could not have been more than four years old when the well cover in question came into being. Many works in this country are

* Read before the members of the Incorporated Clerks of Works Association on January 9 by A. Percy Witchell.

attributed to Quintin, notably a pair of gates at St. George's Chapel, Windsor, which originally shielded the tomb of Edward IV., and another pair in Bishop West's Chapel in Ely Cathedral.

(To be continued.)

METAL FILAMENT LAMP PATENTS.

ALTHOUGH electric patents are outside the wide sphere of an architect's professional interest, a case was commenced last week in the Chancery Division which, though concerned with patent rights in an electric lamp is of sufficient importance to demand notice. The plaintiffs were the Osram Lamp Works, Ltd., and they asked for an injunction against Messrs. G. M. Boddy & Co., Ltd., in respect of some of the patents in the well-known Osram lamps, also for an order that the defendants should pay the costs and for a certificate of validity. The action was not, however, fought out, as Messrs. Boddy & Co. consented to an injunction with costs. The defendants act as agents for the "Philips Lamps," which are manufactured by the Philips Metallic Glowlamp Works, Ltd., at Eindhoven, Holland, and exported to this country. It was in respect of these lamps that proceedings were taken.

The proprietors of the "Osram" lamps have, during the past few years, acquired a very large number of protecting patents, and two of these were, it was alleged, infringed in the manufacture of the Philips lamp. Their victory was complete. The Philips Metallic Glowlamp Works, Ltd., will henceforward, by the agreement entered into, manufacture the Philips lamps under a license from the Osram Company, and a clause controls prices, discounts, and the quantities of those imported into this country.

The General Electric Company, Ltd. (who are the selling agents of the Osram Lamp Works, Ltd.) hope to signalise the victory, not by raising the prices of Osram lamps, but by a further decrease. The litigation above referred to has for some months past had an unsettling effect on the trade which will now be completely removed and the company can devote themselves to their business without distraction. The result should therefore be to the benefit of the public. The British Thomson-Houston Company have exchanged licenses with the Osram Lamp Works under their respective patents covering metallic filament lamps. The public are therefore free from liability in respect of actions for infringement of patents by purchasing Mazda lamps as well as Osrams.

HOUSE AND COTTAGE EXHIBITION, 1911.

THE response of the architectural profession to the invitation to take part in the architectural and building competition for houses and cottages to be erected in Gidea Park, Squirrels Heath, Romford Garden Suburb, this summer has been, we understand, of a very satisfactory kind. More than 300 architects submitted designs for houses and cottages, of which about 100 will be erected.

The entries for the competition for a Town Plan in Gidea Park remain open until the 31st March. The first prize is 100l., the second prize, 50l., and there is a special prize of 25l. for a perspective drawing of part of the proposed lay-out.

The Judges are Mr. Guy Dawber, Vice-President of the Exhibition, Mr. H. V. Lanchester, F.R.I.B.A., and Mr. Mervyn Macartney, F.R.I.B.A., M.S.A.

The competition should prove an attractive one to architects, as the area to be laid out presents no exceptional difficulties, and the work involved is nothing like so serious or extensive in character as was involved in the recent Town Planning Competition for 1,300 acres at Ruislip. The rapid development of the Romford Garden Suburb, as Gidea Park is called, affords an assurance that the successful designer may hope to see his plan carried out at no distant date. The area to be planned is approximately 300 acres, intersected by the Romford golf course and the Roman road leading to Romford.

MR. R. MORTON RIGG, architect, Penrith, has been instructed to prepare plans for a village hall and institute to be erected at Ullswater, as a memorial to the late Colonel W. H. Parkin.

MESSRS. C. PEARSON SHAW & SON, Ms.Q.S.A., quantity surveyors and arbitrators, have removed their offices from 14 Sherwood Street, Nottingham, to more convenient and commodious premises, 21-23 Goldsmith Chambers, Hippodrome Buildings, Nottingham.

ASSOCIATION OF MASTER PAINTERS IN IRELAND

THE twelfth annual Convention and Exhibition of the Association of Master Painters in Ireland was held in the Royal Hibernian Academy, Lower Abbey Street, Dublin. The Convention, which lasted three days, opened with a reception by the outgoing president, Mr. John O'Connell, Cork. At the subsequent meeting Mr. John M'Intyre (Dublin) was installed President for the ensuing year. The report of the secretary and treasurer showed that the Association is in a most flourishing condition, and carrying on very valuable work in fostering the education of young men engaged in the trade by annual competitions and travelling scholarships and in other directions.

Mr. James Maxwell (Armagh) was appointed President-elect and it was decided to hold the next annual Convention in Armagh.

In the afternoon there was a formal opening of the Convention and Exhibition by Count Plunkett, Hon. A.R.I.B.A., Director-General of the National Museum of Science and Art, who said the industry in which the Master Painters were engaged was one in which everyone took an interest, because it concerned the question of how to make their houses fit to live in. He congratulated those engaged in the decorating trade in Dublin on the fact that the Association was living and thriving so well. The Association was especially to be congratulated on the work it was doing in preparing the students.

On the following day Count Plunkett distributed the prizes, previous to delivering an interesting address on "Decoration," which he illustrated with fine lumière lantern slides and coloured cartoons. The lecturer first dealt with some of the difficulties of the decorator in his relation to the public; then he showed how, in this artistic craft, there is a demand on many branches of knowledge. As illustrating the history of decoration he gave examples of very simple designs of the eleventh, twelfth and thirteenth centuries from churches and other public buildings. Several photographs from a sculptured altar-piece in the Cluny Museum, and from a portion of the Sainte Chapelle, were thrown on the screen. Count Plunkett laid great emphasis on the mediæval and Renaissance methods of using gold freely, indicating the means whereby the splendour of its effect was relieved from garishness. He instanced, among other examples, Pinturicchio's decorations in the Vatican. He also dealt with the fresh colour schemes of North Italian work, and urged that the colouring of plaster and other reliefs was more than justified in the examples given. Beginning with the close connection of ornament with architecture in the early ages, he showed the importance given to structural design by the painters in the "Golden Age" of Italy, and the continuance of decorative schemes when Naturalism had changed the style of composition in painting. Count Plunkett referred to certain simple rules for producing unity and variety in design and stimulating invention. In conclusion he urged that it was very desirable that Irish workers should develop a native style, pointing out that every race showed its idiosyncrasies in the arts, and that it was for this distinction, even more than for its artistic merit, that much of the best work of Europe was valued by the world.

VARIETIES.

ALTERATIONS estimated to cost about 100l. are to be carried out in the basement of the Guildford Technical Institute, to prevent flooding.

THE Walton Urban Council, Surrey, have decided to adopt a by-law permitting the erection of cottages built of materials other than brick and stone.

A GIFT of 3,000l. has been made to St. Bartholomew's Church, Blackburn. The money is to be spent on building a tower and providing a peal of bells for the church.

MR. RUSSELL REA, M.P., proposes to erect buildings on a site leased from the London County Council at the junction of Smith and Dean Stanley Streets, Westminster. The elevation will be built in red Dutch bricks and Portland stone.

THE North Dublin Rural District Council have agreed to carry out a scheme for the erection of 107 labourers' cottages, and the acquiring of five additional allotments at an estimated cost of 20,000l.

THE Special Committee appointed by the Stockport Town Council to recommend a site for police buildings has chosen a site now used as the town's yard in Wellington Street. The Committee considered several sites, but Mr. H. Beswick, F.R.I.B.A., architect to the Cheshire County Council, reported that three were not suitable, and that the town's yard site was in his opinion the best, being in an excellent position and providing ample space. A handsome approach, he says, could be given by widening Fletcher Street to 40 or 50 yards and forming it as a boulevard.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

WAKEFIELD.—For certain work to be carried out at the Crofton Council school, and the head teacher's house attached thereto, by bricklayer and joiner, for the Sharlston District Education Committee. Mr. Benj. Sheard, divisional clerk, W.R. Education Offices, Northgate, Wakefield.

WALES.—For erection of a house at Brynecrug. Mr. F. Howarth, architect, Towyn and Barmouth.

WALES.—Feb. 14.—For the rebuilding and reinstatement after fire of the Liverpool Stores, and premises adjacent thereto, Beaufort-street, Brynmawr. Mr. Hy. Waters, M.S.A., architect and surveyor, Ebbw Vale.

WALES.—Feb. 13.—For erection of vestry and classrooms, for the trustees of Carmel C.M. Church, Abercrave. Mr. R. S. Griffiths, M.S.A., architect and surveyor, Tonypany, or Mr. Rhys Davies, Cefnymeusydd, Abercrave.

WALES.—Feb. 20.—For erection and completion of 14 houses at Aberkenfig, for the Pandy Estate Building Club. Mr. F. W. Burnett, architect and surveyor, Tondy, Glam.

WALES.—Feb. 27.—For the erection of a training college for women at Barry, for the Glamorgan County Council. The Barry Docks Police Station, and the Glamorgan County Council Offices, Westgate Street, Cardiff.

WHITLEY.—Feb. 20.—For the erection of farmstead at Whitley, near York (builder, joiner, tiler, plumber, painter). Send 1l. deposit to the West Riding Treasurer, County Hall, Wakefield. The West Riding Treasurer, County Hall, Wakefield.

WOKING.—Feb. 22.—For the construction of an underground sanitary convenience near to the Victoria Arch, Woking Station. Deposit 1l. 1s. Mr. G. J. Wooldridge, surveyor, Council Chambers, Woking.

COMPETITION NEWS.

BRIGHTON.—The following eight architects were invited to compete in Brighton, Hove and Sussex Grammar School Competition:—Messrs. Russell and Cooper, Mr. Henry T. Hare, Mr. Arnold Mitchell, Messrs. Giles, Gough & Trollope, Mr. H. Carter Pegg, Mr. J. A. O. Allan, Mr. John T. Lee, Mr. Alfred W. S. Cross, Mr. John Bilson, F.R.I.B.A., of Hull, who was appointed by the President of the Institute to act as assessor, has now made his report. The design of Mr. S. B. Russell, F.R.I.B.A., of the firm of Messrs. Russell & Cooper, 11 Gray's Inn Square, London, W.C., is selected for the first place. The Governors of the School have accepted his recommendation, reserving to themselves the right to make such modifications as they think desirable. The plans will be on exhibition at the Brighton Grammar School, 80 Buckingham Road, Brighton, from Saturday, February 11, until Wednesday, February 15, from ten to five o'clock.

ILFORD.—The plans of Mr. J. B. Thornley, architect, Blackpool, have been selected in a limited competition for the proposed United Methodist Church at Ilford.

SCUNTHORPE.—The designs submitted by Messrs. George Baines and Son, 5 Clement's Inn, Strand, W.C., have been placed first in the competition for the Congregational Church and schools at Scunthorpe, Lincolnshire.

VARIETIES.

A FACULTY has been applied to build a new vestry and to enlarge the Parish Church of Witley, Surrey, by adding to the North Aisle the existing Vestry.

MR. H. ASPINALL, F.R.I.B.A., Liverpool, has been instructed by the Committee of Visitors of the County Asylum at Lancaster to prepare plans for a Female Patients Block. The cost is estimated at 24,000l.

THE Kingstown Urban Council (Ireland) has received a letter from Mr. Andrew Carnegie approving of the plans for the proposed library. The Committee will advertise for tenders for the erection of the building at an early date. About 4,000l. is the amount which will be expended on the building, for which Messrs. O'Callaghan and Webb, architects, have supplied the plans in competition with over 40 competitors.

THE following six applicants have been selected as candidates for the position of architect for the Council schools to be erected at Cowpen by the Blyth Education Authority:—Messrs. Fenwick and Watson, Mr. Jos. Morton, Messrs. Shewbrooke and Hodges, Mr. Chas. Walker, Messrs. Oliver and Leeson, and Messrs. Simpson and Lawson. The final selection will be made at the next meeting of the committee.

SIR WM. RICHMOND, K.C.B., proposed, and the meeting unanimously carried the following resolution at the Smoke Abatement Conference convened by the British Institute of Social Service, in London:—"That in the opinion of this Conference the pollution of the air by coal smoke is injurious to public health and vitality, destructive to works of art and vegetation, and directly demoralising to the inhabitants of all large towns; and that the time has therefore arrived when Parliament should strengthen the hands of local authorities by enabling them to take more effective measures than are at present possible or the suppression of smoke nuisances."

THE Premier Re-forming Co., Ltd., Rubber Manufacturers, Walthamstow, E., have issued an illustrated price-list of some of their manufactures. Their method of demonstrating the value of the process is as convincing as it is simple. They say: "Send us your old rubber with instructions as to what you would like it to be made into, and we will return part of it in the shape of the goods required, together with a quotation for carrying out the complete work." The charge for re-forming naturally varies in accordance with the quality of the rubber and the amount of work involved in the remaking; the saving likewise varies, being upwards of twenty-five per cent. Such goods are indistinguishable from new, and in fact for such purposes as steam valves and goods coming into contact with chemicals it is claimed that re-formed articles are actually better than new. A special feature is made in the list of some sample designs in tiling. In work of this sort there lie great possibilities of use in the building trades, for rubber-flooring can now from time to time be taken up, re-formed and then relaid as good as new. This Company's process must not be confused with those in use for operations like re-enforcing or reclaiming. It is easy to test its value by accepting their offer and sending a trial order, as no liability attaches to the enquirer.

IRON: ITS WORKER AND A PORTION OF HIS WORK.*

(Concluded from last week.)

Whether, as some say, the murderous effect of the Wars of the Roses was specially felt among England's smiths is difficult to decide, but the fact remains that the latter part of the fifteenth century and the first portion of the sixteenth were peculiarly barren of work of the kind under consideration.

We read that Henry VIII. imported smiths from Flanders, and the effect of their foreign ideas was certainly felt for some years later.

During Elizabeth's time wooden staircases were made a feature on most of the buildings then erected. These provided scope for the beautiful wrought-iron balusters and balustrades which began to be constructed somewhat later. We also have a few examples of outdoor work in gates, railings, &c., a fine specimen gate of about this period existing at Beddington House, Surrey.

Under the earlier Stuarts, scroll ironwork appears to have been almost neglected, and the Puritanical simplicity of the Commonwealth prevented the rapid contemporary advance then taking place in France and Germany making itself felt in our own country; but when the Restoration had become an accomplished fact, Charles II. among his various "King's officials" retained a "King's blacksmith and locksmith," one John Callendar, who from 1673-1676 devoted himself to ornamenting Holyrood Palace with specimens of his skill. Yet, although Charles employed Frenchmen to lay out his gardens, no trace of French influence in our ironwork shows itself until the accession of William and Mary in 1689.

Their Continental tastes, combined with the fact that Holland at the time was the haven of refugees from France in consequence of religious persecution, caused them to introduce men into England whose work at once created a fashion and a new style of art.

Daniel Marot, the architect and designer, and Jean Tijou, the skilled smith, were two of the leading men who were called here by the Royal couple, and Christopher Wren being then at the height of his career, both architecture and art received a great stimulus from their labours.

Wren commenced to rebuild Hampton Court, and Tijou was given various commissions for ironwork required there, being granted a free hand in order that he might produce the best that was in him. As a result of this Royal liberality, the period of about thirty years following 1690 has to its credit some of the finest ironwork the country has ever seen.

Wren, however, must not be allowed a false reputation for designing this work, as in no way does he show himself to have been a patron of artistry in iron. The strenuous work involved in the general designing of his cathedral and of fifty or so churches, all progressing at about the same time, probably precluded him from giving attention to detail work such as this.

It is to Jean Tijou himself that the designing of the work must be attributed, although he may have been influenced by Marot. Tijou could not have done much more than direct actual work, as the amount he accomplished was so extensive, and in connection with Hampton Court we come across the name of Huntington Shaw.

Certain authorities have given Shaw the credit of being entirely responsible for the work, basing their opinions on a presumably authentic statement in his epitaph in Hampton Church. This describes Shaw as "a smith of Nottingham," and says, "he was an artist in his way," "he designed and executed the ornamental ironwork at Hampton Court Palace."

Mr. Carraway Rice, in a paper to the *Archæological Journal* in June 1895, went deeply into this controversy, and proved satisfactorily that Shaw was not entitled to so much credit. He states that, after the fullest investigation, he failed to find Shaw's name in any official documents, but found, on the contrary, in the "List of Debts of the Office of Works, 1701," a statement that there was "due to John Tijou, smith, 1,982l. 0s. 7d., in respect of work executed at Hampton Court Gardens."

Then we have the evidence of Tijou's book. This volume of designs was probably the first book to be published dealing solely with ironwork. It is a set of engravings, issued in 1693, and a large number of the highly elaborate designs

are specified as "being for Hampton Court, of which the most part hath been wrought."

So perhaps Huntington Shaw was Tijou's foreman and did part of the practical work, as we know he had a workshop in Francis Street (now part of Regent Street) from 1700 to 1710, and may have worked for, and with, Tijou. It is a coincidence that the year of Shaw's death (1710) was also about the time of Tijou's retirement.

A quantity of Jean Tijou's work is at Chatsworth, and is also to be seen at St. Paul's Cathedral, where most of the panels, screens, choir gates, &c., are to his design, and were, no doubt, executed by English craftsmen, under his direction, as they bear a distinctly English stamp. Bills approaching 5,000l. were presented for this work alone. Parts of his St. Paul's work have been altered since, and some additions have been made, principally by Mr. Krall, of London.

Poor Jean, who had obtained most of his commissions through the Queen's influence, after devoting the best years of his life to the beautifying of some of our noblest buildings, fell out of favour at Court, and, in 1711 or thereabouts, he left the country, we are told, a poor man, allowing his wife to remain behind him to settle his affairs. From the time of his departure all trace of him seems to be lost.

Needless to say, such a master must have left behind him pupils and imitators, but it is strange that no subsequent work of his style appears in the Metropolis.

Robert Bakewell, a probable assistant of his, carried out work of the "Tijou style" in the Derby district. Tijou's designs, again, were probably the primary source from which the famous gates, railings, balusters, &c., at Drayton House, near Lowick, Northamptonshire, were elaborated. They have many of the characteristics peculiarly associated with Tijou's work, and though no mention has come down to us of the artificer, they were erected in 1700, when he was at the height of his fame.

But Tijou's influence was felt as much in the inspiring of other works as in creating a style.

Nicholas Hawksmoor, the church architect, for instance, was responsible for the design of some beautiful gates and screens to the choir at Beverley Minster (dated 1730), which, together with other masterpieces designed by him, may have been directly due to his coming into contact with Tijou's work in his capacity of Wren's clerk of works at St. Paul's Cathedral.

Contemporary with Tijou, but working entirely independently of him, was Thomas Robinson, whose forges were at Hyde Park Corner. In 1711 he erected the gates at New College, Oxford, and his style is essentially English as compared with the French-influenced style adopted by Tijou.

Also, in the records of Trinity College, Cambridge, is found the entry of payments amounting to 400l. for the iron gates, "paid to Mr. Partridge, the London smith," and dated 1691, but no further details of this craftsman are given.

In fact, a great part of the elaborate ironwork at the colleges of the Universities of Oxford and Cambridge dates from this period.

Of several of the fine works erected in the eighteenth century we cannot definitely state the authors, as with freer circulation of ideas came appropriation and adaptation of designs, and, consequently, it becomes more and more difficult to individualise styles.

Of the famous work at Carshalton Park and the grand gates in front of Devonshire House in Piccadilly we can do no more than suggest the authorship—Robinson, for instance, having been credited with the last-mentioned.

The eighteenth century also saw many beautiful examples of wrought ironwork being erected in our churches—chancel screens, altar rails, and some interesting smaller pieces, such as civic sword- and mace-rests, hat stands, &c. Three excellent specimens of these sword-rests are to be found in the church of All Hallows Barking, bearing the arms respectively of the Lord Mayors of 1726, 1755, and 1759.

We ought not to pass entirely without mention the very interesting tradesmen's signs belonging to this period, contemporary prints showing us to what a great extent they were used in the City; but the fashion for these did not last, though a revelation of their artistic beauty was effected by their temporary revival in Lombard Street as part of the street decorations celebrating King Edward VII's Coronation.

We have now reached a period—namely, the nineteenth century—when, the manufacture of wrought iron being a well-established art, we find its employment spreading into so many channels that a chronological history of its progress is well-nigh impossible, or, at any rate, lapses into mere generalisation.

* Read before the members of the Incorporated Clerks of Works Association on January 9 by A. Percy Witchell.

Special works of note and particular craftsmen will naturally stand out from the mass here and there; but to select or follow up a special line of investigation is beyond the scope of the concluding portion of a paper such as this.

During the last few decades, however, new ideas in constructive work of all kinds have rapidly been evolved, keeping pace with scientific progress, and the conveniences of modern life have brought with them new applications of the uses of wrought ironwork. Perhaps the most notable instance is to be found in the use of passenger lifts, which, with their requirements in the matter of well-enclosures, ornamental cages, and so forth, afford immense scope for the artistic employment of wrought iron.

Like every other art, wrought ironwork suffers from the vagaries of fashion and taste, and always that all-important factor, the leaning of the architect, enters into the scale.

The greatest drawback, however, of modern days is, without doubt, that fatal enemy of all art—financial competition. The real lover of his art to-day is seldom able to say to himself, "How can I make this work a thing of beauty and a lasting memorial to my skill?" but must, perforce, think "How can I conscientiously satisfy my customer for the money he will allow?"

In addition, he frequently has to pit himself against the "artist" (if such he can be called), who has a less exacting conscience, and has but one aim in view, the obtaining of work at no matter what price so long as he can make a profit and avoid having his productions condemned as being "impossible," which, from an artistic standpoint, they generally are. Such men should beware lest they eventually defeat their own ends by creating a revulsion of feeling in the matter of the artistic worth of wrought ironwork.

A severe competitor to wrought iron is still its "first cousin" cast iron. In the early part of the last century a wave of public taste in favour of this "poor relation" swept over the country, and we find even very large works being turned out by the foundry.

A good specimen exists in the gates closing the arch on Constitution Hill facing Hyde Park Corner. This arch will shortly be attracting attention by reason of the erection on its summit of a gigantic piece of bronze statuary, and details of the gates may not be uninteresting in this connection. They were cast by Bramah & Son, of London, in or about the year 1830, to the design of Mr. Hebblethwaite, at a cost of 5,712*l*. They measure 21 feet high by 16 feet 9 inches wide, and weigh nearly 7 tons.

With several large firms keeping a varied stock of cast iron, most of the cheapest modern railings, gates, and balconies are of this description, but wrought iron now holds its own in most cases where artistic effect is required, and the "nobler" metals such as bronze are not employed.

In conclusion, it is scarcely necessary to say that smith-craft has not—alone among the arts—been unaffected by science. With modern facilities, the smith can now produce results impossible in the time of his grandfather.

Could our ancestral craftsman return to his task to-day, what surprises would await him! He would find ready to hand, immense stocks of bar iron rolled to every conceivable section with almost mathematical accuracy. If he had secured a means of getting up-to-date in his markets, he would be shown, also, ready prepared lengths of ornamental mouldings, bars with decorated surfaces, bars so treated in rolling that, if his brain could accommodate itself to the bewildering changes it could split, twist, weld, and remodel them with comparatively little trouble into forms undreamt of. He would be introduced to ready-stamped leaves in multitudinous design, which, if he could be brought to do it, he might pass through the fire to add to them some of his own individuality before welding them to his bars. Then, for his final surprise, we would show him how, by means of the invisible electric current, his bars could be joined together "end on," or, if electricity were beyond him and he preferred to "see the heat," we would take a piece of iron and, melting it with a 6,000° Fahr. flame of oxy-acetylene gas, use it as a solder to join, say, a bar at right angles to a piece of plate, performing in a few seconds a feat which he would tell us was impossible and ridiculous.

And here, having traced in some measure the course by which the smith's art has reached its present high development, and having brought our imaginary smith from the scrap-heap of the past to look upon the results of his experience, accumulated through the centuries, we will leave him wondering what further surprises the future will have in store.

I must not conclude this paper without making grateful

acknowledgment to my friend, Mr. William Emmerson, for the benefit of his varied and practical experience, which I have received and which has been of great assistance to me.

THE EVOLUTION OF FIRE-RESISTING CONSTRUCTION.*

To the outside observer buildings are now erected—apart from questions of architectural style and taste—(or the absence of them) much as they used to be, but the professional man knows that, to employ a well-known expression, a "sort of" revolution has during the last fifty years or so taken place in fire-resisting building construction.

It has been truly said that there is nothing new under the sun, and I have little doubt that, if we could get at beginnings, we should find that Noah's Ark was not entirely free from some kind of metal, although we know that there was no necessity for protection from fire so far as that particular structure was concerned. There is a passage in Revelation which reads: "And he shall rule them with a rod of iron, as the vessels of a potter shall they be broken to shivers, even as I received of my Father." This, I think, shows clearly that iron rods were in existence in those days.

As early as 1835 we find Mr. George Godwin reading a Paper on the "Nature and Properties of Concrete," and on the architectural treatment of it. He showed how concrete had been used largely as a building material by all the principal civilised nations of antiquity; how Alberti had described walls made of it, nearly in the same way as is done now, by moulding it between boards; how Pliny had described cisterns made of it; and how many of our principal buildings, including St. Paul's and Westminster Abbey, stand upon concrete foundations dating from Roman and Saxon times.

One wonders what our cathedrals would be like if the twelfth and thirteenth-century cathedral architects had known the uses and value of steel. They knew the value of iron tie-rods, or we should not have so many as we have left to us of the beautiful monuments of their scientific and artistic achievements. The areas of the points of support and the buttress resistance to thrusts of roof and vault are light enough as they are, but these grand old constructors would have probably, to an even greater extent than they have, afforded ground for wonder and admiration. Their grouped shafts in nave and aisle might have, for aught we know, presented to the eye the naked steel, and we should have thereby lost the beauties of Purbeck marble and stone. Or they might have encased their skeletons in Purbeck or stone, and thus deceived the innocents abroad, much as they have been deceived by the subsequent discovery that what they had thought to be fine stone vaulting was really wood made to imitate stone. The Italians are past masters in the art of these deceptions.

Even the clever modern critic has been deceived over Crosby Hall, for after all the abuse of the "Vandals" who did not mind its destruction some of us know that most of the roof pinnacles, which were supposed to be oak, were really cast-iron grained to imitate that material, and that really very little of the old work remained. These pinnacles call to mind the caustic observation of Bismarck at the Berlin Conference that one of our statesmen was a "lath painted to look like iron."

We know what terrible adjectives have been hurled at the engineer and architect of the Tower Bridge because its skeleton steel work is encased in masonry, but I have always been at a loss to appreciate the adverse criticism. The majesty of their bridge has, to my mind, been vastly increased by this casing, and there is, I think, no more ground for adverse criticism of the bridge than there would be as regards the encasing of our own skeleton anatomy with human flesh.

Evolution is sometimes slow in its working, but the evolution of fire-resisting construction in our buildings cannot be said to be of prolonged growth. It was the knowledge and appreciation of the uses and value of concrete, as much as of the uses and value of steel, which gave rise to that impetus in their combined uses which has culminated in what we know as ferro, or reinforced concrete construction.

In 1854 architects were keenly discussing the construction of concrete floors, roofs, and walls, and their experiments led no doubt to a liking for the material as fire-resisting; as one which could carry very large unsupported areas, and which was cheap. There seems to have been at that time some difference of opinion as to the embedding of iron in the concrete, and as to its employment as a finished material in architectural decoration; but there does not appear to have been any

* A paper by Mr. William Woodward, F.R.I.B.A., read at the ordinary general meeting of the Surveyors' Institution on Monday, Feb. 6.

difference of opinion on the fact that concrete as a constructive material, whether with or without iron reinforcement, depends to a very large extent indeed upon the care with which it is mixed, and that no supervision can be too great to ensure strict compliance with this absolute condition.

Many years before 1854 Fox & Barrett's fire-resisting floors, and the various kinds of similar floors as regards fire, were in vogue, and such firms as Homan & Rodgers and Dennett & Ingle were paying great attention to this important subject of fire-resisting construction, and French architects and engineers especially were devoting their labours to the same end, and although the French methods differed from ours in detail, much the same ideas prevailed, except that the French construction was always much lighter than ours—they took greater risks, and yet I have not heard of a case of failure in Paris due to collapse of a floor by reason of insufficient strength per foot superficial.

I find an interesting statement made by Mr. Wyatt Papworth at a meeting of the R.I.B.A., in February, 1854, when the French and other methods of constructing iron floors were under discussion. An obelisk erected in 1776, on Putney Heath, by order of the Corporation of London, commemorated the satisfaction felt by committees of that body with experiments made in 1776, described in a pamphlet, printed in 1785, and entitled "An account of the invention and use of fire-plates for the security of buildings and ships against fire." The resistance to fire was accomplished by applying the fireplates above and below the timbers with dry sand or rubbish between them. A room was filled from floor to ceiling with faggots and pitch and tar, and the result seems to have been most satisfactory as a prevention from fire. The inventor's experiments, however, showed that "the only way to check a fire was to prevent the access of air; for flame would inevitably calcine such materials as concrete and plaster."

Fifty years ago, as some of us can remember, we knew very little indeed, comparatively, of concrete for constructional purposes, but architects were even at that period beginning to test and to study this form of construction. I have little doubt that we shall some day discover that the Egyptians knew all about ferro-concrete, and that the tomb of a departed Pharaoh owed its preservation to a mixture of iron and concrete. To prove that fifty years ago architects began to consider concrete construction I find that Mr. T. H. Lewis, on December 14, 1857, read a Paper at the Royal Institute of British Architects on some experiments upon concrete. Those experiments were directed to the suggested sensible loss in bulk of the ballast independently of that of the lime, and that the materials, after being mixed together, expand considerably. Mr. Lewis stated that this idea of loss of ballast was so prevalent that a respectable builder asked him to allow, in calculating the price of the concrete, one-seventh more ballast than the concrete cubed to. The general result of the experiments with lime concrete was "that the whole mass, made into concrete, occupied precisely the same space as the dry ballast, viz., one cubic yard, all the bulk of the lime and water (being about two-fifths of the ballast) being lost, but none of the ballast itself. The surface was carefully levelled and thin boards tacked over so as to ascertain if there were any expansion in the setting, but none could be perceived. The weight of the mass was 27 cwt."

Then on June 5, 1871, two Papers were read before the Royal Institute of British Architects, with Mr. Edward P. Anson (a Past-President of the Surveyors' Institution) in the chair. One Paper was on the use of Portland cement concrete as a building material, by Mr. Thomas H. Wonnacott, in which he speaks of the "novelty of the material." Mr. Wonnacott dealt with concrete in walls, and he opined that it was to a great extent incapable of artistic treatment, except at great cost, for moulds, patterns, &c., adding that he was persuaded that neither brick nor stone had anything to fear from competition with it. I am surprised to find Mr. Wonnacott stating he had not found that, although as he himself says, it may appear strange, "a larger proportion of cement than 1 in 8 increases the strength of the concrete. On the contrary, it appeared to diminish it." For ordinary walling Mr. Wonnacott found 1 in 10 sufficiently strong, and that "in engineering works in Copenhagen 20 to 1 was the proportion used," and further that he was informed by an experimenter that "he had gradually lessened the proportion of cement to 1 in 24, and found it then make fairly strong work. This proportion would rather startle the engineer and architect of to-day, and I am not surprised to find Mr. Wonnacott saying that in such a case the "conditions must have been exceptionally favourable," and the "dispersion of the cement among the mass perfect." This perfect dispersion of the cement I shall refer to later on when speaking of reinforced concrete.

(To be continued.)

CEMENT INDUSTRY IN GERMANY AND DENMARK.

H.M. CONSUL-GENERAL at Hamburg has furnished the following particulars relative to the cement industry of Germany:—

In the autumn of 1909 the German cement factories came to an agreement to raise the minimum prices of cement for export, but this agreement lasted for only a very short period, and export prices sank to their former level as soon as it became evident that the negotiations of the German groups in regard to the home trade would not lead to a satisfactory conclusion. In November, 1909, several of the German groups were dissolved, and this is said to have been the cause of much excited competition in Berlin, and large contracts were then made at prices equal to the cost of production. The Berlin group and the central German Union of Cement Factories were unable to agree owing to the exorbitant demands of the newly-founded factories. These circumstances, combined with the competition of Belgian cement in Westphalia and in the Rhine Province, led to a general reduction in prices. Then came the general strike in the building industry in the summer of 1910, and the results revealed by the reports of those works which closed their balances in June were far from satisfactory. On the other hand the export business has been brisk, especially during the last few months, but this activity has not been sufficient to relieve the factories of the large stocks which had accumulated, more especially in central Germany.

In spite of this unfavourable state of the industry, the number of new factories has still further increased, a circumstance which for a long time deferred the realisation of an agreement among the German groups. After protracted negotiations an agreement was reached in November, but a considerable number of the factories have not accepted it. The prospects for the year 1911 are not considered as encouraging, and the only favourable feature in the situation is thought to be that little money is available for the establishment of further new undertakings. The demand for cement, however, remains large, and is probably increasing, and as the cement trade abroad is also improving, it is hoped in Germany that an improvement may be anticipated towards the end of 1911.

The British Consul, in his report on the trade and commerce of Denmark in 1909, states that the Danish cement industry, which has now reached a high pitch of excellence, has been gradually built up during the last twenty years, often under considerable difficulties and without any support from the State in the shape of a protective duty, but, on the contrary, having to contend against keen competition from neighbouring countries, most of which are protected by high tariffs and formerly provided Denmark with a large proportion of the cement used. In the year 1889 the total production in Denmark was 115,000 barrels of Portland cement, the import being 135,000 barrels. In 1908 the total production reached 1,560,000 barrels, of which 380,000 barrels were exported. The import has decreased to less than 100,000 barrels per annum. A drawback to the success of the Danish cement trade lies in the circumstance that the country is devoid of water-power and coal, so that fuel, which forms so important a factor in this industry, has to be imported from abroad.

Until January 1, 1909, when the duty on coal was withdrawn, the cement manufacturer not only had to pay dearer for his fuel, but similar conditions prevailed in respect of materials for packing, such as staves for casks, iron hoops, and bags. On the other hand, foreign cement (packing included) has always been imported free of duty. In spite of these difficulties, the Danish cement industry has gained ground so rapidly that it is now able to compete with the industries of the neighbouring countries. This is mainly due to the advanced state of its technical development and the introduction of new and original labour-saving devices. The labour necessary within the factories has been reduced about one-sixth of what was formerly required. It may be justly claimed that the Danish cement industry to-day rests on a sound foundation. Its present capacity is about 2,600,000 barrels per annum, or considerably more than twice the consumption of the country. The balance of the production is sold for export, for which Denmark has favourable conditions, on account of her geographical position. The export takes place to Sweden, Norway, Germany, Russia, Finland, the United Kingdom, South America, South Africa, and East Asia.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

From a Drawing by "LE QUAYT."

PULPIT IN BOLTON PERCY CHURCH, YORKSHIRE.

BOLTON PERCY Church, of Perpendicular date, contains two pulpits, one of Elizabethan times and the other, the subject of the accompanying illustration, erected in the eighteenth century. Five years ago it stood in the centre of the nave, but recently, when the pews were rearranged, it was removed to the south-east respond to the chancel arch. It is a beautiful example of church furniture, fine in proportion, with good mouldings and enrichment, and the carving of the pilaster brackets, the Ionic capital, and the angels' heads

in the pediments is superb. The pulpit is of finely-figured English oak with bog oak and boxwood inlay to the panels and on the soffit of the sounding board. The base and the steps with handrail are modern.

THE committee of the South Shields Queen Victoria Memorial Fund have accepted the model submitted by Mr. Albert Toft, sculptor. The cost will be 1,000*l*. The late Queen's statue of bronze will be nine feet in height upon a pedestal of Aberdeen granite twelve feet in height, and will stand in front of the Municipal Buildings.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB,
17TH CENT^Y PULPIT IN S. JOHN'S CHURCH NEWCASTLE-ON-TYNE

From a Drawing by "SANS PEUR."

SEVENTEENTH-CENTURY PULPIT IN ST. JOHN'S CHURCH, NEWCASTLE-ON-TYNE.

This is an excellent example of Renaissance woodwork. The design is thoroughly Classic and forms an interesting study of the orders. The pulpit is of two stages—the base being treated with the Tuscan order and the second stage with the Corinthian, the detail being quite good and refined in each case. The upper portion is panelled and treated with a smaller Corinthian order with curious pilasters at each side to receive a stilted arch. The cusping is curious and rather quaint when compared with Gothic cusping. The church itself is in the heart of the city and has work of the twelfth, thirteenth and fourteenth centuries in it. It is cruciform in shape with a pinnacled tower over the baptistery at the west end. Lately it has had a new organ case added, from the design of Sir Charles Nicholson, also clergy desks, and an

interesting reredos, mediæval in character, coloured and gilded, which adds greatly to the charm of the church.

MESSRS. HOMER & LUCAS, architects, 35 Bucklersbury, London, E.C., and Oxford, have prepared plans for the projected Cinematograph Theatre at Oxford. The contractors are Messrs. Kingler & Sons, of Oxford.

MR. JAMES MILLER, A.R.S.A., architect, Glasgow, has been invited by the Clydebank Town Council to advise them in the proposed competition for a Carnegie Library. The question whether the competition be an open or limited one will be decided by Mr. Miller.

THE final voting returns on the question of the Amalgamated Carpenters and Joiners continuing their connection with the Trade Union Congress show a majority in favour of separation. The figures were:—For separation, 7,124; against, 6,137; majority, 987.

LONDON—continued.

For the erection of a section house at Blackheath Road, Greenwich. Mr. J. DIXON BUTLER, F.R.I.B.A., Surveyor to the Metropolitan Police District, New Scotland Yard, S.W.

THE Torquay Town Council have agreed that Mr. H. A. Garrett, borough surveyor, should be paid an inclusive sum of 500 guineas for his extra services as architect for the Pavilion, the Council bearing the cost of additional assistance and expenses incurred in connection with the work.

The administrative committees of the Primitive Methodist churches in the Sheffield district have approved the amended plans of a proposed church at South Elmsall. The cost will be 1,500*l*.

SWIMMING baths are to be provided by public subscription at Spalding, as a Coronation memorial, and also as a memorial of the late King Edward VII., at a cost of between 2,000*l*. and 2,500*l*.

MR. G. WASHINGTON BROWNE, architect, Edinburgh, has been appointed architect for the proposed extension of Chambers Institution, Peebles. The scheme has the approval of Mr. Andrew Carnegie, who gave a donation of 10,000*l*.

MR. FRANK BELLIS, architect and surveyor, Bangor, has been selected by the local Board of Guardians out of forty-six applicants to prepare plans for a new workhouse infirmary at Bangor. The cost is estimated at 14,000*l*.

MR. ERNEST G. GILLOCK has been entrusted with the making of the new mayoralty seal of the City of London to replace the one now in use, which was made more than 500 years ago in 1381, during the reign of Richard II.

THE plans of the new place of worship for the congregation of John Knox Parish Church, Aberdeen, have been passed by the Plans Committee of the Town Council. The total estimated cost is between 6000*l*. and 7000*l*.

At the first meeting of the newly-formed Electricity Supply Committee of the Dublin Corporation, it was resolved that an application should be made for a loan of 125,000*l*. to carry out extension work.

EIGHTEEN engineers sent in schemes in the competition for the water supply project at Alnwick, and Major Tulloch the adjudicator, has awarded the 100*l*. premium to Messrs. Paterson & Nicholson, civil engineers, Bradford.

THE Nelson Loom and Power Company propose to build a new weaving shed in Brook Street, Nelson, Lancs., which will accommodate about 1000 looms and find employment for 500 operatives. It is also proposed to build a shed to hold over 1000 looms on a site in the Hendon district.

THE Surrey County Council have given formal notice of their intention to erect an elementary school at Ewell for 500 children and another public elementary school at Ellens Green for 100 children.

THE Nottingham Guardians on Tuesday agreed that accommodation for about 150 children be provided on a site near the present workhouse by the erection of six cottages, four to hold 30 children each, and two 15 each. A competition will be arranged, and a premium of 50 guineas offered for the best design.

PLANS have now been approved of for the addition to the Stirling County Council's Fever Hospital at Camelon of a building giving accommodation for ten beds in five wards, together with nurses' day-room, storeroom, &c., at an estimated cost of 1,600*l*.

THE committee of the Devon and Exeter steeplechases have decided to erect a grand stand on the race course at Haldon, in readiness for the next races in August. The present structure will be demolished, and the new stand built further back towards the road. Provision will be made for various rooms for officials and jockeys.

THE question of erecting a verandah round the Town Hall, Birmingham, for the protection from the rain of citizens waiting for admission has been considered by the Estates Committee of the City Council on several occasions. Some time ago the project was opposed by the members of the Birmingham Architectural Association, and at the last meeting of the Estates Committee the scheme was abandoned.

MR. CHARLES HODGSON FOWLER, of The College, Durham, for forty years architect to the Dean and Chapter of Durham, architect to the late Sir Tatton Sykes, architect also to Lincoln and Rochester cathedrals, left estate valued at 14,998*l*. gross, with net personalty 14,747*l*.

LININGS were granted on the 30th ult. at Renfrew Dean of Guild Court for the new soap works at Renfrew for Messrs. Ogston and Tennant (Limited). The site of the new works is in the burgh of Renfrew, on the Cart side. The probable cost is 50,000*l*. The buildings will be of steel construction, with fire-resisting floors. The building operations started on Tuesday last.

A LOCAL Government Board inquiry was held at the Guildhall, York, on the 31st ult., by Mr. R. G. Hetherington into an application by the York Corporation to borrow 57,637*l*. for extensions and improvements at the Sewage Works. The present scheme is intended to provide pumping machinery capable of lifting ten million gallons in twenty-four hours, septic tanks with a capacity of 2,700,000 gallons, and stand-by tanks with a capacity of a million gallons to deal with excess flow.

TRADE NOTES.

THE committee of the memorial clock and chimes fund at Bognor, Sussex, have placed the order for the Cambridge quarter-chime clock with Messrs. W. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle-on-Tyne, from the plans of the late Lord Grimthorpe. Messrs. Wm. Potts & Sons have fixed a quarter-chime clock for H.M. Government at Armley Prison, near Leeds.

THE "Boyle" system of ventilation (natural), embracing the latest patent "air-pump" ventilators and air inlets, has been applied to St. Philip and St. James's Church, Ilfracombe. In a report received by Messrs. Boyle it is stated in regard to the ventilation that "satisfaction is general. The purity of the atmosphere in the church is remarkable, and ventilation without draught is an accomplished fact."

MESSRS. DOULTON & Co., Ltd., have been entrusted with the entire installation of sanitary appliances for the public conveniences at the approaching Scottish Historical Exhibition, Glasgow. A thoroughly representative exhibit of the company's various manufactures will be made at the same exhibition.

A LARGE clock is to be erected in the parish church, Hognaston, Derbyshire, the gift of the late Mr. J. H. Smith, of Derby. It will be fitted with all the latest improvements. The work is being done by John Smith & Sons, Midland Clock Works, Derby. The same firm are also making a large chiming clock with four 7 ft. dials for Elland Church, Yorkshire, and they recently made the town hall clock there.

THE Yale and Towne Co. are just putting upon the market an exhibit board of "Yale" padlocks for hanging to the upright of a fitment or shelves; the board containing an assortment of sixteen different padlocks, and so constructed that it may either swing out at right angles to the fitment or lay back flat against it. The price of the board (for which no charge is made) is 2s., which represents the aggregate list price of the individual padlocks. With each board is packed a small assortment of keys of each line.

MESSRS. C. & R. LIGHT, Ltd., Curtain Road, E.C., have paved the way to further and still greater success by erecting at Bedford commodious new works. In their wise recognition of the strenuousness of industrial competition the firm decided to put themselves in an unassailable position. A highly equipped factory or workshop is nowadays a *sine qua non* of success. Any visitor to the Bedford Cabinet Works will appreciate the thoroughness with which Messrs. Light have prepared to cope with additional business. Their main machine shop is laid out on a generous scale, and is fitted with the most modern appliances for economical and perfect production. Of no less importance is the re-organisation and increase in the Designing Department, because, as they wisely say, design is the keynote of success in the furniture trade, and the public rapidly becomes more discriminating. Special attention may be made in closing of their "Bestwood Panelling," for which a patent has been applied. This aims at putting the artistic embellishment of wood panels within the reach of people who have hitherto been denied it. There is a wide scope for wood panelling which will compete in price with good quality surface decoration in shops, residences, offices and public buildings. "Bestwood Panelling" can be fitted up by any ordinary workman, and is put forward as the cheapest panelling on the market.

VARIETIES.

DUMBARTON Dean of Guild Court on Monday approved of the plans submitted by the Burgh School Board for the new academy to be erected at Braehead at a cost of over 26,000l.

A SPECIAL meeting of Girvan School Board was held on the 14th inst., when nine competitive plans of the proposed school were considered. The plan submitted by Mr. Cowie, architect, Ayr, was unanimously chosen. The estimated cost was well within the Board's limit. Mr. H. E. Clifford, architect, Glasgow, acted as assessor.

MR. J. SIMPSON, F.R.I.B.A., Bolton, has prepared designs for a proposed Liberal Club at Ellesmere Port, Cheshire. A prominent feature is a public hall with seating accommodation for 300 persons. The club house will accommodate about 500 members. A company is being formed to raise the necessary 2,000l.

THE Annual Conversazione of the Institution of Civil Engineers has been fixed to take place on Thursday, June 22, in the Royal Albert Hall.

THE National Provident Institution will hold their twenty-fifth annual general meeting on the 24th inst., at the Cannon Street Hotel, E.C. The report shows that during the last financial year 1,643 proposals for assurance were

accepted, amounting to 629,605l. The amount of the Life Assurance Fund on November 20 was nearly seven millions sterling. The accounts for the year show a balance of receipts over disbursements of 232,394l. From the commencement of the Institution in 1835 to November last over sixteen millions sterling had been paid in claims.

AN interesting piece of engineering work is now being done at Earl's Court. When it was decided to replace the old wooden bridge that has connected the two sections of the Court with an ornamental steel structure, the question of the traffic on the District and Metropolitan Railways that send more than 100 trains per hour under the bridge had to be considered. Messrs. E. C. & J. Keay, bridge builders, of Birmingham, undertook to make the change without interference with ordinary conditions, and they are now engaged in replacing the old bridge with the new one, and doing it without disturbing traffic, either across the bridge or on the railways. One bridge is being torn down as the other goes up, and heavy work of carrying material over the structures is continued by the workmen engaged in the rejuvenation of Earl's Court for the coming summer season's Exhibition.

HAMILTON Dean of Guild Court last week approved of plans of an infant school in Beckford Street at an estimated cost of 3,000l. Plans of a pavilion for the Caledonian Bowling Club and of offices at the Greenfield Foundry, were also passed.

A MOVEMENT is on foot for the erection of a first-class theatre at South Shields, in the High Shields district. A large block of property at the top of Frederick Street, near Laygate Lane, has been secured for the purpose by Mr. Richard Thornton and Councillor John K. Hall, of South Shields, and Mr. John Heaton, of Roker. Plans will shortly be submitted to the Town Council for approval.

MR. COLIN MACANDREW, Lauriston Place, Edinburgh, has secured the contract for the men's quarters in the cavalry section of the barracks the War Office are to erect at Redford, N.B. It is understood the contract price is 100,000l., and that the work must be completed in a couple of years. Operations will be commenced immediately. The portion for which the contract has been given is the men's barracks and the officers' and troopers' stables. The contract for the commanding officer's quarters, officers' mess, sergeants' mess, married quarters, guard-room, block, and stores has not yet been settled.

WE regret to announce the death of Mr. J. J. Griffiths, J.P., the chairman and founder of the Patent Victoria Stone Co. For many years Mr. Griffiths took a very active part in the control of the company and much of the success obtained was through his untiring energy. Formerly, Mr. Griffiths was associated with his son, Mr. William Griffiths, in the business of William Griffiths & Co., Ltd., of Hamilton House, Bishopsgate Street and Guernsey, and there are very few local authorities who have not had business transactions with the firm as suppliers of Guernsey granite setts and roadway supplies.

THE Callender Company have sent us a handsome photograph of H.M.S. "Thunderer," built by the Thames Iron Works and Shipbuilding Co., Ltd., at Canning Town, E. The keel was laid April 13, 1910, the vessel launched on February 1, 1911. The main electrical distribution has been entirely effected by means of Callender's cable and special boxes.

THE Seventh Manchester Building Trades Exhibition, as arranged at the last Exhibitors' Meeting, will take place next year at the City Exhibition Hall from March 5 to March 16. The 1912 Exhibition is under the direct patronage of the Trade Associations and is already well supported by leading firms who have been exhibitors at Manchester in previous years. Invitations and free admittance tickets will be sent to architects, corporation officials, builders, and all interested in building and kindred trades within a wide radius of Manchester. Mr. Walter Cawood, 16 John Dalton Street, is acting as general manager.

THE Corporation of Monmouth have approved the design for the memorial of the Hon. C. S. Rolls, and commissioned Mr. Goscombe John, R.A., to proceed with the statue, which is to show Mr. Rolls holding a small model aeroplane in his hands and inspecting it. The pedestal is designed by Sir Aston Webb, K.C.B., R.A., and will have four bronze panels in relief—one with the inscription, the other three with ballooning, motoring, and flying the Channel respectively. It will be completed during the summer.

THE Bexhill Town Council have received the sanction of the Local Government Board to a loan for the erection of a colonnade on the Central-parade. The scheme combines an ornamental shelter with a sunk bandstand and enclosure. The enclosure will accommodate 700 people, and it can be enlarged to seat 3,000. The colonnade will complete the central front improvement scheme, which has been carried out at a cost of about 12,000l. The necessary plans were prepared by Mr. G. Wall, architect, Bexhill.

Diagram to Scale showing area and relative size of the principal Garden City, Garden Village and Garden Suburb Schemes in England.

THE EVOLUTION OF FIRE-RESISTING CONSTRUCTION.*

(Continued from last week.)

THE second Paper above referred to was read by Mr. A. W. Blomfield on "Concrete Building." This Paper was confined to the consideration of concrete in walls constructed *in situ*, by filling concrete into cases or moulds, made to shift to the various heights and positions as the work proceeds. This system has, we know, since been very largely adopted.

Mr. Blomfield confined his remarks principally to the limits which the material imposes on architectural design and decoration, and I think we shall all be in accord that at present no form of concrete exposed externally as concrete can take the place of stone or brickwork for architectural treatment, and Mr. Blomfield very sagaciously says that nothing can be done in the way of artistic treatment so long as the only aim is to show how well concrete walls can be made to imitate some other material and some other method of construction. Mr. Blomfield quite rightly protests against the idea of a concrete arch, and that it would be as rational to scoop out the underside of a York landing or a Portland stone lintel into an arched form to increase its strength as to mould a mass of concrete into such a shape with the same object. There can be little doubt that forty years ago fire-resisting construction in floors was greatly in favour, and Mr. Blomfield predicts that its capabilities in that direction, "without any adventitious aid of iron girders or other supports over considerable areas, has never yet been properly tested." We know the gradual increase in later days of unsupported areas of concrete in floors, but bearing in mind the great importance which should be attached to the mixing of the concrete, I do not think it would be wise to push this increase in unsupported area too far.

Mr. Edward P. Anson in summing up the Papers made one or two useful remarks, which are quite as useful to-day. He was convinced that unless thorough dependence can be placed upon the honest and conscientious execution of the work by the contractor, concrete is a dangerous material to use, inasmuch as a small percentage of inferior material in Portland cement would cause the ruin of the entire work. Mr. P. Anson testified to the great desirability of not using cement too newly made, and mentioned that the Metropolitan Board allowed concrete buildings to be used in London, but insisted upon a considerable amount of iron hoop bond, and would not allow concrete walls of less thickness than brickwork. So that at this date "reinforced concrete," in the shape of hoop iron bond and concrete, was adopted.

Then in April, 1876, with Sir Gilbert Scott, R. A., President in the chair, a Paper was read at the Royal Institute of British Architects by Mr. Alexander Payne on "Concrete as a Building

Material," and this was principally dealing with its ornamental for the fronts of buildings and avoiding ugliness. Mr. Payne observed, and this is an important matter in dealing with concrete and iron combined, that once you bed iron and keep it from the air you entirely protect it from rust and oxidation. Mr. Payne laid it down as an axiom that concrete offers unusual facilities as a material for walls, &c., "from the readiness with which iron or other ties can be embedded in it in any direction to resist any thrust or tendency to separate in the structure." Mr. Payne showed a design for a street façade in iron and concrete, but I cannot say that it would induce me, personally, to substitute concrete for stone or brick. Mr. Payne would not imitate the projections of stone and brickwork, but would obtain as large wall spaces as possible and as few projections ornamenting the work instead by indentation, calling to recollection the magnificent ornamentation of the Alhambra and the Mahomedan buildings of India. Mr. Payne went so far in his intense admiration for concrete, to advocate the panelling of the interior of an apartment and "do away for once with the everlasting wall paper," and he practically described ferrocement concrete when he proposed to "use iron embedded in concrete for the purpose of giving tensile strength to prevent fracture caused by thrusts of arches, vaults, &c., instead of opposing them by buttresses as is done in brick or stone."

(To be continued.)

THE Salford Union Guardians have decided to go forward with a proposal for providing new offices. A sub-committee is to go into details and formulate a scheme for the erection or rebuilding of the offices on the present site. The cost will be between 15,000*l.* and 20,000*l.*

At the monthly meeting of the Blackpool Building Plan Committee, at the Town Hall, fifty-three plans were considered and thirty-eight were approved. Among the latter were plans submitted by Mr. J. Cunliffe for twenty-eight houses and a shop in Cunliffe Road.

THE *Natal Mercury* of December 30 states that a Government White Paper has been published showing, in respect of the works and bridges provided in the Union Provincial Estimates the amount of commitments entered into by the South African Colonial Governments at the date of Union, and the works since authorised. The allocation to the Cape covers the provision of new post offices at Wynberg, Mowbray, and Oudtshoorn, aggregating 5,750*l.*; and renovations at Government House, Capetown, 5,000*l.* The chief item in the Free State is for new Law Courts at Bloemfontein at a cost of 64,500*l.* The largest expenditure for Natal is on account of Maritzburg Asylum, viz., 26,200*l.* In the Transvaal it is proposed to expend 19,295*l.* on the Pretoria Asylum; 72,000*l.* on Government buildings and Courts at Standerton, Barberton, Krugersdorp, and Benoni; and 46,665*l.* on additions to the prison buildings at Johannesburg.

* A paper by Mr. William Woodward, F.R.I.B.A., read at the ordinary general meeting of the Surveyors' Institution, on Monday, Feb. 6.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

* As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

WHITLEY.—Feb. 27.—For the following works for the Whitley and Monkseaton Urban District Council, Northumberland, viz.: (1) construction of public conveniences at the rear of the Council Offices, Front Street, Whitley Bay; (2) private improvement works in Pykerley Lane. Mr. A. J. Rousell, A.M.I.C.E., surveyor, Council Offices, Whitley Bay.

WHITEFIELD.—March 2.—For erection of a secondary and art school at Whitefield, Lancs., for the Governors of Stand Grammar School. Deposit 3l. Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

WINCHESTER.—March 2.—For supplying and erection of certain fencing, stalling and other wood work at the bathing place in the new recreation ground. The City Surveyor's Office, Guildhall, Winchester.

WORKSOP.—March 1.—For new church, Worksop, Notts (whole or separate trades). Messrs. Hodding & Co., solicitors, Worksop, and Messrs. Austin & Paley, architects, Lancaster.

WORKSOP.—March 4.—For erection of a school off Newgate Street. Send names and 2l. 2s. deposit by Feb. 25, to Mr. E. G. Lucas, architect, Bridge Street, Worksop.

TENDERS.**ALDERSHOT.**

For erection of secondary school. Mr. T. C. UREN, surveyor.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

From a Drawing by "SANS PEUR."

**FONT AND COVER IN ST. JOHN'S CHURCH,
NEWCASTLE-UPON-TYNE.**

This is an example of the steeple variety of font covers. The cover is of sixteenth-century date, probably late; the design, though Gothic in spirit and in form, shows in the details the Classic influence. It is octagonal in shape, and of two stages surmounted by a crocketed spirelet.

The present font dates from A.D. 1689, and was erected by Andrew Bates, who was lecturer at the church at that date, one of the shields bearing his arms. Other than the

shields it is quite devoid of ornament and forms an excellent foil to the rich woodwork above it.

The position of the font in relation to the baptistry is such as to give a very effective contrast between the light of the aisle and the gloom under the tower vault.

MR. MERVYN MACARTNEY, consulting architect to the Dean and Chapter of St. Paul's, London, has been appointed consulting architect to the Dean and Chapter of Durham, in succession to the late Mr. Hodgson Fowler.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB,
THE PARISH CHURCH OF ST. JOHN
THE BAPTIST, KNARESBOROUGH.
MEASURED DRAWING OF THE
FONT AND COVER

ELEVATION

From a Drawing by Mr. E. H. GIBSON.

ST. JOHN THE BAPTIST, KNARESBOROUGH.

The font is Early Perpendicular in style, and is rather rudely
rved. It is of unusual depth and breadth, being one foot
ree and a half inches deep and two feet and a half inch

wide. The date is a matter of conjecture; it is probably
about 1440. The cover is supposed to have been made during
the reign of Charles II., probably about 1670. There is a
curious mingling of styles in the turned pinnacles and the
general curvature of the whole cover, and the Classic detail

of the leaves which cover the scrolls. Most of the panels are modern copies of the old ones, and were put in when the cover was rescued from a store room, where it had laid for years, covered with dust and several coats of paint. There is a beautiful modern wrought-iron bracket fixed to the west wall of the church, from which the cover is suspended. There is a poor-box in the church of very similar character to the font cover, which bears the date 1600 and the names of the churchwardens at that time.

Knaresborough Church dates back to a Norman foundation. It is mentioned in Hargrove's "History of Knaresborough" that in 1114 it was given to the Priory of Nostel (near Pontefract). In 1230 Archbishop Walter Grey united it to the Prebend of Bickhill. The piers supporting the tower seem to have been erected about the middle of the twelfth century, and in the chapel on the south side of the chancel there is much work of about the end of the twelfth and the beginning of the thirteenth century, viz., an oggee piscina, sedilia (double) and a recessed canopy which formerly contained the recumbent effigy of a knight. There is a beautiful arch on the west side of the chapel enriched by dog-tooth ornament. The chapel is lighted by a simple Early English window and on the east by a Decorated one. There was at one time a shrine in the chapel, and there is now a niche which evidently contained the figure of some Saint. This chapel was formerly owned by the Plumpton family, now extinct; it is now held by the Roundell family.

On the opposite side of the chancel is the Slingsby Chapel, which contained two good Geometrical windows and some fine monuments. One is a beautiful altar tomb on which are the recumbent effigies of Sir Francis Slingsby and his lady. The date upon it is 1600. The nave, which is very lofty, is fifteenth century work throughout.

The tower is of the same period and is surmounted by a modern spire.

THE INSTITUTION OF HEATING AND VENTILATING ENGINEERS (INCORPORATED).

THE annual General Meeting of the above Institution was held at the Trocadero Restaurant, Piccadilly Circus, on Tuesday, February 14. The president, Mr. C. Ingham Haden, was in the chair.

The minutes of the last meeting, held October 18, 1910, were read by the Secretary and confirmed by the meeting. The report and balance sheet were adopted. There were twelve new members elected, thirteen associates, one member re-elected, and two transfers from associate to full membership.

The new president, Mr. O. M. Row, M.I.Mech.E., of Irlam, Manchester, was inducted to the chair by the retiring president, and the Presidential address was given.

A paper was read by Mr. John H. Blizard, A.M.Inst.C.E., F.R.I.B.A., of Southampton, on the "Ventilation and Heating of Public Buildings in their relation to the Prevention of Tuberculosis." An address was given by Mr. W. H. Hurtley, D.Sc., of St. Bartholomew's Hospital, London, on "The Air of Inhabited Rooms with Special Reference to Dust" and a "Case of Corrosion by Water of the Hot-Water Pipes at a Sanatorium."

The paper and address were full of interest and well received by the meeting, discussions taking place on both.

The dates of future meetings were fixed as follows:—Summer meeting at Chester, July 3 and 4; Autumnal meeting, October 17, at the Institution of Mechanical Engineers, Storey's Gate, London, S.W., and the annual meeting in London on February 6, 1912.

BUILDING TRADES EXHIBITION, OLYMPIA.

THE ninth biennial Building Trades Exhibition will be opened on Saturday, April 22, by Mr. Leonard Stokes, President of the Royal Institute of British Architects, and will close on May 6.

No more successful event is associated with Olympia than the Building Trades Exhibition, organised every two years by Messrs. H. Greville & Hugh C. Montgomery. Indeed, we doubt whether there is another Exhibition which can in the same way fill the huge building at Addison Road—main hall, annexe and galleries—from end to end with exhibits strictly germane to the industry immediately concerned. As before, the galleries will be found to constitute a municipal section for the special benefit of borough surveyors and engineers; whilst the whole of the ground floor is devoted to the multifarious requirements of the architect and builder. The wall which used to separate the main hall from the annexe

has recently been removed, the result being that the stand will run continuously from the entrance in Addison Road to the exit in Blythe Road.

Arrangements are being completed for official visits of numbers of the many associations and societies connected with the building industry, and there is no doubt that the Exhibition of 1911 will be an even greater success than any of its predecessors.

THE HYGIENIC ASPECTS OF GAS LIGHTING AND HEATING.

THE current issue of "The Medical Magazine" contains an interesting and valuable report of some experiments recently carried out at the Lewisham Infirmary by the medical superintendent, Dr. F. S. Toogood, for the purpose (1) of comparing hygienically the relative values of the open fire and the gas radiator as heating agents; (2) of ascertaining whether and to what extent the atmosphere of a room affected by incandescent gas burners and lamps; and (3) of ascertaining the hygienic value of the gas fire. This report by an independent scientist on matters that are frequently in controversy between interested parties will be welcomed by the public who are only interested in getting at the truth on a subject of very general domestic and commercial importance.

Full details are given of the numerous tests made, and will be found valuable by all who are desirous of close investigation of the subject. It is sufficient here to give Dr. Toogood's general conclusions, which state that these experiments may be regarded as having proved conclusively:

(1) That in both large and small apartments which have normal means of ventilation, gas consumed in modern incandescent burners can be used for lighting without any detriment to health, being found, in fact, to assist ventilation by the increased circulation of the air.

(2) That a gas fire, properly constructed and fixed, not only does not vitiate the air, but is a valuable adjunct to the ventilation of the room. Its advantages in the sick room in respect of its reliability, avoidance of noise, freedom from dust-producing propensities, and saving of both work and anxiety—are obvious.

(3) That in large rooms, adequately ventilated, flueless gas stoves can be used for heating without any hygienic disadvantages, the heated products of combustion (mainly CO₂ and water vapour) ascending quickly above breathing level. This method of heating—by radiation and convection from flueless gas stoves—is economical, but proper ventilation of the buildings in which it is adopted is essential, which, of course, is also the case whatever means of heating be adopted. A ward or other public building in which gas radiators cannot be used with advantage is improperly ventilated.

These conclusions, confirming as they do those arrived at by Dr. Rideal, published in the "Journal of the Royal Sanitary Institute," No. 2 (1908), will be welcomed by the public as showing that gas, which they know to be cheap and convenient, is not unhygienic when used in a rational and normal manner.

THE Windsor Town Council have under consideration a proposal "that the house No. 11 Church Street, which belongs to the Corporation, should be pulled down and new municipal offices erected at a cost between 700 l. and 1,000 l."

THE Hooton (Cheshire) Education Committee have agreed that a new school, to provide accommodation for 400 children should be provided for the Bebington and Storeton districts. The committee also appointed an architect for the school at Willaston, which is to accommodate 170 children.

THE Oxfordshire County Council have agreed that application be made to the Local Government Board for the sanction to the raising of a loan for educational purposes for a new Council School and teacher's house at Sonning Common to the amount of 2,300 l. the repayment to be spread over 5 years, at 3½ per cent. interest.

A LOCAL GOVERNMENT BOARD inquiry was held last week into the application of the Liverpool City Council for further borrowing powers of 200,000 l. The money is to be expended during the next ten years on street improvements, chiefly on the outskirts. Mr. J. A. Brodie, city engineer, said the policy of the city had been to widen all the roads from the centre of the city to the outskirts to at least 60 feet, and in the outskirts, where land had not been built on and the cost of widening was therefore much less, the general policy had been to widen to at least 80 feet. In latter years a number of streets had been made 90, 100, 108, and in one case 114 feet wide.

THE EVOLUTION OF FIRE-RESISTING CONSTRUCTION.*

(Continued from last week.)

The previous paper was followed by an interesting discussion. W. H. Lascelles referred to warehouses gutted by fire, where slabs consisting of concrete with pieces of iron, three inches by a quarter of an inch, embedded in the centre, were not affected by fire, although the cills and other parts were. The concrete was mixed in the proportion of one of cement to six of breeze. Mr. P. Brannon was a great believer in iron and concrete, and made window heads by bedding rods of angle-iron and discharging with any framing or brasssummers. He had then put concrete doors in St. Paul's Cathedral, under Mr. Penrose, in order to render fire-proof that portion of the dome to which the public have access. Mr. Brannon had then built some stages in Derbyshire where the concrete walls were made of the "slag of furnaces ground with selenitic lime," the compound being "nearly as good as Portland cement concrete." Drake, at the same meeting, was most earnest in his partiality to concrete in floors, roofs, and staircases, and he asserted that Portland cement concrete, or good selenitic concrete, or old lime concrete, correctly treated, "will never either contract or expand in the smallest degree after having once set." J. Tull stated, at the same meeting, that slag from the blast furnaces was an excellent material because it is easily crushed and furnishes in the crushing a sharp grit. He did not approve of iron in concrete floors. His first attempt was with an upper room 19 feet by 13 feet without any iron joists; his second attempt was with a drawing-room floor 40 feet by 16 feet, and he contended that that floor is stronger without iron than it could be with it. The thickness of the floor was 11 inches reduced to 4½ inches in the middle, and he believed there was not a crack or blemish to be found in the whole. Major Seddon, Royal Engineers, made some important remarks on concrete. He was not so much afraid of the work being scamped, as of failures arising from the ignorance of the contractor or his workmen. He had a slab of concrete made 6 inches thick and 6 feet 6 inches by 13 feet 6 inches clear of the supports, which were 14-inch brick walls, and after twenty-one days' setting thirty men marched on to it, who marked time at the quick and double, and then jumped upon it altogether, without having any effect whatever upon the concrete. The whole of the unsupported part of the slab was then loaded with bricks, until an evenly distributed load of 10½ tons was piled upon it, when it gave way suddenly. The major stated that no iron whatever had been used in any of the concrete floors designed by him, as he "preferred using iron where he knew what work it was doing within certain limits," whereas, "when iron is embedded in concrete, no one can determine the relative proportion of the work which falls to the share of the iron and the concrete respectively." Mr. Aitchison was desirous that experiments should be tried with and without the iron, "to show whether any or what additional strength is gained," and Mr. Arthur Cates made some interesting references to the work of Mr. Brannon in which the cupola of St. Paul's was made fire resisting. Mr. Payne (the author of the Paper) agreed with Mr. Charles Barry that "if concrete fails it fails suddenly and disastrously." It will be observed that I have generally used the term fire-resisting "instead of "fire-proof," as examples of large failures prove that at the present moment there is nothing which has been invented to make a building "fire-proof." The most we can do is to so construct our buildings as to minimise as much as possible the risk from fire and smoke.

The London County Council General Powers Act, 1909, now enables skeleton framed structures to be erected, at the same time permitting the reduction in the thickness of external walls under the Act of 1894; and so far as I have been able to judge, the anticipatory objections to the provisions of that Act have been modified, and it seems to work well and does not entail those delays and interferences which some members of the profession thought would be likely to arise.

We may now conclude that fire-resisting material has come to stay with us, and I think we may congratulate ourselves on the practical immunity from accident as regards that construction in this country. Before coming to the most modern of fire-resisting constructions, viz., "Reinforced Concrete," I propose to say a few words on other methods. There is the plain and simple rolled iron or steel joists, some three feet apart, laid in between with concrete or breeze and Portland cement. Its demands centering, and at times trouble is caused by the radiation of moisture just when it is not wanted. One of the

early floors, which still holds its own, is what is known as "Dennett & Ingle's." The steel joists are from 4 feet to 10 feet apart, according to the particular form of construction; in some cases the concrete is with arched and in others with horizontal soffits; each method lends itself to either joists on plates bearing on the concrete, to wood block flooring, and to soffits either plastered on the concrete direct, or with ceiling joists and lath and plaster in the usual way. The material is concrete composed of highly calcined gypsum and broken brick, or of Portland cement and an aggregate of broken brick and gravel. This method demands temporary centering. Messrs. Dennett & Ingle recommend the avoidance of coke breeze as an aggregate as being unsuitable, either from the point of view of strength or fire-proof qualities. Messrs. Dennett & Ingle instituted a series of experiments for the encasement of stanchions, columns and to girders which proved to be most successful. Many buildings where Dennett & Ingle's construction was used have caught fire, and I believe that in every case the fire was localised in consequence of this form of construction and much valuable property saved. Amongst the many buildings provided with Dennett & Ingle's floors are the Foreign Office, Royal Courts of Justice, St. Thomas's Hospital, National Gallery, asylums, and theatres.

We then get to the various forms of fire-resisting floors consisting of brick or tile arches between iron or steel joists, different forms of terra-cotta laid on the joists and carrying concrete, such as the Frazzi floor—all doing away with the necessity for centering, which is an important matter, not only on the ground of expense, but for the fact that centering keeps back moisture and rather lends itself to careless filling in on the part of the workman. The terra-cotta of these patent floors is made so that it can easily and accurately be laid in lengths between the steel joists and the soffits plastered afterwards. The objection to them is that the terra-cotta is somewhat brittle and fragile in substance, and requires care in handling and in knocking nails in it. These floors are, however, commendable, and are being made—and the system is also much used in partitions—so that nails can be knocked in the terra-cotta without enlarged fractures. I think also that they are as fire-resisting as could be wished.

(To be concluded.)

VARIETIES.

THE Forfar Presbytery has accepted an offer to erect within the parish of Forfar a memorial church with from 600 to 800 sittings, hall and manse.

THE Salford Town Council has adopted a resolution sanctioning an application to the Local Government Board for permission to borrow 7,944*l.* to defray the cost of erecting a slab-making plant at the Agecroft refuse destructor depot.

ARCHITECTS resident or practising within a radius of 20 miles round Sale, desirous of submitting designs for public baths, are requested to send in their names to the Clerk not later than Friday, February 24. It is intended to make a selection of architects, who will be invited to submit competitive plans.

THE approved alternative design prepared by Mr. J. H. McGovern, architect, 26 North John Street, Liverpool, for the erection of a church in the Classic style, at an estimated cost of 5,000*l.*, in Parkfield Road, Liverpool, for the Methodist New Connexion is postponed in consequence of a suggestion by one of the committee "that a cheaper site could be obtained at Garston."

THE Seaham Harbour Dock Company have decided to erect new coal staithes and spouts at the South Dock, and they have instructed Messrs. P. A. Mudd & Co., of West Hartlepool and Newcastle, to prepare the designs and to supervise the carrying out of the work. The extensions will consist of approach railway bridges leading on to steelwork coal staithes 600 feet long and 48 feet high, carrying four railway lines. The estimated cost of the work is 22,000*l.*

THE Holne Cultram Urban District Council's (Cumberland) consulting engineers, Messrs. Henry Adams & Son, of 60 Queen Victoria Street, London, E.C., have reported that the sea wall and concrete apron at Silloth, about 1,400 yards long, carried out under the first contract, has now been satisfactorily completed, and application has been made to the Local Government Board to sanction a loan in connection with the proposed extension for about 1,000 yards, which is to be carried out as soon as possible.

THE Berkshire County Council at their last meeting had before them a report and plans prepared by the County Surveyor of Hampshire, in conjunction with the County Surveyor of Berks, for a new bridge in three brick semi-elliptical

* A paper by Mr. William Woodward, F.R.I.B.A., read at the ordinary general meeting of the Surveyors' Institution, on Monday, Feb. 6.

arches at the county boundary, Newtown, the estimated cost of which is 2,400*l.*, and an alternative scheme for a bridge of brick with concrete pier and wing walls with ferro-concrete platform and oak parapet rail for 2,200*l.* The new bridge will occupy the site of a portion of the existing bridge. It was decided to erect it in brickwork.

MESSRS. DOUGLAS YOUNG & Co., surveyors and auctioneers, 51 Coleman St., E.C., ask us to call attention to the sale of the complete fittings of a fine oak-room in The Grange, High Road, Kilburn. This is a genuine panelled room of the Georgian period, containing some finely executed carvings in an excellent state of preservation. The sale will take place on Wednesday, March 8. The room may be viewed privately by appointment on application to the auctioneers.

THE monthly meeting of the Council of the London Master Builders' Association was held at Koh-i-Noor House, Kingsway, W.C., on the 16th inst., under the chairmanship of Mr. Leonard Horner (president). The audited accounts for 1910 were received from the finance committee and will be submitted to the general meeting on Monday, the 27th inst. The organisation committee's report was received, and although the matter is proceeding slowly, those districts that have been taken in hand have produced good results, and many builders have become members. It is now hoped to proceed with the work of organisation much faster. Other matters of interest were discussed.

A NEW aspect of co-partnership in trade has been the subject of a vote amongst the Amalgamated Carpenters and Joiners, and a recommendation to add a clause to the rules prohibiting members from working under a co-partnership system when provision is made for operatives to hold only a minority of the shares in the concern has been carried by a majority of 10,195. The Council, alluding to the subject, say they believe a co-partnership based on the principle of the employing class holding the majority of the shares to be pernicious, demoralising, and enslaving to the workmen. They also declare that past experience has shown that one of the main objects of such movements has been the breaking up of trade unions.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on Thursday, February 16, at the Society's house, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Clapham Common, the Holy Spirit, Surrey, 200*l.*; Llanelly, S. Alban, Carmarthen, 100*l.* for the first portion and Purlwell, S. Andrew, Eatley, Yorks., 200*l.*; rebuilding the church at Hensingham, S. John, Cumberland, 75*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Bermondsey, Christ Church, Surrey, 40*l.*; Branscombe, S. Winifred, Devon, 50*l.*; Plumstead, Church of the Ascension, Kent, 80*l.*; Spitalfields, Christ Church, Middlesex, 40*l.*; Norton-juxta-Malton, S. Peter, Yorks., 100*l.*; and Walton-on-the-Hill, S. Mary, Lancs., 100*l.* A grant of 20*l.* was also made from the Special Mission Buildings Fund towards building a mission church at Burstow, Surrey. The following grants were also paid for works completed:—Llanddewi, S. David, North Wales, 20*l.*; Wittersham, S. John the Baptist, Kent, 40*l.*; East Thorpe, S. Mary, Essex, 40*l.*; Chelsea Old Church, Middlesex, 75*l.*; Longcott, S. Mary the Virgin, Berks., 15*l.*; Newton Heath, S. Wilfrid (Rossall School Mission), Manchester, 140*l.*; Llanelly, S. Elli, Brecons, 40*l.*; Natland, S. Mark, near Kendal, 70*l.*; and Shacklewell, S. Barnabas (Merchant Taylors' School Mission), Middlesex, 50*l.* In addition to this the sum of 265*l.* was paid towards the repairs of 16 churches from trust funds held by the Society. The annual general court of the Society will be held at the Church House on Thursday, May 18, when the Bishop of Salisbury has consented to take the chair.

TRADE NOTES.

MESSRS. R. WAYGOOD & Co., LTD. (established 1833 in the reign of King William IV.), have received the royal warrant of appointment as lift makers to H.M. King George V. A similar warrant of appointment was held by R. Waygood & Co., Ltd., from H.M. King Edward VII. and Her Majesty the late Queen Victoria.

MESSRS. PECKETT & SONS, locomotive engineers, Atlas Locomotive Works, St. George, Bristol, have just issued an interesting book of views showing their workshops, with a few examples of their locomotives. The Atlas Works are on an imposing scale, having a covered area of 101,800 square feet, and there is a further eight acres for future extension. The works are a model of what an up-to-date engineering

establishment should be, and have the rare advantage being conducted under the immediate supervision of the proprietors. All the machinery installed is of the most modern type, and additions to the plant are constantly being made. Locomotives are turned out of all sizes and gauges special-constructed for main and branch lines, contractors, iron works, brick and cement works, &c. Locomotives of various sizes are always in stock ready for immediate delivery.

MESSRS. W. POTTS & SONS, of Leeds and Newcastle, have recently installed a turret clock and chimes at Ebchester parish church; a set of six bells and chiming apparatus at Birtley parish church, and a clock with 6-feet illuminated dial at the premises of Messrs. Knight & Forster, printer, Water Lane, Leeds. The firm have instructions from the borough surveyor to erect a four-dial turret clock at Holbeck Gardens, Scarborough.

A NEW patent method of making thin partition walls at a small outlay is brought to our notice by the agent Messrs. Joseph Griggs & Co., Ltd., Loughborough, under the name of "Stability" Construction. "Stability" Construction walls or partitions are formed of a combination of brick blocks, special wire, and cement. Both faces of the blocks are provided with horizontal and vertical grooves, arranged that when in position they form continuous grooves running from top to bottom, and from end to end of the wall or partition. The cement mortar used in erecting must be a good mixture, which will set thoroughly hard. After the blocks are in position the requisite number of wires are cut, according to the width and height of the structure. They are then placed in the grooves and held in position where necessary, with small bell staples. The partition is then finished with a thin coating of cement. It is pointed out that the blocks escape the disadvantages of many partitions now on the market. They are neither weak in regard to side-thrust or compression, nor made of combustible materials, nor capable of harbouring vermin. "Stability" Construction is economical, fire and sound proof.

THE use of mechanically-propelled vehicles, both for pleasure and business purposes, is now almost universal. It has become necessary therefore that provision be made in private houses and business premises for their proper storage. An important feature of the inevitable motor house is the inspection pit. Until the introduction of the "Luna" Patent Steel Inspection Pit, brick pits were deemed sufficient although not infrequently they proved to be far from water-tight. The accompanying illustration shows the "Luna"

pit. The sides are made of corrugated steel sheets heavily galvanised on both sides after manufacture. They are bent by special process to form the corners, and there is no possibility of leakage. The bottom is of steel strengthened by angle irons. Two steel steps and a light movable wooden floor (to give a comfortable foothold) complete the inspection pit. No foundation is required, all that is necessary being a hole dug large enough to hold the pit into which it is lowered and the ground filled in round it. The stay shown in the illustration is then removed. The makers, Messrs. Pemsel & Wilson, Ltd., of Hemel Hempstead, adopt a standard size of 6 feet long by 3 feet wide and 4 feet deep, but other sizes can be supplied when required. That this pit is both watertight and non-corrodible was proved on examination of one fitted at Messrs. G. B. Kent & Sons' works, where the ground at two feet depth is water-logged. After three years without receiving any attention it is in perfect condition.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt

To Architectural Students.

Back Volumes of THE ARCHITECT will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C. between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples is 12s. 6d.

THE CHATEAU LAURIER, OTTAWA, CANADA.

THE "Château Laurier" at Ottawa, which is owned and operated by the Grand Trunk Railway system, is splendidly situated in Major's Hill Park. It faces to the west the Parliament Buildings and grounds, to the north the Ottawa River, and the grand Laurentian Hills in the Province of Quebec.

It is built in the French château style, in the most approved method of fire-resisting construction. The frame of the building is steel, the walls are of Bedford limestone, surmounted with copper roof, and the whole building presents a picturesque appearance from every view-point.

The hotel contains, in addition to its regular dining-room and café, a ladies' dining-room, banquet room, ballroom, a State suite, and a number of private dining-rooms, as well as three hundred and fifty bedrooms with two hundred and sixty-two private bathrooms. Each bedroom has a front outlook, for there is no courtyard to this hotel, and upon three sides it fronts the beautiful Major's Hill Government Park.

Besides the ordinary entrance to the "Château" from the street, it is connected with the Grand Trunk Railway's new Central Union passenger station by a private passageway.

COMPETITION NEWS.

SCOTLAND.—The Council of the Royal Institute of British Architects request the members and licentiatees of the Institute not to take part in the New Cumnock United Free Church Competition.

IRELAND.—The managing committee of the Royal Hos-pital for Incurables, Donnybrook, Dublin, recently invited designs in competition from architects in practice in Dublin for a pavilion for incurable consumptive patients, and additions to the existing hospital. At a meeting of the Building Committee on the 24th ult. the report by Mr. A. William West, the assessor, was adopted. The first prize has been awarded to Messrs. Kaye Parry & Ross (D. 102), 43 Kildare Street; the second to Messrs. Walter Doolin & Butler (D. 106), 12 Dawson Street; and the third to Mr. G. P. Sheridan (D. 101), 1 Suffolk Street.

VARIETIES.

THE Italian *Gazzetta* of February 17 contains a decree granting a sum of 96,000*l.* for the erection of a Central Post Office Savings Bank in Rome.

THE York Education Committee have decided to purchase 7,198 square yards of land in the South Bank district for the purpose of erecting new elementary schools.

THE Governors of Robert Gordon's Technical College, Aberdeen, have approved generally of the extension of the School of Domestic Science, at an estimated cost of 7,000*l.*

A SCHEME has been adopted for the purchase of some land close to the Rectory, at Acton, for the sum of 4,200*l.* It is proposed to erect a large parish hall on the site.

MR. G. H. FELLOWS PRYNNE, architect, Westminster, S.W., has prepared plans for the addition of an operating-room to the St. Barnabas Hospital, Saltash. The local committee are seeking to collect 500*l.* for the purpose.

THE Dean and Chapter of Lincoln have appointed Sir Charles Nicholson, Bart., of 2 New Square, Lincoln's Inn, W.C., as consulting architect of the Cathedral, in succession to the late Mr. C. Hodgson Fowler.

THE Northamptonshire Memorial to King Edward is to take the form of an extension of the County Sanatorium for Consumptives. It is intended to build a new wing, and any surplus will be utilised for endowment and the erection of a memorial tablet.

THE Queensland Appropriation Act for 1910-11 provides for the payment from the Loan Fund Account of 56,200*l.* for public buildings, 19,500*l.* for artesian boring, and 14,500*l.* for wire netting. It further provides, under the heading of the Department of Public Works, for the pay-ment from revenue of 87,376*l.* for buildings.

THE Institution of Municipal Engineers have appointed Mr. Ernest Prescott, the President, and Messrs. Henry C. Adams and H. C. H. Shenton to represent them on the Joint Committee being formed by the Council and the Science Standing Committee of the Concrete Institute to consider the loads that should be provided for in the design of highway bridges.

THE third annual Cement and Concrete Exhibition will be held at Toronto, under the auspices of the Canadian Cement and Concrete Association, from March 6 to 11. The exhibits will comprise cement, cement products, cement-using machinery, cement-testing apparatus, concrete mixers, cement literature, architects' and engineers' plans of struc-tures in which cement is used, &c.

MR. JOSEPH NORRIS, cabinet and chair manufacturer, Hull, has just made the tip-up chairs for the new Brightside and Park Baths, Sheffield, under the city architect; as also the tip-up chairs for the Duke Street Conservative Club, in the same city. Mr. Norris, who makes a speciality of this class of work, has just issued an illustrated tip-up chair catalogue.

A SMALL folder issued by the London and South-Western Railway Company, under the title of "To Pleasant Scenes by Pleasant Means," carries the memory to Devon, Cornwall and the many beauty spots on the sunny south coast between Plymouth and Southsea. The company's excellent railway service to this part of England has kept many people in this country who heretofore thought that the Continent offered the only possible winter resorts. But the Western Riviera is now rapidly attaining the favour it deserves. This movement has been assiduously fostered by the London and South Western Company, who offer fast trains, comfort-able carriages, and low fares.

PREMISES OF MESSRS. W. N. FROY & SONS, LTD.

ON a Thursday morning some eighteen months ago the premises of Messrs. W. N. Froy & Sons, Ltd.; builders' merchants and manufacturers, in King Street, Hammersmith, W., were the scene of a disastrous fire. After some hours of strenuous and perilous work the fire brigade obtained the mastery. But it was not until an area some 250 ft. by 80 ft., or half the entire premises, had been gutted. With most commendable smartness and pluck the firm took immediate steps by which their customers were spared any inconvenience as a consequence of the mishap. The temporary rearrangement of the business was so effective that work went on as if nothing had happened. But in the meantime a great deal was happening, for a contract was quickly entered

marble works, smith shop, glazing shop, &c. In these a number of processes may be seen in operation and lessons learnt in stained glass production, leaded light manufacture, fixing tile-surrounds for fireplaces, and so on.

The showrooms offer a wide range of choice in equipment whether of a hotel or a villa. The great things and the small things are alike waiting to be inspected. A coal box, a central range, or an electric light shade; a chimney-piece, a drain-pipe, or a radiator are equally obtainable, and the choice is equally varied. Yet by the orderly arrangement of everything there is no possibility of bewilderment in the mind of the visitor. The greatest difficulty must be not one of selection, but of rejection.

It is just over sixty years since this business was founded. Messrs. Froy have evidently found the secret of perpetual

into for the reconstruction of the burnt-out portions. And now the public are, with some excusable pride, invited to inspect the Brunswick Works as they have arisen phoenix-like from the ashes.

In this case, at any rate, "good cometh out of evil," for Messrs. Froy boldly seized the opportunity of rebuilding to refurnish and rearrange their many departments, and to put their works on an equal footing with the best of their class in this country. It is now a positive pleasure to go over them if only for the purpose of observing the method, the spotless cleanliness, and the lightness of the new and the old buildings.

Brunswick Works have the initial advantage of extreme accessibility. They are two minutes' walk from Hammersmith Broadway, which is one of London's great traffic centres. On it converge railways, tramway systems, and motor 'bus services, affording ready communication with all parts of the Metropolis. The main front is on King Street, and this thoroughfare is one of the links connecting east and west London. Unlike some businesses, that of Messrs. Froy does not disappoint by having an impressive front and nothing more. On the contrary, though the street facade of four high and broad storeys is in no sense insignificant, yet it does not prepare a visitor for the length and depth awaiting behind. The show rooms alone have a floor area of 21,439 square feet. This again fails to give a proper idea of the spaciousness of the works, for the wall area and the ceiling area ought to be included since they both are turned to good account. One of the most striking impressions made by a tour of the premises is the cunning dexterity shown in utilising every inch, and yet without any annoying sense of overcrowding. The many showrooms are well lighted both by daylight and by electricity.

Apart from the big showrooms there are extensive stores and warehouses as well as leaded glass works, tile warehouse,

youth, and they are now entering on a new phase with all the advantage of mature experience allied to youthful optimism and initiative.

THE new council of Labour representatives of Ruskin College, Oxford, have decided to proceed at once with the rebuilding of the institution. Plans for a handsome block of buildings to accommodate 50 students have been adopted.

THE Rattray U.F. Church, N.B., congregation have adopted plans for a church to be built in Balmoral Road, New Rattray, to seat 400, with a hall to hold 200, and other accommodation. The funds collected amount to 1,042l.

THE Doncaster Race Committee recommend the Corporation to purchase an acre of land behind the Grand Stands, for the erection of a motor garage. Accommodation will be provided for at least three hundred cars, and it is estimated that the cost will be about 4,000l.

MESSRS. ROBERT BRUCE, contractors, Edinburgh, have had their tender accepted by the Admiralty for the construction of the Explosive Works at Crombie, in connection with the Rosyth Naval Base. It is expected that the work will cost 100,000l., and it must be completed in two and a half years.

TENDERS have been invited from twelve firms for the erection of a church at Oxshott, and it is proposed to commence building operations about the middle of March. It has been decided to proceed only with the erection of the chancel, vestries, Lady chapel, and a part of the nave, providing accommodation for about 250 persons. The completion of the nave and the erection of the upper portion of the tower and spire will be carried out when additional accommodation is required. The cost of the work mentioned will amount approximately to 4,000l. Messrs. Caroe & Passmore, Great College Street, Westminster, S.W., are the architects.

THE EVOLUTION OF FIRE-RESISTING CONSTRUCTION.

(Concluded from last week.)

SPEAKING generally, with reference to fire-resisting construction, it is to be regretted that England does not "wake up" more rapidly and bring itself up to the German excellence in steel work. For example, I believe England cannot roll a steel joist with a depth equal to that attained by the Germans; but I think with regard to cast-iron, England holds its own. The perfection to which cast-iron stanchions is now brought, and the enormous weights which they carry, leads one to question whether their continued employment is not superior to steel as regards weight in compression, and that, combined with ordinary steel joists, with either one of the patent floors or ordinary concrete filled in, to my mind brings us as near the perfection of fire-resisting construction as we can hope to attain.

We have all had to do, too, with *wood floors*, and there are still men left who would prefer—in cases of big fires, where the "devouring element," as the penny-a-liner says, has got strong hold—a solid wood floor to all the steel and concrete floors ever invented. Some years back experiments were made with solid wood floors, *i.e.*, wood joists of the usual scantlings, laid close together, side by side, and I think the result of such tests was that these floors would stand concentrated heat better than the steel and concrete floors. I remember watching a fire, some years ago, where the building had a canted angle, and the supporter at each point consisted of a fir post 9 inches by 9 inches. The building was completely gutted, but the fronts were intact, due, I think, to the wood supports, which stood the fire well, and when I inspected them the following day I found that their centre parts had been consumed to within about 3 inches. I doubted very much whether steel stanchions or iron columns would have been left to tell the tale. We all know too that the most deceptive fire-resisting material is stone or granite in staircases, and stonework generally, brickwork and concrete being far more reliable.

The evolution, though, of fire-resisting construction in the form of reinforced concrete may be termed a revolution; because not only do we get it in floors and walls but in piles and girders.

That too much care and attention cannot be given to any form of construction, or the employment of any material which will minimise, if not abolish, the risk from fire goes without saying; and it is this dread of fire in buildings which necessarily alarms those upon whom falls responsibility in case of deaths or injury from fire. Recent occurrences in business premises make one tremble at the thought of fire where women and men sleep in brick houses, and where we know that an outbreak must result in a sad list of deaths. The London County Council have from time to time initiated legislation having for its object the relief of such risks, and they have by a recent Act permitted the use of steel-framed structures which will encourage their use and lead to filling in with fire-resisting material, and so gradually tend to lessen these too frequently recurring accidents.

Enormous strides have recently been made in the manufacture and use of reinforced concrete for all sorts of purposes besides building construction, *viz.*, bridges, staircases, &c., and, personally, I place considerable reliance upon those engineers and architects who have made the subject a study. I know it is said that "Prejudice vanishes when knowledge comes," and if I am, at the moment, prejudiced against the use of reinforced concrete it must be put down to my ignorance, and to a conservatism which should be absent when dealing with inventions. Frenchmen may be said, I think, to have been the pioneers in this form of fire-resisting construction, but an English architect, Professor C. H. Reilly, has just constructed a church, at Dalston, throughout practically of this material, and both in design and appearance, from the illustration I have seen, it does not present any feature of ugliness. I could sleep comparatively happily in a building where the walls and floors are of this material, but a little nervousness would creep over me if I knew that the piers or vertical points of support were of concrete with embedded steel, and that nervousness would be alarmingly increased if I knew that the girders, with a bearing of say 30 or 40 feet, were relied upon to prevent collapse. It would be no comfort to me to be told that provision had been made for ten times the load which could ever be put upon the floor, and I should begin to think of a few matters which tended to upset my equilibrium. We all agree that in the first place great reliance is placed upon the Portland cement used. It should not be too fresh, it should be most finely ground, and it should be laid out on a boarded floor and turned over for a few days before it is used. Is this always secured? Then the proportion in which it is mixed with the aggregate is of moment. Is this always attended to? Of course, in all concrete work great care

is required, and strict supervision necessary; but in the modern work I am afraid the limits are being pushed a little too far. The specification and drawings may be perfect, but the safety of the structure depends upon the mixing of the concrete and the proper and regular embedding of the steel or iron work. Now this mixing is left as a rule to labourers, and although the specified quantity of steel and aggregate may be there, if more of the Portland cement finds its way into one part than should be, and less therefore in another part, I should certainly get nervous if a moving load with consequent vibration were brought to bear on the girder. I am also not clear as to the effect of the concrete on the steel or iron reinforcement. An essential is, of course, perfect dispersion, and from my experience this would in the ordinary way be very difficult to attain.

Then as to expansion and contraction. Some authorities say there is none in this reinforced concrete, but whether that be so or not, is expansion, or contraction, if they do take place—and I think in many cases they do—equal? I mean does the concrete go with the steel, and the steel with the concrete, or does each go its own way? If they do go their own way, then risk is at once present. Then does the steel or iron oxidize? We are told they do not, but we do not know, and I suppose we must wait and see. Directly one of these concrete girders yields to any appreciable extent, then I anticipate complete collapse; concrete is not elastic, and metal is; and, taking into consideration the few above-named queries, the result perhaps of a highly-strung and over-nervous temperament, and without wishing in any way to place my views in opposition to those distinguished architects and engineers who are so freely using this reinforced concrete, I would wish to make this Paper perhaps a little useful by concluding with a few words of caution, which may or may not be acceptable.

First see that you specify the best English Portland cement, and then see that you get it. Let Belgium and Germany keep their Portland cement for themselves. Then see that your Portland cement is not used too fresh, and that it is turned out of the sacks on to a boarded floor for, say, three days, and turned over two or three times in the interval.

Then determine as to your aggregate. Avoid burnt ballast but do not be afraid of well and evenly broken brick mixed with stone ballast, or breeze, quite free from particles of coal. Then do not mind spending a little money on reliable clerks of works. A hundred pounds or so in salaries to such men, simply to supervise the mixing of the materials and the proper disposition of the reinforcement will probably save many thousands of pounds, and many lives.

The evolution of fire-resisting material may apparently know no bounds; it has at the moment culminated in reinforced concrete put now to all sorts of uses. I am only concerned in *buildings*, and as regards these buildings, I should be sorry if a word I said here led to any diminution of the use of reinforced concrete; and I hope that we shall have to-night a good discussion, and that I shall hear enough to make me sleep comfortably at home in an early Georgian house where the joists are of deal, 9 by 2, with a 16-foot bearing. But, Mr. President, may I say one final word to *architects* (I leave engineers to take care of themselves)? Do not tremble at your floors and roofs; be very confident about your walls; be a little over-careful with your piers or other vertical supports; but, but, be over, and doubly, and trebly anxious about your *girders*.

THE Texteth Board of Guardians have adopted a recommendation that a new building should be erected at the rear of the present Public Offices for the accommodation of two medical officers, &c. The cost is expected to be 3,000l.

THE usual lectures on the Architecture and History of the Church of St. Bartholomew the Great, West Smithfield, E.C., are to be given on Saturdays, March 18 and April 1, at 2.30 p.m. The whole of the building will be thrown open without charge, but a collection will be made for the benefit of the Restoration Fund.

THE Kirkcaldy and Dysart Parish Council are considering plans for the proposed extension of Dysart Combination Poorhouse and also for hospital accommodation. The alterations proposed in connection with the former are to the kitchen, washing-house, and laundry, and these would cost 2,103l. Hospital accommodation is also badly required, and this would cost an additional 7,750l. to provide sixty-one beds.

A COMMITTEE of the Belfast Corporation are developing a scheme for the erection of an art gallery and museum worthy of the city. At present the municipal collection is in the Central Free Library. Two sites are under consideration; one is in Botanic Gardens Park and the other is in the Methodist College grounds.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

* As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000l. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3l. 3s. Apply to Mr. G. C. Copstick, L.R.I.B.A., County Offices, Derby.

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt of a bona-fide design or if the particulars are returned within fourteen days of receipt. Mr. Geo. Sutton, town clerk, 10 Hay Lane, Coventry. (For further particulars see advertisement, November 18.)

CUBA.—April 15.—An international competition has been arranged for a Presidential Palace to be erected at Havana at a cost of about 205,000l. Premiums of 10,000 pesos and 5,000 pesos will be awarded. Conditions may be seen at the Cuban Legation, 3 Grosvenor Mansions, Victoria Street, S.W., or the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

LOWESTOFT.—The Education Committee invite architects practising or residing in Norfolk and Suffolk to submit designs for an elementary school. Premiums of twenty, ten, and five guineas. Particulars may be had on payment of 5s. from Mr. R. Beattie Nicholson, town clerk, Town Hall, Lowestoft. For further particulars see advertisement, Feb. 10.

MANCHESTER.—March 31.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes March 31. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester. (For further particulars see advertisement, January 6.)

ROMFORD.—The Town Planning and Modern House and Cottage Exhibition at Gidea Park, Squirrels Heath, in the Romford Garden Suburb, summer 1911. Class IV.—Town plan of Gidea Park—prizes of 100l. and 50l. Class VII.—Open to builders. For excellence of workmanship and construction in the erection of a cottage in Class I. or II.—first prize, gold medal and 100l.; second prize, 50l. Final dates for designs; Class IV., March 31, 1911. Mr. Michael Bunney, A.R.I.B.A., hon. secretary, 33 Henrietta Street, Strand, W.C.

SOUTHAMPTON.—The Council of Hartley University College invite designs for the proposed new buildings. Mr. H. T. Hare, F.R.I.B.A., will act as assessor. The deposit of 1l. 1s. with the application will be returned if the conditions are returned within fourteen days. Mr. D. Kiddle, registrar, Hartley University College, Southampton.

SOUTH MOOR.—March 15.—Competitive designs are invited for parochial hall and institute at St. George's Church, South Moor. Cost not to exceed 1,500l. Premiums of 15l. and 5l. will be awarded. Particulars from Rev. F. S. Myers, South Moor, Stanley, S.O., Durham.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1l. 1s., which will be refunded on receipt of a bona-fide design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250l., and a premium of 50l. will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

CONTRACTS OPEN.

ALFRETON.—For building chimney stack, 120 feet high. The Offices, Swanwick Collieries, Alfreton.

BACUP.—March 20.—For erection of a brick urinal in Todmorden Road. Mr. W. H. Elce, A.M.I.C.E., borough engineer, Municipal Offices, Bacup.

BELFAST.—March 16.—For erection of two shops, stores, and dwelling-house at Donegall Road, Belfast, for the Belfast Co-operative Society, Ltd. Deposit 1l. Messrs. McCarthy & Brookes, Scottish Provident Buildings, Belfast.

BOLTON.—March 13.—For erection of special school in Flash Street. Deposit 1l. 1s. Mr. Fred Wilkinson, director of education, Education Offices, Nelson Square, Bolton.

BOSTON.—March 17.—For renewing stonework, &c., to the two chapels at the cemetery. The Borough Surveyor, Municipal Buildings, Boston, Lincs.

BURNLEY.—March 20.—For the adaptation of existing buildings and the construction of new buildings on the site of the Old Barracks, situated at Barrack Road, for the accommodation of the 6th Lancashire Battery 1st East Lancashire Brigade R.F.A., and "C" Section No. 2 Field

Ambulance. Deposit 1l. 1s. Mr. W. Greenwood, A.R.I.B.A., architect and surveyor, Victoria Chambers, Victoria Street, Blackburn.

CARLTON.—March 16.—For alteration and additions to farmhouse at Carlton, Yorks. Messrs. Thorp & Turner, architects and surveyors, Goole.

CHASE TOWN.—March 11.—For erection and completion of a Council school for 258 infants at Chase Town, near Walsall. Send names and 1l. 1s. deposit by March 11 to Mr. Graham Balfour, director of education, County Education Offices, Stafford.

COCKERMOUTH.—March 13.—For the whole or part of the work in connection with the erection of a cricket pavilion at Sandair. Mr. Jas. W. Pooley, surveyor, Cockermouth.

CORNHOLME.—For the various works required in erection of a minister's house at Shore. Mr. J. Earnshaw, architect, Town Hall Buildings, Cornholme, Yorks.

COVENTRY.—March 13.—For work comprised in building a governor house at the Gas Street works of internal dimensions of 51 ft. by 27 ft. by 22 ft. high to eaves, and basement for the same, together with the taking down of buildings now upon the site. Deposit 1l. 1s. Mr. Fletcher W. Stevenson, engineer and general manager, Gas Works, Coventry.

GRAVESEND.—March 17.—For alterations, additions and repairs to 52 Queen Street. The Borough Surveyor's Office, Gravesend.

GREETLAND.—March 18.—For various trades required in alteration of premises into stabling for 20 horses at Greetland, Halifax. Messrs. Chas. F. L. Horsfall & Son, architects, Lord Street Chambers, Halifax.

GRIMSBY.—March 14.—For additional cells at the police station, Town Hall. Deposit 1l. 1s. Mr. H. G. Whyatt, A.M.I.C.E., borough engineer, 170 Victoria Street, Grimsby.

GRIMSBY.—March 15.—For erection of a wooden band stand at the Boulevard, West Marsh. Mr. H. G. Whyatt, A.M.I.C.E., borough engineer and surveyor, 170 Victoria Street, Grimsby.

HALIFAX.—March 20.—For the execution of the mason's, carpenter's, and slater's work required in erection of a barn, mistal, stable, and cart-shed, at Mixenden Green. Deposit 1l. Mr. R. J. Hartley, C.E., waterworks engineer, Gibbet Street, Halifax.

HALIFAX.—March 20.—For the removal and rebuilding of the mortuary and disinfectant house at the Hospitals, Stoney Royd. Deposit 5l. Mr. J. Lord, M.I.C.E., borough engineer, Town Hall, Halifax.

HANDSWORTH (STAFFS.).—March 16.—For the extension of the Rookery Road junior school, for the Handsworth Education Committee. Deposit 2l. 2s. Messrs. Wood & Kendrick, architects, High Street, West Bromwich.

HULL.—March 17.—For the builders' work in the reconstruction of the Madeley Street baths. Mr. A. E. White, M.I.C.E., Town Hall, Hull.

HULL.—March 17.—For the steel roof work required in the reconstruction of the Madeley Street Baths. The work consists of eight curved trusses, 49 ft. span, and weighs with purlins, about 18 tons. Deposit 1l. Mr. A. E. White, M.I.C.E., city engineer, Town Hall, Hull.

IPSWICH.—For erection of a lodge at the Porter's Lodge, East Suffolk and Ipswich Hospital. Send names, accompanied by a deposit of 1l. 1s., to Mr. John Shewell Corder, architect, Wimborne House, Ipswich.

A MOVEMENT has been started by the house joiners of Glasgow for an advance of a penny on their present wage of 9d. per hour. It is pointed out by the men that they have received 10d. per hour in previous years, and now that the shipbuilding trade is good, and trade prospects generally are satisfactory, that they are entitled to once again receive this rate. At present the house joiners are receiving 1l. 17s. 6d. for a 50 hours week, while the shipyard joiners have 1l. 17s. 8½d. for a 54 hours week. If the former obtain the increase of wages sought for they will have 2l. 1s. 8d. per week. Meanwhile the joiners' application has been before their Conciliation Board, a body which was formed in March 1909, and consists of six representatives of the Glasgow Master Wrights' Association, and six representatives of the Executive Committees of the Associated and Amalgamated Societies of Carpenters and Joiners. The Board has adjourned consideration of the question until a meeting to be held on March 23.

LONDON MASTER BUILDERS' ASSOCIATION.

THE Annual General Meeting of the above Association was held in the Council Chamber at Koh-i-Noor House, Kingsway, on Monday, the 27th ult., the President, Mr. L. Horner, occupying the chair.

The minutes of the last General Meeting having been read and confirmed, the annual report of the Council was received and adopted.

The accounts and balance-sheet for the year ended December 31, 1910, were received and adopted.

The following officers were elected for the ensuing year:—
President, Mr. G. Bird Godson; Senior Vice-President, Mr. James S. Holliday; Junior Vice-President, Mr. Walter Lawrence, jun.; Treasurer, Mr. W. F. Wallis, J.P.

The following gentlemen were elected to serve on the Council:—Messrs. W. Downs, T. Hall, J. W. Jerram, E. D. Pratt, H. Smith, F. Thorne, and F. J. Walton.

Mr. C. F. Kearley was elected Hon. Auditor.

The President having acknowledged the honour conferred upon him, proposed a hearty vote of thanks to Mr. Leonard Horner, the retiring President, for the admirable manner in which he had conducted the business of the Association during the past year.

An interesting discussion took place respecting a universal week's holiday for the trade. The President opened the discussion, remarking that, though he admitted that no hard and fast rule could be laid down, as some firms might have urgent work in hand which it would be impossible to leave dormant for a whole week, it was undeniable that business in a builder's office was more or less disorganised through the summer months by one or more members of the staff being away for holidays, whether it was the chief clerk or the office boy; each adds his proportion to the disorganisation. His suggestion for remedying this dislocation of business was to close all works for the first week in August.

The majority of works in progress are already closed from mid-day on the Saturday before the Bank Holiday until the following Thursday morning, leaving a total number of only 23 hours to be subsequently worked to complete the week. By closing down for the whole six days, opportunity would be given for half the staff to take their vacation during the last week in July and the first week in August, the other half commencing on the Saturday before Bank Holiday. By this means, where a fortnight's holiday is the rule, the whole of the holidays are got rid of in three weeks.

It was further contended that if this system was adopted it would be greatly welcomed by the merchants, and possibly by architects and surveyors, and it would also give an opportunity for the outside staff to obtain a week's rest, which, under the present system, they do not get. The matter having been discussed, it was referred for the Council to deal with.

HEATING AND DOMESTIC ENGINEERS' ASSOCIATION FOR BIRMINGHAM AND THE THREE COUNTIES.

At a meeting of engineering employers in the above-named trades, held at Birmingham on March 3, it was resolved to form a branch association of the National Association of Master Heating and Domestic Engineers, to cover Birmingham and the three counties of Warwick, Stafford, and Worcester.

An organising committee was elected, consisting of: Mr. John P. Achurch (Parker, Winder & Achurch, Ltd.), Mr. Charles Barter (Benjamin Parker, Ltd.), Mr. G. N. Guest (Hollings & Guest, Ltd.), Mr. J. Jackson (J. Jackson & Co.), and Mr. W. L. White, 82 Upper Trinity Street, Birmingham, the last-named being convener.

The new branch association is to promote and forward the interests of heating and domestic engineers in the area above-named, and to be affiliated with the National Association, whose headquarters are at 12 Great James Street, Bedford Row, London, W.C. (Mr. H. B. Watt, secretary).

THE finance committee of the Liverpool Corporation have definitely decided not to further entertain the idea of setting back the town hall. The project has been before the committee for several months, having first been brought under their notice by Mr. A. J. Iversen, of Brooklyn, New York. Reports on the subject were obtained from both the Corporation surveyor and the engineer. The committee last week decided not to take the inevitable risk attending the operation.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB,
MEDIÆVAL ORNAMENT FROM THE ROUND 14TH CENTURY.

*Vaulting Boss from St. Mary's Abbey
York.*

From a Drawing by "LORDS."

AN EXAMPLE OF MEDIÆVAL STONE CARVING.

A SPLENDID example of stone carving of the fourteenth century is to be seen in the above, a boss from the vaulting of the "Calefactory," or warming-house of the Benedictine Abbey of St. Mary, York. The workmanship is vigorous, yet full of delicate modelling and detail, and the resultant light and shade is very refined and subtle. The original is

now carefully preserved in the building called the Hospitium in the grounds of St. Mary's Abbey, York.

THE Carnarvon Guardians have appointed a committee to prepare a report on the best site for the erection of a new infirmary in connection with the workhouse, and submit an estimate of cost of a building to contain forty patients.

L.C.C. PRIZES FOR ARCHITECTURAL AND MUSEUM STUDIES.

THE London County Council offers each year one prize of 10*l.* and two prizes of 5*l.* each for sets of carefully executed drawings of buildings, churches, and artistic objects in museums. The drawings for which the prizes are awarded become the absolute property of the Council. According to the conditions the work must have been executed previous to Easter, 1910, and must not have been submitted in another competition. Notices were inserted in the "London County Council Gazette," and copies of handbills were sent to the schools of art, polytechnics and technical institutes with reference to the award of the prizes for 1911. Fifteen students competed, and the works submitted by them have been examined. One of the two candidates recommended for a prize of 5*l.* was awarded a similar prize in 1910; she has therefore been regarded as ineligible. The examiner reports that the rest of the drawings are not of sufficiently high standard to warrant the second 5*l.* prize being given to any other candidate. Prizes, therefore, of 10*l.* and 5*l.* have been awarded to George C. L. Underwood and Mary Gilbertson respectively, subject, however, in the former case to the following recommendation being approved:—

Regulation No. 870 (a) provides that applicants for these awards should be students in schools or institutes which are maintained or aided by the Council. In 1910, a number of the Council's art scholarship holders were sent to the Royal College of Art, an institution not aided by the Council. The Education Committee think it desirable that the regulations should be altered to include the Council's scholars, whether attending aided or non-aided institutions, and they therefore propose that the existing regulation should be amended, so as to read:—"The Council offers annually one prize of 10*l.* and two prizes of 5*l.* each for museum and architectural studies, executed either (i) by students in schools or institutes which are maintained or aided by the Council, or (ii) by holders of the Council's full-time art scholarships."

THE TOWN PLANNING AGITATION.*

THE discontent naturally engendered and fertilised by constant contact with the abnormal conditions of personal inconvenience, waste, and wreckage which invariably supervene within a state of free competition induces, in all sensitive and cultured minds, firstly, a sentiment of revolt, purely often inarticulate and unformed in its expression, and making no appeal to those who succeed in the general turmoil, but rather exciting acute prejudice and misunderstanding in their midst. The revolt of the cultured mind gathers strength and volume but slowly, and a long and wearisome passage through the wilderness and the desert of the unthinking and prejudiced immediately ensues, for the cultured are few and the enemy is strong. This struggle then assumes a second position, and proposals are made and prospects discussed, and finally a definite advance is made on the enemy's citadel, and the cultured few imagine they have secured an outpost which will bring their uncultured enemies to their knees. This imagined success often leads to a cessation of hostilities, with the result that any concessions made prove entirely futile when achievement appears to be in view, and the proprietors of vested interests, the uncultured, have still to be fought with even more energy and persistence than before, and by an attacking party greatly weakened by the absence of the force of public opinion behind them, which was previously held by that stirring sense of revolt which now disappears before a mere technical expression or a project in law. This rough outline of the general path of reform is fully applicable to the town planning agitation. The atmosphere of discontent to which I have alluded is admirably expressed by the following extract from a leading article of *The Times* published during the time the Town Planning Conference was being held:—

"We find in innumerable instances that the ugliness, the squalor, and the overcrowding which we are now trying to remedy are entirely modern products of commercialism. The old town or village had a grace and spaciousness of its own until the great industrial movement of last century planted raw and hideous sheds upon its open spaces, and made cheap and hurried adaptations of its old buildings to commercial uses. The slums we have to deplore are the result, not of the old leisurely life, but of the haste to be

rich at any cost, and of the crude utilitarianism which sixty years ago was preached as economic gospel."—*The Times* October 18, 1910.

This position is politely admitted, but practically ignored, and although some attempt was made in the technical press to revive the notion of individual effort, and pointed, in my opinion very aptly, to the planning of some of our London squares and to the streets of Bayswater, yet it was felt that those efforts were made when commercialism had not firmly gripped society, and that now when commercialism had a firm hold such efforts in the direction of the improvement of our streets were far less likely to arrive at fruition. We now see clearly that what is anyone's business is no one's business, and that only a bold municipal policy backed by the State purse can overcome the united and strongly entrenched opposition. We recognise that neither by "plucking landlords as brands from the burning" nor by the primary consideration that the planning and architecture of our streets and buildings must not raise the rates can we arrive at the accomplishment of the ideals of civic architecture that the Town Planning Conference has set forth.

The aspects of the main current of social discontent which affect the architectural profession often run an even track up to the point when the query profession or art becomes so pressingly obvious as to demand a complete solution to all members of our profession who have sincerely studied the present, and are resolved, accurately and faithfully, to determine their future line of conduct. It is obvious that the questions of the organisation, disorganisation, or even disintegration of the profession can have but a mere secondary interest to those of us who have decided that art should prevail, for why should we question the means if the end be thus attained? We may sympathetically deplore the loss and wreckage, but we point to the result and the carnage may seem justified.

Unfortunately this position can be consistently and comfortably maintained in those few instances only where social position and a substantial bank balance find themselves in close alliance. The majority of our profession are not so placed. Finding themselves constrained to look closely at the purely professional side of their business, although candidly admitting the right of art to prevail, they are reduced to making terms with the enemy and keeping their cherished beliefs in a state of trepidation when their practice is involved. In no instance is this prevailing state of hesitation so well marked as in the question of town planning, and the conditions of unhealthy compromise between prevailing commercialism and ousted art could not be better illustrated. An abnormal tendency to abhor the practical in favour of the ideal is one of the characteristics of our profession, and is a direct reactionary outcome of the divorce between art and average practice due to this commercial compromise. The motives of the earnest student guilty of elaborate drawings bearing the title, "Design for a Greek Temple on the Verge of a Forest," or "Design for a Cathedral on a Suburban Site," which are met with that quiet smile of self-satisfied complacency so irritating to the culprit are treated in quite an ultra-serious fashion when indulged in by men of professional rank in connection with the town planning.

The initial movement of revolt against the slum and the unholly aspect of our streets was successfully urged by John Ruskin, Thomas Carlyle, and the small but enthusiastic band of enlightened spirits led by Charles Kingsley and Frederick Denison Maurice, and later, as far as its town planning aspect was concerned, by William Morris, whose artistic instincts as a successful designer were severely shocked by the conditions and harshness of the modern town, and who was able by the magnetism of his personality and genius to bring to his standard many varied minds who had imbibed the spirit of discontent and the enthusiasm for his teaching. But still nothing definite was done, and it was not until Mr. Ebenezer Howard drew some circles of a cryptographic character and carried on a curious type of guerilla newspaper war with them that town planning in its modern sense could be said to have had any existence; of course, since then, the architectural lantern slides of Greece and Rome and Paris, which were previously exhibited for quite other purposes, are now found of equal value in illustrating town planning.

Even at this stage the measures passed by our Government, excluding some private Bills, dealt with housing of the working classes and some powers under the Public Health Acts. The corrupt Metropolitan Board of Works did a splendid service for the civic planning of London by

* A paper read by Mr. E. J. Dixon, A.R.I.B.A., at a meeting of the Guild of Architects' Assistants, on March 7.

he carrying out of the Thames Embankment, which must find an "easy" place in any future scheme, and the clearing of many disreputable slums in the route of Charing Cross Road. The London County Council and suburban Councils did much in connection with Kingsway and various ramway improvements, and the opening of churchyards as open spaces for recreative purposes. Still nothing of a definite character in relation to town planning was broached. It is curious to note that architectural societies up to this stage did practically nothing in their own interests or to advance those of the art consigned to their care, but occasionally and perfunctorily stepped in or attempted to step in when the spade work was done instead of being one of the prime movers, and producing and discussing schemes for improvements and submitting them to the consideration of those anxious for light on the subject. In most cases it was left to the civil engineer and the estate agent, who, it must be admitted, often performed their tasks with a degree of ease, patience, and perseverance, resulting in many inholy architectural vistas, which should render our profession envious, whilst we merely occasionally and dilatorily dealt with a matter which so closely and intimately concerns our professional welfare, concerning ourselves only with the finished articles.

At last the garden city movement was fully afloat, and although at first treated as a mere "will o' the wisp" of a few cranks and philanthropists, gradually took place as a serious attempt to solve a difficult problem, and by development of a somewhat erratic nature eventually succeeded in placing town planning on a substantial footing and impressing the philosophers of Westminster with a sense of further possibilities under Government inspiration.

The Town Planning Act at length arrived, bearing in its structure the real sources of its inspiration in Part I., under which some litigation has already transpired, and the legal construction of which has occasioned much foreboding; it confers powers to improve existing dwellings and secure new dwellings for the working classes. The provisions of this part are to be deemed part of the appropriate part of the principal Act (Act of 1909, Sec. 47).

(To be concluded.)

NEW BOOKS.

THE 1911 edition of "Spons' Architects' and Builders' Pocket Price Book" appears in a new form. The book has been divided into two sections, viz., "Memoranda and Tables" (price 2s. 6d. net) and "Prices and Diary" (price 2s. 6d. net). The diary, showing a whole week at an opening, is a new feature of the "Prices and Diary" section, and is printed on India paper. The whole has been again edited by Mr. Clyde Young, F.R.I.B.A., and Mr. Stanford M. Brooks, L.R.I.B.A., and has been subjected to thorough revision. To distinguish the two parts the "Memoranda and Tables" is bound in red, the "Prices and Diary" retains its green cover. The authors were confronted with the alternative either of omitting new matter, or of so increasing the thickness of the book as to render it unsuitable for any ordinary pocket. They cut the Gordian knot by separating the memoranda section from the prices section. The principal additions are some notes on levelling to the former; and to the latter section a chapter on the cost of lighting by acetylene and air gas, together with the diary mentioned above. In its old form "Spons' Architects' and Builders' Pocket Price Book" reached its thirty-seventh edition. This shows how useful it has always been. That usefulness is in no way diminished in its new guise.

"The Local Government Annual and Official Directory" (1s. 6d., 27A Farringdon Street, London, E.C.) makes its twenty-sixth appearance this year. No pains have been spared to obtain correct information and to bring it up to the latest date before going to press. The main portion of the book is devoted to the directory, which gives the names and addresses of the chief officials of all corporations, London borough councils, county councils, boards of guardians, urban and rural district councils, county and borough asylums, &c., throughout the kingdom. The names of the chairmen of committees in the metropolitan boroughs are given, also the chairmen of the London County Council committees. Readers will find the telephone numbers of all those London borough councils which have adopted them. In addition to the directory, there is a large quantity of useful information relating to baths and washhouses, markets, and electric light undertakings in the boroughs of London, and an abstract of the local government legislation of 1910. The charges for water,

and gas in London are shown, together with the population of the various provincial unions. There is also a complete list of all the parks and open spaces of the metropolis, with the local authorities controlling them.

Lockwoods' "Builders' Price Book" for 1911 (4s. London: Messrs. Crosby Lockwood & Son) is a portly handbook of 800 closely-printed pages. That it contains no prominent novel feature is due to the fact that the preceding annual issues covered the ground so thoroughly as to leave no corner untouched. Such variations in prices as have occurred are carefully noted, and several sections have been examined and, where necessary, revised or amplified. The 250 page supplement contains the London Building Acts 1894 to 1908 and other regulations relating to London, together with notes on important decisions in the Superior Courts. Architects, contractors, engineers and all other users who have come to rely on "Lockwood's Price Book" will welcome the new edition.

VARIETIES.

A NEW town pavilion is about to be erected by the Newquay Urban Council.

MR. DAVISON, the architect for the new Municipal buildings at Torquay, has been requested by the Town Council to advise as to the cost of enlarging the Assembly Hall.

THE Willesden Education Committee are about to purchase school sites on undeveloped areas at a cost of 1,000l. per acre.

THE east wing of Gordon College, Aberdeen, was destroyed by fire on Wednesday morning; the estimated damage is 10,000l.

A SECOND contingent of Belgian marble workers have just entered upon their duties in connection with the development of the marble industry in the Island of Skye.

THE synagogue in Great St. Helen's, Bishopsgate Street, E.C., is to be closed, and the site, which is valued at over 100,000l., is to be offered for sale.

MESSRS. HOMER & LUCAS, architects, 25 Bucklersbury, E.C., and Oxford, have prepared plans for a proposed cinematograph theatre to be erected in Fleet Road, Hampstead, N.W.

THE Bilston District Council have approved a scheme for extending the sewerage system and other work at an estimated cost of 7,800l. The work is to be carried out in the neighbourhood of Coseley Road and Mill Street.

THE Birmingham City Council on Tuesday gave authority for an expenditure of 8,750l. upon the extension of the Jewellers' School in Vittoria Street, a new lease of the site having been obtained from the Governors of King Edward's Foundation.

THE Board of Education have fined the Wood Green education authority 50l. for a violation of the code by exceeding the accommodation at three of the schools. The Wood Green authority have decided to build a new elementary school, which will relieve the existing pressure.

THE syndicate of the Swansea Chamber of Commerce, who are arranging for the erection of a coal exchange at Swansea, propose to utilise the existing site and expend from 15,000l. to 20,000l. on the building, the design of which will be open to competition.

THE Liverpool City Council, up to 31st December, had spent on demolition 427,486l. 19s. 5d., and on housing 671,004l. 2s. 7d., a total of 1,098,491l. 2s., from which has to be deducted 66,321l. 16s. 5d. derived from the sale of surplus lands, thus leaving the net expenditure 1,032,169l. 5s. 7d.

MR. AND MRS. M. E. SADLER have presented to the National Gallery, through the National Art Collections Fund, the bronze statue, entitled "Lycidas," by J. Havard Thomas. This remarkable statue has been placed in the Sculpture Hall at the National Gallery of British Art, Millbank.

COLONEL PAYN DAWNEY has informed the Easingwold Rural Council that he proposes to lay out a residential estate on a triangular piece of land immediately to the south-west of Shipton village and close to Benningbrough Station. The estate would be laid out for 200 sites for houses, and it might ultimately be increased to 300 sites.

ALTERATIONS at a cost of 7,228l. are to be carried out under the supervision of the architect, Mr. E. Seward, F.R.I.B.A., to the Cardiff Coal and Shipping Exchange. Messrs. E. Turner & Sons of Cardiff have secured the contract.

PLANS have been prepared by Mr. J. H. McGovern, architect, 26 North John Street, Liverpool, for the necessary alterations to Palace Chambers, Victoria Street, Liverpool, in providing an electric lift at an estimated cost of 500*l*. Other structural alterations have already been carried out to the building by Messrs. Jones & Son, contractors.

THE Postmaster-General of the Commonwealth of Australia invites competitive designs for a uniform postage stamp for the Commonwealth. Two premiums are offered, one of 100*l*. and one of 50*l*. Designs will be received in Melbourne up to May 31. Full particulars may be obtained from the Official Secretary, Commonwealth of Australia, 72 Victoria Street, S.W.

THE Board of Education have approved of the amended plans for Wellingborough Infants' School, which, as arranged, would accommodate 360 scholars. The following is a detailed estimate of the cost of the school:—Site, 450*l*.; school buildings, playgrounds, and fencing, 3,900*l*.; furniture, 480*l*.; architects' fees, 320*l*.; clerk of the works, 150*l*.; expenses and contingencies, 100*l*.; total, 5,400*l*.

THE Corporation of Edinburgh have arranged for holding a town planning exhibition in Edinburgh from March 13 to April 1 inclusive. The exhibition will be held in the galleries of the Royal Scottish Academy at the Mound, and in connection with the exhibition lectures on town planning and other cognate subjects will be delivered in the lecture hall of the Scottish National Portrait Gallery, Queen Street. The exhibition will be open daily from 12 noon till 5 p.m., and from 7 p.m. to 10 p.m. Admission (including lectures), 6*d*.; season tickets, 2*s*. 6*d*. each. Admission in the evenings to the exhibition and the lectures will be free.

A RECENT bulletin of the United States Department of Agriculture contains information relative to the forest resources of the world. It shows that the forests of Europe occupy an area of 750,000,000 acres, about 31 per cent. of the total land area of the Continent. The most wooded country is Finland, followed by Bosnia and Herzegovina and Sweden, the least wooded countries being Portugal and Great Britain. In the British Isles there are 3,030,000 acres of forest area.

THE Sheffield City Council received some few months ago a conditional offer from the trustees of the late Mr. W. R. Sutton to expend 50,000*l*. on the erection of artisans' dwellings in the city. The estates committee have now decided to recommend that model dwellings on the block system be erected in or about the centre of the city, in preference to the alternative cottages in the style of a garden suburb. The committee suggests certain sites belonging to the Corporation in Portland Street, Infirmary Road, and Eyre Street, and other similar sites as being suitable for the buildings.

MR. JOHN HOWARD COLLS, of 26 Park Crescent, Portland Place, W., builder, joint chairman of Messrs. George Trollope & Sons and Colls & Sons (Ltd.), of 5 Coleman Street, E.C., a director of the Builders' Accident Insurance (Ltd.), of Hobbs, Hart & Co. (Ltd.), and of the House Property and Investment Co. (Ltd.), left estate of the gross value of 419,797*l*., of which the net personalty has been sworn at 326,876*l*. Testator bequeathed 500*l*. to the Royal Institute of British Architects for educational or benevolent purposes, 300*l*. to the Builders' Benevolent Institution, and 300*l*. to the Builders' Clerks' Benevolent Institution.

THE Lord Provost's Committee of Edinburgh Town Council on Tuesday considered the offers for the work of erecting the Usher Hall, on a site at Lothian Road. It was decided by sixteen votes to two that an estimate for the whole work by one contractor should be accepted in preference to separate offers for the various departments of the work. This decision limited the available tenders to five or six, and it was thereupon agreed to recommend the acceptance of the estimate of Messrs. Neil McLeod & Sons, builders, Edinburgh, amounting to 59,916*l*.

DR. MATTHEW HAY, Medical Officer of Health for Aberdeen, in a report on tuberculosis in Aberdeen, shows that stonecutters and masons stand above all the others with a death-rate of 5.7 per 1,000 from phthisis; that is three times as high as the average (1.9) for males above 21 years. If allowance is made for the inclusion of wallers, among whom the mortality from phthisis can scarcely be higher than the average, the death-rate among persons actually engaged in the cutting and hewing of granite is probably about 6.2 per 1,000. Next to stone workers come printers and lithographers.

THE Minister for Works in New South Wales has given details of the experiment of establishing State brick works, which is to be embarked on at once. The estimated cost of

the works is 37,000*l*., and their capacity half a million bricks weekly. The Minister says that the best burnt bricks can be manufactured at well under 28*s*. per thousand, and that lime bricks at a trifle more. It is proposed to distribute the bricks by the Government tram service during the night. Boxes will be filled at the kiln, lifted by a crane on to transport trucks, and from the trucks, at the distributing centre, to drays.

THE societies affiliated to Co-partnership Tenants, Ltd. are combining to provide a technical library on behalf of the workmen in their employ. The more expensive books will be kept at a centre for the present at 6 Bloomsbury Square, W.C., and a catalogue of them supplied to each society, so that they may be forwarded by post on request. Of the cheaper manuals duplicate sets will be provided, and a set located on each estate. The library will continually be added to in order to keep it up to date. No entrance fee or other charge will be made to employees who take out books, but they will be asked to make a general collection amongst themselves once a year towards the upkeep of the library. Mr. Henry Vivian has accepted the committee's invitation to become President. Each society that makes a contribution will have the right to nominate a representative to the Library Committee. As the affiliated societies number fourteen—at Derwentwater, Ealing (London), Falings Park (Wolverhampton), Garden City (Letchworth), Hampstead (London), Harborne (Birmingham), Humblestone (Leicester), Levenshulme (Manchester), Liverpool Sealand, near Chester, Sevenoaks (Kent), Stoke-on-Trent—the library will fulfil a most useful and extensive educational purpose.

ACCORDING to Mr. John P. Bray, the United States Consul-General at Sydney, a record volume of business in the building and kindred industries stands to the credit of the State of New South Wales for the year 1910, with every promise of a still higher mark during the twelve months to come. The great difficulty looming largely, however, is the shortage of ground space, and the only way to overcome it will be to erect "skyscrapers" after the style in America. An architect prominent in the city declares that such a trend of events was inevitable, and that he was studying as much as he could the art of building these huge edifices. He demonstrated his remarks with the declaration that a building was shortly to be erected which would be twelve storeys high. Two or three other buildings proposed to be erected within the next few months will be of similar altitude. Another reason advanced for the erection of high buildings was the Federal land tax, owners of property being compelled to build "into the air" in order to gain profits.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, Ltd., of Failsworth, Manchester, have had in hand the following contracts:—The Galway New Fever Hospital is being supplied with patent Manchester stoves with descending smoke flues, patent exhaust roof and special inlet ventilators; the New Temperance Memorial Hall, Newcastle-on-Tyne, is being ventilated by means of Shorland's exhaust roof ventilators and inlet ventilating panels; the Electric Theatre, Folkestone, is being supplied with their exhaust roof ventilators, and the Isolation Hospital, Stanhope, is being supplied with Shorland's warm air ventilating Manchester grates, exhaust roof ventilators and special inlet ventilators.

THE Carron Company, having lately acquired the business of Messrs. Longden & Co., Phoenix Foundry, Sheffield, and 3 Berners Street, London, have appointed Mr. A. Harold Smith as Art Director for their combined businesses. Mr. Smith will be glad to wait upon clients at any time, by appointment, which may be made at No. 3 Berners Street, W., for the purpose of submitting drawings of fireplaces from original models of eighteenth century and other periods, and also of fireplaces built on scientific principles.

MESSRS. THOS. PARSONS & SONS, 8 Endell Street, Long Acre, W.C., have issued a very ingenious patent showcard for the purpose of indicating the effect of their motor colours. Six cardboard panels bearing different colours can be placed at the back of a partly-transparent sheet, in the centre of which is outlined a motor-car. The colour shows through on the paintable parts of the card only, and gives a perfect idea of its appearance if that particular tint were employed. Messrs. Parsons are particularly suited to produce the best motor colours, for when their business was established over a century ago their reputation for carriage paints was second to none.

THE

Architect and Contract Reporter.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000*l*. Prizes of 1,050*l*., 700*l*. and 440*l*. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000*l*. A first prize of 800*l*., and a second prize of 320*l*. will be awarded. The Greek *Official Gazette*, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3*l*. 3*s*., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000*l*. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3*l*. 3*s*. Apply to Mr. G. C. Copstick, L.R.I.B.A., County Offices, Derby.

COVENTRY.—April 1.—The Corporation contemplate the erection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2l. 2s., which will be refunded on receipt of a bona-fide design or if the particulars are returned within fourteen days of receipt. Mr. Geo. Sutton, town clerk, 10 Hay Lane, Coventry. (For further particulars see advertisement, November 18.)

CUBA.—April 15.—An international competition has been arranged for a Presidential Palace to be erected at Havana at a cost of about 205,000l. Premiums of 10,000 pesos and 5,000 pesos will be awarded. Conditions may be seen at the Cuban Legation, 3 Grosvenor Mansions, Victoria Street, S.W., or the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

LOWESTOFT.—The Education Committee invite architects practising or residing in Norfolk and Suffolk to submit designs for an elementary school. Premiums of twenty, ten, and five guineas. Particulars may be had on payment of 5s. from Mr. R. Beattie Nicholson, town clerk, Town Hall, Lowestoft. For further particulars see advertisement, Feb. 10.

MANCHESTER.—March 31.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes March 31. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester. (For further particulars see advertisement, January 6.)

ROMFORD.—The Town Planning and Modern House and Cottage Exhibition at Gidea Park, Squirrels Heath, in the Romford Garden Suburb, summer 1911. Class IV.—Town plan of Gidea Park—prizes of 100l. and 50l. Class VII.—Open to builders. For excellence of workmanship and construction in the erection of a cottage in Class I. or II.—first prize, gold medal and 100l.; second prize, 50l. Final dates for designs; Class IV., March 31, 1911. Mr. Michael Bunney, A.R.I.B.A., hon secretary, 33 Henrietta Street, Strand, W.C.

SOUTHAMPTON.—The Council of Hartley University College invite designs for the proposed new buildings. Mr. H. T. Hare, F.R.I.B.A., will act as assessor. The deposit of 1l. 1s. with the application will be returned if the conditions are returned within fourteen days. Mr. D. Kiddle, registrar, Hartley University College, Southampton.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1l. 1s., which will be refunded on receipt of a bona-fide design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250l., and a premium of 50l. will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

STONE v. PLASTER.

At a meeting of the City Council of the Corporation of Bath held last week, it was decided to erect at the approaching Festival of the Empire, to be held at the Crystal Palace, as an exhibit for the city of Bath, a replica of the entrance portico of the Temple of Minerva, which it is believed in ancient times stood on the site of the present Pump-room. The height of the front will be 24 feet, with four fluted columns, surmounted with Corinthian caps and a carved tympanum.

Estimates were obtained for erecting it in Bath stone and also in plaster, and it was found that it could be carried out by the Bath Stone Firms in St. Aldhelm Box Ground stone at a price below that of plaster. It is rare for stone to beat plaster in fair competition, and the result speaks well for Bath stone. On the obvious great artistic gain by the use of the latter in connection with the replica of a Classic temple there is no need to insist. It will be extremely interesting to compare this temple front in the best stone with the usual lath and plaster shams which have hitherto passed muster in temporary exhibitions. The stone, it may be mentioned in conclusion, will be taken from the quarries which were worked by the Saxons.

THE Devonport Borough Council have appointed a committee to consider the question of erecting new municipal buildings.

MR. CHARLES BERRINGTON, builder and contractor, of Waterloo Road, Bedford, and Wavertree, Liverpool, left estate of the gross value of 331,935*l.*

APPLICATIONS are invited immediately for the office of Diocesan Surveyor for the Diocese of Bath and Wells in place of the late Mr. A. B. Cottam. The appointment will be made on Tuesday next, the 21st inst.

THE Lincoln Education Committee on Tuesday decided to enlarge Monks Road Council School at a total cost of 3,025*l.*

MEMBERS and licentiates of the Royal Institute of British Architects are requested by order of the Council not to take part in the competition for new school buildings, Wallsend.

THE Chartered Surveyors' Golfing Society will hold a tournament between 25 March and 31 July. The winner will hold the challenge cup presented by the Council of the Surveyors' Institution for one year, and also receive a memento from the President, Mr. Leslie R. Vigers. Entries are to be sent to Mr. Sydney A. Smith, 22 Chancery Lane, by 20 March. All members of the Surveyors' Institution are eligible to join the Society.

THE TOWN PLANNING AGITATION.

(Continued from last week.)

PART II. deals with the subject of this paper, and Part IV. may be deemed supplementary thereto, containing as it does protective clauses for commons, open spaces, land near Royal Palaces and parks. Part III., which indicates the inspiring sources of the Act, requires County Councils to appoint medical officers and to establish County Public Health and Housing Committees, and empowers them to assist building societies. Roughly, this is a general description of the Act, which had been in force twelve months before the Town Planning Conference, that vast mosaic of opinions practical, chimerical, Utopian, and trivial was spread before the bewildered eyes of a dull and ineffectual public; which, in its newspaper utterances, responded vaguely, and with that final uncertainty which bade fair to gather up town planning with all the other banalities that a respectable public finds pleasure to admit and treasure on the Sabbath, but too expensive for weekday enjoyment. Mr. John Burns's speeches at the conference we may correctly summarise as apologies for the singular barrenness and lack of achievement of any purpose, however logical and latently possible of social betterment, when it depends upon the goodwill of the landlord and the property owner. We instinctively feel that if town planning is to be really successful architecturally, more restrictions must be placed upon the activities of building owners and their architects, to whom restriction of any kind is anathema, and freedom of action, which, in the case we are now considering, is evidently and admittedly an absolute deterrent, the only deity which is genuinely adored. The profession generally must look closely to its laurels and determine by effective organisation and co-operation that the Town Planning Conference shall be something more than an elaborate feu d'artifice to a sad and dismal future performance. Nothing is carried out orderly, and we shall find that as towns have muddled into ugliness there will only be questions as to how to muddle out. There is rarely, if ever, a clean slate upon which we may lay our plan, but rather a regrettable smudge on a foundation which will support little erasure. The Ruislip town planning competition so admirably brought about by the persistent efforts of Mr. F. M. Elgood, F.R.I.B.A., will undoubtedly remain a monument in the history of the movement, not so much on account of its being one of the first moves under the Act, but as a constant reminder of the steady effort and personal interest in the important preliminaries necessary to the carrying out of Part II. of the Act—a dull and uninteresting struggle the record of which successfully chills the enthusiasm of the average manufacturer of the town plan design of the Turkey carpet or linoleum type. The Ruislip competition was thoroughly justified by its results, but I think it doubtful whether town planning competitions should be general, for if the architects of a district or a suburb co-operate with the object of pressing the local council into action a scheme of some kind should take the field in order that local problems and their solution may assume a definite practical shape. If this be so, it must naturally follow that competitors in any town planning competition that may be launched may suffer greatly in the preparation of their schemes due to a lack of that close knowledge of local conditions that a residence within the area concerned alone can give, and, further, the occasional acquisition of competitive work by architects comparatively unknown, but residing in the district and in close touch with local affairs lends colour to the impression that many competitors must have completely lost the grasp of an adequate solution to the problem set them by their lack of local knowledge.

An important preliminary to the adoption of a town planning scheme is the spirit of its inception. If it is merely economical in its aspect, and it is desired to see a quick return for the capital expended at a high rate of interest, the final result of the scheme will be disappointing to all concerned, commercially on account of the slowness with which sites will be taken up, due to the desire of the promoters to obtain the best market and best architectural result at the same time, rendered incompatible in practice by the amount of capital to be expended in building operations to suit ideal conditions, and the loss of interest on that capital due to the lengthy interval which elapses before adjoining sites are built upon, and the scheme is sufficiently developed to be commercially successful. Architecturally on account of the panic which supervenes, due to lapse of time and subsequent acceptance of any scheme of architectural bathos and individual advertisement resulting in a deplorable patchwork, successful perhaps as regards traffic

and mere utility, but void of architectural art. As a rate reducing machine, therefore, town planners must look to the far distant future for financial return if the scheme is to be a genuine success or even appropriate thereto.

Before a local authority actually prepares a town planning scheme it must satisfy the Local Government Board that there is a *prima facie* case for making a scheme (Section 54 (2) and Schedule 5), and after making formal application must receive an authorisation for them to prepare one. A like authorisation is required to enable a local authority to adopt a scheme proposed by all or any of the owners of any land which may be the subject of a scheme. The placing into operation of Part II. of the Act depends upon the creation of local opinion as to the necessity thereof, and steady pressure must be brought to bear upon local authorities. It is obvious therefore that the creation of voluntary groups for the study of local conditions combined with the co-operation of all architectural bodies, a point this Guild has for one of its objects, and the preparation of a practical scheme, and its imposition on public opinion is imperative.

The evident necessity that town planning should receive some consideration and thought in the vertical, as well as in the horizontal, as Mr A. E. Rickards has pointed out, forces on the student of this question the method by which the best result may be obtained. The initial obstacle which oppresses the matter in relation to streets is that of advertisement, which, generally speaking, has two aspects, that of the architect and that of his client. The architect, the man whose work we all desire to see, and who is anxious that his designs should be as unfettered as possible by existing structures in order to exhibit his skill and ability to the best advantage is evidently an advertiser of his art. The client is equally desirous of exhibiting his wealth or his pre-eminence in relation to his neighbours, or of advertising the business his building is to house. We often marvel at the latter spending money on architectural effects at all, for a plain plaster front or a prize design for a facade in glazed bricks would form a much better background for the enormous gilded letters or electric signs that the art of advertising has made us acquainted with. Perhaps his idea is that architectural ornament offers trusty points of support to the homely spider weaving his web between them and the aforesaid lettering. The commercial aspect of the question is so strong that it would seem that any attempt to suppress or modify the advertisement either of the design on the part of the architect or the imposed abominations on the part of the client would cause nothing short of a general revolt. The large sums spent on this latter type of advertisement indicate the supreme faith the business man has in their efficacy. For him architecture is a thing apart, and to force upon him the practical consideration of what he has hitherto considered an abstraction is an enterprise of high aim, and can only be secured by official imposition. Evidently the best means of achievement is, as Professor Beresford Pite has pointed out, that more architects should serve on local authorities.

Doubtful as the reception of the issues of town planning are to the public, still more so are they to our profession. The struggle of the individual against the collective interest was never better illustrated. The proposals of Mr. Paul Waterhouse in relation to city architecture exhibit an outlook over the future to which all reformers in all questions relating to government and organisation ultimately agree. The freedom of the "artist" in our city architecture has had its day, we see its results and deplore them. We are incapable of directly managing our own professional affairs, so we must call in outside aid in order that the artistic betterment of our streets may be attained, to see ourselves practically reduced to the position of assistants to a borough architect in that province of our profession. Design, which we have hitherto regarded as peculiarly our own, in addition to the fetters with which building Acts and local authorities have loaded us, seems a doleful fate even for the most unimportant acolyte in the temple of art. Yet it must be admitted that it is a fate we fully deserve, and furthermore will accomplish much in the direction of our better architectural education.

That Mr. Paul Waterhouse's principles are correct cannot be doubted. The position is that our work suffers from lack of public appreciation as well as co-operation in our own ranks. The remedy is obvious, despite the objections of an individualist like Mr. T. G. Jackson, R.A., who has attempted to draw a risible picture of the collisions of styles under the domination of borough architects; we must impose our views upon the public and ourselves by legal pressure.

As the bye-laws of local authorities and building Acts have not only taught us the importance of many constructional and sanitary matters, so the surveillance of a legal authority in matters of design will render us more capable.

The result, of course, cannot be the achievement of satisfaction to the critical artist except perhaps through dreary stages of incomplete and indecisive effort. But our profession has such a leeway of individual progress to make up, such a crowd of incomplete architects and doubtful architecture, that to pay any further attention to the caprices of the individual practitioner and his lack of education, or to bring any forcible influence to bear by appeals to professional unity are now clearly seen to be ineffective and ridiculous. The problem is how to obtain control of would-be architects, and if we cannot do so by methods in vogue since the term architect was first used, we must do so by legal influence.

(To be concluded.)

VARIETIES.

MR. TEMPLE MOORE, F.R.I.B.A., has been appointed architect to the Dean and Chapter of Rochester Cathedral.

THE Town Council of Bournemouth at their last meeting approved seventy plans for new houses to be erected within the borough.

PLANS were passed on Wednesday by the West Riding County Council for the addition of a new wing to the County Hall, Wakefield, at an estimated cost of 32,000*l.*

THE Pontypool Urban District Council are going to obtain plans in competition from local architects for three types of workmen's dwellings to cost respectively 128*l.*, 153*l.*, and 188*l.*

THE Ilfracombe District Council are about to invite competitive plans for a free library to be erected in Wilder Road. Mr. Andrew Carnegie has offered 3,000*l.* towards the scheme.

THE Windermere District Council contemplate borrowing 32,500*l.* for sewerage and sewage disposal and 9,000*l.* for providing a park and developments around the lake side at Bowness.

THE London, Tilbury, and Southend Railway Company propose to erect two generating stations—one at Tilbury and the other at Thames Haven—for the purpose of the electrification of their railway.

THE Guardians of the Rochford Union invite architects practising within Rochford Hundred who may be willing to prepare plans, &c., for and supervise the erection of new infirmary block and nurses' home at the workhouse to apply to the Clerk on or before Monday, the 20th inst.

THE Barnsley Town Council have under consideration a recommendation from the General Purposes Committee that a new Town Hall should be built as a memorial to the late King Edward VII. The existing building was erected about eighty years ago at a cost of 1,500*l.* The present rateable value of the town is 170,000*l.*

PLANS have been prepared on behalf of the trustees of the Alkrington Estate, Middleton, for the development of about three hundred acres as a garden city. These plans only await the sanction of the Local Government Board, as they have been already approved by the Middleton Corporation.

THE Southport Town-planning Committee has before it several schemes for the development of the town. Plans have been supplied for the laying out of St. George's Place in Lord Street; and the borough surveyor has received instructions to prepare a plan for the general improvement of the whole of Lord Street. The Committee has decided to make a complete inspection of the town with a view to further improvements.

THE Stoke-on-Trent County Borough Council have adopted a report by Mr. C. H. Yeaman, the electrical engineer, on the establishment of a transmission system at a cost of 60,000*l.*, made up as follows:—New generating station, 20,000*l.*; cables to sub-stations, 20,000*l.*; sub-stations, 10,000*l.*; and additional mains and distribution, 10,000*l.*

MESSRS. HARRY DAVIES & DAVIES, architects, Cardiff, have prepared the development scheme for the new colliery village of Edlington, near Doncaster, which is now in course of erection. The plans show 823 cottages, of which about 100 are already completed. The colliery is owned by the Staveley Coal and Iron Company, Ltd., who expect to have between two and three thousand men engaged in a few months time. Eventually the number of houses will be 1,400.

THE Luton Education Committee invite designs for an elementary school to be erected in Charles Street. Architects

wishing to compete are to submit their names by March 21 to the Secretary of Education. Of these, six architects will be chosen to send in designs, and the Committee, with professional assistance, will select the one they consider most suitable. The author of such design will be employed to carry out the work. To the unsuccessful selected competitors an honorarium of 5*l.* 5*s.* each will be paid.

THE Liverpool Cathedral Executive Committee state that the second portion of the building, the choir and transepts will be ready for consecration in the early part of the year 1915. The sum of 43,750*l.* is still required for this work. The sum of 36,000*l.* has accrued as interest on the capital sums given to the fund. The walls of the choir are now 77 feet and 88 feet high respectively, and those of the chapter house are 17 feet high. There are at present 221 men employed on the building.

At a meeting on the 10th inst. of the Aberdeen Provincial Committee for the Training of Teachers block plans of a proposed new training centre were submitted. The building will occupy the square block of ground formed by St. Andrew Street, Charlotte Street, John Street, and North St. Andrew Street, and the area is approximately about 1½ acre. The United Free Church Training College occupied part of the site, and it is proposed that the demonstration school should be retained. The estimated cost is 47,500*l.* The Committee after discussion agreed that the plans be thrown open to competition among the eight architects already selected.

DURING the past few weeks hundreds of thousands of people have inspected the model of the All Red route at the junction of Aldwych and the Strand. This is a well-executed model of the All Red route, which, at a cost of 60,000*l.*, is being erected in the Crystal Palace grounds in connection with the Festival of Empire. The Strand model has just been rendered even more attractive by means of electricity. Plaster windows have been cut out of the six buildings, so that the interiors may be illuminated. Other lighting effects include miniature standard lamps dotted about the walks. Most entertaining of all are the two little electric trains which run over 120 feet of railway line. At frequent intervals free lectures, lasting about seven minutes, are given.

THE north aisle of Rochester Cathedral, which has recently been restored at a cost of 600*l.*, was dedicated on Saturday last. In the course of the work some fifteenth century windows were uncovered, one being since entirely renewed and the others repaired; the old walls have been uncovered and re-plastered; stone work has been cleaned; and new oak doors have been erected. The flat leading to the roof over the staircase has been lowered to below the level of the windows in order to let in more light. The old pilgrim steps have been brought to light, but in order to prevent further wear iron raisers have been placed over them.

IN answer to a question in the House of Commons, Mr. Haldane has informed Mr. Watt (Glasgow College) that the form of the bills of quantities supplied in connection with the tenders for the erection of Redford Barracks had for many years been in general use for War Department building contracts without question. Quantities were issued to twenty-four Scottish, one Irish, and four English firms, of whom eleven Scottish and two English firms did not eventually tender. The reasons for their not doing so were unknown except in the case of one Scottish firm, which gave the form of the bills of quantities as the reason. A representation on the subject was received from the Edinburgh Building Trades Association, and was under consideration.

A SPECIAL meeting of the Council of the Glasgow Institute of Architects was held on the 9th inst., when the following office-bearers were appointed, viz.: President, Mr. John B. Wilson, F.R.I.B.A.; vice-presidents, Messrs. A. N. Paterson, M.A., F.R.I.B.A.; J. K. Hunter, F.R.I.B.A.; and R. D. Sandilands, F.R.I.B.A.; secretary and treasurer, Mr. C. J. MacLean, writer, 115 St. Vincent Street; auditor of professional accounts, Mr. George Bell, F.R.I.B.A. The various committees for the year were also appointed. The following were admitted as associate members of the Institute, viz.: Messrs. W. J. Wright, Bearsden; R. Carswell, Yoker; G. L. Grieve, Yoker; D. W. M'Math, Glasgow; J. King, Wishaw; G. A. Boswell, Glasgow; G. Lennox, Glasgow; and J. W. Weddell, Glasgow. The following were admitted as student members, viz.: Messrs. J. R. W. Reid, J. M. Honeyman, and A. G. Lochhead. A number of applications by members of the Institute for licentiatehip of the Royal Institute of British Architects were passed. The president was appointed an examiner in the Glasgow School of Architecture.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280l., 120l., 80l., and 4l. Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000*l.* Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.* Apply to Mr. G. C. Copstick, F.R.I.B.A., County Offices, Derby.

COVENTRY.—April 1.—The Corporation contemplate the refection of municipal offices in the centre of the city, and also possibly a town hall, and accordingly invite competitive designs. Mr. E. Guy Dawber, F.R.I.B.A., will act as assessor. Deposit 2*l.* 2*s.*, which will be refunded on receipt of a bona-fide design or if the particulars are returned within fourteen days of receipt. Mr. Geo. Sutton, town clerk, 10 Hay Lane, Coventry. (For further particulars see advertisement, November 18.)

CUBA.—April 15.—An international competition has been arranged for a Presidential Palace to be erected at Havana at a cost of about 205,000*l.* Premiums of 10,000 pesos and 1,000 pesos will be awarded. Conditions may be seen at the Cuban Legation, 3 Grosvenor Mansions, Victoria Street, S.W., or the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

MANCHESTER.—March 31.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes March 31. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, F.R.I.B.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester. (For further particulars see advertisement, January 6.)

ROMFORD.—The Town Planning and Modern House and Cottage Exhibition at Gidea Park, Squirrels Heath, in the Romford Garden Suburb, summer 1911. Class IV.—Town plan of Gidea Park—prizes of 100*l.* and 50*l.* Class VII.—Open to builders. For excellence of workmanship and construction in the erection of a cottage in Class I. or II.—first prize, gold medal and 100*l.*; second prize, 50*l.* Final dates for designs; Class IV., March 31, 1911. For the erection of an addition to tramway car sheds, Greengate Street, Plaistow, for the West Ham Town Council.

HORSWILL, Forest Gate (accepted) £5,855 0 0

MR. E. HOWLEY SIM, architect, has been elected Councillor of the city of Westminster.

THE estate has been sworn of the late Sir John Aird, Bart., contractor and engineer, at the amount of 1,101,489l.

MR. BENJAMIN WALMSLEY, builder and contractor of Leeds, who was also interested in the Clayton Wood Quarries, has left estate of the value of 139,730l.

THREADNEEDLE STREET Branch Post Office is to be rebuilt at an estimated cost of 18,000l.; a new sorting office is to be erected at a cost of 4,500l. at East Ham, and the cost of work at the South-Western District Office will be 17,000l.

MEMBERS and Licentiate of the Royal Institute of British Architects are requested by order of the Council not to take part in the competition for buildings for Rochdale Nurses' Home.

OWING to the complaint of the Northumberland County Council with regard to the pollution of Willow Burn, the Bedlington Urban Council have decided to carry out a sewage scheme for Netherton, Barrington, and Choppington Collieries at a cost of 8,000l.

THE contract for the first section of the National Library of Wales at Aberystwyth has been let. Ten tenders were received, and the lowest, that of Messrs. H. Willcocks & Co., Wolverhampton, at about 50,000l., was accepted. The total cost of the completed library building is estimated at over 100,000l.

THE monthly meeting of the Council of the London Master Builders' Association was held at Koh-i-Noor House, Kingsway, W.C., on the 16th inst., Mr. G. Bird Godson, president, in the chair. The quarterly financial statement was presented by the Finance Committee, and, after discussion, adopted. The various committees for the year were appointed, also the Conciliation Boards for the various trades. A proposal for affiliation from the Master Decorators was considered, and it was unanimously resolved to agree to the same, it being an important step towards unity in the trade. Various items of interest to the trade were discussed. Mr. F. J. Gorham, builder and contractor, of Point Hill, Greenwich, was elected a member of the Association. Messrs. W. Elore & Son, timber merchants, of South Lambeth Road, were elected associate members.

INSTITUTE OF BUILDERS.

THE twenty-seventh annual general meeting of the Institute of Builders was held at Koh-i-Noor House, Kingsway, W.C., on Wednesday, March 15.

The audited accounts and balance-sheets for the Institute General and Benevolent Funds for the year ending December 31, 1910, together with the report of the Council, were adopted.

The Council, in their annual report, regret that the prosperity of the country generally has not yet greatly improved the building trade.

Representatives from the Council attended several sittings of a joint conference held under the auspices of the Royal Institute of British Architects, on the subject of the proposed London County Council regulations concerning ferro-concrete construction, and the recommendations of that conference have been forwarded to the L.C.C.

At the instance of the L.C.C. Education Authority, the Council has formulated a scheme with a view to the encouragement of the formal apprenticeship of lads from elementary schools who are likely to make good mechanics. It is hoped that the suggestions made may lead to a better supply of capable workmen and tend to reduce the redundancy of unskilled labour in the future.

A committee of the Council is considering the question of the position of the principal contractor with respect to sub-contractors under the agreed form of contract, and hopes in due course to formulate proposals for alterations to the clauses bearing on the subject, which will be subsequently submitted to the Royal Institute of British Architects.

The Council regrets that the medals in brickwork and masonry which were offered at the South Kensington technological examination could not be awarded, owing to there being no entries for the practical examination in either of those trades. The carpenters' medals and money prizes, however, were duly awarded, and, in addition, a special gold medal was placed at the disposal of the Carpenters' Company in connection with their examinations in carpentry and joinery.

Gifts of books are invited from the members in order that the usefulness of the library may be extended.

The following grants were made during the past year from the I.O.B. Benevolent Fund:—(1) Builders' Benevolent Institution, 50*l.*; (2) Builders' Clerks' Benevolent Institution, 10*l.* 10*s.*; (3) Provident Institution of Builders' Foremen and Clerks of Works, 10*l.* 10*s.*; (4) Builders' Foremen's Association, 10*l.* 10*s.*

It was with deep regret that the Council learned of the death of the late J. Howard Colls, Esq., and puts on record the sense of loss that they have thereby sustained, and their appreciation of the talents and character of their late respected colleague.

The following officers, &c. were elected for the ensuing year:—

President.—Mr. James S. Holliday (Messrs. Holliday & Greenwood, Ltd.). *Vice-President*.—Mr. F. G. Rice (Messrs. Rice & Son). *Treasurer*.—Mr. Jas. Carmichael, J.P. *Hon. Auditor*.—Mr. G. C. Hudson (Messrs. Hudson Bros.).

To fill vacancies on the Executive Council.—Mr. Walter Lawrence, jun. (Messrs. Walter Lawrence & Sons), Mr. Ralph J. Holliday (Messrs. Holliday & Greenwood, Ltd.), Mr. Samuel Smethurst, J.P. (Messrs. S. & J. Smethurst, Ltd., Oldham), and Mr. Edmond J. Hill (Messrs. Higgs & Hill, Ltd.).

A very hearty vote of thanks was passed to Mr. Fredk. Higgs (Messrs. F. & H. F. Higgs), for his able and energetic discharge of the duties attached to his office of President during the last twelve months.

Votes of thanks were also given to the Treasurer (Mr. Joseph Randall) and to the Hon. Auditors (Mr. F. N. Cowlin (of Messrs. Cowlin & Son, Bristol), and Mr. Eric M. May (of Messrs. W. Cubitt & Co.).

A GENERAL assembly of the Royal Scottish Academy was held last week for the purpose of making four elections to associate rank—two painters and two architects. Sir James Guthrie, the president, occupied the chair. At the close of the proceedings the following elections were announced: Painters—Mr. J. Whitelaw Hamilton, Helensburgh, and Mr. Robert Hope, Edinburgh; runner-up—Mr. James Rid-del Colinton. Architects—Mr. William Kelly, Aberdeen, and Mr. A. N. Paterson, Glasgow; runner-up—Mr. T. Duncan Rhind, Edinburgh.

VARIETIES.

THE Ipswich Dock Commissioners have approved the principle of a scheme of dock development, the cost of carrying out which is estimated at about 200,000*l.*

MESSRS. WIDNELL & TROLLOPE, surveyors, have moved from 20 Tothill Street, S.W., to Broadway Court, Broadway, Westminster, S.W. Their new telephone number is Victoria 1923.

THE Civil Service Estimates for the year 1911-12 include particulars of the financial provision for a new Head Post Office at Bolton. The total cost is estimated at 20,480*l.*, with 1,520*l.* additional chargeable to telephone capital account, making 22,000*l.*

THE Photographic Survey and Record of Surrey will hold their annual general meeting in the Surrey Archaeological Museum, Guildford, on March 25. An exhibit of prints will be shown and will remain on view to the public for the following week.

THE Northern Architectural Association have elected the following officers: President—Mr. H. C. Charlewood; vice-president—Mr. W. Milburn; Hon. Secretary—Mr. C. S. Errington; Hon. Treasurer—Mr. R. Burns Dick; Hon. Librarian—Mr. J. Bruce.

It is understood that the governors of the High School for Girls at Bridlington are likely to proceed with the erection of a boarding-house or hostel adjoining the new school buildings erected on The Elms estate. The County Council will shortly be asked to assent to a proposal.

THE following five church-building schemes are contemplated for Sheffield: New Church for St. Timothy's, Crookes, 4,000*l.*; Mission Church for Walkley, 3,000*l.*; New Church for St. Clement's, Newhall, 3,200*l.*; New Church for St. Alban's, Darnall, 4,900*l.*; Parochial Hall, St. Timothy's, Crookes, 1,900*l.*

THE Electric Lighting Committee of Edinburgh Town Council, after considering estimates for the erection of two cooling towers at Dewar Place Power Station, agreed to recommend the acceptance of that of the Motherwell Bridge Company of a little over 18,000*l.*, which was the lowest of the nine tenders received.

A BILL has been presented with the object of securing funds to carry on extensive building operations in Belgrade. It appears that many government offices are situated in premises held on lease, and that it is now proposed to erect independent buildings for the public service. The cost of this undertaking, including the enlargement of the Servian Royal Palace, is estimated at 760,000*l.*

THE Executive Committee of the Penistone Free Library scheme have accepted plans prepared by Mr. H. B. Collins, of Barnsley. The site, which is being purchased from the Sheffield Shrewsbury Hospital Trustees, covers an area of 500 square yards, and is situate in Shrewsbury Road. The plans will be forwarded to Mr. Carnegie for his approval.

THE Imperial Trade Correspondent at Toronto reports in the *Board of Trade Journal* that a transept, with a seating capacity of 2,500, and a nave are to be added to the existing portion of St. Albans Cathedral, Toronto, at a cost estimated at 300,000 dols. (about 62,000*l.*). The architecture is to be Early English. The edifice will be cruciform with a central tower. The material to be used is white stone. The Imperial Trade Correspondent at Victoria, British Columbia, has forwarded a report of the budget speech of the Provincial Minister of Finance, from which it appears that provision is made for the expenditure of about 267,000*l.* on the construction and extension of court-houses, schools, an asylum, the Parliament buildings, &c., and of about 176,000*l.* on bridges, including 250,000 dols. for the bridge over the Second Narrows Burrard Inlet.

A CONFERENCE on practical details of town-planning administration is to be held in the National Portrait Gallery, Edinburgh, on Thursday and Friday, 30th and 31st March. The subjects to be considered include the actual details of the various steps which should be taken prior to the presentation of a formal application to the Local Government Board for Scotland for permission to prepare a town-planning scheme; the extent to which a local authority should, under a town-planning scheme, relax or alter conditions relating to widths of roads and methods of road construction; and the limitation of the number of houses per acre. The conference will be under the auspices of the National Housing and Town-Planning Council, and at the close a Town-Planning Advisory Committee for Scotland will be appointed, on similar lines to the committee already formed for England, for the purpose of stimulating the administration of the town-planning powers of the new Act in Scotland.

THE TOWN PLANNING AGITATION.

(Concluded.)

To the commonplace that architecture of the best type was produced in the good old days of uncontrolled practice we must reply that conditions have changed, and the gradual advent of commercialism, which brought the modern architect in its train, has determined the close of that golden period. Art in individual buildings under such a regime as Mr. Paul Waterhouse has proposed may suffer in those few isolated cases where their architects may be better artists than their official surveillants, but if matters are properly adjusted as the proposed machinery will render easy, the great artists in architecture should not lack complete and even better opportunities to exhibit their skill, as, for instance, the continued rejection of a common class of pot-boiling facade due to the attempt of the architect to gracefully reflect his client's ideas of design will gradually lead to more trust being placed in our profession, and a consequent rise in status of the practitioner.

The difficulties from the point of view of art are enormous, and I recall the dilemma in which a certain circle of artists were placed when met with the question of the decoration of their club. Their opinions were so much at variance that finally the matter was decided by Tottenham Court Road. Opinions on this aspect of town planning are greatly at variance in the profession; the initiators of the movement are for co-operation amongst architects, and there are even cries for a benevolent despot. The impatience of the architect to be untrammelled in the exercise of his art and the indifference of the building owner to the whole question except when conducive to effective advertisement evidently point to the conclusion that in this matter, as in all others, a compromise must be arrived at if any proposal is to take practical shape. That compromise must involve some restriction upon architects and co-operation amongst them. A general scheme for the architecture of a street must be laid down by architects in the district and duly imposed by all available means on the authorities, and the first building of artistic distinction nearest the agreed standard must be duly recognised, and form the main lines upon which the future street should be based. Adjoining structures should harmonise in mass and alignment of main lines, the general treatment and detail being left to the architect immediately concerned.

There is no doubt that the exercise of the powers of local authorities by continued pressure of architectural opinion within and without would do much to secure repression of the cult of advertisement, and new Parliamentary powers obtained to correct present deficiencies. Before the blatant advertisements disappear from our streets it is obviously necessary that architects should modify their own desires in that respect, and be contented to co-operate with their colleagues wherever the success of street architecture depends upon it.

Whilst we should repress to some extent our dominant instinct in respect of the production of ambitious design when the architecture of blocks or streets is concerned, there is every reason why we should institute a propaganda for the advertisement of good modern work amongst those who build. In this matter we are all concerned, and the lack of proper anchorage for our art in the large space in which commercial projects hold the position, necessitates an appeal on quite another plane to those who are likely to engage our services. Gothic architecture has been lectured and written to death popularly. We must now endeavour to popularise modern work, point out its object, its interest, and its beauty to the public who build, and who now have no adequate notion of the differences between good and bad work. This has been successfully done in regard to country houses, why not for the town house, the shop front, and the warehouse?

To summarise my proposals, we should first see the formation of voluntary groups of students interested in town planning, each group confining its attention to a definite area and being dominated by the local architectural society or a parent group. The work of these groups would consist in the study of local conditions and the preparation of a town plan and its popularisation locally, together with constant pressure upon the local authority within and without. The plan agreed upon to form part of any main scheme that may be considered the best by the local architectural society. The latter to endeavour to secure the local co-operation of architects, and also that of any local non-architectural societies likely to assist.

The R.I.B.A. appears at present to be somewhat in

agreement with this position generally, but the work done appears to be of a very speculative type.

The gradual evolution of a town plan by these means will necessarily prove a slow and painful process, but I think that, combined with Professor Beresford Pite's suggestion, that architects should be seated on local authorities, and, further, the possibilities of increased local powers, as Mr. Paul Waterhouse proposes, by Parliamentary action is practically certain, if strongly urged and even in the face of influential objectors. I have made no attempt to show that these proposals will result in the complete realisation of the ideal town, but I believe that only such machinery of a painfully dull and unemotional type will bring into being a tithe of the possibilities that this current phase of architecture has so eloquently placed before us.

At a general assembly of Academicians and Associates of the Royal Academy held on March 22 Mr. Alfred Parsons, A.R.A., was elected a Royal Academician.

THE Birmingham Board of Guardians have decided to erect a pathological-bacteriological building at a cost of 392*l.*, an extension of the nurses' accommodation in the infectious quarters (560*l.*), and two new infants' homes at Marston Green (3100*l.*).

MR. A. R. JEMMETT, F.R.I.B.A., began on March 17 a special course of six weekly evening lectures on "Town Planning" at the L.C.C. Westminster Technical Institute, Vincent Square, S.W. The fee for the course is two shillings and sixpence.

A FUND has been opened for raising 3000*l.*, with which to erect a new roof and other works at St. Paul's Church, Bray. Messrs. Bolton & Sons have received the contract, their tender of 2492*l.* 10*s.* being the lowest of the six received. The architect for the work is Mr. R. Caulfeild Orpen, Dublin.

THE Hull Corporation Property Committee have adopted a scheme for the demolition of the old Town Hall in Lowgate, and for its reconstruction in harmony with the adjoining new law courts and municipal offices. The work is estimated to cost between 20,000*l.* and 25,000*l.* Messrs. Russell & Cooper, architects, who prepared the successful competitive designs for the latter buildings, will prepare a detailed report on the scheme.

IN a competition limited to four architects, three being London firms, the Council of the Institution of Mechanical Engineers have selected the design of Mr. James Miller, A.R.S.A., Glasgow, for extensive additions and alterations to their institution buildings at Storey's Gate, Westminster. Mr. Miller is also architect for the new building now being erected in London for the Institution of Civil Engineers at a cost of over 100,000*l.*

At a meeting last week of the Art Gallery Committee of Aberdeen the proposed extension of the gallery was considered, with special reference to improvements to be carried out in the locality in connection with the Technical College and the erection of the King's statue. Mr. A. Marshall Mackenzie, A.R.S.A., the architect, was requested to draw up a detailed plan for the committee's consideration. Additional rooms will be constructed adjoining the Celtic Court, while upstairs there will be one large gallery to accommodate 700 people, to be utilised as a lecture-room and for large meetings. There will also be a room for arts and crafts and for exhibits from South Kensington, and for other purposes. The estimated cost of the new buildings is 9,000*l.*, and this does not include the cost of the site.

"THE MERCANTILE GUARDIAN" states that the new water works engineer at Bombay urges local architects to insist on first-class fittings and first-class plumbing. Some of our home towns might safely consider the suggestion. Our contemporary also contains the following information: The amount—23,500,000*l.*—ear-marked for broadening the gauge of the Tokio-Shimonseki line, Japan, deserves passing notice. Some 4,500,000*l.* for rolling stock, the same sum for bridges, and 3,000,000*l.* for rails, to say nothing of other expenditure, can hardly be made without creating some incidental opportunities for import business. Important water-works schemes are reported to have been approved in Argentina. In Buenos Ayres 275,000*l.* is to be spent in new mains and pipes, and foreign tenders are being invited for metal work in connection with the Caballito water supply. Both schemes are under the "Obras de Salubridad de la Nacion."

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaría de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Aug. 21.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—May 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280l., 120l., 80l., and 4l. Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

To Architectural Students.

Back Volumes of **THE ARCHITECT** will be found to be of great value to you, containing as they do fine examples of measured drawings, perspective work, and details; all of importance to you in your studies. Call at the Offices, 6-11 Imperial Buildings, Ludgate Circus, E.C., between the hours of 10 A.M. and 5 P.M. on any day but Saturday, and ask for some back volumes to look through. Cost of each volume, containing over 100 examples is 12s. 6d.

INTERNATIONAL HEATING AND VENTILATING CONGRESS AT DRESDEN.

AN International Heating and Ventilating Congress will be held at Dresden from the 12th to 14th June this year.

It is hoped that this year's congress at Dresden will meet with widespread interest abroad, and that even a larger number of foreign representatives will attend than on previous occasions.

Apart from the congress itself with its scientific lectures and social functions, Dresden, one of the finest and most beautiful cities, will be a particular centre of attraction. Indeed, a visit to this town should prove of special interest to engineers, as from May to October an International Exhibition on Hygiene is being held, which in size and importance surpasses all previous exhibitions of its kind. At the same time a special exhibition, on a large scale, of heating and ventilating appliances will claim the attention of the visitors to this congress. This last named exhibition not only combines everything that is used in regard to appliances and apparatus for heating and ventilation, but offers, moreover, a historical view of the development of heating and ventilation up to the present day.

The Managing Committee of the Congress has arranged for foreign visitors to be shown round the exhibition by guides familiar with the subject matter and the various languages, who will not only be at their disposal during the course of a number of scientific lectures, and inspection of some heating plants, but also during the social functions.

The programme commences on Sunday, June 11th, with an evening reception in the hall of the Exhibition Palace.

Monday, June 12.—Forenoon: First meeting in the aula of the Royal Technical High School, Dresden. Afternoon: Inspection of heating and ventilating plants in the following buildings: Municipal Offices (Staendehaus), County Court and Prison, Town Hall, Slaughter House. Evening: Official dinner in the hall of the Exhibition Palace.

Tuesday, June 13.—Forenoon: Second meeting in the auditorium of the International Hygiene Exhibition. Report on the exhibition itself, and on the scientific section of the exhibition, ventilating, heating, and collective exhibition of the Union of German Central Heating Engineers. Inspection of the exhibition under the guidance of experts.

Wednesday, June 14.—Forenoon: Third meeting in the aula of the Royal Technical High School, Dresden. Afternoon: Inspection of heating and ventilating plants. Evening: Performance at the Royal Opera House.

The following lectures will be given: (1) Far distance heating; (2) Heating of Schools; (3) Hot Water Supply Plants; (4) Historical development of the science of heating; (5) Report on the Hygiene Exhibition at Dresden in 1911, and on the special exhibition of heating and ventilating appliances.

ADAPTATION OF NATURAL FORMS IN INTARSIA.—From S. Maria in Organo.

THE CONCRETE INSTITUTE.

THE next ordinary general meeting of the Concrete Institute will be held at Denison House, 296 Vauxhall Bridge Road, Westminster (close to Victoria Station), on Thursday, April 13, at 8 P.M., Sir Henry Tanner, I.S.O., F.R.I.E.A., presiding, when Mr. C. Percy Taylor will read a paper entitled "The Reinforced Concrete Pier at Swanscombe," to be illustrated by lantern slides. The offices of the Concrete Institute will be removed after March 25 from 8 Waterloo Place, S.W., to Denison House, 296 Vauxhall Bridge Road, Westminster, S.W. The new offices will be more accessible to the majority of members and will give increased accommodation. A library and reading-room will be formed for the general use of the members. The new telephone number is 2112 Victoria.

The rules of the Concrete Institute were recently altered so as to enable a Students' Section to be established in fulfilment of one of the chief objects of the Institute, namely, to advance the knowledge of concrete and reinforced concrete and their constituents, and to direct attention to the uses to which these materials can be best applied. In further extension of this policy a course of educational lectures on the subject of "Reinforced Concrete" is being arranged for students and the public; these will be given on six consecutive Wednesdays, commencing April 26, at 5.45 P.M., and occupying approximately one hour, the lecturer being Mr. R. W. Lawdrey, B.A., Assoc. M. Inst. C.E., M.C.I. Admission will be free, by ticket, obtainable on application to the Secretary.

The Concrete Institute has made progress during the last year, its membership having increased by fifty-five. It has reported on a number of technical subjects, and it has been consulted on various matters by public authorities, societies and others.

THE Glasgow Corporation recently invited plans for a branch library at the corner of Saracen Street and Allander Street, Possilpark, and in reply received 127 designs. The design submitted by Mr. George Simpson, Glasgow, was awarded first place, and that architect will carry out the work. Premiums of 50l. and 25l. were awarded to Mr. W. B. Whitie (Glasgow) and Mr. T. S. Allan (Rutherglen) respectively.

LONDON ASSOCIATION OF MASTER STONEMASONS.

THE first annual meeting of the London Association of Master Stonemasons was held at the Cannon Street Hotel, E.C., on Wednesday, March 15, when the following were present: Mr. Fred. Corben (who occupied the chair in the absence owing to Parliamentary duties of the president, Mr. Stephen Collins, M.P.), Messrs. C. W. Courtenay, J.P., Corben, junior, F. J. Barnes, E. E. Way, Walter Pangbourne (Bath Stone Firms, Ltd.), J. Beckley (Messrs. Geo. Wimpey & Co.), W. H. Johnson, J. Bysouth, Morris (Yockney & Hartham Parkstone Co., Ltd.), Frank Mortimer, W. Gibbons, E. J. Fox, Frank Collins (Stephen Collins, Ltd.), Walter Bryant (United Stone Firms, Ltd.), Walpole Collins (hon. sec.). Mr. Walter Pangbourne (hon. auditor) presented his report, showing a satisfactory balance in hand.

Mr. Stephen Collins, M.P., on completing his year of office as president, was unanimously and most cordially thanked for his services, as it was felt that it was largely owing to his initiative that the Association was started and had flourished so well.

Mr. Fred. Corben was unanimously elected president for the ensuing year, and Mr. Stephen Collins, M.P., and Mr. C. W. Courtenay, J.P., as vice-presidents. The following were elected to serve on the Committee:—Messrs. Walter Pangbourne, Ernest E. Way, Frank Mortimer, J. Beckley, Geo. Calvert, W. H. Johnson, and Mr. Walpole Collins, hon. secretary and treasurer.

INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING, AND REPAIRING OF CHURCHES AND CHAPELS.

THIS Society held its usual monthly meeting on Thursday, the 16th inst., at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Reverend Canon C. F. Norman in the chair. There were also present:—Viscount Dunluce, the Reverends Canon Arnott, the Master of Magdalene College, Cambridge, Canon Edgar Sheppard, C.V.O., D.D., and A. G. Ingram; Lieutenant-Colonel the Hon. G.

H. W. Windsor-Clive, Messrs. George Cowell, F.R.C.S., J. E. Ollivant, Lewis Wigram, and the Reverend T. T. Norgate, F.R.G.S., F.R.Hist.S., Secretary.

Grants of money were made in aid of the following objects, viz.:—Building new Churches at Newtown, Tisbury, Wilts, £50; Westcliff-on-Sea, S. Saviour, Essex, £100 for the first portion, and Weston-super-Mare, S. Paul, Som., £150; rebuilding the Churches at Birmingham, S. Stephen, £200; and Taplow, S. Nicholas, Bucks, £150; and towards enlarging or otherwise improving the accommodation in the Churches at Maindee, S. John-the-Evangelist, Mon., £100; Tibshelf, S. John-the-Baptist, Derbyshire, £40; and Winchelsea, S. Thomas, Sussex, £55. Grants were also made from the Special Mission Buildings Fund towards building Mission Churches at Borth-y-Gest, Portmadoc, N. Wales, £30; and Edmonton, S. John, Middlesex, £40. The following grants were also paid for works completed:—Purlwell, S. Andrew, Yorks., £200; Ben Rhydding, S. John, Yorks., £25; Walton-on-the-Hill, S. Luke, Liverpool, £10; Scopwick, Holy Cross, Lincoln, £25; Mitcham, S. Mark, Surrey, £145; South Tottenham, S. Philip, Middlesex, £100; Starbeck, S. Andrew, near Harrogate, £100; Greenfield, Holy Trinity, near Holywell, N. Wales, £20; Sneinton, S. Christopher, near Nottingham, £100; Ilkeston, S. Mary, Derbyshire, £70; East Ham, S. Bartholomew, Essex, £250, being balance of a grant of £1,000; and Carlton Vale Mission Church, Kilburn, Middlesex, £25. In addition to this the sum of £510 was paid towards the repairs of twenty Churches from Trust Funds held by the Society.

It is earnestly hoped that Churchmen will come to the assistance of this venerable Society, which is entirely dependent upon voluntary contributions. The funds at the disposal of the Committee are almost exhausted by the grants voted at this meeting, and there is an increasing flow of applications for aid. The Society is doing a great work of Church extension by promoting the building and repairing of Churches upon right lines.

The annual General Court of the Society will be held at the Church House on Thursday, May 18, at 3 P.M., when the Bishop of Salisbury has kindly consented to take the chair. The other speakers will be the Bishops of S. Davids and Colchester, Lord Aberdare, Charles Spooner, Esq., F.R.I.B.A., and the Rev. P. S. G. Propert, Vicar of S. Augustine's, Fulham, and Chairman of the Fulham Board of Guardians.

PRESERVATION OF NATIONAL MONUMENTS IN IRELAND.

In the seventy-eighth annual report of the Commissioners of Public Works in Ireland an appendix is given showing the works carried out on National and Ancient Monuments under the Irish Church Act, 1869; Ancient Monuments Protection Act, 1882; and Ancient Monuments Protection Act, 1892.

Works of protection and repair have been carried out at twenty-six buildings, or groups of buildings, with funds provided under the Irish Church Act, and at sixteen structures, or groups of structures, with funds provided under the Ancient Monuments Acts, 1882 and 1892.

1. Funds provided under the Irish Church Act, 1869, were expended on the following:—Ruins on the Rock of Cashel, co. Tipperary; the Seven Churches, Glendalough, co. Dublin; the churches, crosses, and round tower, Monasterboice; St. Columba's stone-roofed house, Kells, co. Meath; Timoleague Franciscan Church and Convent, co. Cork; Skreen Church and Tower, co. Meath; Roscrea Round Tower and Church, co. Tipperary; Donaghmore Church, co. Tipperary; St. Bridget's Monastery, Clare Island, co. Mayo; Rattoo Church and Round Tower, co. Kerry; Fenagh Abbey, co. Leitrim; Franciscan Church and Convent, Ross, co. Galway; the Cistercian Abbey of Holycross, co. Tipperary; the Augustinian Priory of Athassel, co. Tipperary; the Cistercian Abbey of Mellifont, co. Louth; the Monastery, Cathedral Church, and St. Peter's Church, Ferns, co. Wexford; the Cistercian Abbey of Jerpoint, co. Kilkenny; Titeskin Church, co. Cork; St. Molaga's Church, co. Cork; Clones Cross, co. Monaghan; Drumlane Church and Round Tower, co. Cavan; St. Kieran's Church, Clear Island, co. Cork; the Tower and Choir of the Franciscan Church of St. Francis, co. Kilkenny; the Church of Kilmalkedar, co. Kerry; the Ogam stone circle of Ballintaggart, co. Kerry; the Franciscan Church and Convent, Kilcrea, co. Cork.

2. Funds provided under the Ancient Monuments Acts, 1882 and 1892 were expended on:—The Cistercian Abbey of

Mellifont, co. Louth; the "Giant's Ring," Ballyleson, co. Down; Sherkin Franciscan Friary, co. Cork; Staigue Fort, co. Kerry; the Ancient Monuments on the Promontory, Dingle, co. Kerry; the Grianan of Aileach, co. Donegal; the Cistercian Abbey of Dunbrody, co. Wexford; Kilcrea Franciscan Friary, co. Cork; Buttevant Franciscan Friary, co. Cork; Inniskeen Round Tower, co. Monaghan; Trim Yellow Steeple, co. Meath; Donegal Castle, co. Donegal; Donegal Franciscan Friary, co. Donegal; Franciscan Friary, Ennis, co. Clare; Killone Abbey, co. Clare.

Timoleague Franciscan House was illustrated and described in the Board's report for last year, and the repair then commenced were this year carried through to completion. Considerable difficulty is experienced here with the promiscuous interments which take place in the absence of any burial regulations. The area within the walls regarded merely as a desirable burying ground not alone for the locality, but for persons from a distance. The courtyard, in which there were no burials in 1878, is now overcrowded.

At the tower of Skreen Church in County Meath, which is much resorted to an account of the extensive view to be obtained from its summit, the floors and stairs have been strengthened and protected to avoid possible accidents.

The Augustinian Priory of Athassel, County Tipperary at which initial repairs had been executed in 1882, has become dangerously overgrown with vegetation. The ivy was removed from the walls, and some large trees with overhanging branches had to be cut down; considerable repair were found to be necessary to make good the ravages of the ivy, and a general clearing up of the area within the wall was attempted. The presence of a large number of graves, some of them within the walls where the stone-vaulted roof still remains, makes it difficult to maintain the precinct with an aspect of decency.

At Kilcrea Friary, County Cork, extensive repairs were carried on and completed during the present year. At the instance of the Inspector of Ancient Monuments the local clergyman has succeeded in getting the Rural District Council to appoint a caretaker to control the burials, the Board of Works supplementing his salary by an equal amount to look after the ruins. It has also been arranged that burials are to be confined to those in the ecclesiastical union of parishes having burial rights within the walls, and that the unauthorised burials of unknown persons coming from a distance are to be discouraged. Efforts towards similar satisfactory arrangements are being made at other ruins under the Board's care.

The repairs commenced at Mellifont Abbey during the year 1908-09 were carried on and completed, including the enclosing of the additional space vested in the Board. The cutstone work of the foundations of the piers and abutment of the nave and choir is of sandstone of a friable nature, and requires treatment with a baryta solution to prevent it from crumbling away.

In the interior of the Tumulus of Dowth, County Meath some of the supporting stones showed signs of disintegration and it became necessary to introduce reinforced concrete to maintain them in position.

The repairs at the Franciscan Friary at Sherkin Island were completed. The grave spaces in the interior have been cleaned up. The area of the cloister garth is at present free from graves, and it is intended to preserve this portion from being used for burial purposes.

The repairs at Franciscan Church at Buttevant, County Cork, have been completed. The walls have been preserved by concreting the top and pointing the faces where the open joints were injured by the ivy. Owing to the overcrowding of the interior with grave mounds, headstones, tombs, &c., but little could be done to improve the neglected aspect of the interior of this ruin.

At Inniskeen Round Tower, County Monaghan, recently vested in the Board, preliminary repairs have been carried out. Vegetation has been removed, and some pointing done to secure and preserve the walls. A wooden rail has been placed around the base of the Tower to prevent injury to the foundations by the digging of graves.

The "Yellow Steeple" at Trim, which is all that is left of the Church of St. Mary, is in need of repair. As a precaution against danger from falling stones a railing has been erected around its base. Owing to its great height and the cost of scaffolding the tops of the walls were not secured when the initial repairs were undertaken, but as the matter has now become urgent the work will be commenced during the coming year.

Ancient Monuments under the Irish Land Act, 1903 Section 14.—During the past year the Estates Commissioner

have offered for vesting under the above Act the following twelve structures:—

Togher Castle, co. Cork; Cregnaakeerogue Fort and Basinstone, &c., co. Clare; Relaghbeg Fort, co. Cavan; Killusty Castle, co. Tipperary; Kinnafad Castle, co. Kildare; Callas Fort, co. Cork; Cullahill Castle, Queen's County; Inchbofin Abbey, co. Westmeath; Laughanstown (Tully) Crosses, co. Dublin; Longstone Rath and Standing Stone, co. Tipperary; St. Connell's Cross, co. Donegal; Ballynoran Castle, co. Tipperary.

Out of this number the following three have been accepted:—

1. Cregnaakeerogue Fort, Basinstone, &c., co. Clare.—In addition to the Fort and Basinstone, there are two standing stones and a cairn, the whole forming a most interesting group of monuments.

The "Fort" is an earthen mound of considerable extent, evidently intended for ceremonial purposes, and was the inauguration place of the Dalcassian Princes, known as the Mound of Magh Adhair. It is flat topped—the level portion measuring 105 feet by 83 feet, and is 20 feet in height, surrounded by a fosse. It has an approach sloping upwards from a cairn on the west side. The Basinstone is on the north side of the Mound. It is a conglomerate boulder with a depression in its upper surface, and has two pear-shaped sinkings, the larger about 6 inches deep. The Mound is mentioned as early as A.D. 981 and A.D. 1051 in the "Annals of the Four Masters." In the thirteenth century Brian, son of King Conor, was inaugurated here by Sioda MacNamara, the Hereditary Marshal. It is described as the place "where the kings of Thomond were made."

2. Laughanstown (Tully) Crosses, co. Dublin.—These crosses are near the ruined church of Tully—one standing on the public road and the other in the field adjoining. They are the remains of an important ecclesiastical foundation dating from the time of St. Bridget. The original name of Tully in Irish is Tulach-na-nespuc, or Tulach-na-h-easbog, meaning the Hill of the Bishops. There are the bases of two other crosses and two cairns included in the vesting, and the Board are in treaty with the Rural District Council of Rathdown No. 1 for vesting the remains of the primitive church in the adjoining graveyard of Tully.

3. Inchbofin Abbey and Church, co. Westmeath.—These ruins are situated on an island of that name in Lough Ree adjoining the Westmeath shore, to which county it belongs. The island is associated with the name of St. Riogh, a nephew of St. Patrick, who is said to have founded a monastery there. The Abbey is a small structure, consisting of nave and transept. It has a beautiful Romanesque window, and there are some remains of the domestic buildings. The church, a little distance away, is a larger structure, and has a semi-circular headed chancel, arch, and window of eleventh century date in good preservation.

The remaining nine structures offered by the Estates Commissioners, though of much local interest and worthy of preservation, seem to be more suited for the custody of the Councils of the respective counties in which they are situated.

Of the ruins offered by private individuals and bodies other than the Estates Commissioners there is only one—viz., St. Mary's Church, Gowran, co. Kilkenny, the guardianship of which has been accepted by the Board.

EXPENDITURE ON GOVERNMENT BUILDINGS IN GREAT BRITAIN.

THE Civil Service Estimates to be submitted to the House of Commons for the year ending March 31, 1912, have been published. Class I. deals with public works and buildings.

Under the heading of "Palaces not in His Majesty's Occupation" grants of 4,075*l.* and 4,040*l.* are asked in respect of new works at Hampton Court and Holyrood respectively; the former being for the erection of houses to accommodate firemen and for works necessary to safeguard against fire.

For Royal Parks and pleasure gardens it is proposed to obtain 14,493*l.* for new works, of which amount 5,290*l.* is to be expended at the Edinburgh Royal Botanic Garden, and 1,635*l.* at Regent's Park.

The gross total proposed for the Houses of Parliament buildings is 47,495*l.*, made up as follows:—(a) new works, alterations and additions, 4,335*l.*; (b) maintenance and repairs, 12,690*l.*; (c) maintenance of approaches and gardens, 2,380*l.*; (d) warming, ventilating, lighting, &c., 28,090*l.*

On County Court buildings it is proposed to expend 13,340*l.* on new works, alterations, additions and purchases, chiefly on further work at Blackburn (3,500*l.*), Bournemouth (2,000*l.*), Bury (3,000*l.*), Watford (2,170*l.*), and Wandsworth (1,000*l.*).

For Art and Science Buildings the sum of 27,470*l.* is asked for to be expended on new works, alterations, additions and purchases. The largest amounts are 12,000*l.* towards the erection of a new Spirit Building at the Natural History Museum; 5,000*l.* for the acquisition of property adjoining the Royal Scottish Museum as a protection against fire risks, and 2,600*l.* for the erection of administrative offices at the Museum; 1,300*l.* towards the cost of alterations to roof construction at the British Museum.

On new works and alterations at Customs and Excise Buildings and Inland Revenue Buildings it is proposed to spend 7,365*l.* and 17,680*l.* respectively, chiefly for small work. The largest items are 6,750*l.*, being the first portion of the amount required for erection of new offices at Bury, and 2,500*l.* for additional repositories at the Secretaries' Office, Somerset House, by roofing in areas.

On Post Office and Telegraph Buildings it is proposed to ask for 339,000*l.* for new works, alterations and additions. The works in progress in the London District for which grants are asked include the following:—Acton: new branch post office, 2,600*l.*; Blackheath: new post office, 3,215*l.*; Deptford: new sorting office, 2,305*l.*; Kilburn: sorting office enlargement, 3,440*l.*; Leytonstone: new sorting office, 2,500*l.*; Mount Pleasant: removal of returned letter office to second floor and improved accommodation for parcel sorting office, 9,100*l.*; Notting Hill: branch post office and sorting office extension, 2,360*l.*; Poplar: new branch post office, 6,145*l.*; South Eastern district office extension (estimated cost, 59,900*l.*), 14,000*l.*; South Lambeth: new sorting office, 2,320*l.*; Stoke Newington: new sorting office, 2,000*l.*; Western Central district office extension (total cost, 31,200*l.*), 14,000*l.*; Western district: parcel office enlargement, 500*l.*; Whetstone: sorting office, 1,795*l.*

In the Country.—Bacup: new post office, 2,060*l.*; Banbury: post office extension, 930*l.*; Birmingham: telegraph stores (total cost 86,470*l.*), 16,000*l.*; Birmingham, Hockley Hill: new branch office, 3,500*l.*; Bishop Auckland: new post office, 5,130*l.*; Blyth: new post office, 3,340*l.*; Bournemouth: parcel sorting office, 1,560*l.*; Bromley: post office extension, 2,020*l.*; Carnforth: post office extension, 6,600*l.*; Chester: new sorting office, 6,500*l.*; Chesterfield: post office extension, 1,475*l.*; Chislehurst: post office, 240*l.*; Crewe: station sorting office, 7,920*l.*; Devonport: post office extension, 4,335*l.*; Doncaster: new sorting office, 5,250*l.*; Eastbourne: new head post office, 7,700*l.*; Eltham: new post office, 2,200*l.*; Kidderminster: head post office enlargement, 1,250*l.*; Leamington Spa: post office extension, 4,000*l.*; Leeds: head post office enlargement, 7,000*l.*; Liverpool, Rice Lane: new sub-district office, 1,580*l.*; Llanelli: New post office, 1,220*l.*; Malton: new post office, 1,110*l.*; Mansfield: new post office, 4,420*l.*; Newcastle-on-Tyne: head post office extension, 7,000*l.*; Newcastle-on-Tyne: eastern district new branch post office and sorting office, 5,400*l.*; Newcastle, Staffs.: new post office, 3,500*l.*; Petworth: new post office, 1,545*l.*; Romford: new post office, 2,830*l.*; Smethwick: branch post office enlargement, 1,070*l.*; South Shields: head post office enlargement, 3,400*l.*; Swindon: head post office extension, 3,100*l.*; Tidworth Camp: new post office, 1,370*l.*; Torquay: new post office, 5,100*l.*; Tunbridge Wells: post office extension, 5,200*l.*; Waltham Cross: post office enlargement, 720*l.*; Weybridge: head post office, 4,220*l.*; Woking: new sorting office, 2,825*l.*; Edinburgh: general post office extension, 2,950*l.*; Helensburgh: post office extension, 560*l.*; Maybole: new post office, 2,345*l.*; Motherwell: post office extension, 600*l.*; Paisley: post office extension, 6,000*l.*; Wick: new post office, 4,860*l.*

The proposed works votes required for 1911-12, amounting to 1,000*l.* and upwards, in the London district, are as follows:—G.P.O. North: extension of kitchens and dining-room, 4,000*l.*; East Ham: new branch post office and sorting office, 1,000*l.*; South Western district office (revote, 6,000*l.*), (total cost, 18,100*l.*), 8,000*l.*; Threadneedle Street: branch post office rebuilding (total cost, 18,000*l.*), 8,000*l.*. In England and Wales they include:—Barking: new post office, 2,000*l.*; Birkenhead, Liscard: new sorting office, 2,500*l.*; Birmingham: new parcel office (estimated cost, 50,880*l.*), 7,500*l.*; Bolton: new head post office (estimated cost, 20,480*l.*), 4,000*l.*; Darlington: post office extension, 2,000*l.*; Hinckley: 1,000*l.*; Huddersfield: post office alterations and new sorting office, 2,000*l.*; Lichfield: Whittington Barracks sub-office, 1,500*l.*; Nuneaton: post office rebuilding,

1,000l.; Portsmouth: 3,000l.; Rochester: new post office, 1,500l.; Stafford: new post office, 1,500l.; Stockport: post office rebuilding, 1,000l.; Teignmouth: post office adaptation, 1,800l.; Walsall: post office enlargement, 1,000l.; Woking: post office extension, 1,025l.; Workington: new post office, 2,000l.; Glasgow: head post office extension (total estimated cost, 58,078l.), 20,000l.; Perth: new sorting office, 3,260l.

VARIETIES.

It is proposed to add to the King's School, Rochester, a large hall, a gymnasium, a swimming bath, and a fives court at a cost of 6,000l. or 7,000l.

MESSRS. J. CRAIG, BARR & COOK, architects, Paisley, have prepared plans for a new day nursery which is to be erected in Storie Street, Paisley.

THE Works Committee of Plymouth Corporation have adopted plans for the reconstruction of subsidiary sewers and the repaving of streets within the seventh district at an estimated cost of 12,665l. The existing sewers which it is proposed to reconstruct are principally composed of masonry, with tile or rock inverts, and shillet arches or cover stones, and are in a very defective condition.

THE Committee of the General Council of Aberdeen University promoting the movement for the reconstruction and restoration of Bishop Elphinstone's tomb in King's College Chapel, Aberdeen, have issued a special appeal for funds. The artist and sculptor selected for the work is Mr. Henry Wilson, and already a sum of 1,018l. has been subscribed.

At a meeting of the Swansea and Merthyr Joint Asylum Committee, it was reported that 55 applications had been received for the position of architect of the proposed asylum. The following were placed on the short list:—Mr. G. T. Hine, Westminster; Messrs. Johnson & Richards, Merthyr; and Mr. D. J. Wood, London. It was decided that the Committee should inspect the last asylum erected by each of the three selected architects.

THE Local Government Board have given authority for the preparation of two further town planning schemes, under the Housing, Town Planning, &c., Act, 1909. The schemes are to be prepared by the Corporation of Birmingham and the Urban District Council of Ruislip-Northwood. In the case of Birmingham sanction had previously been given to the preparation of a scheme in regard to over 2,300 acres in the parishes of Quinton, Harborne, Edgbaston, and Northfield, and the further scheme is to apply to an area of about 1,450 acres in the parish of Aston, on the east side of the city.

THE Town Improvement and Street Committee of the Newcastle Corporation last week had under consideration plans presented by the London Joint Stock Banking Co., Ltd., for the erection in Grey Street of bank premises in the modern Renaissance style. The committee thought that the style of the proposed building would interfere with the uniformity of the buildings in Grey Street, and it was suggested that the architect should amend the plans in relation to the proposed external appearance of the new building, so as to bring it in harmony with the other buildings in that thoroughfare.

THE Middlesbrough borough engineer last week presented to the Streets Committee his report on a plan for the laying out of a considerable area of building land on the south side of Station Road, just outside the borough boundary. The plan embodies the laying out of fourteen front streets, some 600 feet in length, and provides for the erection of 350 cottage houses. The borough engineer's suggestion that notice should be given of the scheme, and the land scheduled as an area for town planning, was adopted, and a committee was appointed to attend a conference of the parties concerned.

THE Stoke-on-Trent Education Committee have adopted the report of the Sites and Buildings Committee, in which they stated that they had very fully considered the question of the carrying out of the architectural work of the Education Committee, and recommended that an architect be advertised for at a salary of 250l. per annum to devote his whole time to the duties of the office. It was also recommended that the question of the appointment of an assistant be deferred until the appointment of an architect had been made.

THE Staffordshire Education Committee have decided to purchase 4,840 square yards of land at Chandle from Mr. William Alcock at 1s. 9d. per square yard as the site of a new Council school. It was resolved that statutory notices should be issued of the intention of the Committee to provide new Council schools at Fulford for 95 children and at Norton Canes to accommodate 300 children. It was decided that

the Rushall Council Girls' and Infants' School should be reorganised as a school for girls only, and that a new school for 220 infants should be erected.

THE New York State Capitol at Albany was partly destroyed by fire on Wednesday last. The damage is estimated by the State Architect to be five million dollars, irrespective of the burnt documents in the library. The building was begun in 1869, and the estimated cost was 800,000l. Up to the present no less than 5,200,000l. have been expended on the building.

THE Humber Conservancy Board are considering an important scheme for the improvement of the River Humber from the junction of the Ouse and Trent down to Paull Bight, the object being the training of the ebb and flood streams of the Ouse and Trent into the Humber at such an angle that the combined discharges may be trained to follow the same channel. This involves the construction of three half-tide training walls in the Humber from Flaxfleet Ness, five miles in length, at a cost of 90,000l.; a second in the Trent from Island House to Trent Falls, about one and three-quarter miles, costing 25,000l.; and a third in the Ouse, from Ousefleet Ness to Trent Falls, about two and a quarter miles, at a cost of 17,000l. Other works would also be necessary. The Board has appointed Sir M. B. Williams, K.C.M.G., in conjunction with Mr. S. N. Abernethy, to act as consulting engineers.

THE Glasgow Dean of Guild Court last week granted linings for all the buildings within the grounds of the Scottish National Exhibition at Kelvingrove on condition that an inspector be appointed by the Court, and that he report to the Court before the buildings are used by the public. The following linings were also granted:—Maryhill Bowling Club, to take down existing clubhouse and erect a new one in Watt Street, Maryhill; Messrs. Percy & Halden (Limited), oil merchants, 54 Great Wellington Street, Kinning Park, to erect additions to their works; the Rev. A. J. Maguire, to erect schools in East Rose Street and Henrietta Street; the Savoy Theatre, Glasgow (Limited), 36 St Vincent Street, to erect a theatre at the corner of Hope Street and Renfrew Street; the Glasgow Olympia Theatre of Varieties (Limited), 116 Hope Street, to erect a theatre at 1-9 Charles Street and 2-16 Orr Street, Bridgeton.

THE famous Kentish cromlech known as "Kits Coty House," Aylesford, supposed to be of greater antiquity than Stonehenge, and to have been erected not later than 1,800 or 2,000 years before Christ, is to be sold by auction, with the freehold building land, by Messrs. Hampton & Sons, on Tuesday, April 11. Several historians speak of this monument as being the burial-place of "Catigern," the British Prince who was slain in single combat with Horsa in a battle between the Britons and Saxons, A.D. 455, when the Britons were victorious. The monument is in a remarkably good state of preservation, is enclosed by stout iron railings, and is scheduled under the Ancient Monuments Protection Act of 1882. The freehold building land of eighteen and a half acres is offered as an ideal site for a convalescent home.

MESSRS. GEORGE MILLS & Co., LTD., Radcliffe, have received the following letter from the Mutual Spinning Co., Ltd., Heywood:—"Your (Titan) sprinklers practically saved us from having a very serious fire on the 17th ult. A man was going his round in our No. 1 Mill just before 6 A.M. lighting the gas previous to the operatives commencing work. In passing through the cotton mixing-room he stumbled near a number of bales of cotton which lay opened ready for mixing, and the light he was carrying came into contact with the cotton. The cotton ignited and the flames spread rapidly, but fortunately the sprinklers came into operation at once, and kept the fire 'well under' until the mill brigade got to work, when the fire was very quickly extinguished. We were pleased with the prompt action not only of the sprinklers, but of the alarm and everything in connection with the sprinkler installation."

At a meeting of the Law Society to be held on April 7 at 2 P.M., Mr. J. S. Rubinstein will move:—"That, having regard to the fact that the Report dated January 19 last of the Royal Commission on the Land Transfer Acts fully supports the contention that the present system of Registration of Title creates unnecessary difficulty, expense and delay in dealing with property subject to such registration, and in view of the statements made by the Commissioners that the effect of Compulsory Registration with Possessory Title in London has been to place a purchaser there at a disadvantage as compared with a purchaser elsewhere, and that the system as it stands is imperfect, this meeting is of opinion that the experimental trial of the system in the County of London, involving an expenditure of about 55,000l. per annum, should be brought to an end at once."

THE Architect and Contract Reporter.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

NOTICE.

Next Friday being Good Friday, THE ARCHITECT will be published on Thursday. All advertisements intended for this Number must reach the Office not later than 4 P.M. on Wednesday, April 12.

No alteration of advertisement copy can be allowed after Saturday morning, April 8.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

Works: FALKIRK.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.*, which will be refunded on receipt of a *bona-fide* design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280*l.*, 120*l.*, 80*l.*, and 4*l.*. Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000*l.*. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.*. Apply to Mr. G. C. Copstick, F.R.I.B.A., County Offices, Derby.

CUBA.—April 15.—An international competition has been arranged for a Presidential Palace to be erected at Havana at a cost of about 205,000*l.*. Premiums of 10,000 pesos and 5,000 pesos will be awarded. Conditions may be seen at the Cuban Legation, 3 Grosvenor Mansions, Victoria Street, S.W., or the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

DEVIZES.—May 10.—The Committee of the Devizes Cottage Hospital invite competitive designs for providing a new six-bed ward at, and making a general re-arrangement of, their existing hospital (16 beds) at a maximum cost of from 1,200*l.* to 1,500*l.*. Deposit 10*s.* 6*d.*. Conditions of competition and particulars of the buildings required will be supplied to intending competitors by Mr. E. Thorp, honorary secretary, Devizes.

MANCHESTER.—May 1.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes May 1. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester.

STOCKPORT.—April 22.—Architects desirous of entering a limited competition for the designs of the Police Station and Courts which the Corporation propose to erect are invited to forward their names and addresses, with particulars of their qualifications and experience in the erection of similar buildings, on or before Saturday, April 22, to Mr. Robert Hyde, Town Clerk, Town Hall, Stockport.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1*l.* 1*s.*, which will be refunded on receipt of a *bona-fide* design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250*l.*, and a premium of 50*l.* will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

CONTRACTS OPEN.

ACCRINGTON.—April 19.—For the arching of the River Hyndburn and the erection of boundary walls required in the proposed extension of the Coppy Clough Sewage Works, Church. Deposit 2*l.* 2*s.*. Mr. W. J. Newton, A.M.I.C.E., engineer to the Board, Town Hall, Accrington.

THE ROYAL BOROUGH OF KENSINGTON.

LAND TRANSFER ACTS.

REPORT of the Law and General Purposes Committee of
the Council of the Royal Borough of Kensington upon the
report of the Royal Commission on the Land Transfer Acts
submitted to and adopted by the Council at a meeting held
on the 28th March, 1911:—

We have considered, pursuant to the reference by the
Council of the 14th February, 1911, the report of the Royal
Commission on the Land Transfer Acts dated the 19th
January, 1911. In order to better explain the conclusions
we have come to we think it desirable to briefly recall the
action taken by the late Vestry and by the present Council
since the subject first came under notice in 1897.

1. The Land Transfer Act, 1897, empowered the Privy
Council to select one county in England in which the regi-
stration of title to land under the Land Transfer Act, 1875,
was as an experiment to be made compulsory.

2. In November, 1897, the London County Council were
asked to consent to the system being made compulsory in the
County of London. That Council thereupon sent a circular
letter to local and other bodies inviting an expression of their
views on the subject. On the 1st December, 1897, the late
Vestry of Kensington adopted a report enumerating the
serious objections that existed to the system being tried as
an experiment in London and informed the London County
Council that they did not approve of registration of title
being made compulsory in London.

3. Notwithstanding that the large majority of the local
bodies and all the other bodies interested in property who
were invited to give their views expressed themselves as un-
favourable to compulsory registration, the London County
Council on the 15th February, 1898, adopted a resolution in
favour of the trial of the system in the County of London
on the understanding that it would be introduced progres-
sively so as to give the Council an opportunity of estimating
the value of the work as it proceeded and of watching gener-
ally the progress of the Act.

4. The Act came into operation on the 1st January, 1899,
and the experience since gained proves conclusively that the
predictions embodied in the report of the Kensington Vestry
as to the system being a harmful and unworkable one have
been borne out.

5. In 1903 this Council promoted a petition to Parliament
praying for an inquiry into the result of the working of the
compulsory provisions of the Land Transfer Act, 1897. The
petition when presented was sealed by eighteen of the Metro-
politan Borough Councils.

6. In May, 1907, this Council adopted a further report
on this subject. It referred to the unsuccessful efforts that
had been made to obtain an inquiry, and indicated some of
the glaring defects of the system and the expense, delay and
complication it involved. We cite the following paragraphs
and recommendations from this report as they embody the
practical conclusions we then came to and which we still
desire to emphasise:—

"When the Act of 1897 was passed Parliament provided
that in the event of the experimental trial proving a failure
the Privy Council might revoke or vary any Order applying
compulsory registration to any county. In our view the time
has now arrived when this provision of the Act should be put
into force.

"For some two centuries there has been in existence in
two counties in England—Middlesex and Yorkshire—regis-
tration offices for the registration of deeds relating to land.
This system of registration is entirely distinct from the
system of registration of title under the Land Transfer Acts.
The work of registering deeds under the Middlesex Registry
Acts is simple in the extreme, and the registration fees are
limited in every case to 5s.

"The Middlesex fees were, until 1891, received by the
Middlesex Registrar as the emoluments of his office. They
have since been diverted towards the upkeep of the Land
Registry Office, and are estimated to produce a surplus of
about 15,000*l.* a year, independently of the fees chargeable
under the Land Transfer Acts.

"In the county of Yorkshire the fees are, under the pro-
visions of the Yorkshire Registry Acts, 1845 and 1885, pay-
able to the local authorities in aid of the rates. They
amount to some thousands of pounds a year. In our opinion
the fees of the Middlesex Registry should be treated in a
similar manner, and paid over to the London County Council
in aid of the county rate.

"Having regard to the facts set out in this report we
recommend:—

"(1) That in view of the fact that the system of compul-

possession registration of title has now been tried as an experiment in the County of London for over eight years, and has been found to add greatly to the difficulty, expense, delay and risk of property dealings in London, the Council do endorse the view that the Order applying compulsory registration to the County of London should be forthwith revoked, so as to leave it optional for everyone to register or not as he deems best in his own interest.

"(2) That the report be communicated to the London County Council and to its members, and that they be urged to support the views set forth therein, and to claim in aid of the rates the Middlesex Registry fees, estimated at 15,000*l.* a year, thereby following the example of the Yorkshire County Councils, who receive for the ratepayers the Yorkshire Registry fees."

7. The action of this Council in co-operation with other Metropolitan Borough Councils led ultimately to the London County Council in January, 1908, passing a resolution requesting the Lord Chancellor to provide for an inquiry, and on the 30th July, 1908, a Royal Commission was appointed. The terms of reference "to consider and report upon the working of the Land Registry Acts and whether any amendments are desirable" were too restricted, and were calculated to prevent the Commission considering the one vital question involved, viz. whether or not the experimental trial of the system of compulsory registration of title in London should be continued.

8. On the 6th October, 1908, this Council adopted a further report giving expression to this view, and also urging that in the interests of the public it was highly expedient that at the then pending inquiry the evidence should be taken in public. The efforts that were made by this Council and by other bodies (1) to have the number of Commissioners increased by the addition of an adequate number of solicitors, (2) to have the terms of reference enlarged, and (3) to secure that the evidence should be taken in public, were unfortunately fruitless.

9. Between October, 1908, and November, 1909, the Commission held thirty-six sittings and examined eighty-four witnesses. An offer made by this Council to tender evidence was at first refused on the plea that the Corporation of the City of London and the London County Council both intended to give evidence which it was presumed would cover any evidence that this Council might tender. As a result, however, of further representations the Commissioners withdrew their objection, and the Town Clerk (Mr. W. Chambers Leete) and Mr. Councillor J. S. Rubenstein were, on the 18th February and 4th March, 1909, examined as witnesses for the Council. Mr. Councillor Rubenstein considered that undue restrictions were placed upon him, and he therefore deemed it right to subsequently address a letter of protest, dated 8th March, 1909, to the Commissioners. The matter was reported to the Council on the 30th March, 1909, a copy of the letter being set out in the report.

10. In February, 1909, the evidence given before the Commissioners on behalf of the Land Registry was published by way of a preliminary report, and the evidence given on the other side has now just been published.

11. The final report of the Commission was published on the 11th February, 1911. Two of the Commissioners died before the issue of the report, one being Mr. Pennington, the only solicitor on the Commission.

12. The Commissioners, owing no doubt to the restricted terms of the reference, do not express any opinion on the real question in controversy, viz. whether or not the experimental trial of the system of compulsory registration of title in London should be continued. The perpetuation of the system is impliedly assumed.

13. On the question of expense the report recognises that registration throws upon landowners additional charges payable to solicitors and in office fees, the Commissioners stating that "it may fairly be urged that fees rising so high deter voluntary registration, and are felt as a hardship when it is compulsory. There is still more ground for objecting to the present fees on dealings with land registered with possessory title, because much less advantage is derived from such registration."

14. The question as to what return has been obtained for the fees paid is answered by the Commissioners who state "Much complaint is made, and in our opinion with good reason, that the immediate advantage to be gained from Possessory Registration is in no way commensurate with the expense and inconvenience it entails. . . . It is not too much to say that up to the present time the effect of Compulsory Registration with Possessory Title in London has been to place a purchaser there at a disadvantage as compared with a purchaser elsewhere."

15. The Commissioners have no praise for the existing system. They recall the observation made by a previous Commission that "for an institution to flourish in a free country it must offer to the people the thing that they want." They refer to the "alarm" that would be felt if effect were given to the Registrar's proposal that all landowners should be compelled at once to register their land and they say the objections to the proposal "could only be overborne by a really strong public feeling in favour of the compulsory Registration of Title," and that they "have been unable to find proof of the existence of any such feeling in the country." They go on to say, "But apart from this, the system as it stands is, in our judgment, imperfect; and we cannot recommend the compulsory extension of an imperfect system. We think that it should first be amended in the manner we have proposed and that if, after sufficient experience, the amended system is found to work satisfactorily within the present compulsory area of the County of London, a Bill for the gradual extension of compulsion on sales to the rest of the country . . . should then be considered by Parliament."

16. We recall the fact that innumerable attempts have been made since 1862 the date of the first Land Transfer Act to evolve a workable system of registration of title but one and all have ended in failure. We have not thought it necessary to consider in detail the new amendments suggested but the fact that one recommendation is that mortgages of registered land are to be effected by deed as if the land was not registered confirms our view that the present system even if amended cannot be made a satisfactory one.

17. Amongst the recommendations made by the Commissioners is a proposal that the precedent made by Parliament in the cases of Middlesex and Yorkshire should be followed, and that County Councils should be empowered to establish local Registries of Deeds. The suggestion was one that was strongly advocated by Mr. Councillor J. S. Rubinstein in his evidence and is fully endorsed by us.

18. Attention should, we consider, be directed to the fact that the total of the Registry fees exacted since 1899 amount to close on 700,000*l.* If to this sum is added the 250,000*l.* spent on the new Registry in Lincoln's Inn Fields, the total cost to the individuals and the State of the experiment is known to have amounted to nearly 1,000,000*l.* sterling. The Commission's Report makes it clear that for the last five years, notwithstanding that the receipts have averaged 55,000*l.* per annum, the Registry has been carried on at a loss of about 3,000*l.* per annum—a loss that will grow in amount if, as is suggested, the present high Registry fees are reduced. We consider it unjust to the taxpayers generally that they should have to bear any loss in the supposed interests of a small section of the community. It is, we submit, still more unjust that they should be further burdened by the continuance of an experiment which it is now obvious has entirely failed.

19. Having carefully considered the report we are of opinion that only one conclusion can be formed from a careful perusal of its contents and that is that the Land Registry Office has been unable to justify its existence, and that there is no sufficient reason why the County of London should any longer be trammelled with this costly experiment.

20. We feel that the Council will find themselves confirmed in the opinion which was embodied in the report which they adopted on May 7, 1907, that the Privy Council should exercise the power vested in them by revoking the order which applied compulsory registration to the County of London.

21. We therefore recommend:—(a) That a communication be addressed to the Privy Council urging them to revoke the Order which makes the registration of titles in the County of London compulsory. (b) That the London County Council and the Middlesex County Council be urged to claim in aid of the rates the fees received by the Middlesex Registry, estimated at 15,000*l.* a year, thereby following the example of the Yorkshire County Councils who receive for the ratepayers the Yorkshire Registry fees. (c) That the London County Council be further urged to take action with a view to obtaining forthwith, in accordance with the recommendation of the Commission, the extension to the whole of the County of London of the existing Deed Registry, and to secure for the ratepayers the resulting profits, estimated to produce an additional income of 12,000*l.* per annum. (d) That copies of this report be forwarded to the Prime Minister, the Lord Chancellor, and the Members of Parliament for the Metropolitan constituencies. (e) That copies of this report be also sent to the Corporation of the City of London, the Council of the City of Westminster and the Metropolitan Borough Councils, with the request that those authorities will support the action of this Council in the matter.

(Signed) A. G. COLVILLE, *Chairman.*

ARCHITECTS' CLAIM FOR FEES.

MESSRS. FAIR & MYER, architects, practising at 39 Fumival Street, Holborn, sued before Mr. Justice Grantham and a special jury in the King's Bench Division on April 5, the Harper Electric Piano (1910) Company, Ltd., of Holloway Road, London, for the recovery of 275*l.* for professional services rendered.

Mr. Alec Neilson, the plaintiffs' counsel, stated that in the spring of last year in pursuance of an agreement entered into between the parties, the plaintiffs were engaged to prepare plans and specifications for a cinematograph theatre, rink and café, which it was proposed to build at 321 Holloway Road, London. The plaintiffs prepared two sets of sketch plans and two sets of working drawings and a specification, and they also obtained a tender. For that they charged 150*l.*, that being 3 per cent. upon 5,000*l.*, the amount of the tender, according to the scale of charges authorised by the Royal Institute of British Architects. For taking quantities they had charged 125*l.*, that being 2½ per cent. upon the sum of 5,000*l.* These charges, as evidence would be called to show, were fair and reasonable.

Mr. Thorn Drury, for the defendants, said that from the first Messrs. Fair & Myer were told that the defendants were getting out a prospectus to go to the public for capital, and that the building would be proceeded with only if the capital were forthcoming. His case was that the plaintiffs were asked by the defendants as to what would be their position regarding the plaintiffs if the building did not go on, and that they said, "Oh, you pay us for the work we have done and we shall not quarrel about that." His clients, the defendants, had agreed to pay plaintiffs 5 per cent. upon the actual cost of the building, and it was to be an inclusive charge. Counsel declared that his clients had never abandoned the scheme. They were at this moment negotiating for the capital to enable them to build, and it would probably be forthcoming next week. Counsel reiterated that Mr. Harper told Mr. Fair that he would have nothing to do with such a basis as 2½ per cent., but would agree to an inclusive charge on the actual cost of the building.

Mr. Justice Grantham said he did not know whether that would entitle the defendants to get work out of the plaintiffs for nothing.

Mr. Neilson: My friend says that we were to be paid only if the building were carried out. Up to the issue of the writ they have not agreed to pay us for the work done.

Mr. Thorn Drury: There are letters offering twenty-five guineas.

Mr. Neilson said plaintiffs were employed in accordance with the terms contained in the R.I.B.A. schedule, a copy of which had been sent to the defendants. His clients, who were not quite novices in their business, recognised that the scheme might fall through, and in this schedule there was provision for the remuneration of architects when schemes did not go through.

Evidence was given by Mr. Val Myer, A.R.I.B.A., and partner in the plaintiff firm, to the effect that the charges they claimed were fair and reasonable and in accordance with the Institute scale.

Mr. Thorn Drury put it to the witness in cross-examination that they had never let it be understood at the outset that they would charge for taking off quantities, but that, on the contrary, they had proposed to do this as part of the work they had to do for 5 per cent.—The witness: Quite untrue. Answering another question by counsel, the witness said: "We take out quantities for our own jobs, but not for other people's jobs."

Mr. John William Fair, in the course of his evidence, said there was no truth in the suggestion that they agreed to look for payments from the defendants only if the building were erected. He added that 2½ per cent. was a customary and reasonable charge for taking off quantities. If the scheme had gone through the remuneration would have been 7½ per cent., including 2½ for quantities. In the North of England architects almost invariably took out their own quantities, which constituted quite a different branch. He admitted that quantity work in London was usually done by quantity surveyors. But he denied that 1½ per cent. was the usual charge. In answer to further inquiries the witness denied that he told Mr. Harper that if they did not raise the money for the scheme they (the architects) would not quarrel over the sum they would charge for their labour. It had happened often that tenders were obtained without plans having first been passed. He explained that very often a client would not care for delay, and wished to ascertain the cost of a building; knowing pretty well what the local authorities would require. One

went forward with his drawings, quantities and so forth, so that when the plans were passed the building could be proceeded with at once.

Mr. Phillips Fletcher, F.R.I.B.A., said that he considered the plaintiffs' charges fair and reasonable, both in respect to the plans and specifications and the quantities. The charges in respect to the plans were in accordance with the schedule of the Institute. But the quantities were specifically excluded from the schedule.

Mr. Neilson: Is it absolutely necessary to take out quantities before a tender can be obtained?—Yes. Before you can get any reliable builder to give you a reliable tender you must have quantities.

In cross-examination by Mr. Thorn Drury, the witness said that if the plans required adjustment in any way the quantities could be adjusted. The quantities would not be useless even if plans were wrong. Under the contract an architect had power to rectify. Architects in the North of England invariably did the quantity work as well. He thought for one thing that they worked harder in the North. Besides, they got more pay for so doing. But the taking out of quantities was quite a separate thing. In several law cases it had been decided that 5 per cent. did not cover that work.

In reply to Mr. Thorn Drury, who asked if it was not a common thing that quantity surveyors will do it for 1½ per cent., Mr. Fletcher said: You would not get a reliable surveyor to do it for that. You get cheap men in every profession.

Evidence was also given by Sir Alfred Brumwell Thomas, F.R.I.B.A., who said that he had inspected the plaintiffs' plans and specifications, and also the quantities, and he agreed with the last witness as to the fairness and reasonableness of the charges.

Hearing was adjourned.

THE PROPOSED MARYLEBONE TOWN HALL.

THE Finance Committee of the London County Council have had under consideration an application from the St. Marylebone Metropolitan Borough Council for sanction to the borrowing of a sum of 40,000*l.*, repayable within 60 years on the annuity system, for the acquisition of a site for a new town hall.

The Committee report as follows:—We are advised that the accommodation of the present town hall is inadequate, and that the proposed site is suitable for the erection of such buildings as are necessary for the adequate accommodation of a sufficient staff, including provision for probable future requirements; and that the price proposed to be paid, after allowance has been made for the facts that a portion of the site proposed to be acquired is in advance of the general line of buildings, and that it is unlikely that any buildings will be allowed by the Council on such portion, is not unreasonable. We are informed that a further sum will have to be spent in the acquisition of outstanding leasehold interests, which extend beyond 1913, in which year the purchase of the interests now in question will be completed. We are advised that the possibility that hereafter the borough council may be prevented from using the whole of the site for the purpose of a town hall is no legal objection to the sanctioning of the sum required for the acquisition of the whole of the site for such purpose, provided that the remainder of the property is sufficient for the purposes for which the borough council requires it, and that the price, having regard to the use that can be made of the site proposed, is reasonable.

The borough council intends to dispose of the existing town hall, and the borough council states that the money received from the sale would be applied in reduction of the loan for the new premises. The borough council states that it still intends to make use of the offices in Aybrook Street (where the electricity distribution staff is housed), as the members of this staff are not to be moved into the new town hall.

The estimated cost of the new buildings is 65,000*l.* and of the equipment 5,000*l.* The total cost of the new town hall as at present estimated, without including the cost of acquiring the outstanding leasehold interests for which negotiations are pending, is therefore 110,000*l.*, but this amount will not represent the net addition to the borough council's indebtedness, because the sale proceeds of the existing town hall, when sold, will be applied, as stated by the borough council, in reduction of the loan for the new premises. Subject to the borough council acquiring the outstanding leasehold interests

which extend beyond 1913, we see no objection to the loan being sanctioned for 60 years. We recommend—

That the borrowing by the St. Marylebone Metropolitan Borough Council of 40,000*l.* for acquisition of a site for a new town hall within the borough be sanctioned, such sum to be repaid by yearly, half-yearly or quarterly instalments of principal, or of principal and interest combined, of as nearly equal amounts as may be, within 60 years from the date of the borrowing.

FACTORY AND WORKSHOP.

SPECIAL EXCEPTION—LIMEWASHING, &c.

*Order of the Secretary of State, dated 1911,
granting Special Exception:—Limewashing, &c.*

IN pursuance of Section 1 (4) of the Factory and Workshop Act, 1901, I hereby grant to all factories and parts of factories which have been painted with at least two coats of a washable water paint, as defined below, and are repainted with at least one coat of such paint once in every three years, a special exception that the provisions in sub-section (3) of the said section with respect to limewashing shall not apply thereto. Provided—

1. That the paint shall be washed at least once in every fourteen months;

2. That the name of the paint used and the name and address of the makers of the paint, together with a certificate, in the form shown in the schedule hereto, from the makers of the paint, and the date of the original painting and of each washing and repainting, shall be entered in or attached to the General Register;

3. That nothing in this Order shall be taken to affect the obligation of keeping the factory in a cleanly state, as prescribed by subsection (1) of the said section;

4. That if it appear to an inspector that any part of a factory to which the exception applies is not in a cleanly state, he may, by written notice, require the occupier to lime-wash, wash or paint the same; and in the event of the occupier failing to comply with such requisition within two months from the date of the notice, the special exception shall cease to apply to such part of a factory.

In this Order a washable water paint means a washable paint which when finished for use contains—

1. At least half its weight of solid pigment containing not less than twenty-five parts by weight of zinc sulphide as zinc white (lithopone) in each hundred parts by weight of solid pigment; and

2. At least ten parts by weight of oil and varnish to each hundred parts by weight of solid pigment.

One of his Majesty's Principal

Home Office, Whitehall, Secretaries of State.
, 1911.

Schedule.

CERTIFICATE.

It is hereby certified that the washable water paint made by me/us and known as _____ will when finished for use in accordance with the directions given below (on the label attached to each tin) comply with the definition of washable water paint in the Order of the Secretary of State, dated _____

(Date) (Signature)

THE Mersey Docks and Harbour Board have adopted a recommendation to provide 40 per cent. additional accommodation for the storage of wool at the existing wool warehouses, which were erected fifteen years ago.

THE Ashton-under-Lyne, Stalybridge and Dukinfield Joint Water Board have decided to instal thirty-three mechanical filters for purifying their water supply, and we learn that the order has been placed with Messrs Mather & Platt, Ltd., of Manchester. This Company has thus secured the largest contract ever placed in this country for mechanical filters.

THE Sunderland Education Committee recommend the Town Council to carry out a scheme, at a cost of 74,258*l.*, for the reconstruction and extension of the Bede Collegiate (Secondary) School, and providing temporary premises. The present premises are considered insufficient and unsuitable by the Board of Education's Inspectors, and there is a possibility that the Board will withdraw the grant of 4,000*l.* yearly if the premises are not improved. The scheme provides land for building development, and a playing field, and was selected from seven propositions.

THE ADMINISTRATIVE ASPECT OF WATER CONSERVANCY.*

IN introducing the subject the author pointed out that during a period of over forty years there had been a steady output of papers, articles and reports of Royal Commissions and Select Committees of one or both Houses of Parliament, all urging the development of some system of conservancy and the creation of a number of local authorities, acting under the direction of a central authority. But the subject did not appear to have received that attention from Parliament which its importance merited, and which the weightiness of several of its recommendations should have ensured for it, doubtless because, as the author pointed out, the subject was too complex and technical to appeal to the general public, and even amongst those who recognised the necessity of doing something, there was a fear that any alteration in the existing order of things might lead to increased taxation, little thinking that the cost of dispute under a continuance of the existing condition of things far outweighed any possible expenditure on systematisation; whilst others found themselves unable to draft a scheme which whilst being comprehensive and efficient should not be too costly.

The author urged that no general scheme should be engaged in until systematic data had been collected by a special hydrographic survey staff, and when subsequently the local authorities were created to administer the several river basins, the authorising Acts should be general, so that each rivers board comprising all the varied interests of the basin might be left a fairly free hand to administer their area to its best advantage, having regard to its own peculiar interests.

He then dealt in detail with the extreme divergence in the characteristics of river basins in point of size, geological structure, distribution of population, the number of local authorities, the rateable value and the economic and industrial importance of each basin, and pointed out that the characteristics were so diverse that no truly efficient scheme could be formulated which was not sufficiently elastic to meet the varied conditions.

The author next reviewed the various schemes for grouping river basins proposed by the Royal Commission on Rivers Pollution Prevention, and by Messrs. Ansted, de Rance and himself, and gave tables showing the population, rateable value and number of local authorities in each of the twelve groups of his own suggestion.

He then attempted an estimation of the value of the public water interests in the country, and outlined an administrative system comprising a central authority controlled by a Minister of Water Supply, supervising twelve main drainage boards, each in charge of an area comprising a group of basins, and rivers boards each in charge of a river basin; he showed that such proposals were by no means revolutionary, and need not develop into anything more bureaucratic than the existing system of local authorities responsible to the Local Government Board; but he suggested as a preliminary step that a survey staff should be at once organised to collect the necessary data, upon which Parliament might deliberate when it took in hand the creation of the new administrative system. He pointed out from reference to similar organisations in other countries that the cost of maintaining such a body need not be excessive, and suggested that such funds as were required in the first instance might be obtained by the Local Government Board from the Development Fund.

The paper was illustrated with numerous tables and a map.

DRY ROT AT AN ASYLUM.

A REPORT has been prepared for the York City Council on the question of the defective flooring of Naburn Asylum, on the ground floor, the woodwork of which had indicated the existence of "dry rot" to such an extent as to necessitate the relaying of some of the floors. Attention was called to the matter a short time ago, and as it was very necessary at once to remedy the defective parts then pointed out, directions were given to the city surveyor (Mr. Spurr) to proceed with the work. Since then other defects were discovered, and both the City Surveyor and the engineer to the Ouse and Foss Navigation (Mr. Creer) were requested to present independent reports, and particularly as to the cause of the defects. These reports have now been submitted.

The report of the City Surveyor states that the total remaining area of floors laid on the particular system that is

* Abstract of a Paper by Mr. William Ralph Baldwin-Wiseman, M.Sc., A.M.Inst.C.E., F.G.S., F.R.Met.S., read at a meeting of the Society of Engineers on April 3.

proving unsatisfactory amounts to 2,665 square yards. Some floors have already been re-laid with wood blocks, the area being 357 yards. The floors that are affected, and which it would be advisable to deal with at once, are 761 yards in area. The cost of relaying the floors will amount to about 300*l.* if laid with wood blocks, and about 260*l.* if ventilated floors are adopted. There are also about twelve single rooms that should be re-laid on the solid system, the area being 120 yards sup. and the estimated cost 52*l.* 10*s.* 0*d.*

"Those floors which are now apparently sound, I think," says Mr. Spurr, "might be left for the present, and it is possible they may last for some years to come, but their useful life I cannot estimate. Their total area is 1,794 yards, and the probable cost of re-laying (if found necessary) on the solid system will be about 775*l.*, or if single room floors laid solid, and others ventilated, 682*l.* The cost of the solid floors will be materially reduced if it is found possible to remove the joists without disturbing the present concrete, and a further saving could be effected if it were possible to utilise patients' labour."

In the floors dealt with it was found that rot had first commenced in the joists bedded in concrete, the rot afterwards spreading to the boards above. Moist heat was, in his opinion, the cause of the trouble, the moisture coming from the ground under the concrete and the heat from the steam-pipe subway, of which there was a very considerable length all laid either directly under the floors, or immediately adjoining them.

In his separate report Mr. Creer states that in considering the class of floor best suited to the requirements of a public institution of this character, one had to bear in mind that a "solid floor" would be more hygienic than one bearing joists and floor boards, on account of the facilities provided by the latter for rats and other vermin. Accordingly he decided upon a type that was economical and, in his opinion, suitable, and costing from 5*s.* 6*d.* to 6*s.* a square yard, including concrete foundation. The various classes of solid wood block floors from 11*s.* 3*d.* upwards he considered would be an extravagance that was not justified, especially as the site was a dry one.

The specification for the work and the close inspection both of labour and material were such as to ensure good work, and to the best of his knowledge was satisfactorily carried out. It was not foreseen that the heated air in the subways would be the means of transmitting heat to the ground behind the subway walls. There could be no doubt but that the ground had been so heated, and that this had in turn been transmitted to the concrete and joists, and in the absence of ventilation (which was not necessary in a solid floor), had set up dry rot. It was a piece of sheer ill-luck and would not, he felt certain, have occurred under any other conditions, minus the moist heat from subways. He recommended the removal of the whole of the affected timber and all timber in which rot had not commenced coated with a solution of sulphate of copper, more especially in proximity to affected timber. There should be no delay in adopting remedial measures, as the fungus would travel along brickwork or concrete in order to get to clean unaffected timber. In concluding his report, Mr. Creer says:—"I need hardly say how disappointed I am at this unexpected and unfortunate development. It was entirely unforeseen. In the absence of any premonition of this mischief, I should have considered it a piece of useless extravagance to put down wood block flooring over the area where the cheaper floor has been adopted."

The Asylums Committee have decided to proceed with the work of remedying the defects already existing in the floors as suggested in the report of the City Surveyor.

TRADE NOTES.

The Coatstone Decoration Co., of 77 Mortimer Street, Regent Street, W., have been awarded the Grand Prix and Gold Medal for "Coatstone" liquid stone decoration at this year's International Exhibition, Paris, held in March, 1911.

MESSRS. FARROW & JACKSON, LTD., 16 Great Tower Street, London, E.C., carried out the contract for the wine bins in the new premises of the Royal Automobile Club in Pall Mall, W.

WE understand that Messrs. Mather & Platt, Ltd., the well-known electrical engineers of Manchester, have despatched to India Mr. Coubrough as a representative of their firm in connection with electrical equipments. Mr. Coubrough is discussing with various firms in India, especially in Bombay and Calcutta, the possibility of electrifying

their plant or of installing electrical power, and perhaps even putting down plant to generate their own electric power and light.

VARIETIES.

MR. A. MARSHALL MACKENZIE, A.R.S.A., has prepared tentative plans for the extension of the Aberdeen Art Gallery at the west end. The cost is estimated at about 9,000*l.*

MR. ROWLAND LLOYD JONES, county architect, Carnarvon, has been appointed by the Carnarvon Board of Guardians to prepare plans for the proposed hospital in connection with the Workhouse.

A GRANT of 300*l.* is to be made to the Senate of the University of London by the London County Council for the year ending March 31, 1912, in respect of courses in heating and ventilating engineering at University College.

MESSRS. FRANK MATCHAM & Co. have prepared plans for the proposed Empire Theatre of Varieties at Chatham, which is to be erected on the site of the present Gaiety Theatre. Seating accommodation will be provided for 2,050 people.

The General Purposes Committee of the Torquay Town Council recommend the enlargement of the assembly hall of the new municipal buildings. The architect's previous estimate of the additional cost—from 8,000*l.* to 10,000*l.*—has been reduced from 6,000*l.* to 7,000*l.*

THE Education Committee of the London County Council recommend (a) That the Randall Place School (Greenwich) be enlarged by about 250 places. (b) That a central school for about 260 girls be provided at Royal Hill (Greenwich). (c) That, if required by the Board of Education, public notices be given of the Council's intention to provide about 510 additional public elementary school places in West Greenwich, in lieu of the 400 places which have already been advertised, by the enlargement of the Randall Place school (Greenwich) by about 250 places and by the erection of a central school for about 260 girls at Royal Hill (Greenwich).

MR. W. WILLIAMSON, the Bradford city architect, last week submitted to the Health Committee of the Corporation a scheme for the erection of a sanatorium for consumptives. The proposed site is near Grassington, and 800 feet above sea level. Fifty beds are provided for by the scheme at a cost of 16,500*l.*, or, as an alternative, 66 beds at a cost of 17,680*l.* The buildings are arranged in the form of a crescent facing south, with protection from the easterly and westerly winds. The plans are to be submitted to the City Council.

An ordinary meeting of the Council of the Royal Institute of the Architects of Ireland was held on the 4th inst. at No. 31 South Frederick Street. The President, Mr. A. E. Murray, A.R.H.A., F.R.I.B.A., was in the chair, and there were also present:—Messrs. W. Kaye-Parry, F. G. Hicks, Lucius O'Callaghan, C. H. Ashworth, G. P. Sheridan, C. J. MacCarthy, R. Caulfield Orpen, A. G. C. Millar, J. H. Webb, H. Allberry, and C. A. Owen, Hon. Secretary. A subscription to the Architects' Benevolent Fund was sanctioned. The report of the Examination Committee was again under consideration, and, with a small amendment, was passed. The Committee was asked to prepare a list of examiners and to suggest a date for the first examination. A report from the Arts Committee, with reference to the portraits of past Presidents and Vice-Presidents was adopted. The by-law as to the admission for members was under review.

THE problem "Where to Spend Easter" will present itself to many, and as Easter is the first holiday and is this year fortunately late, thousands will take advantage of the cessation from business for a brief holiday. In the days of quick travel distance is no object, and we notice that the Great Central Railway have been specially careful in their arrangements to shorten the journey of the long distance traveller by bringing his destination as near to London as possible in point of time. The special holiday programme issued by the Great Central Company contains an almost unlimited choice of resorts suitable for all tastes and requirements. Express corridor trains equipped with restaurant cars leave Marylebone on Thursday, April 13, at 8.45, 10.0 A.M., 12.10 P.M., 3.15, 3.20, 4.30, 6.20, 10.0 P.M. and 12.30 midnight, and special trains will also be run on Good Friday, Saturday, Sunday and Monday (Bank Holiday). Other attractive features of the programme are the issue of week-end tickets, frequent day and half-day facilities to the picturesque villages of the Chiltern Hills and Vale of Aylesbury. Special low fares are announced for walkers and cyclists available from Marylebone by any train on any day, and from Saturday to Monday. Copies may be obtained free of charge at Marylebone Station, Great Central Town Offices and Agencies, or by post from Publicity Office, 216 Marylebone Road, N.W.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—April 20.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280*l.*, 120*l.*, 80*l.*, and 4*l.* Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000*l.* Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.* Apply to Mr. G. C. Copstick, L.R.I.B.A., County Offices, Derby.

DEVIZES.—May 10.—The Committee of the Devizes Cottage Hospital invite competitive designs for providing a new six-bed ward at, and making a general re-arrangement of, their existing hospital (16 beds) at a maximum cost of from 1,200*l.* to 1,500*l.* Deposit 10*s.* 6*d.* Conditions of competition and particulars of the buildings required will be supplied to intending competitors by Mr. E. Thorp, honorary secretary, Devizes.

LIVERPOOL.—The Finance Committee of the City Council last week, after considering plans prepared by the City Surveyor, Mr. Shelmerdine, and the Baths Superintendent and Engineer, for proposed baths on a portion of the old George's Dock site, decided to invite designs from architects for the elevations. Three premiums of one hundred, fifty and twenty-five guineas will be offered for the designs adjudged to be first, second and third in the order of merit. It is understood that the estimated cost of the scheme is about 70,000*l.*

MANCHESTER.—May 1.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes May 1. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester.

MANCHESTER.—The Corporation of Manchester having last year invited plans for the suggested laying out of their Blackley estate, have awarded the premiums as follows:—(1) 150*l.*, Messrs. Cooper & Slater, Blackburn; (2) 100*l.*, Mr. James Carruthers, I.A., Glasgow; and (3) 50*l.*, Messrs. Salmon & Son & Gillespie, F.R.I.B.A., Glasgow. The plans become the property of the Corporation of Manchester, as it was announced in the conditions that it was not intended to engage the author of any design to carry out the work.

NEWTON ABBOT.—April 18.—The Governors Seale-Hayne College invite architects to submit designs and estimates for the college. A block plan of the site and other particulars, together with the conditions of the competition, may be obtained from the Principal, upon receipt of a deposit of 1*l.* 1*s.* 0*d.*, which will be returned to each competitor who submits a bona-fide design or who returns the plan and printed particulars within a fortnight after receiving the same. Mr. Chas. Steward Smith, J.P., F.R.I.B.A., of 164 Friar Street, Reading, will act as assessor. Premiums of 100*l.*, 50*l.*, and 30*l.* are offered to the authors of the first three designs. Applications, addressed to Mr. B. N. Wale, Principal, Seale-Hayne College, Newton Abbot, Devon, must be received not later than April 18.

STOCKPORT.—April 22.—Architects desirous of entering a limited competition for the designs of the Police Station and Courts which the Corporation propose to erect are invited to forward their names and addresses, with particulars of their qualifications and experience in the erection of similar buildings, on or before Saturday, April 22, to Mr. Robert Hyde, Town Clerk, Town Hall, Stockport.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1*l.* 1*s.*, which will be refunded on receipt of a bona-fide design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250*l.*, and a premium of 50*l.* will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

CONTRACTS OPEN.

THE Neath Town Council have adopted a proposal to borrow 5,585*l.* for laying out pleasure gardens and recreation grounds at Mount Pleasant, Melincrythan.

THE Wigton Rural District Council have accepted the scheme of main sewerage and sewage disposal for Fletcher-town, prepared by Mr. Harry W. Taylor, A.M.I.C.E. (Messrs. Taylor, Wallin & Taylor), of Newcastle, and have engaged him as engineer for the execution of the works. The sewage will flow by gravitation to the outfall, and be purified by the latest bacterial system.

THERE is a proposal on foot to erect a large hydro at Stratford-on-Avon. The syndicate which has been formed for this purpose have acquired the Rowley House Estate of four acres, finely situated on the banks of the Avon. The existing residence will be utilised for the accommodation of visitors until the new hydro is completed, after which it will serve as an annexe. A most picturesque design for the establishment has been prepared by Mr. L. L. Dussault, architect, Birmingham, having the front elevation carried out in sand-faced brick with stone mullioned windows and half-timbered gables. It is understood that a contract has been entered into for the erection of the building at a cost of 22,500*l.* The plans provide for the accommodation of about two hundred guests. It is calculated that during the long Stratford-on-Avon season (which commences with Shakespeare's birthday, April 23, and terminates towards the end of September), the visitors will average 180 per day, and during the remaining months 50 per day. Considering the numerous attractions of the town and neighbourhood this estimate seems moderate. The share capital of the Stratford-on-Avon, Ltd., is 45,000*l.*, of which 35,000 *l.* shares will be issued to the public.

VARIETIES.

MR. C. E. RIVERS, of the local borough surveyor's department, has been appointed borough surveyor for Harrogate at a salary of 350*l.*, rising by five annual instalments of 20*l.* to a maximum of 450*l.*

MESSRS. HALL & DALBY, architects, Leeds, have prepared plans for a cottage hospital of 24 beds, and an outpatients' department to be erected at Goole at an estimated cost of 5,500*l.*

THE Bury Corporation are spending 37,000*l.* on extensions in connection with their gas undertaking. The items are as follows:—New mains, 12,000*l.*; meters, 15,000*l.*; sidings, tar plant, &c., 5,000*l.*; and cookers, 5,000*l.*

IN regard to a recent application of the York City Council to the Local Government Board for sanction to the borrowing of 57,637*l.* for sewage purposes, the Board have intimated that the scheme is generally satisfactory, but that certain details require to be amended and amplified. The plans are accordingly being amended and a revised estimate prepared in view of the Board granting their sanction to the necessary loan.

AT a special meeting of the Newport Parliamentary and Works Committee last week consideration was given to the question of reconstructing Newport Bridge. The Town Clerk reported that he had received designs from several firms offering to provide cross-river communication over the Usk on the site of the present bridge. It was decided to recommend to the Corporation that the time was now opportune to proceed with constructing a new bridge. Discussion ensued as to the material. While some of the members favoured a steel bridge, the majority were in favour of a ferro-concrete bridge, with a 60-feet roadway. It was resolved to invite designs for such a bridge from the leading engineers and experts in ferro-concrete in this and other countries. During the discussion it was stated that a ferro-concrete bridge could be erected without materially interfering with the traffic at an estimated cost of about 40,000*l.*

WE gave in our issue of March 31 a large number of the Civil Service Estimates of the expenditure on Government Buildings to be submitted to the House of Commons for the year ending March 31, 1912. Under the heading, "Public Buildings, Great Britain," the total amount asked for on behalf of new works, alterations, additions and purchases is 179,700*l.* The principal items are 16,500*l.* for the erection of offices in Whitehall Place for the Board of Agriculture (total cost 90,700*l.*); 17,200*l.* on structural works at the National Gallery; 17,000*l.* for the extension of the Patent Office (total cost 96,000*l.*); 30,000*l.* for additional courts at the Royal Courts of Justice (total cost 97,500*l.*); 13,300*l.* on new buildings for die and seal departments at the Mint; 8,000*l.* for erecting new offices for the Public Trustee and Lunacy Departments (total cost 85,000*l.*); 6,500*l.* on increased accommodation at the Melting Branch of the Royal Mint (total cost 15,400*l.*); 20,000*l.* for erection of stationery office buildings in Lambeth (total cost 124,500*l.*); 2,500*l.* on alterations at the South Kensington generating station for the Office of Works; 4,800*l.* towards fireproofing Sasines office, General Register House, Edinburgh; and 10,000*l.* for works at the National Gallery of Scotland.

THE following plans have been approved during the past month by the various Corporate Committees of the Bolton Town Council:—Falcon Spinning Co., Ltd., for crossing in Handel Street; Mr. J. M. Smith, alteration to Picture Palace in Bury Old Road; Bolton Education Committee, for special school in Flash Street; Messrs. Bradshaw & Gass, alterations to St. James's School, Waterloo Street; Mr. John Smith, new streets and levels off Wigan Road; Mr. A. Maginnis, for six houses in Deane Church Lane; Messrs. Barlow & Jones, new weaving shed in Slater Street; Messrs. J. Sharmon, Son & Co., Ltd., for pavilion at Robin Hood Hotel, Lever Street; Mr. R. Threlfall, rebuilding works in Salop Street; Mr. W. H. Orrell, for 12 houses in Hawarden Street, Astley Bridge; Messrs. J. Chadwick & Bro., Eagley Mills, for stabling; Mr. R. R. Rothwell, new streets and levels off Blackburn Road, Astley Bridge; St. John Ambulance Brigade, for drill shed in Weston Street; Mr. R. S. Hirst, for four houses in Lever Edge Lane and Calvert Road; Messrs. Hughes Bros., 12 houses in Georgina Street, Hulton; Mr. Edward Gerrard, for motor shed in Plodder Lane; Mr. J. Ormrod, for eight houses in Deane Avenue; Mr. W. Heaton, for new entrance and crossing at Hollinhurst, Chorley New Road; Mr. C. Stott, two houses in Church Road; Messrs. Jos. Jackson & Sons, new streets and levels off Lonsdale Road; and Mr. J. Uttley, for 12 houses in Lonsdale Road.

ARCHITECTS' CLAIM FOR FEES.

(Concluded from last week.)

JUSTICE GRANTHAM and a special jury, in the King's Bench Division on April 6, resumed the hearing of the action in which Messrs. Fair & Myer, architects, sued the Harper Electric Piano (1910) Company, Ltd., of Holloway Road, N., for the recovery of 275*l.* for architectural services rendered in connection with the erection of a proposed cinematograph theatre, rink, and café.

The evidence on behalf of the plaintiffs' case was reported in our supplement of last week, p. 14.

In the course of cross-examination by Mr. Thorn Drury, A. Brumwell Thomas, F.R.I.B.A., one of the witnesses called by the plaintiffs, said that quantity surveyors' charges varied. In his own experience of a case in which the tender was 150,000*l.* he thought the quantity surveyor received as much as 1½ per cent. In another building he (the witness) had completed and which represented a cost of 60,000*l.* or 70,000*l.*, the fee of the quantity surveyor was 2 per cent. A fee of 2½ per cent. in a small job of 5,000*l.* would be normal.

Mr. Drury, in opening the defendants' case, repeated that it was understood that plaintiffs were to be paid a nominal sum for their services if the scheme were abandoned, but the scheme had never been abandoned. It was also understood that plaintiffs in other events were to be paid 5 per cent. inclusive upon the total cost of the building.

Mr. S. C. Harper, managing director of the defendant company, as he was of the former one, stated that last year it was proposed to form a new company with additional capital, there being in view a site in the Holloway Road for the erection of a cinema theatre, café, and so on. The County Council had passed, he said, a resolution on March 1 of last year to let the company this site, and prepared a building agreement which could be extended directly they were ready to go on with the building. The County Council had told him that they did not give options, but that they granted building leases, and that before they communicated with anyone else they gave them notice to ask if they wanted to take up the option. Mr. Harper proceeded to give his version of the various interviews he had had with the plaintiffs. Mr. Fair, when asked what would be their charges if the scheme did not go through, had said "Just a nominal sum for getting out the preliminary plans." Witness wanted to know what he meant by a nominal sum, and Mr. Fair replied that that would be according to the time spent on the work, adding "We shall not quarrel about that." The prospectus was published on May 31, but they did not get sufficient money to enable them to embark on this scheme.

In cross-examination by Mr. Neilson, the witness said that managing director he had given Mr. Fair instructions to send necessary plans to the L.C.C. in order that any objections concerning exits and other details should be ascertained. Mr. Neilson: The necessary procedure you knew had to be adopted before plans could be passed. Your use of the word "preliminary" was, to say the least, unconsidered?—do not think so.

Mr. Harper said they had approached Messrs. Fair & Myer because they were responsible for the Finsbury Park park, which was looked upon as most up-to-date. They had then appointed architects in this case with the knowledge of his directors.

Answering further cross-examination, the witness persisted in the declaration that the work accomplished by the plaintiffs was of a preliminary character.

Mr. Neilson: What other drawings can you suggest could be prepared for the erection of buildings together with the specification and quantities?—I do not know much about them.

Counsel: Then how can you say that all that has been done is preliminary? Point out any plan that has not been prepared but what you say is necessary for the completion of the scheme.—I cannot.

Then you have no ground for saying they were preliminary plans?—I consider they were.

It is not unfair to ask you on what ground you say these are preliminary plans?—Everything that has been done is preliminary, because the whole scheme was dependent upon getting the capital.

If you mean plans must come first and the building afterwards I agree with you, but what ground, I ask you again, have you for suggesting that these plans, which were working plans and drawings, were merely preliminary?

The Judge: He has given you his answer.

The witness said that subsequently Mr. Fair and he discussed how the scheme could be modified, and subsequently

it was modified. Witness added that he was trying to get capital in another way, and he was still sanguine on the subject. In accordance with an agreement the London County Council were still using the land for tramway storage purposes.

Mr. John Farren, an architect and surveyor with thirty-five years' experience, said he had examined the plans, specifications, and quantities in this case.

Mr. Thorn Drury: Does the specification and the alleged bills of quantity strike you as being the usual specification and bill of quantities, prepared for the execution of the work, or as documents prepared to get rough estimates?—Documents to get rough estimates undoubtedly. No details are given.

Mr. Drury: What do you say would be the proper sum supposing the defendants ought to pay?—I say forty guineas.

Mr. Neilson (cross-examining): You are not a Fellow of the Institute?—No, but I am an architect and surveyor.

Mr. Neilson: Have you any qualifications at all beyond the fact that you call yourself an architect and surveyor?—I have been in practice for thirty-five years as an architect and surveyor, and that in itself, I venture to think, is a qualification. And I have had much experience during that period.

Mr. A. W. Cleaver, B.A., A.R.I.B.A., gave similar evidence, save as to the question of amount if any were due to the plaintiffs for past work. His figure was thirty-five guineas.

This closed the evidence on behalf of the defendants' case.

The jury in the result awarded the plaintiffs fifty guineas.

Mr. Thorn Drury asked for judgment for the defendants on the ground that his clients had paid a similar sum into Court with a denial of liability.

His Lordship agreed.

VICTORIA AND ALBERT MUSEUM

THE Department of Architecture and Sculpture has recently acquired two important examples of early French Gothic art, which are now on view in Room 8, immediately to the right of the main entrance. One of these, a cluster of five detached gray marble shafts, with united bases and capitals of stone, is said to have come from Villemer, a little village between Fontainebleau and Nemours, where it appears to have stood at the corner of a small cloister. The boldly-cut foliage and grotesque heads on the capitals are of a very early type, recalling the similar work on the north door of Chartres and the west door of Notre Dame at Paris in the first half of the thirteenth century. The other is a beautiful early fourteenth century statue in sandstone of the Virgin and Child, said to have come from Ecouen. The type is a traditional Parisian one, and the treatment of figure and drapery is closely akin to that in the admirable reliefs on the northern apsidal chapels of Notre Dame, which were probably executed between 1296 and 1316, under the direction of Pierre de Chelles. The upper part of the body of the Child is, unfortunately, lost, but in spite of this the statue is a singularly charming example of the mediæval sculpture of the Ile-de-France, at what is perhaps the most gracious point in its development.

MR. SYDNEY VACHER has recently presented to the Victoria and Albert Museum a valuable series of studies of Pompeian ornament and mural decoration, made by him in 1879; and a number of these have now been arranged for exhibition in the Department of Engraving, Illustration, and Design (Room 70). Among other additions to the exhibition rooms of this department are a series of tracings of old English stained glass, chiefly from the Minster and other churches in York, by Mr. Lawrence B. Sainsbury (Room 71) original designs for woven silks, made at Lyons in the second half of the eighteenth century (Room 72); while, to the collection of tools and materials illustrating the process of making Japanese colour-prints, in Room 74, a case has been added containing a set of Japanese brushes (the gift of Mr. B. H. Webb) and original drawings (unused), by Hiroshige, Kuniyoshi, and Kunisada II. In Room 65 a collection of Japanese colour-prints is now exhibited, illustrating the treatment of landscape subjects in this method, by various artists.

THE Rochdale Board of Guardians have agreed to build a nurses' home at a cost of 4,250*l.*

THE Barrow Town Council have decided to build a fire station in Abbey Road at a cost of 5,461*l.*, and to purchase a motor fire engine for 1,191*l.*

AMERICAN FAILURES IN REINFORCED CONCRETE WORK.*

It is a truism often repeated that the public has a short memory. The lessons to be derived from great disasters are soon forgotten except by a very small number. The fatal Iroquois theatre and Collinwood school disaster of a few years ago, so costly in child life and so much in the public mind for short intervals, showed the necessity of safeguarding the occupants of public buildings. For a time our civic authorities were active in having places of public entertainment carefully inspected. Much was heard for a season about fireproof curtains, accessible exits, fire drill and fireproof schools, but soon the public relapsed into its old ruts. Inspection became less searching, and the authorities more forgetful, and the public continues to run daily the same risks that the victims of these disasters ran. It sends its children to the same schools and attends itself the same places of public worship or entertainment, and only becomes conscious as to the chances it is taking when some other horrible calamity occurs. Truly, the public has a short memory.

It is chiefly because humans are humans and not machines that we continue to take chances. A machine can be constructed to do a given thing in a specified way an endless number of times. Whether its work be punching or drilling or cutting, it does it with machine-like precision. It never tires, never grows careless, and is never actuated with a spasm of over-zeal or indolence. It is never tempted to scamp its work. It is never influenced by the desire to make excessive profits, and never knows the flattery of the multitude or the sting of adverse criticism. It never forgets, never flatters, never tempts, never cajoles, never bluffs, and never pleads. But men are differently constituted. They possess the human traits. They are influenced by example, possess passions and emotions, cherish hatred, remember injuries, and forget the lessons which great crises in their experience ought to impress on them. The attention of engineers, architects, builders, and building departments has been called to the lessons which are taught by the failures of structures designed and erected by them or under their supervision. It is not that the field is a new one that this paper is devoted to so hackneyed a topic, but to emphasise once again, firstly, those elements which have contributed to failures, and, secondly, those corrective or precautionary measures which will tend to prevent their recurrence.

Especially in the use of reinforced concrete has the general reader's attention during the past five years been called to a rather large list of failures, all of them more or less serious and not a few of them having fatal results. Reinforced concrete has been comparatively new in the building art and in its fabrication is very different from other materials with which the constructor is familiar. Unlike steel or wood, its strength increases with age. It is poured into forms, at which time it is plastic, and has to be sustained until it acquires sufficient strength to support itself. It consists of two materials, not one, and since the disposition of these with respect to each other vitally affects the strength of the product, exercise for great care in this placing is necessary. More perhaps than of any other building material is this true—it possesses great capacity for injury in the making and placing. Following are cited a number of failures of reinforced concrete structures which during the past twelve months or so have occurred, and reference to which in the engineering press has come to the writer's notice. They represent typical cases, and an examination of the list will enable us to classify the causes under a few general heads.

The comparatively recent announcement that the great dam across the Colorado River at Austin, Texas, is to be rebuilt has served to recall its failure over a decade ago. It will be remembered that that failure was announced to the world at first as a serious reflection upon the engineering profession because some hydraulic engineers of eminence had been connected with the work. Subsequently, however, when the whole history had been investigated, it was found that the authority of the engineers had been interfered with to such an extent by the city officials in control that their responsibility had been practically nullified. Indeed, one prominent engineer had resigned rather than have his name

further connected with a work over which he had no control. On February 28, 1910, a reinforced concrete arch of three spans over the Flat Rock River at Edinburgh, Ind., collapsed during an unusually heavy flood. The design had been furnished by a well-known bridge company, but the Bridge Commissioners, in their desire to economise and with a wisdom commensurate with their experience in such matters, decided to omit the piling underneath the abutments, and to carry them instead to a somewhat greater depth. And so the bridge was built. The materials supplied and the workmanship throughout seemed to be excellent, but in the season of heavy flood the piers were undermined by scouring, and the structure collapsed. There does not appear to be any other cause of failure than the insufficiently-supported piers, and the responsibility, of course, must rest on those who ordered the modification of the original plan.

A concrete dam at Fertile, Minn., was washed out by floods early in April 1910. The trouble is attributed to the fact that the foundations were not laid sufficiently deep to prevent scouring and undermining, and failure ultimately ensued.

The partial failure of the Bayless reinforced concrete dam at Austin, Pa., in January 1910, exemplifies a trouble of a slightly different character. The dam was completed in December 1909, at a cost of upwards of \$70,000. On completion, it was observed that there was a small crack $\frac{1}{8}$ inch wide, extending from the top of the dam to the ground level. Subsequently others, similar in appearance, developed, and during a heavy freshet on January 23, 1910, a section of the dam between vertical cracks, under the thrust of the impinging water, slid forward some 18 inches. This movement covered a period of some eight hours and then stopped. Investigation disclosed the information that the failure was due primarily to the fact that the dam was founded upon a bed rock, the successive strata of which were separated by layers of shale or clay. The impounded water, having worked itself under the foundations, had softened the clay, with the result that the upper stratum carrying a portion of the dam had moved forward on the lower. It was stated that the weakness of the concrete was doubtless due to the fact that much of it had been hurriedly placed, part of it in freezing weather. The anchor bolts, which had been grouted into the foundation rock, had moved outward with the rock into which they were anchored.

On April 7, 1910, the collapse of a concrete roof under construction of the new car-barn of the Shore Line Electric Road at Saybrook, Conn., took place, and resulted in the death of one man and the injury of two others. The roof was a 4 inch slab of reinforced concrete on girders, about 8 inches on centres and of 37 feet span. The last work had been completed about ten days and the forms were being removed. It was believed that the premature removal of the forms and the excessive loading of the green roof slab with roofing material were the joint causes of the accident.

On July 13, 1910, one of the columns of the concrete groined arch roof to the filter chambers in course of construction at Owen Sound, Ont., collapsed while the centering beneath was being removed. Two men were quite seriously injured. The accident, apparently, was due primarily to the early removal of forms, combined with the fact that the 13 x 18 inch columns on two sides of the square roof of the arch were quite incapable in themselves of resisting the arch thrust. The forms were removed in only four days after pouring, notwithstanding the fact that seven days was the minimum specified time for removal.

The upper part of a reinforced concrete chimney under construction at the plant of the American Woollen Company, South Royalston, Mass., collapsed on April 9, 1910, causing the death of two men. The chimney was to have been 105 feet high, with an inside diameter of 4 feet and an outside diameter of 4 feet 8 inches at the bottom, and with walls varying in thickness from 8 inches at the bottom to 4 inches at the top. The forms used in construction were in two sections, each $3\frac{1}{2}$ feet deep. The procedure was to fill the upper form, then to loosen the lower, and set it above for filling. This took one day. Next morning the form in the lower section was loosened, and it was placed on top and filled. Thus the concrete in any $3\frac{1}{2}$ foot vertical section had less than twenty-four hours in which to set before its side-supporting forms were removed. The accident occurred when a height of about 70 feet had been reached, the section last uncovered, then only twenty hours old, caving in and carrying the workmen to the ground with it. It is reported that the temperature the day before the break had taken a sudden drop, but it was not at any time below freezing. The failure was undoubtedly due to loading a very green concrete

* An address entitled "Some Failures and the Lessons they Teach" delivered by Mr. Peter Gillespie before the Third Annual Convention of the Canadian Cement and Concrete Association at Toronto last month and published in *Construction*.

ore it had acquired sufficient resisting power, as the materials were good and the design and execution satisfactory.

A reinforced concrete grain elevator of typical design led under a normal pressure of grain at Springfield, Ohio, October 24, 1910. As has been rather common in elevator construction where a battery of cylindrical units has been constructed, the unused spaces, external to the cells, but lying within the tangent walls, had been utilised as auxiliary bins. No one saw the beginning of the collapse, so that its exact behaviour cannot be stated, but from the appearance afterwards it was evident that the lower section of the wall where the pressure was greatest was forced out under the pressure of the wheat. This portion sheared off clean at the place where the straight wall connected with the circular wall of the larger bin. The weak point in the structure was at the horizontal rods in the straight wall were not connected to those in the circular, nor were they tied back for any distance into the concrete of the circular walls. It was stated that the plans showed the rods in the straight walls merely fastened into the circular bins, and that the failure so fasten them was due to the negligence of the foreman.

On November 22, 1910, a four-storey reinforced concrete building being erected for the Henke Furniture Company, Cleveland, Ohio, suddenly collapsed, throwing one of the walls over a two-storey frame building next door, and so crushing the structure as to cause the death of four of its occupants and the serious injury of seven others. It was of reinforced concrete column and girder construction, with hollow tile and concrete floor system, and brick curtain walls rising in thickness from 21 inches at the basement to 12 inches at top floor. A commission of enquiry was immediately appointed, on which were representatives of the Builders' Exchange, the Cleveland Engineering Society, and the Cleveland Chapter of American Institute of Architects. This commission was empowered to take evidence, and to consult every available source of information that might explain the cause of failure. After the wreck had been carefully examined, the design checked over, and the witnesses examined, the finding was announced. The failure, it stated, was due primarily to the premature removal of forms in the third storey. It fixed the responsibility on the architects, the contractor, the owner, and the Department of Buildings for the city of Cleveland. The architects were adjudged responsible in that they did not give sufficient consideration to the removal of forms, in that they did not give sufficient attention to the materials, and in that they did not give adequate supervision to the work of construction. The contractor was judged culpable in that he employed foremen who were entirely ignorant of the intent of plans and specifications or the nature of the materials they were handling. In consequence, the sand was inferior, the forms were removed prematurely, and that regardless of weather conditions, the green concrete was regularly overstressed, the members were not of the sizes called for in the plans, the concrete composing them was open and porous, and sawdust and shavings were found in the bases of columns. In addition, it developed that less cement had been delivered to the building than would have been necessary to construct it had it been built as planned.

The owner was deemed responsible in that he had not employed a special concrete inspector on the work, as required by the building regulation.

The Department of Buildings was held responsible in that it had ignored the requirements of that portion of the building code which makes it necessary that the owner employ a special reinforced concrete inspector. It thus appears that the Building Department rather than the building code was at fault.

I have chosen to classify the causes of failure in the above listed cases as follows:—

- (1) Interference with a suitable design by those in authority, but not possessing a knowledge of engineering practice.
- (2) Defective design.
- (3) Inferior materials.
- (4) Ignorant or wilful disregard of specifications and plans.

The first of these is, unfortunately, of too common occurrence. In all human probability the Austin dam and the Edinburgh arch would be standing to-day but for the intervention of the "cock-sure aggressive" individual, who, when clothed with a little brief authority, becomes a paragon of wisdom on everything under high heaven. This type is found frequently in our municipal councils, and it is to be regretted that engineers of wide experience and good judgment some-

times permit themselves to be dominated by them. An engineer's judgment may be in error, but is it not more likely to be productive of good results if it be corrected through consultation with other engineers of equally good standing, than if it be reversed by men entirely untrained in the problems of design and construction?

Fortunately, the day of unsafe design in reinforced concrete is becoming a thing of the past. The design of reinforced concrete, like the design in wood or steel, has been reduced, or is being reduced, to a standard based on the proportion and strengths of materials which constitute it. There is, therefore, no reason to-day why the average practising engineer should not acquaint himself with concrete designing, so that, at least, he can finish his plans with some such detail as he does for his structures in steel. He may, if he prefers, leave the details to his contractor, who, like the contractor for steel, can make them according to the standards of his practice. He must exert every care in informing himself as to the character of the materials he must employ and of the foundation upon which he proposes to erect his structure. The dams at Fertile, Minn., and at Austin, Pa., furnish illustrations where disaster might have been averted by a careful examination of the underlying strata, prior to construction. The designer must recognise, too, that the safety of his design depends upon the contractor as well as upon himself, since concrete construction is not fixed as is that in steel. An editorial in the "Engineering News," speaking of this phase of a designer's responsibility, asserts that "the design cannot be sent from the drawing table with perfect confidence in its precise reproduction in the structure. It is the joint product of the man in the office and the man in the field, and any design which fails to recognise this is a poor one, no matter how nearly it may conform to accepted standards. No engineer who is not prepared to supervise the construction of a reinforced concrete structure is justified in designing that structure as closely to the safety limit as he is when the construction is to be under his eye."

The prevention of the utilisation of inferior material is the work of the engineer, the architect, and the inspector. No reinforced concrete work of any magnitude should be constructed without a capable, conscientious inspector. The Henke building suffered from inferior material, as it did from almost every malady to which reinforced concrete is heir. The remedy for this is vigilant, constant inspection. Failures resulting from the premature removal of forms could invariably have been prevented by the exercise of intelligence and a little precaution. The Henke building disaster, the Owen Sound filtration plant accident, the car-barn roof failure at Saybrook, Conn., and the chimney collapse at South Royalston, Mass., were all preventable if careful examination had been made before stressing the concrete, which, possibly due to temperature conditions, had not yet acquired its preliminary strength. The failure of the grain elevator at Springfield, Ohio, was due to the ignorance of a foreman. Any foreman who appreciated the proportions of the materials he was handling would not make the blunder that was made.

The remedy for these evils is the employment of the experienced, intelligent, painstaking inspector. He sees that the forms are cleaned before the concrete is poured, that the ingredients are correctly proportioned, that the steel is properly placed and in correct amount, that the members are of dimensions called for by the plans, and that the forms are not removed until the material has acquired sufficient strength to be self-sustaining. The capable inspector is essential to safe construction.

BRITISH SECTION AT THE TURIN EXHIBITION.

THE visitor to the Turin International Exhibition entering by the gate at the end of the Corso Massimo d'Azeglio will find on his right, in a commanding position overlooking the River Po, the pavilion which houses the exhibits from Great Britain and Ireland.

The British Section is unique, inasmuch as it is self-contained. British-made machinery, for instance, need not be looked for in the International Machinery Hall, for examples of the most recent developments in electrical plant, gas and oil engines and machine tools will be found in a Hall which forms, facing the river, the left wing of the British Pavilion.

Leaving the Machinery Hall the visitor will first pass through the Land Transport Court, which contains very fine examples of the advance made of late years by Great Britain in the manufacture of motor cars.

He will next reach the Court of Chemical and Scientific Industries, where everything is to be shown, as far as pos-

sible, under actual working conditions. Generally speaking, no means are provided at exhibitions for demonstrating the utility of the instruments exhibited, but the two completely-equipped laboratories which are shown here mark the inauguration of a novel and eminently practical method of exhibition. Another instance of the same system is the adjoining representation of a house, outwardly designed on the same quaint and picturesque lines as those built in England during the Tudor period. Its rooms will contain examples of different styles of British-made furniture (for which the makers claim that it is the most luxurious, practical and elegant in the world), and silk-hangings, tapestries, and carpets will also be shown in situ.

Further on the right are exhibits from the cotton and linen factories of the North, as well as tweeds of every kind. Close by, in a separate enclosure, are tableaux representing that great centre of the textile industries—Bradford—which will undoubtedly prove a special attraction of the British section.

Traversing the remainder of the Textile Section, the visitor will descend a short flight of steps into the sunken part of the centre of a handsome gallery, where there will be exhibited a number of models of ships, made to scale and complete in the minutest detail. He may then visit the sections devoted to food products, sporting guns and rifles, perfumery, and "real British leather," and stand at last just outside the rotunda, where are collections of the most beautiful pottery, china, and glass. So far as the pottery industry is concerned, Great Britain has recently taken a decided lead. In one or two cases, after years of patient experimental research, her potters claim to have re-discovered the secrets of the art of the ancients in this respect; and what is shown may, therefore, be regarded as being among the most valuable contributions to the section.

The Photographic Court should not be omitted, containing as it does many fine specimens of what may be described with truth as the most recent developments of this branch of "applied art."

The Circular Hall, in the centre of the rotunda, will be found fitted up as a library, the cases in many instances being arranged so that the books may be taken down and examined. Upwards of thirty publishers are contributing the newest and most notable books, which will cover every department of literature, from standard works on religious, scientific, educational, and biographical subjects, to the most recent productions of the best-known English novelists. The principal geographical publishers are exhibiting maps, and a representative display will be made by the bookbinding and printing industries.

Last comes a collection of exhibits from the British Board of Agriculture, which form an excellent advertisement of what may be regarded as rural and scientifically-rural Britain.

QUEENSLAND'S ARTESIAN WATER.

THE Great Australian artesian basin includes considerably more than one-half of Queensland, taking in practically all that part of the State lying west of the Great Dividing Range, with the exception of a small area in the north-west contiguous to the Northern Territory; a large slice of New South Wales along its northern boundary and west of the Great Dividing Range, and the north-eastern part of South Australia proper, together with the extreme south-east corner of the Northern Territory. This basin is about 569,000 square miles, of which 376,000 are in Queensland, 110,000 in South Australia, and 83,000 in New South Wales. The Queensland intake beds, estimated at 50,000 square miles, are the largest in the world, save those of the Dakota basin in the United States, but in storage capacity they are superior to those of America.

There are said to be 1,650 bores tapping the artesian water of the three States, but in comparison with the huge area covered by the deposits—something like ten times the size of Great Britain—very little has been done to develop this great artesian area. Of 850 wells in Queensland in the year 1908, 229 were less than 500 feet deep, 200 from 500 to 1,000 feet, 231 from 1,000 to 2,000 feet, 124 from 2,000 to 3,000 feet, and 66 over 3,000 feet. The aggregate flow of all the bores would be about 65,000,000 cubic feet. Bimerah Run, No. 3, lying between the Barcoo and Thomson Rivers, had the deepest well at the publication of the last Queensland statistics on the subject. Its depth was 5,045 feet, and the flow was said to be 70,000 gallons daily. Wells uncontrolled yield from one to three million gallons a day, while a bore at Cunnamulla is said to have a daily flow of 4,500,000 gallons.

When analysed, the water of some of these wells has been found suitable for wool-washing only; others are good enough for watering stock, but not for irrigation, owing to the presence of alkali; others, again, serve for both stock and irrigation. Some of the bores discharge water containing sulphuretted hydrogen, which is frightfully offensive, and useless for any purpose. Water fit for stock often has mineral flavour, but if cattle drink it safely human beings do not run any risk. Temperatures in the Queensland wells vary from 60 to 202°, so that a warm bath is a familiar luxury in the artesian country.

The cost of artesian wells works out at an average of 17s. 6d. per lineal foot. It depends upon the depth to which boring operations have to be extended, and on the accessibility of the bore to a railway station. According to the latest figures available, contracts, including the use of six inch casing, have been let at the following rates:—Up to 1,100 feet, 11s. per foot; 1,000 to 1,500 feet, 12s. 6d.; 1,500 to 2,000 feet, 13s.; 2,000 to 2,500 feet, 14s.; 2,500 to 3,000 feet 16s.; 3,000 to 3,500 feet, 19s.; 3,500 to 4,000 feet, 24s.

THE Willesden District Council propose to erect public baths and wash-houses at a cost of 16,500l.

SIR MICHAEL NAIRN is to extend, at a cost of 10,000l., the hospital he presented to Kirkcaldy about twenty years ago.

MESSRS. LEWIS SOLOMON & SON, architects and surveyors, announce their removal from 16 Union Court to 5, Finsbury Pavement, E.C.

THE Newcastle Board of Guardians are advised by their Hospital Extensions Committee to proceed with the erection of a new block at a cost of 18,700l., which works out at 121l. 10s. per bed.

A LOCAL Government Board inquiry will be held on April 24 into the application of the Corporation of Dublin to the Local Government Board for Ireland for their sanction to a loan of 128,129l. for the purpose of carrying out extensions of the electric lighting system.

THE Pontardawe District Council has decided to interview the agent for Colonel Gough, and negotiate for land which he offered for the erection of 150 houses for the working classes in the Ystalyfera area, which is notoriously overcrowded. The first instalment will be one of fifty houses.

MR. W. H. COLLIN, an Inspector of the Local Government Board, held an inquiry at the County Hall, Oxford, in respect of the application of the County Council for consent to borrow a sum not exceeding 10,000l. for the provision of additional County Offices and Buildings at the corner of New Road and Titmouse Lane, and the conversion of the second Assize Court into a Council Chamber.

THE Bristol General Hospital Committee had collected up to last week 38,416l. towards the 45,000l. required for an extension scheme. The proposal is to erect a new wing on land the property of the hospital at a cost of about 30,000l. Plans have been prepared by Messrs. Oatley & Lawrence, architects, Bristol.

THE partnership between William Morgan Lewis and Thomas Naunton Morgan, architects and surveyors at Pontypridd and Tonypandy, Glamorgan, under the style of firm of Messrs. Lewis & Morgan, has been dissolved by mutual consent. The practice hitherto carried on at Pontypridd will be continued by Mr. W. M. Lewis alone, and the practice hitherto carried on at Tonypandy will be continued by Mr. T. N. Morgan alone.

THE Glasgow Dean of Guild Court last week granted the following linings:—Trustees of Parkhead Parish Church, to erect a suite of halls adjoining church, Great Eastern Road; trustees of Hillhead Baptist Church, to erect a mission hall in Canal Street, Port Dundas; the Corporation of the Royal Exchange Assurance Company, London, to take down existing building and erect in its place a new building at the south-west corner of West George Street and West Nile Street; Mr. J. Porter, 577 Dalmarnock Road, to erect a tenement of dwelling houses in Summerfield Street.

THE Chief Officer of the Birmingham Fire Brigade (Mr. A. R. Tozer) has issued the following circular to the occupiers of lofty buildings in the city:—"Dear Sir,—The Fire Brigade Sub-Committee have again had under consideration the question of the grave risk that exists in many of the lofty buildings in the city, where caretakers and employees are engaged or sleep on the premises. I am requested to call your most serious attention to the matter, and to inform you that if no adequate provision for escape in case of fire has been already provided by you, no time should be lost in making such provision. If I can be of assistance in advising you in the matter I shall be pleased to do so."

at Stand 194, Row J, Messrs. Hartley & Sugden, Ltd., make a good show of their boilers and heating appliances. There are three cast-iron sectional "White" boilers representing Series H., B., and F. for heating public and private buildings, greenhouses, &c., by hot water circulation. Our illustration is of one of the H. type, which is the only type of sectional boiler with a magazine fuel feeder on the market; it has been designed to burn at least twelve hours with one charge of fuel. This type has been installed very extensively throughout the country, and has always proved most satisfactory and economical. "Sentinel" cylindrical boilers are a cheap but strong type of hot water heater suitable for small greenhouses, motor-houses, &c. The "Octradia" combination

materials into the finished cement. The raw materials as taken from the quarries are chalk, which is almost pure carbonate of lime, and gault clay, practically identical with the clay used in the Thames and Medway district. The chalk and clay are first mixed together in wash-mills with about 40 per cent. of water. The resultant "slurry" is then passed to large mixing and storing reservoirs, where absolute uniformity is ensured, before it is pumped either to the drying floors or direct to the rotary kilns. When the "slurry" is dealt with on the drying floors the moisture is evaporated by the waste heat from the kilns, which adjoin the floors, and this dried material, known as "slip," is broken up and burnt in the intermittent and continuous shaft kilns. When the burning is done in rotary kilns the

boilers serve the double purpose of heating and domestic water supply by means of an internal copper coil inserted in the waterway of the wrought iron boiler. The following boilers on exhibit are chiefly for hot water supply: "Manor," the "Hospital," the "Malvern," and the "Avile." The latter is fitted with cylinder, to show the method of use. These are all wrought iron boilers fitted for boiler work. There are several smaller boilers adapted to hot water circulation. The "Dromana" is a wrought iron boiler for heating by steam at low pressure. A vertical rivetted steam boiler is shown with all fittings, suitable for working at high pressure for motor or cooking and heating purposes. The steam jacketed pans for boiling liquid by steam are thoroughly tested by Messrs. Hartley & Sugden at 60 lbs. per square inch. Radiators, loose sections, &c., will also be exhibited on the stand.

Messrs. Sissons Bros. & Co., Ltd., of London and Hull, have, as usual, attempted to display within the compass of an exhibition stand their varied products; and distempers, paints, enamels, varnishes, &c. The two apartments, which form the main feature, are decorated in different but equally successful styles. The larger room, measuring 19 ft. by 11 ft., is in Adam's style; and the smaller, 16 ft. by 10 ft., is in the Louis XV. style. A comprehensive idea of the decorative treatment of panels, walls, and ceilings by their materials is thus obtained. The key-note of the larger room is flatted white, with a very delicate harmonious colour scheme of green introduced into the panelling. The small room proves that Messrs. Sissons' paints lend themselves equally well to the decorations applied to the larger room, and to those styles of decorations where elaborate and heavy ornamentation plays a conspicuous part. The colour contrasts are most pleasingly arranged on a white background. The ceilings in both rooms show distemper work upon Adam's swags and patterns of attractive design. The interior of the stand is panelled throughout in Adam's style, and is decorated with Hall's distemper in various shades. The Sussex Portland Cement Co., Ltd., are showing by samples and by demonstration the evolution of the raw

materials into the finished cement. The raw materials as taken from the quarries are chalk, which is almost pure carbonate of lime, and gault clay, practically identical with the clay used in the Thames and Medway district. The chalk and clay are first mixed together in wash-mills with about 40 per cent. of water. The resultant "slurry" is then passed to large mixing and storing reservoirs, where absolute uniformity is ensured, before it is pumped either to the drying floors or direct to the rotary kilns. When the "slurry" is dealt with on the drying floors the moisture is evaporated by the waste heat from the kilns, which adjoin the floors, and this dried material, known as "slip," is broken up and burnt in the intermittent and continuous shaft kilns. When the burning is done in rotary kilns the drying is dispensed with, and the liquid mixture is taken direct to the kilns, into which it is automatically fed and burnt with finely ground coal. The rotary kiln is an inclined steel cylinder, varying in length from 110 to 200 feet, revolving at a slow speed, from which the "slurry" finally emerges in the form of clinker. The clinker is taken to the grinding mills, where it is ground to an almost impalpable powder, containing a large portion of "flour." This is the finished production. The Company, being the first firm of English manufacturers to recognise that the more finely cement is ground the greater its value, claims to be the pioneers of the modern methods of grinding. To-day the Company produce one of the finest ground cements in the world in the "Newhaven" cement, which is guaranteed to comply entirely with the revised British standard specification. Their "Cathedral" brand was specially prepared for the restoration of Winchester Cathedral, and has since been largely used for other similar important works. It is used for reinforced concrete and fireproof floor construction, for which it is eminently suitable, and is also guaranteed to comply with the British standard specification. On the stand there will be a complete testing apparatus, and demonstrations will be carried out at intervals during the day.

The stand of the Ruberoid Company, Ltd., of 81-3 Knight-bridge Street, E.C., is itself worthy of attention. The white joinery contrasts well with the roof, which is of green ruberoid of a pleasant coppery green appearance. The exhibit partly consists of models showing the practical application of ruberoid roofing on flat and pitched roofs, the method of flashing, &c. The ruberoid system has held for the past twenty years a high reputation among architects and engineers both for flat and trussed roof work. It is easily applied to curved surfaces, and durable under extreme conditions of climate. A portion of the exhibit will also be devoted to ruberoid dampcourse, which has become one of the firm's leading specialities. The giant insulating papers will be fully displayed. The stand will, as usual, be floored with ruberoid flooring, which material is specially manufactured for use on concrete and brick floors, and for passage-ways and verandahs exposed to the weather. Like

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB,

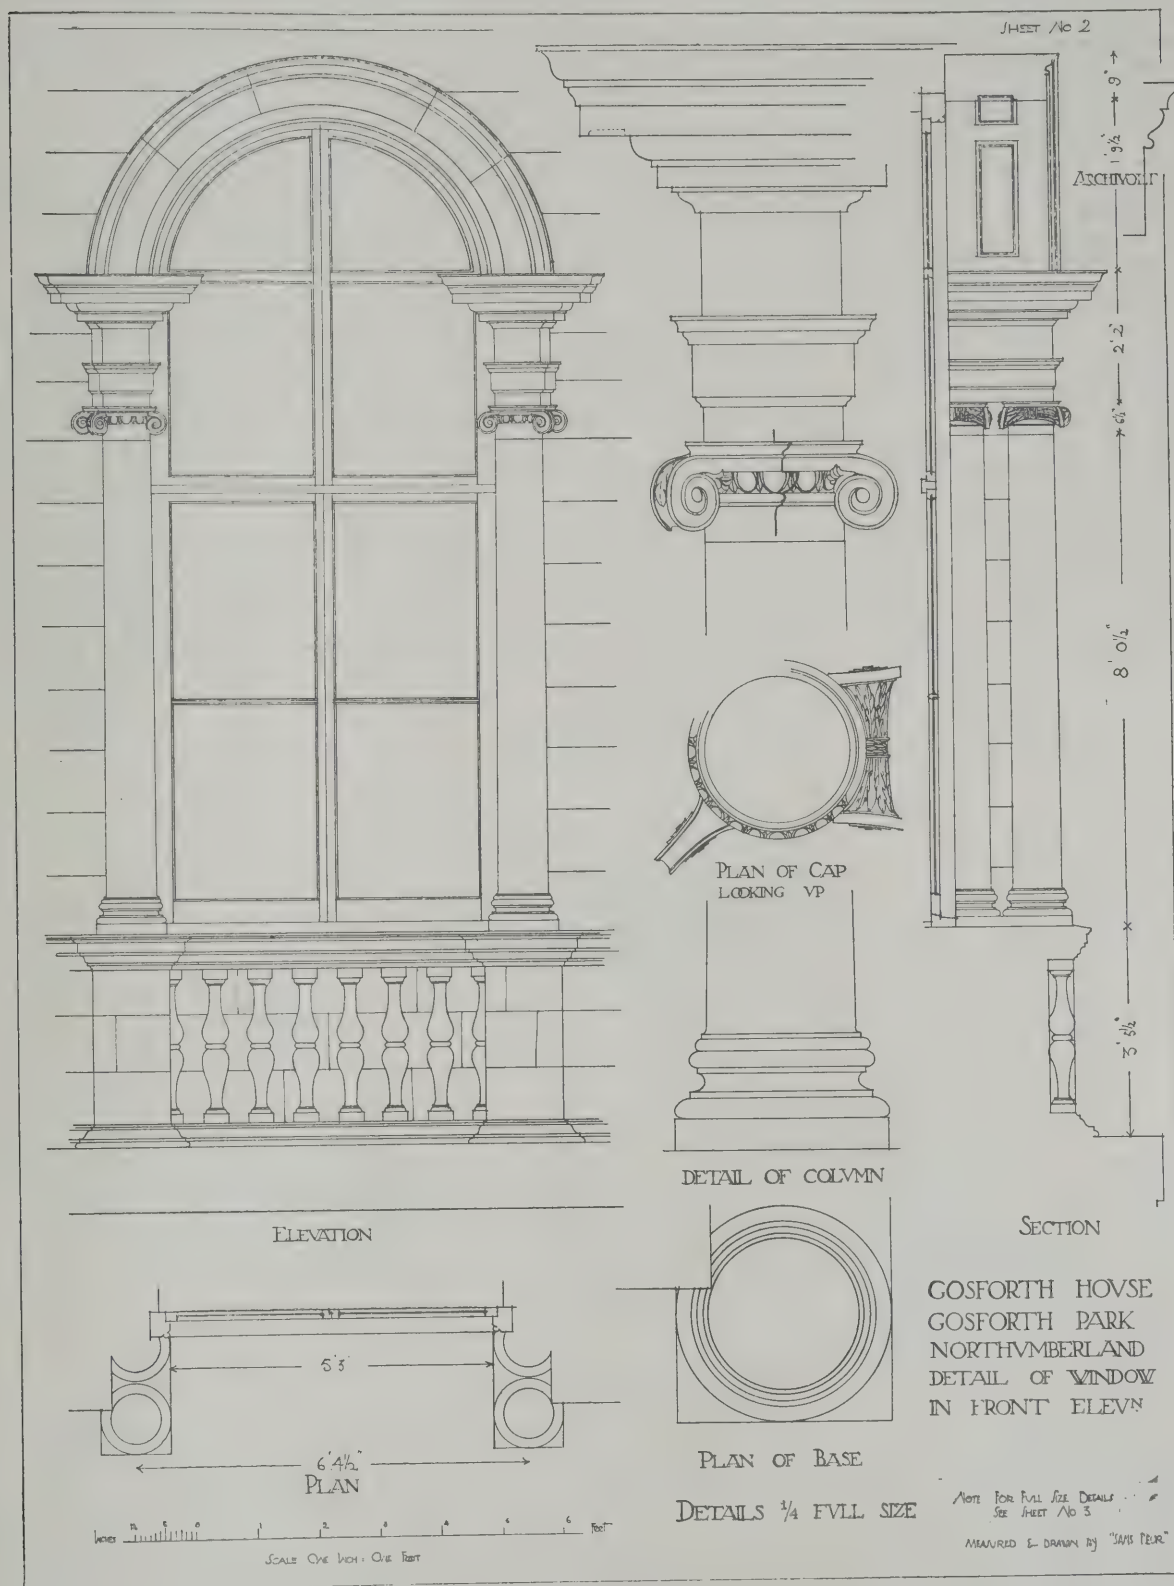

From a Measured Drawing by "SANS PEUR."

Gosforth House was designed by James Paine in 1757, who, according to Professor Blomfield in his book on the Renaissance, was one of the most skilful house-planners of the eighteenth century. He designed a great number of noblemen's houses during his career, notably Kedleston Hall. The two windows drawn are excellent examples, and show quite good feeling in the mouldings, &c.

the roofing, ruberoid flooring is manufactured in three colours, slate, red, and green. The Ruberoid Company have recently constructed new and extensive works at Brimsdown, Middlesex. It is worth remarking that ruberoid has been used for roofing all the large garages erected by the German Government for housing the Zeppelin airships, and is also in use for similar purposes on the Hangars at Shell Beach, Sheppey, the Crystal Palace, and elsewhere. Some 130,000 square feet of ruberoid roofing were used by Messrs. Lever Bros., soap manufacturers, on their new works at Durban, Natal, South Africa; whilst the portable buildings taken to the Antarctic by the Scott Expedition were built of identically the same material.

Messrs. H. C. Cleaver, Ltd., Tudor Works, Park Royal, N.W., have an attractive stand. Oak panelling in Jacobean and Elizabethan style is illustrated by numerous examples. These include "Tudoresk" patent panelling in wax polished and fixed complete from 1s. 6d. per square foot. Oak panelling in the Georgian period is also shown together with expert wood carving. There is a display of solid oak doors designed in harmony with the foregoing. The firm's Composition Modelled Decoration is exhibited in friezes and wall panels for Adams and Georgian work. To entirely new types of revolving door known as the dome oblique and the single direct types respectively are shown. Contrary to the usual practice in revolving door construction

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

From a Measured Drawing by "SANS PEUR."

THE windows forming the subject of these drawings are both from the front elevation of Gosforth House, the one with the Ionic order being used centrally, flanked on each side by two windows similar to that in sheet No. 1.

tion the doors are semi-circular on plan and revolve round the operator instead of being pushed before him. This construction enables a Cleaver revolving door to be built in much smaller space than has hitherto been considered necessary.

Messrs. Ingram, Perkins & Co., Hardwood and Softwood Importers and Merchants, of Beech Street, Barbican, E.C., and Irongate Wharves, Paddington, W., again show their stocks of hardwoods and softwoods. Instead of displaying choice specimens of rare woods, the firm exhibit fair samples of the stocks at their yards of hardwoods and softwoods in everyday use from which they are prepared to execute at once orders received from builders, joinery manufacturers, shop-fitters, carpenters, &c. Amongst some of

their specialities are yellow deals, planed and unplanned boards and quarterings, prime American whitewood, hardwood floorings, mahogany logs, wainscot oak logs, Dominion whitewood facias, doors, mouldings, compo board, &c.; in fact the firm are open to supply any and all timber requirements with the exception of purely fancy woods. As a large quantity of timber will be used for erecting Coronation stands, Messrs. Ingram, Perkins & Co., who do a big business in this class of timber, have specially imported large consignments for this particular purpose, samples of which they are showing on their stand.

The Ravenhead Sanitary Pipe and Brick Co., Ltd., St. Helens, Lancashire, at Stand 49, Row D, make a big display of their rustic facing bricks. These are clean hard bricks

roughened on the face so as to give the appearance of well preserved age on a new building. When first the rustic brick was introduced some three years ago, the cut was straight and close, very similar to the bed cut, and consequently flat on face with no weathering property. Last year this was remedied by improving the face with a slight projecting moulding (shaped so as not to hold rain or dirt) which also improves the appearance. The effect may be seen in the lengths of walling erected to display the different kinds of bricks made by the firm. Rustic bricks are plastic made, very dense in texture, and free from lime, and Kirkaldy's crusting test is 354.7 tons per square foot. The company have been making high class building and engineering bricks from the same raw material for the past thirty years. The floor of the stand will be paved with their clinker pavers in "Upholland" brindle buff and "Ravenhead" red. There will also be shown a new brick partition and a brick-faced flag.

Ronuk, Ltd., might certainly be described as beauty (floor) specialists, for their preparation resembles skin-foods or other cosmetics which are made to repair the damages of wear and tear. It must be remembered that "Ronuk" is something besides a preparation which gives a polished surface; for it in addition renders that surface smooth, hard, durable and waterproof by filling up the pores of the wood. The curator of the City of Manchester Art Gallery some years ago wrote after the tenth cleaning of the parquet floors with "Ronuk" that they were in a far better con-

cabinet lavatory stands fitted with white porcelain basins of a patent and improved pattern. The H.H. gully and grease trap are also shown. In all these fittings the common disadvantages have been avoided and replaced by more sanitary and common-sense principles. A perfect working model of the Whalley Concrete and Tar Macadam Mixer may be seen mixing and delivering batches of material in under two minutes each batch. This is claimed to be the most efficient and economical mixer on the market, having a minimum of wearing parts and requiring a minimum of power to drive. Samples and particulars of Robbins Non-Set Plaster Cement may be had. This material is of great value in sealing inspection boxes and street covers of all kinds. It may also be used for jointing earthenware drains. The bronze medal of the Sanitary Institute was obtained at Brighton, 1910, and also for "Coverwell," the non-conducting material for covering steam pipes and boilers, which proves an economical and efficient commodity. Congo roofing felt has proved to be a most excellent material for roof covering, and also for damp-course work. The Parker patent earthenware pipe may also be inspected in full size sections.

The exterior of *The Silicate Paint Co.*'s stand is in the form of a cottage suggesting the Jacobean period, and is cleverly treated with Duresco in various colours to represent tiles, rough-cast, &c. The woodwork is painted with Charlton White Zinc Paint (non-poisonous). The interior shows a modern drawing room: the painted ceiling and cornice is in L snow-white Duresco, with floral decorations on

EXHIBIT OF "RONUK," LTD.

dition than when first laid down, although three hundred and fifty thousand visitors had entered the gallery. Five years later the curator again wrote, "the floors are as good as ever." That "Ronuk" is certainly sanitary is shown by the following analytical report given in the *Lancet*:—"The essentials of a good polish have been carefully studied by the manufacturers of the 'Ronuk' polishes, who have devoted special attention to the sanitary treatment of floors. Composed largely of antiseptic materials which possess the same germicidal properties as common disinfectants, but are without their disagreeable characters of smell and corrosive qualities, 'Ronuk' is an excellent floor-polish, preserving a sanitary condition of the floor, sealing up all germ harbours, and presenting a surface which pleasingly evidences an appreciation of sanitary principles."

Bristow & Co., Ltd., 20 Tothill Street, Westminster, S.W., are again showing up in the Gallery, Bay 12 (Surveyors' section). The porticos of their stand are formed from Parker's Safety Pipes and Congo patent roofing. There is altogether a very business-like appearance about this exhibit. "Tarvia," which, as a bituminous compound for roads, has so long and successfully stood the test of time, is again in evidence in samples; and full particulars may be obtained regarding its use. The H.H. series of sanitary fittings include a white porcelain closet with patent mechanical flush pipe and outgo connections, a hygienic form of seat, and special

a light grey frieze. The walls are done in C grey Duresco and the woodwork throughout is painted with Charlton Imperial Zinc White. "Duresco" is stocked in three whites and some fifty tints—intermediate tints being obtained by intermixture. Washing with cold water may be carried out when the distemper has become thoroughly hardened. A sound surface washed down and covered with a fresh coat of "Duresco" of the same colour gives splendid results at a very low cost. The main points to be remembered in applying the "King of Water Paints" are that success depends on (a) using the correct proportion of thinners; (b) obtaining uniform suction over the whole surface; (c) selecting colours suited to the conditions, and (d) not expecting two coats of "Duresco" to do instead of four or more of paint.

The Kleine Patent Fire-resisting Flooring Syndicate, Ltd., 133-136 High Holborn, W.C., show a 6-inch thick floor slab of patent reinforced hollow bricks with closed ends, reinforced both ways. The floor is twenty feet square, has a perfectly level ceiling, and there are no girders or beams protruding. Other forms of Kleine construction with reinforced hollow brick at Stand No. 117, Row F, are shown in the mansard roof with dormer windows and in hollow brick outside walls. It is just upon twenty years since this patent was first placed on the market, and since 1892 various improvements have been introduced. But the floors put

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ARGENTINE.—A competition of plans for a hospital and school of medicine, to be erected at Rosario in celebration of the Argentine Centenary at a cost of about 149,000l. Prizes of 1,050l., 700l. and 440l. will be awarded. A copy of the conditions, &c., may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., where also a limited number of copies are available for distribution. Plans must be sent to the "Secretaria de la Comisión Pro-Hospital é Instituto de Enseñanza Médica del Centenario, Calle Córdoba 1230," Rosario.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280*l.*, 120*l.*, 80*l.*, and 4*l.*. Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000*l.*. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3*l.* 3*s.* Apply to Mr. G. C. Copstick, F.R.I.B.A., County Offices, Derby.

DEVIZES.—May 10.—The Committee of the Devizes Cottage Hospital invite competitive designs for providing a new six-bed ward at, and making a general re-arrangement of, their existing hospital (16 beds) at a maximum cost of from 200*l.* to 1,500*l.* Deposit 10*s.* 6*d.* Conditions of competition and particulars of the buildings required will be supplied to intending competitors by Mr. E. Thorp, honorary secretary, Devizes.

MANCHESTER.—May 1.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes May 1. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester.

STOCKPORT.—April 22.—Architects desirous of entering a limited competition for the designs of the Police Station and Courts which the Corporation propose to erect are invited to forward their names and addresses, with particulars of their qualifications and experience in the erection of similar buildings, on or before Saturday, April 22, to Mr. Robert Lyde, Town Clerk, Town Hall, Stockport.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1*l.* 1*s.*, which will be refunded on receipt of a bona-fide design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250*l.*, and a premium of 50*l.* will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—April 24.—For erection of Groby Council school, to accommodate 1,200 children. Deposit 1*l.* 3*s.* Mr. E. Woodhouse, F.R.I.B.A., 59 Warrington Street, Ashton-under-Lyne, and 88 Mosley Street, Manchester.

BENTLEY.—For building church room, Bentley, Doncaster. Send names and 1*l.* deposit to Mr. P. N. Brundell, architect, Princes Street, Doncaster.

BLAYDON-ON-TYNE.—May 2.—For erection of station buildings, platform roofing, &c., for the North-Eastern Railway Co. Mr. William Bell, the Company's architect, Central Station, Newcastle-on-Tyne.

BOLTON-BY-BOWLAND.—April 24.—For erection of two cottages, additions to two houses, and a stable and cow shed on the Bolton Hall Estate. The Coffee House, Bolton-by-Bowland, Yorks.

BOSTON.—April 25.—For repairs and alterations to the chemical manure works, for Hubbert's Bridge, belonging to Messrs. W. G. Hammond & Co., Ltd. Mr. W. Willcock, secretary, 2 Main Ridge, Boston, Lincs.

BOURNE.—For erection of a dwelling-house at Bourne. Mr. R. Agnew, architect and surveyor, Bourne, Lincs.

BRADFORD.—For the various works required in extension of incineration works, Laisterdyke, for Messrs. Waring & Co. Send names to Mr. T. H. Gamble, architect, 9 Bond Street, Bradford.

BROMLEY.—April 25.—For widening Mason's Hill Bridge, Bromley, Kent. Mr. Frederick W. Ruck, county architect, 5 Week Street, Maidstone.

BUSHEY.—May 3.—For (a) erection of a caretaker's cottage and (b) construction of a circular sedimentation tank 30 feet diameter by 20 deep, with certain alterations to existing sedimentation tanks, for the Bushey Urban District Council. Deposit 2*l.* 2*s.* Mr. E. E. Ryder, engineer and surveyor, Council Offices, Bushey, Herts.

BUXTON.—For erection and completion of a cottage hospital at Sherbrook. Messrs. Bryden & Walton, architects, 3 George Street, Buxton.

CARLISLE.—April 28.—For erection of disinfecting chambers at Fever Hospital or House of Recovery (whole tenders). Mr. J. W. Benwell, architect, 28 Lowther Street, Carlisle.

CHEADLE HULME.—April 28.—For erection of new county police station. Deposit 1*l.* Mr. H. Beswick, F.R.I.B.A., county architect, Newgate Street, Chester.

COSBY.—May 5.—For erection of a new elementary school and handicraft centre at Cosby, Leics., together with out-offices, drainage, and other works connected therewith. Deposit 10*l.* 10*s.* The County Education Office, 33 Bowling-green Street, Leicester.

DROYLSDEN.—May 17.—For erection of an elementary school for 810 children in Fairfield Road, Droylsden, Lancashire. Deposit 2*l.* Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

EDINBURGH.—April 22.—For erection of two two-storey cottages for attendants at Dechmont village, Uphall, for the Edinburgh District Board of Lunacy. Messrs. Peter Lawrence & Co., surveyors, 50a Frederick Street, Edinburgh.

EDINBURGH.—April 27.—For the following works in connection with the construction of new science laboratories at George Heriot's Hospital, for the Governors, viz.:—(1) Excavator, mason, and brick work; (2) carpenter, joiner, and glazier work; (3) plumber work; (4) slater work; (5) plaster and concrete work; (6) painter work. The Superintendent of Works, 20 York Place, Edinburgh.

ELTHAM.—May 3.—For the erection of Eltham new Post Office, Kent, for the Commissioners of H.M. Works and Public Buildings. Deposit 1*l.* 1*s.* The Postmistress, Eltham, and H.M. Office of Works, Storey's Gate, London, S.W.

THE BUILDING TRADES EXHIBITION.

THE bold step of transferring the venue of the exhibitions dealing with the building trade from Islington to Kensington has been amply justified by results; and for the third of the new series (which will be officially opened by Mr. Leonard Stokes, P.R.I.B.A., to-morrow), the promoters have had the pleasantly disagreeable duty of refusing applications for space. This increasing keenness in the demand for stands is the surest proof of the benefits, either direct or indirect, which exhibitors find they derive from their expense and trouble. The right class of visitors are also being attracted in increasing numbers. It will be found that the 1911 exhibition is second to none of its predecessors. We are enabled to give this week an account of a few of the many stands.

As roofing specialists of practically a century's standing, Messrs. Roberts, Adlard & Co., Bermondsey Wall, S.E., have every reason to so design the roof of their stand as to demonstrate the practical effect of various covering materials. The exhibit should serve a useful purpose in revealing to visitors the wide selection which is at the disposal of house-builders for covering their roofs, as well as in showing work like wall and floor tiling, slate masonry, oak shingling, &c. Messrs. Roberts, Adlard & Co. have included reproductions of old tiling under the names of "Antique" and "Sussex Valley," and these may be compared with the genuine old tiles or with colour-glazed tiles displayed on screens inside, or with their hand-made roof tiling. There are, of course, several kinds of slates, such as "Eureka" green, "Viking"

green, and "Permanent" green English slates, "Penryn" variegated, Bangor and Portmadoc. Another covering shown is Racephas, which is a stone slating suitable for high-class work; it has varying tones, and is quarried in its natural beds. The possibilities of slate masonry are suggested by a slab 8 feet by 7 feet by 2 inches thick, which was specially quarried for the exhibition. Other branches of the firm's work are seen in the wall-tiling and the floor-tiling, the specimens of slate for electrical purposes, enamelled slate, and green and silver-grey slate-slabs.

Messrs. Osler, Ltd., 100 Oxford Street, W., have an interesting exhibition of electric fittings, essentially English in character, and embracing styles from Gothic to late Georgian times. The development begins with a beautifully-executed electrolier in wrought iron, suggesting fifteenth century Gothic. Next comes a dining-room corona fitting, also in wrought iron, which gives evidence of a careful study of Elizabethan strap-work. The Stuart period is represented by a 2-foot sconce, finished to represent old silver. The late English Renaissance is recalled by some charming adaptations of old silver work. The needs of the decorator have been provided for in the creation of types harmonising with the various eighteenth century styles associated with Chippendale, the Brothers Adam, Sheraton, and others. In the revival of crystal glass chandelabra, Messrs. Osler use their experience of over a century to turn out some beautiful models. A reproduction of an old Waterford glass chandelier is of special interest. For metal filament lamps they have produced cut-glass bowls mounted in metals, which convert the glare into a perfectly-diffused light. Altogether this exhibit is one of real interest, showing as it does that the work of the modern craftsman can sometimes emulate that of the old. Great credit is due to the enterprise of Messrs. Osler and to the versatility of Mr. Herbert Papper, their art director.

lown nineteen years ago are still perfectly sound and reliable, as the materials used cannot deteriorate. These floors have made considerable progress in this country since they were exhibited at Olympia four years ago. Two recent contracts are for the new county asylum at Whalley, Lancs., and for a building in course of erection for the Calico Printers' Association in Manchester, which together represent a floor area of more than fifteen acres. It may be mentioned that all work is carried out by the Syndicate and that all material and labour is British.

As the Exhibition may be opened from their stand, the *Expanded Metal Company, Ltd.*, of London and West Hartlepool, have erected an unique construction so far as exhibitions are concerned. The stand, No. 156, Row G, is situated near the Addison Road entrance, the position that the Company has always occupied at Olympia. The exhibit is of reinforced concrete throughout, no structural steel framework having been used, and it shows on a limited scale the application of expanded steel reinforcements for concrete work and expanded metal lathings for plaster work. It comprises full-size examples of reinforced concrete column footings, columns,

beams, stairs, floors, arches, and roofs, the whole being in the form of a building as here shown. The method and arrangement of the reinforcement is clearly displayed. The well-known diamond mesh expanded steel, together with a more recent product—a rib mesh expanded steel—is used as reinforcement for floors, walls, and stairs, while expanded steel bars are used for columns, beams, &c. A hollow and a solid monolithic plaster partition on the expanded metal system are shown, together with a novel application of a suspended ceiling to a reinforced concrete floor. The exhibit shows incidentally that if skilfully handled reinforced concrete on the expanded metal system is an exceedingly rapid method of construction. The shuttering or timber formwork was commenced on Monday, April 10, and will be removed and the stand finished and made ready for opening day, April 22, within thirteen days in all, including Sunday and Easter holidays.

The Calmon Asbestos and Rubber Works, Ltd., Tower Hill, E., have constructed a neat little asbestos bungalow with exterior and interior walls and ceilings covered with "Calmon" asbestos slate sheets, and the roof covered with "Calmon" asbestos slate tiles. The sheets are fixed to a framework of uprights and cross-pieces, and the joints of the exterior lining are covered with strips. The general appearance is similar to half-timbered style. Asbestos slate buildings are erected to a very great extent in the colonies, where they are gradually taking the place of corrugated iron, on account of the non-conductivity of the material, and the fact that it does not corrode by the varying influences of temperature. There is a growing demand also for "Calmon" asbestos slate manufactures for the home trade, and hundreds of roofs of dwelling-houses, skating rinks, drill halls, workshops, barracks, &c., &c., are covered with "Calmon" slates. The sheets are chiefly utilised for ceiling work and wall lining.

One of the most striking novelties at Olympia will be provided by the Stand of *Thos. Parsons & Sons*, the well-known Varnish and Enamel Manufacturers, who are making their first appearance at the Building Trades Exhibition. This original stand represents the fore part of a modern battleship, and every care has been taken to render the model as

accurate as possible. At the back, tier upon tier above the upper deck, are conning tower, chart house and upper bridge; below, on the main deck, which forms the floor of the stand, is the barquette with its pair of heavy guns. Other guns—quick-firers—protrude from behind the armoured bulkhead which supports the upper deck. The spacious reception room is arranged at the back of this bulkhead, and here will be shown a whole range of samples, panels, &c., which could not be displayed outside the stand without spoiling the effect. A prominent display will, of course, be made of "Endelline" and "Endelflat"—enamels which have gained much favour in the high class decorating trade—and some new colours may be looked for, notably a particularly brilliant and permanent green, to which the name "Leaf Green" has been given. "Lacreite," the low-priced enamel from which, however, excellent results may be expected, will also be a strong feature; and with a good exhibit of varnished work, specimens of "Mosaico" Metallic Paint, and sample panels illustrating the obliterating power of the new lead-free undercoating "Opako," the show room should be well worth a visit from any one—whether architect or painter—interested in house-decoration. The stand itself is finished in white enamel—"Endelline"—and attention is drawn by Messrs. Parsons to the very large plain surfaces which have had to be covered, and the circumstance that the enamel is displayed on the flat where it can be examined as easily as on the round.

Messrs. Walter Carson & Sons are in Row K, No. 222, where they have twice the space taken at the last Exhibition. A special feature is made of "Coverine" Flat White Undercoating. This paint has met with great success, and is worthy of the painter's attention. Trade users are invited to visit the stand and try "Coverine" for themselves. A panelled screen erected in the centre displays decorative flat japans of various colours. A flat white enamel suitable for the interiors of hotels, &c., is also to be shown. Glazed sash bars showing "Plastine" against genuine linseed oil putty, after twelve months' exposure, will be on view. The results can also be observed of employing "Vitrolite," "Coverine," and "Japolite" on bare wood. The firm's high class decorators' varnishes and colours (dry) are also shown.

Messrs. James Latham, Ltd., 124 Curtain Road, London, whose interesting exhibit has previously been in the Annexe, have secured a more important position in Row H, 161, in the Main Building not far from the Addison Road entrance. This eminently practical exhibit should not be overlooked by either architect or builder; for to some excellent figured mahogany, oak, walnut and teak are added striking examples of lower priced teak and mahogany, which seem most reasonable at the prices quoted. In one of these woods called "Mahoborn," some finished doors, newels, handrails, and a small shop front show its practical utility. Among other good lines are examples of English oak squared up ready for use as well as wide quartered boards and floorings for church work. The mouldings from this firm's Mahtal Mills have a degree of finish which points to up-to-date machinery. Three ply boards in all woods, and in a variety of sizes look very useful for panels and similar work. The marqueterie work for panels, facias, and stall boards, &c., and the hard-wood veneers will appeal to shop-fitters and decorators generally.

Messrs. Chance Brothers & Co., Ltd., give an excellent idea of the comprehensive uses of glass for modern building purposes. They show Vitreous Glass Tiles for walls and floors, fireplaces, &c.; panels showing tile schemes in various colours and sizes, and also wall and floor mosaics in similar material. The casements glazed in Flemish glass in large and small patterns display a distinctive type of ornamental glass which for elegance and effectiveness is unique for the best class of work. Lovers of old glass will be interested in the small lights with Old English Crown Glass and genuine Crown Bullions. This glass is still made, but only by the exhibitors, according to the actual mediæval process, and is therefore the genuine Old English Crown, which has never been equalled for its surface. Mention should also be made of the samples of Extra White Double Rolled Cast glass, specially adapted by its pure whiteness for studios, picture galleries, and the best work in roof glazing. The exhibit finally includes samples of Muffled, Figured Rolled, Cathedral, Plain Rolled and Rough Cast Plate and other glass. On this stand will also be shown the Maximum Daylight Glass, supplied by the Maximum Light Window Glass Co., of 28 Victoria Street, S.W.

Messrs. C. Jennings & Co., Bristol, show a wide variety of timber goods. These include a flight of stairs; deal and hardwood doors panelled and for glass; round turned and square

cut newels and balusters; garden gates; fretcut grilles; arches and balcony balusters; a shop front; fencing; windows and mantelpieces in deal and hardwood; mouldings; electric light casings, and woodwork of various descriptions. The "Smokure" chimney pot must not be omitted from the list. A souvenir rule—four-fold, brass jointed—will again be sold at 7d. each. C. Jennings & Co. manufacture doors, windows, and other joinery to compete for export to any part of the world.

Messrs. Davis, Bennett & Co., Horseferry Road, S.W., have arranged four model bathrooms similar to those fitted at the Carlton Hotel, Hotel Cecil, and other hotels. These bathrooms are fitted up in various styles, and show what can be obtained for an outlay ranging from 12l. to 100l. There is a similar choice for different purses in the various forms of water closets and urinals. Specimens are also included of tiling, marble wall-linings, sinks, hospital sanitary appliances, and lavatories, suitable for ships, mansions, hotels, clubs and artisans' dwellings.

The Standard Range and Foundry Co., Ltd., Watford, Herts. (London showrooms, 106 New Bond Street, W.), have arranged their stands as an old English oak panelled room, decorated with antique copper interiors and hoods, together with some of their high-class wrought iron work. The interiors and stoves are fitted with the successful patent "Burkone" fire, which is the *pièce de résistance* of the exhibit. About a dozen suites of chimney-piece and interior suggest what can be done to meet the demand for both expensive and cheap property. In addition to this they are showing a municipal combination heating and cooking stove, which has been supplied to many Corporations, week-end dwellings, &c. They have also a new invention, a combination of portable copper and bath heater. This is an ingenious idea, whereby the ordinary domestic copper not only performs the ordinary duties, but will, when occasion demands, supply hot water to sink and sufficient hot water for a bath on the next floor. This patent is to be known as "The Conqueror" combination copper and bath heater. Besides the foregoing, a selection of brassfoundry and ironmongery, and a quantity of mantel registers designed by prominent architects and artists will be shown.

Messrs. John Daymond & Son, architectural sculptors, Vauxhall Bridge Road, S.W., include in their interesting exhibit models for stone carving executed on buildings; polished specimens of coloured marbles and varieties of onyx for decorative and constructional purposes, pilasters, dados, &c.; and a carved Adam's vase in Portland stone. The firm, being carvers and modellers as well as architectural sculptors, show modelling in stucco for interior and exterior decoration: ecclesiastical and domestic hardwood, joinery, and fibrous plaster enrichments for ceilings and cornices. Architects will be attracted by the sketch and scale models of details and portions of buildings and church fittings, and the models and patterns for casting in bronze, and other metals. Figures of a shepherd and shepherdess in cast lead recall a once-popular form of garden ornament.

The New Hopton-Wood Stone and Marble Company, Ltd., Middleton-by-Worksworth (whose London representatives are Messrs. John Daymond & Son), show a fountain and moulded kerb in several varieties of Hopton-Wood; a polished chimney-piece with hearth and kerb complete in Hopton-Wood marble, and several large polished sample slabs. The rough block direct from the quarries with various faces polished and dressed, and the scale section of quarry showing the various beds, are both interesting items. There are specimens of balustrading, step, floor, dado, &c., and examples of rough and squared walling, setts, kerb, channeling to show the applicability of the firm's material to different uses.

(To be continued.)

ITWYFORD'S "J" CATALOGUE.

It may be confidently expected that a firm of the prominence of Twyford's, Ltd., will produce a catalogue that in size and quality should be no less ornamental than it is useful. These two merits are obtained in a high degree by their latest general "J" catalogue, which is an extremely handsome volume calculated to be of real service to the architect, the builder, and to all others interested in such matters. In arrangement it is most remarkable for orderliness. The various sanitary appliances are grouped under eight headings, each of which has a projecting tag so as to enable the desired section to be turned up at once. The headings are (1) baths, (2) lavatories, (3) water-

closets, (4) urinals, (5) sinks, (6) bidets, (7) specialties, and (8) accessories. Each of these sections is introduced by short descriptive notes which should help in the difficult matter of making a choice. There is one point made which may here be mentioned for the guidance of customers. Messrs. Twyford's say that to ensure the metal accessories and other component parts of the sanitary goods fitting properly it is advisable to order the fixtures complete, because in this case each combination is carefully assembled at their works, tested, and any necessary adjustments made before dispatch.

Sanitary potters have a rare opportunity in the manufacture of baths, for turning out goods of irresistible attraction. There always seems to be something fascinating about a highly finished bath, and this is felt in merely looking at the catalogue pages. The baths are made at the Hanley works in both fireclay and cast iron. The former material is, of course, the most highly recommended; and many new and finely modelled designs are shown in "Adamant" fireclay for floor, plunge, shower, foot, and sitz baths. But for those to whom first cost is the governing factor there is a wide range of choice in baths of cast iron white enamelled inside and on the roll, but with the outside left plain for painting.

The longest section in the catalogue is that devoted to "C V" earthenware and "Adamant" fireclay lavatories. The introduction of plain roll rims has produced lavatories which are stronger, cleaner, and more attractive in appearance than the older kinds. Several handsome and novel patterns are given of pedestal lavatories, of which there is an increasing demand. For those who prefer metal supports either shaped as wall-brackets or as cast iron stands, the catalogue gives a wide range of choice, as also in the matter of wastes and overflows, taps, and supports. Special attention is drawn to the fine and extensive selection of their lavatory ranges. To meet the technical difficulty in the production, to exact dimensions, of these large pieces of pottery, a large staff of skilled engineers and masons is employed to carefully adjust the parts prior to installation, and so substantial savings are ultimately effected in plumbing and labour charges for fixing.

In the introduction to the water-closet section particular notice is paid to the "Syphonic" and "Valve" patterns. For the latter an earthenware enclosure replaces the old-fashioned insanitary wooden casings; but the cost must preclude its general adoption. Another important department of the firm's business is in the manufacture of urinals, for these are to be seen all over the world. The prices will, in many instances, be found considerably lower than in their previous list.

Space precludes us from entering into the concluding sections of this monumental *catalogue de luxe* of Twyford's, Ltd.

PROPOSED WORKS AT JOHANNESBURG.

H.M. TRADE COMMISSIONER for South Africa (Mr. R. Sothorn Holland) has forwarded to the Board of Trade a copy of a report by the Finance Committee of the Johannesburg Municipal Council, which includes a statement of the estimates not yet voted of expenditure on municipal public works during the five years 1911-15. The total estimates amount to 2,375,285l. The following are among the more important items:—Town Hall buildings, 231,241l.; Art Gallery, 20,000l.; swimming bath, 7,870l.; market at Newtown, 56,460l.; laying out and improvement of parks and estates, 54,715l.; Fordsburg bath and wash houses, 10,000l.; refuse destructor for Eastern suburbs, 16,630l.; intakes and pipe lines, 13,258l.; municipal compounds, 17,000l.; compounds for native housing, 30,000l.; abattoirs, 28,600l.; live stock market extension, 15,000l.; electric power and lighting, 289,680l.; electric tramways, 298,236l.; water supply, 100,000l.; fire stations and plant, 37,000l.; road construction, 120,000l.; bridges and subways, 132,487l.; kerbing and guttering, 166,782l.; sewerage and storm water drainage, 547,000l. Towards this expenditure it is proposed that borrowing powers shall be obtained to a total sum of 500,000l., and that a loan of 250,000l. shall be raised at once.

THE South Westmorland Rural District Council have instructed Mr. Harry W. Taylor (Messrs. Taylor, Wallin & Taylor), of Newcastle-upon-Tyne, to advise them as to the best means of dealing with the sewage of Arnside. The present sanitary arrangements of this seaside resort are not proving satisfactory.

VARIETIES.

PLANS for a mission church at Maltby, to accommodate 500 persons, and to cost about 2,000*l.*, are being considered, and the Maltby Main Colliery Company have given a site.

COMPETITIVE designs are invited up to July 31 from architects within New Zealand for the proposed new Parliament buildings to be erected at Wellington.

A NEW Primitive Methodist church, with seating accommodation for 500, is to be erected at Barrow Hill, Staveley, at a cost of 1,500*l.*

THE Newcastle City Council have deferred for further consideration the proposal to lease 300 acres of the Walker Estate to Co-Partnerships Tenants, Ltd., for development.

THE Pontefract Town Council have decided to provide new baths for the town, including public swimming and children's baths, and slipper and Turkish baths, at a cost not to exceed 4,500*l.*, on the west portion of the Headlands Estate.

THE friends of the late Mr. J. Howard Colls have raised a memorial fund, and with it are about to endow permanently a cot in the surgical ward at the Evelina Hospital for Sick Children, Southwark Bridge Road, an institution of which Mr. Colls was for many years a generous supporter.

ARRANGEMENTS are being made for the deputation from the municipalities of Winnipeg, Montreal, Quebec, Toronto, Edmonton, and other cities in the Dominion of Canada, which visits this country in June and July in connection with the Coronation festivities, to inspect several of the English garden cities and especially the suburbs.

THE Penzance Town Council have come to an agreement with a syndicate in respect of the proposed pavilion. This stipulates that the minimum expenditure shall be 3,500*l.*; the building completed within fifteen months; a lease of seventy-five years should be granted by the Council; the rent to be 45*l.* a year.

A PUBLIC elementary school for about 500 Roman Catholic children is to be provided at Titchfield Street, Liverpool. The Elementary Attendance and Statistical Sub-Committee have had notice of the intention to provide the school, and they have no objection to offer.

A LOCAL GOVERNMENT BOARD inquiry was held last week at Limerick into an application of the Borough Council for a loan of 16,515*l.*, with the object of erecting workmen's dwellings in the city. It was stated that the indebtedness of the Corporation was close on 92,000*l.*, and it was proposed to build seventy-two houses.

THE Cockpen School Board have finally resolved to erect a school in Polton Street, Bonnyrigg, to accommodate 500 scholars at a cost of about 5,200*l.* The plans of Mr. James Gray, architect, Bonnyrigg, have been approved by the Scotch Education Department and the Bonnyrigg Town Council. A tender has been accepted for the work.

THE Southend-on-Sea Corporation municipal undertakings for the past financial year show a profit of 10,000*l.*—6,000*l.* on electricity, 3,000*l.* on the pier, and 1,000*l.* on the trams. This means that the district rate will remain the same as last year's, 3*s.* 4*d.* in the pound, although sewage and other public works are now going on which will involve an outlay of 264,000*l.*

THE annual business meeting of the Architectural Section of the Royal Philosophical Society of Glasgow was held last week at 207 Bath Street, Glasgow. Mr. Robert Miller, F.R.I.B.A., was elected president, and Mr. James Davidson, F.R.I.B.A., and Mr. Wm. Forbes were elected vice-presidents. The hon. treasurer, Mr. J. G. Renwick, and Mr. Stephen Adam, hon. secretary, were re-elected.

A BUSINESS meeting of the Associates of the Edinburgh Architectural Association was held at 117 George Street, Edinburgh, last week, Mr. W. J. Walker Todd in the chair. The report stated that a satisfactory and profitable session had just concluded. Twelve new members had been admitted and four had resigned. Mr. Todd was elected chairman for the ensuing session; Mr. Sydney H. Miller vice-chairman, and Mr. Arthur Prideaux hon. secretary.

THE trustees of the Hospital of St. Cross, Winchester, have accepted the tender of Messrs. Thompson and Sons, of Peterborough, the builders engaged upon Winchester Cathedral, for the re-conversion of the Master's old house in the quadrangle into ten more dwellings for brethren under a scheme approved by the Charity Commissioners. This house was occupied by brethren in pre-Reformation days.

The number of brethren is to be increased to twenty-seven. In ten years the revenues of the hospital have nearly doubled, and next year will be close upon 8,000*l.*

AT the last sitting of the Glasgow Dean of Guild Court the most important amongst the linings granted was one for the new buildings at Yorkhill for the Royal Hospital for Sick Children, the plans for which were approved. Linings were also granted to Edward Watson, fletcher, 170 Argyle Street, to take down existing buildings and erect a tenement of shops, warehouses, and offices in Union Street, Argyle Street, and Mitchell Street; J. G. Carrick & Co., tinsmiths, to make alterations and additions to their works in North Wallace Street; John Lyle & Co., carpet manufacturers, to build additional weaving sheds in Fordneuk Street.

THE Council of the Surveyors' Institution have accepted an invitation from the Lancashire and Cheshire Committee of the Institution to hold the next country meeting at Liverpool on May 25 and 26. Visits have been organised to various works and places of interest in the locality for the afternoon of the 25th, including a trip by steamer to view the River Mersey, the docks and shipping, and a visit to the Cathedral, Queen's Drive and Calderstones Park, Dock Offices, Tobacco Warehouses, and the Grain Silo. The following excursions have been arranged for the following day:—1, Excursion to Port Sunlight and the Cheshire County Council Small Holdings at Ledsham. 2. A visit to Chester, Eaton Hall, and the River Dee.

THE Lancaster parish church vestry have decided upon a scheme, involving the remodelling of the chancel, for which a faculty is to be applied for. The whole of the floor of the church is to be asphalted, to prevent the rising of noxious gases from the bodies buried beneath; the heating apparatus is to be renewed, and the ancient stalls in the sanctuary re-arranged. Forty-two sittings will have to be sacrificed, but the loss will be more than four times covered by bringing the King's Own memorial chapel into use. The total cost is estimated at 3,300*l.*, of which 1,200*l.* has been raised.

AT a meeting of the sub-committee of the Upper District of Renfrewshire in charge of the Eastwood and Mearns water scheme 19 tenders for the work of providing an additional supply of water from the Bannan Loch, in the parish of Eaglesham, were considered, the lowest being that of Messrs. James Kinniburgh & Co., Ltd., 111 Union Street, Glasgow, amounting as checked to 19,209*l.* with sand filters and 18,326*l.* with mechanical filters. The sub-committee unanimously agreed to adopt sand filters, and to recommend the acceptance of the offer of Messrs. Kinniburgh, the work to be completed within 17 months from the date of the acceptance of the tender.

SIR ALFRED EAST, President of the Royal Society of British Artists, a short time ago offered to present to his native town of Kettering a representative collection of his works. In a letter to the Kettering District Council Sir Alfred said he should like to do it for two reasons—for the love he has for the old town, and also as an expression of gratitude for his recent recovery from a very serious illness. He should regard the collection as a memorial, and would see it was worthy both of the Council's acceptance and of his reputation. The Council on Saturday agreed to accept Sir Alfred East's offer, and to properly house the collection.

H.M. MINISTER at Buenos Aires reports that the Argentine Budget for 1911 makes provision for the expenditure of 100,000,000 pesos (about 8,750,000*l.*) on various public works, the chief items being as follows:—Building and furnishing of new Law Courts, 6,000,000 pesos (about 525,000*l.*); construction of new General Post Office, 1,000,000 pesos (about 88,000*l.*); new port at Mar del Plata (see *Board of Trade Journal* of January 5 last, p. 15), 6,818,182 pesos (about 597,000*l.*); construction work on various railways already being built, and beginning of lines (1) from San Juan to Jachal and (2) from Villa Dolores, Cordoba, to San Luis, and rolling stock, &c., 45,454,545 pesos (about 3,977,000*l.*); construction of military barracks, 2,000,000 pesos (about 175,000*l.*); construction of the port of Quequen, 1,818,182 pesos (about 159,000*l.*); extension of water supply and drainage works in Buenos Aires, 9,000,000 pesos (about 788,000*l.*); water supply and sanitary works in several towns in the provinces, 6,000,000 pesos (about 525,000*l.*); construction of immigrants' hotels and homes, &c., 3,000,000 pesos (about 263,000*l.*). H.M. Minister adds that it is impossible to say at present which of the public works authorised by the Budget will be carried out during this year. A copy of the Budget (in Spanish) may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

THE HYGIENIC ASPECTS OF ILLUMINATION AND RECENT PROGRESS IN ILLUMINATING ENGINEERING.*

By LEON GASTER, Editor of "The Illuminating Engineer."

DAYLIGHT and artificial lighting together constitute a very wide subject. Some of us are concerned mainly with the production of light, the manufacture of electric lamps, incandescent mantles, &c.; others, again, are mainly interested in its appropriate use and distribution; but there are certain aspects of the subject which should be of special interest to architects, surveyors, and sanitary engineers, and with some of these I propose to deal.

Almost everyone, whatever his vocation, has to consider the use of light. The school-teacher, the librarian, the shop-keeper, and the business man are all bound to consider with circumspection the lighting of their premises, and the whole nation is intimately concerned with its direct bearing upon health. Sir James Crichton Browne, in an address delivered before the Manchester Sanitary Association in 1902, laid stress on the very close connection between conditions of illumination and general health. He pointed out, what has since received emphatic confirmation, that abundant light is one of the most potent weapons with which to combat the scourge of consumption, and that dark and dismal interiors, where the access of daylight is poor, are invariably breeding places for disease; and he quoted in this connection the Italian proverb, "Where the sun does not enter the doctor comes."

The truth of this proverb is recognised even more fully to-day. The beneficial effects of free access of daylight in preventing consumption, promoting cleanliness, and generally acting as a destroyer of germs, is being insisted upon by those responsible for factories and workshops. The most recently issued report of H.M. Chief Inspector of Factories in this country lays stress on the evils of badly-lighted underground premises. In Holland it has already been recommended that young people must not be employed in any workshops which require artificial lighting between 9 A.M. and 3 P.M. And, in addition, employers everywhere are becoming aware that people work better and more cheerfully, and waste less time in sickness in well-lighted surroundings than they do under conditions which are dim and dismal.

An excellent comment on the widespread appreciation of the need for light is contained in the charming play by Maeterlinck—which some of you here have doubtless seen—"The Blue Bird." In the play, "Light" is constantly referred to as the Friend of Man. It is she who acts as guardian to the children, and who comes to their aid when dangers threaten. Unlike "Bread," "Milk," "Fire," "Water," and the other creatures who only serve under compulsion, she gives willing service. It will be recalled, too, that it is in the Palace of Night, which is free from her beneficent presence, that Fear and Disease and all the other horrors flourish.

We are accustomed to think of light from the standpoint of its use in industry in enabling us to carry on our daily work. But physiologists go further than this. They assert that the ordinary physiological processes of the body, our respiration, the functions of the skin, even our heart-beats, are directly influenced by light. It may well be suggested, therefore, that all the while there are going on processes in which light plays a part—processes of which, possibly, we are unaware, but which, nevertheless, are of the utmost hygienic consequence. We all know, moreover, how susceptible our frame of mind is to climatic conditions; a long spell of rainy or foggy weather invariably leads to depression. People whose occupation precludes them from enjoying their full share of daylight are notoriously apt to take a sad view of things, and the gloomy mental aspect of the night watchman has become proverbial.

There is also one other point on which I may comment here, namely, the effect of good illumination in promoting cleanliness. Naturally, if things cannot be properly seen, it is very difficult to avoid the accumulation of dust and that "matter out of place" which Dr. Johnson has defined as dirt. The sanitary engineer, therefore, who is closely concerned with preventing dirt, is also necessarily interested in preserving good illumination. In this connection I may quote a paragraph from the most recently issued report of H.M. Chief Inspector of Factories (1909):—"The import-

ance of adequate lighting in industrial employment is obvious; as a matter of safety, especially where dangerous processes are carried on; as bearing upon health in many ways, directly and indirectly, and as a condition of efficient work. On the health side it is hardly necessary to point out that inefficient illumination entails risk, strain, and ultimate damage to the sight, even apart from interference with work, or that it tends to neglect of cleanliness and adds to the working in poisonous materials, or that it increases the need for artificial light, which can seldom be as satisfactory as daylight."

In passing I should like to lay special stress on the fact that rooms, utensils, and appliances are not readily kept clean if there is not abundant access of light, and it has been pointed out that in factories badly-lighted machinery is particularly apt to be neglected and allowed to become dirty, thus leading the way to accidents and breakdowns.

In the same way, one may urge that in places where food and drugs are prepared, and much cooking is done, abundant illumination is a necessity; otherwise the utensils will not be properly cleaned, and the food itself may not reach that standard of purity which we expect in well-lighted kitchens or factories.

One specially interesting example of the effect of bad lighting is its effect on personal cleanliness. Here, again, lack of proper illumination may lead to neglect, not only because people become careless about what cannot be readily seen, but also because matters of cleanliness escape their own observation. This is of special importance as regards children, whose health has been shown to be intimately connected with clean conditions.

A very interesting paper on this subject was recently contributed in "The Medical Officer" by Dr. J. R. Currie, Medical Officer of Health in Chester, who presented statistics, gathered in the schools of that city, showing the relation between cleanliness and defects of vision. Good sight and cleanliness, he pointed out, always occur together. Does not this enable us to substantiate doubly our claim for good illumination?

Insufficient illumination is apt to lead to neglect of personal cleanliness; it is also a natural cause of eye-strain on the part of children who do not receive sufficient light to see their task clearly. Probably, therefore, closer attention to the conditions of illumination in schools might lead to an improvement in both respects.

Progress in Artificial Illuminants.

In the time at my disposal I can only briefly indicate a few of the problems which are confronting lighting engineers at the present day, and it is not possible to enter into the engineering aspects of different illuminants in any detail. It may, however, perhaps be of interest to you if I recall some of the chief developments in artificial methods of lighting of the last few years.

Perhaps few of those whose daily work does not bear on lamps and lighting realise how very rapid the recent progress has been.

(To be continued.)

IN the *Carpenters and Joiners' Monthly Journal* for April, Mr. T. W. Wilson, M.P., gives in his notes a table, which shows the value of wooden house frames, fittings, and joiners' work imported into the United Kingdom, and the percentage of unemployed among trade union carpenters and joiners in the United Kingdom in the years 1900-10. The total value of the joinery imported in 1910 was 205,428l., being the lowest (with the exception of the previous twelve months) since 1900, and percentage of carpenters and joiners returned as unemployed was 8.2. In 1900 the respective returns were 1,195,314 l., and 2.2. Mr. Wilson adds the comment: "The figures are official, and, if carefully studied, will supply food for serious thought."

THE Brilliant Sign Co. (1907), Ltd., 38 Gray's Inn Road, W.C., inform us that they have recently installed a press in Antwerp for making brilliant letters and large fascia signs, and have also opened a showroom in Brussels. The business has increased to such an extent in the United Kingdom and elsewhere that they have found it necessary to extend their London factory a further 225 feet, making room for another 100 men. The Company's new catalogue is in the printers' hands at the moment, and will be ready for distribution at the Building Trades Exhibition. This catalogue will have 64 pages, and be quite up-to-date, with innumerable designs of smart signs and fittings suitable for the building trade.

* A paper read before the Institute of Sanitary Engineers on Monday, April 10.

THE BUILDING TRADES EXHIBITION.

IN the absence through illness of Mr. Leonard Stokes, President of the Royal Institute of British Architects, the biennial Building Exhibition at Olympia was this year formally declared open on Saturday by the organiser himself, Mr. H. Greville Montgomery, J.P.

Some 150 well-known architects were present, and made a tour of inspection round the Hall. At the inaugural luncheon which followed Mr. Arthur Keen, F.R.I.B.A., President of the Architectural Association, said:—"I understand this to be an informal gathering, at which speeches are not generally called for, but there is one speech which I feel should be made. In the absence of Mr. Leonard Stokes, I am sure that I express the feeling of all present in thanking Mr. Montgomery for his hospitality to-day and in wishing all success to his Exhibition. That it will be a success goes without saying, for each one of the series has excelled its predecessor; and, as far as one can judge from a hasty inspection, this Exhibition tops the lot. In conclusion, I can only again wish it all success, and express our thanks to Mr. Montgomery." Mr. Ernest George, A.R.A., F.R.I.B.A., seconded the vote of thanks to Mr. Montgomery, and said that it was a great pleasure to him, when President of the Royal Institute of British Architects, to open the Exhibition of 1909. The toast was received with acclamation and spontaneously accorded musical honours. In reply, Mr. Montgomery thanked Mr. Arthur Keen and Mr. Ernest George for the kind things which they had been good enough to say about him and his Exhibition. The proceedings were somewhat out of joint because Mr. Leonard Stokes, President of the Royal Institute of British Architects, who was to have opened the Exhibition, was unfortunately prevented by illness from doing so, but he was sure that all present would join in wishing him a speedy recovery. As the proprietor of the Building Exhibition, he (Mr. Montgomery) was perhaps in a better position than anybody else to gauge the present position and prospects of the building trade. There was, to his mind, a distinct break in the clouds. The sign might be no bigger than a man's hand, but, despite Form IV. and the Dartmoor shepherd, it was clearly to be seen. Doubtless, with him the wish was father to the thought, but he felt confident that his hearers would two years later admit him to have been a wise prophet. Mr. Montgomery concluded by thanking his guests for the very keen interest which they had shown in his Exhibition.

G. R. Speaker & Co., 29 Mincing Lane, E.C., have a wood-framed pavilion, or imitation half-timbered Elizabethan cottage, which has been designed and erected by their own staff to display the possibilities of "Eternit." "Eternit" sheets on a wood frame make the walls, and these are panelled inside with "Eternit" veneered sheets for parquetry, which have a most decorative effect. "Eternit" asbestos cement tiles, 11½ inches by 11½ inches by 9-64 inch, and laid with a 2½-inch lap, form the roof. It is found this slight lap is sufficient for all ordinary purposes owing to the level surface and perfect finish of the tiles. This patent roofing advantageously competes with Ruabon or Broseley tiles, and is only one-seventh their weight, averaging about 21 lbs. per square yard. After three months' exposure the material becomes impervious, indestructible, and as hard as iron. The tiles are sold in grey, blue, and terra-cotta, and may be fixed in three different patterns, as directed in the firm's "Hints for Fixing for Foremen."

It is not sufficiently recognised that this country still possesses a wealth of timber adequate to the needs of constructors, a fact which might well give them cause for consideration when making their selection. Proof in support of this contention is afforded by *Messrs. William Oliver & Sons, Ltd.*, 120 Bunhill Row, E.C., who have boldly brought together a special English lumber section. This firm occupy two stands, near the entrance, displaying various grades of woods. The outstanding feature is that two-thirds consists of English and one-third of foreign woods. Two solid trees, one of brown oak, one of yew, are also shown, as well as two trees cut into boards and sticked ready for open-air drying. The English woods include wainscot oak, hornbeam, walnut, sycamore, oak, elm, &c. These woods can be purchased, *Messrs. Oliver & Sons* assert, equally as cheap and as good as the foreign varieties. It seems regrettable that greater encouragement is not given to British forestry by the more general specification of English timbers.

There are, we believe, three new specialities on the stand of *George M. Callender & Co., Ltd.*, 25 Victoria Street, S.W., viz. "Ledkore," "Veribest," and "Roofelite." The first is a dampcourse composed of a core of laminated sheet lead, covered on each side with a pure natural bitumen containing no coal-

tar or pitch. "Ledkore" is both tough and pliable, and any of its three grades should be entirely impervious and permanent. The roof of the office on the stand is covered with "Veribest" rubber roofing, which is made in one, two, and three ply. This pliable and odourless material can be used without any further coating; it is acid and alkali proof, and is unaffected by gases or vapours. Here it is covered with "Roofelite" waterproof paint, which improves the appearance and adds to the durability of most roofs. It is made in black, red, grey, and green, and one gallon will cover 250 square feet in one coat. "Protex" is a black mineral rubber paint of remarkable adhesiveness, which defies acids, water, and variations of temperature, and is specially valuable as a bond and waterproofing beneath the plaster on a damp wall or between plaster and paper or under floors and floor coverings. Two more familiar exhibits are "Callendrite" pure bitumen sheeting, and "Callendrite" pure bitumen dampcourse. Both these have been in use for a great number of years in many parts of the world. A small reservoir illustrates the original system of waterproofing as invented nearly forty years ago, and the column of loose bricks in the centre shows the efficacy of the dampcourse.

The picturesque bungalow of the *British Uralite Co.* (1908), 85 Gresham Street, E.C., shows the adaptability of the company's manufactures. The walls are of asbestos sheets, 6 feet by 3 feet, nailed direct to a wood framework. The ceilings are Uralite sheets, in one part fixed direct to the joists so as to give a plain flat surface, and in the other fixed above the joists, giving a picturesque half-timbered effect. Asbestos diagonal tiles nailed to battens make the roof, and the verandah is covered with water-proofed Uralite. Both Uralite and Asbestone are supplied in all sizes up to 6 feet by 3 feet, and in thickness from ½ inch to 1 inch; the most usual thickness is ¾ inch. Being fireproof and quickly erected, Uralite is much in favour for bungalows and portable huts, as well as for more permanent structures.

The Yockney and Hartham Park Stone Co., Ltd., show specimens of the various kinds of stone they quarry, together with worked examples. The varieties include Yockney's Corsham Down, Hartham Park, "Ridge Park," "Copenacre Box Ground, Corngrit, and "Pulpit Bed." Each of these has its own special merits. "Ridge Park" (registered), for instance, is one of the strongest freestones obtainable in the Bath district and is especially recommended for trying atmospheric conditions. On the stand an entrance door-way frame has been erected in this material. Copenacre Box-ground is warmly recommended for weatherings and projections in exposed positions. Corngrit is chiefly used for weight carrying purposes and interior work. The firm are a combination of three Wiltshire firms, viz. Yockney & Co., the Corsham Quarrying Co., and Kinneir & Lucas, and their quarries have for over half a century been supplying Bath stone to the building trade.

Ripolin, Ltd., 35 Minories, E.C., have arranged their stand (149, Row G) so as to show sections of four interiors, decorated in various styles with gloss, flat and semi-gloss Ripolin. It is claimed that Ripolin possesses all the covering qualities of the best oil paint as well as the gloss and wearing properties of the best varnish. It is supplied ready for use on indoor and outdoor work in sixty-eight tints. The firm also sell a cement Ripolin for indoors, a floor and furniture Ripolin, and a Ripolin school-board composition, as well as other specialities. The stand fully demonstrates the charming and contrasting effects which are now within the scope of the house decorator.

The already wide-spread popularity of "Well Fires" will receive a new impetus in connection with the "Welft" decorated tiles which *The Well Fire and Foundry Co., Ltd.*, 21 Berners Street, W., use for their surroundings with very delightful effects. Bowes' patents include the "Well Fire" with or without a raised hearth and the "New Pyramid Fire." The firm have always been happy in their chimney-pieces and the general artistic setting to their fires; but they have never before produced anything so pleasing as these "Welft" tiles, which are coloured and baked in London and sold at most reasonable prices. The patterns shown on the stand are altogether delightful, and are drawn from a wide range of styles. Another exhibit is the firm's self-feeding patent anthracite stove which is remarkable for the fact that it has an open fire instead of the customary mica doors. The design is also pleasingly simple without the florid ornamentation usually associated with independent stoves.

Messrs. Colthurst, Symons & Co., Ltd., Bridgwater, show three different interlocking tiles, viz., "interlocking Roman," "interlocking Paragon" and "interlocking Acme." For these no nails are required. They are absolutely weather-

proof, and they cannot strip off even in exposed positions. If the situation is extremely exposed or the roof is of a particularly flat pitch boarding or felting may be introduced with advantage to exclude suction draught. The firm use the fine local clay for the manufacture of every description of roofing tile, also ridges, finials, &c. Of these an assortment will be found on Stand 205, Row J.

It is uncertain when clay goods were first manufactured at Bridgwater, but at any rate it is generally accepted almost as the mother-place of the brick industry. For generations the old town has splendidly held its own. It is well situated both for railway and shipping accommodation, and its manufactures are widely distributed not only in our own islands, but to our Colonies also. The clays found in the district are pre-eminently good for the making of roofing tiles. Messrs. Colthurst, Symons & Co. have kept abreast of the times in supplying coverings suitable for any kind of building. They were the first to invent the "Roman tile" which for many years held the field, and still is in great demand. But other pattern tiles have since been invented and patented by the firm that have special points to resist drift of rain and snow. These are not made in the old truncated fashion, but are perfectly square at the corners, breaking joint, and with their raised barriers minimise, if not effectually check, the possibility of drift. These tiles have been used extensively by the War Office in covering barracks, and architects have specified them for roofing in churches and in fact almost every conceivable kind of building.

The Premier Re-forming Co., Ltd., rubber manufacturers, Walthamstow, E., are prepared to change old rubber into new by a patent process which marks a big advance on anything of the kind that has gone before. It enables them to quote a substantially lower price for supplying articles that are just as good as if made of entirely new material. The uses of rubber are of course very many, and it figures as a not unimportant accessory to buildings. Of the latter we may mention in particular rubber tiling and matting; for these several coloured designs have been prepared by the company. The difference in price of re-formed rubber tiling compared with the other kinds renders this deserving of careful consideration by the architect and builder. There are besides on the stand stair-treads, squeegees, buffers, washers, tubing, and rings, as well as many other objects of importance.

One of the newcomers to Olympia are the United Stone Firms, Ltd., and they make their entry with considerable

éclat. The view we here give of their pavilion cannot, unfortunately, reproduce more than the general design. Excellent as this is, the general effect owes not a little to the harmonious combinations of stones different in colour and texture from the many quarries owned by this important combination. It was felt that visitors would be better able to

analyse the details and better judge for themselves the general and individual effect when seeing the stones under this pleasant guise than by merely inspecting an ordinary sample block. The name of each stone is clearly indicated on the structure. Particular attention should be given to the Mountcharles Stone, the Ham Hill, and the Nailsworth. The two latter are from English quarries, but the first is a Donegal stone which has obtained a great reputation in Ireland, though not much known in the United Kingdom. It is a very fine sandstone of a warm cream colour, which bleaches white after a few years' exposure, and besides weathering well, has a crushing strain of 772 tons to the square foot. It can be worked to any desired finish. A successful example of its use is Letterkenny Cathedral, co. Donegal, which is built, internally and externally, entirely of Mountcharles stone. A pier adjoins the quarries, so that the stone can be loaded direct into the company's own specially-built steamers—of which there are seven—and conveyed to England at the mere cost of water transit. Ham Hill stone has long been familiar to architects. Recently the United Stone Firms took over the leases of the quarries in Somersetshire worked by the Ham Hill and Doulting Stone Co., and they have since considerably developed them. Nailsworth stone has until lately been chiefly used in the neighbourhood of the quarries near the Gloucestershire town of that name. But now that this business has been acquired by the United Stone Firms and modern methods of working introduced it is expected that the merits of the material for internal and external use will win for it a wide market on account of its economy, strength, quality, and durability.

The Willesden Paper and Canvas Works have arranged their stand to show the principal uses of Willesden Underlining and Underslating which are both waterproof and rot-proof. These may be used either over a boarded roof or on the open rafters beneath the slating or tile battens. One side of the stand shows their 4-ply roofing used to cover a verandah instead of tin or sheet-iron. This when painted has a very ornamental appearance. The papers may also be used for damp walls or under floor boards. As a lining for walls the 1-ply 22 inches wide is the paper most generally used. If sized and varnished it makes a very pleasing interior, or it may be covered with paper in the ordinary way. It should not be used against fresh lime, plaster or cement.

Messrs. Machin & Koenig, 62 Aldersgate Street, E.C., show the application of their specialities to the construction and decoration of ceilings, walls, &c. Their name is primarily associated with "Compoboard." This is made of thoroughly seasoned wooden slats, 4 feet long and about 1 inch wide, joined in an endless web, so that the 4-foot length of the slat forms the width of the complete board. It is recommended as a substitute for lath and plaster, than which it is a little cheaper and a great deal quicker. Another feature of the stand is the show of veneered panels in various hard woods, both polished and unpolished. The firm have an "H.P." asbestos slab and an "H.P." asbestos roofing tile.

Most of our readers are no doubt already aware that the "Carbic" light is a novel and safe way of handling acetylene, and that it consists of a specially prepared and treated carbide compressed into cylindrical cakes and rendered impervious to atmospheric moisture. As the carbide is solely susceptible to moisture in liquid form the generation of gas occurs only when water is in actual contact with the cake. This patent is shown by Carbic Ltd. in what used to be known as the annexe. A No. 3 generating plant for twenty or forty 20 candle-power lights of ten and five hours' duration respectively is shown on Stand 179, Row H. The plant is wonderfully compact. The firm are also specialists in the manufacture of portable acetylene flare-lights from 100 to 5000 candle-power; one form is the "Builders' Light," which burns for ten hours for 1s. 6d. These patent flare-lights are the only ones fitted with a burner which can be adjusted at will to give from 500 to 5000 candle-power by simply turning the regulating wheel. Hand-flares and hand-lamps are also shown.

Rd. Johnson, Clapham & Morris, Ltd., Lever Street, Manchester, show examples of monolithic brickwalling with the "H.B." patent reinforcement in the joints. This reinforcement was patented about five years ago, and has met with considerable success. It consists of a band of strong galvanised steel wire netting, 2 inches and 2½ inches wide; the former is inserted into the horizontal joints of a 3-inch brick on edge wall, while the broader is used for a 4½-inch wall. The netting forms a continuous band, imparting very great additional strength. Many large factories and other buildings have hollow 9-inch reinforced brick walls, which

have all the advantage of a 14-inch or 11-inch cavity wall, at one-third less cost. Mr. E. Fisher, architect to the Berkshire Education Authority, in giving evidence before the recent Departmental Committee on Cost of School Buildings, mentioned the case of a one-storeyed school at Blackwell, where the saving by using reinforced brickwork was about 45 per cent. over a school of similar accommodation of ordinary brick construction in two floors. The Committee, in commenting on what they heard from this and other witnesses, reported: "The evidence seems to us to be in favour of the conclusion that hollow walls of reinforced brickwork might prove suitable and satisfactory for school purposes, and under some conditions might also be economical." On the stand there are also specimens of reinforced concrete, including the firm's new "Keedon" system for beams and columns, in which the adjustable stirrup is keyed-on by a metal wedge. Johnson's steel wire lattice system has been already described in these pages, and will be familiar to most of our readers. Full particulars may be obtained concerning it on the stand.

Among the most handsome of the many fine stands at Olympia this year is that of Messrs. Thomas Lawrence & Sons, Bracknell, Berks., in Row G, No. 152. It stands on an island site and in a very favourable position for inspection from a number of view-points. It is a Georgian pavilion specially and charmingly designed so as to exhibit the popular T.L.B. rubbers and their sand-faced facing bricks for the walls, and for the conical roof varieties of T.L.B. tiles. Each elevation varies in design and in the combination of different kinds and colourings of bricks and tiles. The pavilion itself is a lesson in brickwork, in addition to which there are periodical demonstrations of cutting and preparing T.L.B. rubbers ready for use. This demonstrates the ease with which they can be worked, and at the same time shows their fineness of texture, beauty of colouring and general excellence. It may be mentioned that the pavilion, which is built with a view to removal, may be purchased at the close of the exhibition.

J. A. King & Co., 181 Queen Victoria Street, E.C., utilise Stand 111, Row F, to show "Mack" fire, sound and rain-resisting plaster slabs and blocks, serving as partitions, ceilings, pugging, floors, roofs, &c., and as adopted by the Office of Works, War Office, the Admiralty and the London County Council. A new feature is "Ferro-Glass," which briefly may be described as being made up of translucent glass blocks in all sizes and thicknesses assembled and reinforced with mild steel rods and cement mortar, giving in the case of all horizontal constructions a crystal glass ceiling with practically invisible joints, and at the same time a light-carrying construction. The advantages claimed are fire-resisting, great bearing strength, minimum expense for maintenance, maximum light; no shadow cast as in iron-plate construction, no painting necessary, no iron to rust, easily cleaned, rapid construction, artistic effect. "Ferro-Glass" has great possibilities for use as pavement and stallard lights; roof, floor and dome lights; windows and boarded lights; partitions, lantern and lay lights, &c. Another novelty on this stand is a new system of stone preservation and restoration by the pulverisation and reconstruction by chemical amalgamation of stone so as to resemble the natural stone. It has proved a very effective treatment for decayed surfaces.

The "Random" Oakeley slates shown on the curved roof of Stand 165, Row H, by the Oakeley Slate Quarries Co., Ltd., give incontrovertible evidence that a slate covering need not necessarily militate against a high artistic effect. There exists in some quarters a certain prejudice against this material as being entirely unsympathetic; but such a prejudice must be weakening of late before the many buildings which prove that some slates at any rate add instead of detract from the harmony of the whole. Oakeley slates were carried at Blaenau Festiniog a couple of centuries ago, and the sprinkling of North Wales farmhouses retain their original slates still sound and weatherproof. In 1800 the quarrying was undertaken systematically, and since that time the process has been unbroken. During the last twenty-two years less than sixteen million tons of slate rock were quarried and the finished roofing slates dispatched to all parts of the world. An interesting exhibition of splitting and dressing is given on the stand at intervals.

R. Waygood & Co., Ltd., have as usual fitted a full-size electric passenger lift for taking grateful visitors to the gallery. There is also a full-size hand-power passenger lift, as well as models of their passenger lift operated by ropes for a series of floors, and of their hand-power service-lifts operated by endless rope and controlled by brake-rope by a handle and controlled by foot-brake. As lift-makers

by royal warrant to King George V. Messrs. Waygood may certainly be said to have received the hall-mark of merit. An interesting feature of the exhibit is the electric gear of their double passenger lift after it passed through the disastrous fire at the Brussels Exhibition. A novelty is the hydraulic vacuum-cleaner apparatus (System No. 1) for installing in premises where the high-pressure water or even ordinary domestic supply is available. The machine itself is contained in a small box, from which pipes are carried to any part of the building desired. These pipes are fixed quite out of sight, as with gas or water, the only point visible being a small brass cap in each room, to which is fixed a length of flexible hosing when the cleaning is required to be done. The water is turned on and a powerful suction is at once generated, the dust and dirt being carried away to the drain with the waste or exhaust water. The high power is derived wholly from the water-pressure and is controlled simply by turning the water on or off. No mechanical or expert knowledge is necessary.

C. A. Peters, Ltd., again show their timber pavilion treated with "Carbolineum Avenarius," the wood preservative and antiseptic which has been in steady demand for more than a quarter of a century. This non-inflammable preparation really enhances the appearance of timber, for it acts as a nut-brown stain and at the same time throws up the grain. If antioxide is afterwards applied it gives the wood a beautifully polished effect. Carbolineum is applied by means of an iron-bound brush in the way ordinary painting is done, and by its own action penetrates into the wood, drives out the moisture and renders it impervious to damp without stopping up the pores. Besides being useful for wood, the preservative may be applied to walls of stone and brick. Damp walls should be laid open in fine weather, the cracks and joints carefully scraped and cleaned; afterwards filling them up again with mortar, and when dry paint or soak the whole with Carbolineum, giving two or three coats. Walls on the weather side of new buildings treated with two or more coats of hot Carbolineum will thereby be protected against dampness from the outside. The same treatment holds good for foundations. It has been used with advantage as a treatment for wood paving-blocks. Messrs. Peters also show portable stoves which consume their patent Carbotron fuel, as taken out by Captain Scott on his South Pole expedition. They are recommended for motor houses and garages.

George Farmiloe & Sons, Ltd., 34 St. John Street, West Smithfield, E.C., have a distinctly useful exhibit at Stand 101, Row E. As manufacturers of metal casements in wrought-iron, steel and Delta metal, they have selected two types which are obtainable at popular prices and are therefore calculated to find favour with architects who have to carefully prune the items. The well-assorted sanitary fittings here shown are similarly suited to the average purse, though the quality is good enough for high-class property. Both the end-walls of the stand as well as other surfaces are effectively treated with "Zingessol," the perfected washable water paint. It is made in fifty shades, is easy to handle, and has great covering power. Another paint shown is "Filocol," which is a substitute for whitewash. A feature of the stand is the "Oceanic" glass in white and various tints. The stock size of the sheets is 90 inches long by 36 to 40 inches wide and $\frac{1}{8}$ inch thick, and the standard tints always in stock are blue, green, claret and amber. Another feature is a big display of various kinds of plumbers' solder of their well-known "City" brand. Besides the usual 56-lb. casts, the firm now sell 4-lb. ingots, which are in many respects more handy for ordinary use. Other forms of their lead manufactures are also shown. At their Limehouse Mills Messrs. Farmiloe now can turn out lead-sheets 7 feet, 7 feet 6 inches and 8 feet in width.

The Seyssel and Metallic Lava Asphalte Co., 42 Poultry, E.C., who have been established over 35 years, are again showing the specialities to which they devote their attention, comprising "Seyssel" and other natural rock asphaltes for building works, paving, &c., and "Metallic Lava Asphalte" for dampcourses, floors and indoor use. There are models of Seyssel asphalte laid on grooved and tongued boarded roofs, indicating the proper method of treatment of eaves gutters; a section of a valley gutter as usually occurring between north lights, and a similar model for parapet gutters. Samples of the natural rock asphalte before being melted, also of the mastic asphalte, are to be obtained from the stall, and there are samples of their "Tenoped" paving-blocks, suitable for pavings where heavy traffic occurs, also tar-paving, and the ordinary mastic block, properly branded, on view. A list of works successfully completed, together

THE CAPITOL, ROME. From a drawing by Mr. LAURENCE DAVIES.

with the literature upon the matter, and comparison of prices with other materials, can be had upon application.

The Bath Stone Firms, Ltd.—the largest Bath and Portland quarry-owners in the kingdom—have at their Stand No. 12, wall space, a unique representation of their Monks Park, Bath, and Portland stone; also specimens of both monumental and architectural masonry. The Bath stone exhibits are as follows:—Monks Park balustrade; sun-dial pedestal in Box ground; a fine exhibit of coarsed walling in St. Aldhelm Box-ground Bath stone, and rock-face random walling in Portland stone; a four-cluster column in Monks Park Bath stone with moulded carved base and cap; and also a richly-worked example of Monks Park stone with sunk carved panels. Among the Portland specimens are the following:—Part of the balustrade prepared for the New Opera House, Kingsway, with two turned and fluted columns for the same building; a section of moulded and medallion cornice; twin column with base, cap and four-way springer; and sample cubes. One of the most interesting things on view is a sample stone marked by Sir Christopher Wren when selecting stone from the Wakeham district for St. Paul's Cathedral. The stone from these quarries has been employed in some of the finest buildings in London and provinces. Other very interesting features are the original warrants issued in the year 1698 by Sir Christopher Wren and the Committee, bearing Sir Christopher Wren's signature for the quarrying of the Portland stone for St. Paul's Cathedral, also warrants for the raising of stone for H.M. Dock, Portsmouth, and the Royal Hospital, Greenwich.

The Nostell Tile and Terra-Cotta Works, near Wakefield, show at Stand 202, Row J, buff, grey and salmon terra-cotta; constructional faience; and tiles of different descriptions. The "Ceramo" tiles have a surface which makes them very effective for fire-places. Another feature which may be noted is the large size of the cornice block in buff terra-cotta. There is considerable technical difficulty in obtaining blocks of such dimensions but this piece will be found to be perfect.

The Empire Stone Co., Ltd., can always be counted on to arrange their exhibit attractively, and this certainly is true

of Stand 21, Row B, in the Gallery, which includes a length of balustrading, vases, walling with Gothic headed windows, steps and other architectural dressings. A prominent feature of their business is the manufacture of paving-slabs, of which a thoroughly matured stock of 100,000 yards is kept at the Narborough works. Somewhat allied to this is the mosaic and terrazzo paving. "Empire Stone" is not a natural product, but it is as durable as granite and is not deteriorated by atmospheric conditions. It can be made to match any existing stonework in detail, colour and finish. In price it compares favourably with Bath stone and it is delivered in about three weeks from receipt of instructions. In addition to its popularity for architectural dressings, the material is largely used for staircases.

The Gluicon Manufacturing Co., of 77 Mortimer Street, W., Stand No. 37A in the Surveyors' Section in the Gallery, are showing parquet floors in various designs. This Company lay all floors with "Gluicon," their speciality (which is a special strong glue and claims to be heat-resisting and waterproof), by experienced British workmen, and their prices compare favourably with other competent firms. They are also showing another speciality, viz., the Mozantum Portable Dancing Floor; the panels are 2 feet 6 inches square, fixed together with iron tongues, and can be quickly laid as a temporary floor for dancing. Splendid examples of oak-carving and ornamental enriched mantelpieces are also on the stand. A patent gas-boiler is worthy of note, and will be explained by the attendant on the stand.

In Row D, Stand 69, there is in operation a patent water-closet, which for its usefulness deserves careful attention. It has been recently put on the market by *The Valveless Syphon Co.*, Kirkstall, Leeds. Bell syphon cisterns are of course already generally known to both architects and sanitary engineers for their efficiency. An advance on the accepted types has been accomplished in the "Waterwitch" patent positive bell syphon cistern. Bell syphon cisterns have hitherto been somewhat unreliable in their flushing owing to the fact that unless the pull is smartly released the bell does not always fall freely, and only a partial flush is

TEWKESBURY ABBEY.—From a drawing by Mr. LAURENCE DAVIES.

effected. This grave defect is remedied in the new closet by removing the direct application of the pull lever to the bell and inserting jointed collapsible connecting links, which are so arranged that when the lever is pulled the bell falls by the full force of gravity and a perfect full bore flush results. The model and the full-size cistern on the stand equally prove the efficiency of the new patent. It should be added that no noise occurs when the cistern is operated so far as concerns the working of the syphon.

The *Emdeca Metal Decoration Co., Ltd.*, can point to an imposing list of castles and stately homes where their material has been introduced. But it has been worthily topped by an order for fixing it in the bathroom of Queen Alexandra at Marlborough House. "Emdeca" is an enamelled decorative treatment of flexible zinc sheets, unrivalled for its artistic and sanitary qualities in such situations as bathrooms, lavatories and kitchens. Its sanitary virtues have secured its use in hospitals and institutions like Guy's, Bart's, Dr. Barnardo's Homes, City of London Asylum, Glasgow Royal Infirmary and the Sanatorium at Wokingham. For proof of its decorative effect we may mention that it is to be found in the Savoy Hotel, Berkeley Hotel, Claridge's, Harrod's Stores and Midland Grand Hotel. The variety of designs obtainable and suitable is practically limitless. Besides "Emdeca," the stand shows "Steleonite" stamped steel ceilings, which lend themselves to a beautiful appearance, and some interesting metal-work, including copper finials and rain-water pipe-heads for the Palace of Peace at The Hague, ornamental rain-water pipes in stamped metal, and a fine model, one-tenth actual size, of the zinc tower supplied for the Reformed Church, Pretoria.

"It's an ill wind that blows nobody any good," so Messrs. *Fenning & Co., Ltd.*, among their specimens of polished granite on Stand 77, Row D, are able, owing to a change of policy by a large manufacturing concern, to offer very large quantities of the famous Labradorite Granite, in sections ready for erection, at prices far below cost, and which will place this durable material with its everlasting polish within the reach of those to whom its cost has hitherto been prohibitive. They show specimens of shaped jambs, cornice and string moulds, and offer suggestions for adapting these, in piers, doorways, stallboards, &c. They show, too, coloured marbles, including some quite new, and of unique colouring. The large slabs of blood-red Skyros, Tinos green, and Greek Cippolino, &c. are effective, while those of Bacchiotto

(special quality) show a beautiful statuary ground with Pavonazzo-like veining of black relieved with green markings. The blocks of this quality are very rare and occur only occasionally in the quarry, of which the whole production is handled by Messrs. Fenning. Another smaller slab of Breche Gobe is richly coloured and eminently suitable for dado and pedestal work. Their samples of Roman mosaic and terrazzo are examples of what can be done in these pavings, while examples of dado and wall work in fine terrazzo give a good idea of how suitable this material is for use in school work, where Messrs. Fenning & Co., Ltd., have fixed many thousands of yards in all parts of the country. The exhibit is completed by sample slabs of "Duroolithic" Composition Jointless Flooring, which is confidently recommended.

Doulton & Co., Ltd., have two distinct stands in separate parts of the building. The one nearest the Addison Road entrance is in Row F, Stand 113. It displays five special bathrooms arranged to meet different purses. There is first the lordly "Vulcan," in which all the fittings are in beautiful white-glazed Vulcan-ware; next comes the luxurious "Doulton," where a great economy is at once effected by the substitution of a cast iron bath for one of Vulcan-ware, and of white Queen's-ware for Vulcan-ware in the lavatory and bidet. Next in price comes the "Gold Knot" (so called from its decoration); then the "Model," and finally the "Villa," which illustrates how the firm are ready to cater for the cottage as well as the palace. At Stand No. 137, Row G, is the exhibit of stoneware pipes and their aristocratic relations the fireplaces, and full size examples of Carrara. Of particular interest to architects will be the fine archway in Carrara and a most imposing capital in the same ceramic material which is finding such favour for hotels, shop premises, and public buildings in large towns. The fireplaces in salt-glazed stoneware are as delightful as ever, and as this ware can be used in conjunction with any kind of fire it must meet with approval from all.

Considerable space is required by Messrs. *Phillips & Son*, Sherborne Street, Birmingham, and Caxton House, Westminster, for the display of fire and burglar-proof strong rooms, strong room doors, party wall iron doors, and safes. One of their new specialities is the introduction of Naxian steel, which is formed by uniting plates of mild steel with plates of hard or high carbon steel into one homogeneous plate impregnable to the finest drilling machine and hardest files. When used in small plates to protect the lock only—

as on all Messrs. Phillips' "Channel Bolt" and best quality safes—these Naxian steel plates are rivetted to the door by means of special manganese steel rivets. Safes so equipped are put forward as undrillable and impregnable. The patent "Channel Bolt" has acquired a high reputation. It consists of a special rolled steel channel, forming a continuous bolt, entirely encircling the door. This channel is drawn inwards by turning the handle of door into a similar channel built into the frame of safe. The advantages are: The bolts not shooting outwards cannot be driven in by any tool to admit of access to the safe; it is a continuous bolt right round, and not a series of small bolts; there are no bolt holes in the frame; the fire-proof chamber comes right up to the front of safe. The channel, being all round, assists in keeping air, fire, or water from the interior. Conspicuous on the stand is an exceptionally heavy safe weighing three tons which has been made for extraordinary risks, such as diamond storage. All the parts are armour-plated and undrillable.

An instructive and useful exhibit to all users of Portland cement is at Stand 118, Row F (main gangway), by the *Associated Portland Cement Manufacturers (1900), Ltd.* A complete insight is afforded into the manufacture, testing, and possibilities of this material. There are samples of cement clinkers and cement at various stages; aggregates of various descriptions both suitable and unsuitable for mixing; briquettes for testing, a complete testing apparatus, and an hydraulic crushing machine. Practical tests are carried out from time to time with the latter. The stand is decorated with photographs of notable undertakings in various parts of the world in which the company's brands of cement have been employed. It is over a century since Mr. J. Bazley White founded the first English firm of cement manufacturers, and it is ten years ago since John Bazley White & Bros., Ltd., was transferred with twenty-one other concerns to the Associated Portland Cement Manufacturers, Ltd.

The *Clee Hill Granite Co., Ltd.*, Ludlow, Salop, show in Bay 16a (Gallery) the channelling and paving setts, macadam, rough and broken stone, and chippings for concrete, drives, footpaths, &c., as supplied to a very large number of authorities in England and Wales. The opinions of three county surveyors on the product of the quarries is worth quoting here. The Consulting County Surveyor of Gloucestershire says: "I have tried your stone against six of the hardest and best known road stones, and in every case the Clee Hill stone has proved the best." According to the County Surveyor of Worcestershire "there is certainly not a better stone to be found in any part of England. The broken stone for roads is excellent, and the setts are amongst the best kinds, being very durable, well dressed, and non-slippery." Lastly, the County Surveyor of Middlesex says: "The macadam obtained from the Clee Hill basalt forms a most perfect road metalling." No better testimonial can be required than is supplied by these three experts in road construction.

The *Wilson Rolling Shutter Co.*, St. John's House, 124-7, Minories, E., have erected on Stand 220, Row K, one of their rolling steel shutters and one of their doors, as well as two types of patent collapsible gates. Wilson's interlocking slat rolling doors and shutters are made of open-hearth cold-rolled steel. The interlocking slats are designed to secure the maximum of lateral strength and resistance to wind pressure, and they are constructed in such a way as to avoid all sharp bends, thereby adding greatly to the durability. The door shutters are furnished with endless chain gearing mechanism whereby large doors are easily operated, or the smaller doors can be made self-coiling if preferred. The firm have carried out a number of contracts to the order of the London County Council; and a recent important job was for the supply of double metal rolling doors across one hundred openings in Messrs. Whiteley's new premises.

One of the newcomers to Olympia is the *British Ceresit Waterproofing Co., Ltd.*, Caxton House, Westminster, S.W., who are showing their preparations at Bay 23 in the Gallery. "Ceresit" belongs to the class of waterproofing materials which are added to the water with which the cement, mortar, or concrete is mixed. It is sold as a cream white paste, and immediately dissolves in the water with which it is mixed, in the proportion of about one part of "Ceresit" to twelve of water. This renders cement, brick and concrete work absolutely watertight even under a pressure of over 70 lbs. per square inch. The material has been used all over the world for such exacting purposes as water towers, swimming baths, dams and tunnels, and in structures ranging from the Kaiser's castle at Posen to the premises of the Siam Elec-

tricity Co. at Bangkok. By a number of effective and easily understood tests carried out on the stand, an excellent idea is given of the waterproofing value of "Ceresit."

One of the notable stands of the exhibition is that of *Messrs. Carter & Co., Ltd.*, Row G, No. 157, although it is not one of those made conspicuous by originality of arrangement. Its merit lies in the merits of the objects displayed. The firm's encaustic tile-works in Poole, Dorset, have steadily expanded ever since they were opened by Mr. Jesse Carter in 1873. For the past thirty-eight years the scope of their manufactures has been enlarging until it now covers a wide field. The lines exemplified on the stand include tiling for walls and floors; ceramic, marble and glass mosaics; constructional faience and terra-cotta; faience fireplaces; "Ceramic Marble"; "Ceramiston" and garden pottery. The stand is spanned by a fine archway carried out in "Ceramic Marble," which is one of the firm's principal departures in the way of architectural material. In its soft colour, fine texture, and dull glazed surface the archway is most attractive and offers a welcome addition to the possibilities of street-front architecture in towns. There is an unusual specimen of ceramic floor decoration with antique effect, and also of a ceramic mosaic pavement in soft colours.

The "Durabar" Draught and Dust Excluder and Weather Bar may be seen on Stand 93, Row E (*Messrs. Hy. Hope & Sons*). This useful device, the patent of Mr. A. R. Groome, A.R.I.B.A., for stopping the draught-space found under every door and window, has recently been installed in Windsor Castle for his Majesty the King, having previously proved very successful at Marlborough House. The latter in-

stallation was the outcome of the visit of the present King and Queen to the Building Exhibition at Olympia two years ago, when Mr. Groome had the honour of explaining the "Durabar" to their Majesties. The "Durabar" is also fitted to the front-door of the model cottage and a number of other exhibitors' doors throughout the Exhibition. It can now be had in various styles, and at popular prices (from 3s. 11d. upwards). New illustrated price-list may be had of The Durabar Co., Palace Chambers, Hereford, who are the sole makers.

The *Coatostone Decoration Co.*, of 77 Mortimer Street, W., who are exhibiting Neal's patents, have their usual attractive Stand No. 37 in the Gallery. "Coatostone" (liquid stone) is shown in various tints for interior and exterior decoration; this material can be lined out with a bricklayer's jointer, which gives a slight indentation, and with a painted line giving it the appearance of stonework with a mason's joint. Examples of their interior and exterior rough-cast are also shown. "Nealstone," resembling ashlar work and imitating Portland stone with moulded cornices and fluted pilasters with carved caps and moulded bases, is exhibited. The brickwork is first rendered with cement and sand and finished with "Nealstone" from $\frac{1}{8}$ inch to $\frac{1}{4}$ inch in thickness; it is made in various tints to resemble any kind of stone and texture, and can be carved to suit architects' own designs. "Nealstone" is claimed to be thoroughly waterproof and much harder than stone, the texture being difficult to detect from the natural stone, and it is worth noting by architects as a great saving where their clients require to economise and still get the same effect as a stone building. Several stands in the Exhibition have been decorated with the specialities supplied by the Coatostone Decoration Co. Mr. A. W. Neal, their inventor, has been recently awarded the Grand Prix, Diploma of Honour, and the gold medal for "Coatostone" decorations shown at the International Exhibition held in Paris, March 1911.

Garratt's patent screw-down tap was introduced, we believe, to the trade exactly two years ago at Olympia. It is again shown by *Garratt's Patent Screwdown Valve Co.*, and may be seen in action on Stand 121, Row F. Since 1909 its progress has been phenomenal. They are already in use by H.M. Office of Works, in the Sutton Trust Model Dwellings, and in many hotels, public buildings, and cottages

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000*l*. A first prize of 800*l*., and a second prize of 320*l*. will be awarded. The Greek *Official Gazette*, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3*l*. 3*s*., which will be refunded on receipt of a *bona-fide* design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BULGARIA.—April 30.—An international competition will be held of plans for a building which it is proposed to erect in Sofia for State and municipal offices. The following four prizes will be given, viz., 280*l*., 120*l*., 80*l*., and 4*l*. Applications must be sent to the "Kreis-Permanenz-Ausschuss," Sofia.

BURSTOW.—May 26.—The Trustees of Archbishop Abbott's School, Guildford, invite designs and estimates for erection of a pair of semi-detached labourers' cottages on the Rookery Farm, Burstow, Surrey, to contain a living room, a scullery, and three bed-rooms, and to be provided with a water supply and the usual offices and outbuildings. Mr. H. P. Smallpeice, clerk, 138 High Street, Guildford.

VICKERS' PAINTS.

Our Exhibit at Olympia is practical, and not a collection of highly-finished examples produced under conditions that are impossible on every-day painting contracts.

HANDSOME CLOTH CASES for binding "The Architect," price 2/- each.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000l. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3l. 3s. Apply to Mr. G. C. Copstick, L.R.I.B.A., County Offices, Derby.

DEVIZES.—May 10.—The Committee of the Devizes Cottage Hospital invite competitive designs for providing a new six-bed ward at, and making a general re-arrangement of, their existing hospital (16 beds) at a maximum cost of from 1,200l. to 1,500l. Deposit 10s. 6d. Conditions of competition and particulars of the buildings required will be supplied to intending competitors by Mr. E. Thorp, honorary secretary, Devizes.

MANCHESTER.—May 1.—The Corporation invite designs for a Library and Art Gallery upon the Piccadilly site in the centre of the city. The Preliminary Competition closes May 1. The authors of ten selected designs will compete in the Final Competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in connection with the city architect. Apply for particulars to Mr. Thomas Hudson, Town Clerk, Town Hall, Manchester.

WALES.—May 5.—The Corporation of Swansea invite architects to submit designs and estimates for the Castle Street improvement. Deposit 1l. 1s., which will be refunded on receipt of a bona-fide design or if block plan and particulars are returned within a fortnight after receipt. The architect appointed to prepare the working drawings will be paid not more than 250l., and a premium of 50l. will be paid for the second design. Mr. S. S. Reay, F.R.I.B.A., will act as assessor. Apply to the Town Clerk, Guildhall, Swansea.

WHITLEY BAY.—June 7.—The Whitley and Monk-seaton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed cemetery buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and the conditions can be obtained on a written application being made, accompanied by a deposit of 1l. 1s., which will be returned to every competitor submitting a bona-fide design. The designs, addressed to the Surveyor, are to be delivered at the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Sayille Street, North Shields.

CONTRACTS OPEN.

ALTON (HANTS).—May 3.—For alterations and additions to the Eggars Grammar School. Deposit 2l. 2s. Mr. M. G. Pechell, architect, 7 John Street, Bedford Row, W.C., or Mr. A. F. M. Downe, clerk to the Governors, 46 High Street, Alton, Hants.

BARKING.—May 10.—For the works comprised in the extension of the Electricity Works, East Street. Deposit 2l. 2s. Mr. C. F. Dawson, surveyor, Public Offices, Barking, Essex.

BLAYDON-ON-TYNE.—May 2.—For erection of station buildings, platform roofing, &c., for the North-Eastern Railway Co. Mr. William Bell, the Company's architect, Central Station, Newcastle-on-Tyne.

BRADFORD.—May 2.—For work required in rebuilding Queen Hotel, Listerhills Road. The City architect, Town Hall, Bradford.

BUSHEY.—May 3.—For (a) erection of a caretaker's cottage and (b) construction of a circular sedimentation tank, 30 feet diameter by 20 deep, with certain alterations to existing sedimentation tanks, for the Bushey Urban District Council. Deposit 2l. 2s. Mr. E. E. Ryder, engineer and surveyor, Council Offices, Bushey, Herts.

CAMBRIDGE.—May 2.—For erection of a shelter at the pig pens at the cattle market, for the Town Council. Borough Engineer and Surveyor, Guildhall, Cambridge.

CHADSMOOR.—May 9.—For erection of a church in Can-nock Road, adjoining the Council Schools, for the Trustees of the Primitive Methodist Church, Chadsmoor, Staffs. Apply before May 2 to Messrs. Jeffries & Shipley, architects, 24 Bridge Street, Walsall.

CLEATOR.—For the different artificers' work in connection with a new residence at Cleator, Cumberland. Send names to Mr. E. Martindale, architect, 11 Lowther Street, Whitehaven.

COSBY.—May 5.—For erection of a new elementary school and handicraft centre at Cosby, Leics., together with out-offices, drainage, and other works connected therewith. Deposit 10l. 10s. The County Education Office, 33 Bowling-green Street, Leicester.

CROSSHILLS.—May 2.—For the mason's, ironfounder's, plumber's, plasterer's and slater's works required in re-building joinery works at Crosshills, Yorks., for Messrs. W. Smith & Co. Mr. J. Hartley, architect, Skipton.

DERBY.—May 1.—For erection of knackers' slaughter-house at the refuse destructor. Mr. J. Ward, M.I.C.E., borough surveyor, Babington Lane, Derby.

DROYLSDEN.—May 17.—For erection of an elementary school for 810 children in Fairfield Road, Droylsden, Lancashire. Deposit 2l. Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

EDMUNDBUYERS.—May 4.—For the several works required in erection and completion of villa at Edmundbuyers, Durham. Mr. T. H. Murray, Consett.

ELTHAM.—May 3.—For the erection of Eltham new Post Office, Kent, for the Commissioners of H.M. Works and Public Buildings. Deposit 1l. 1s. The Postmistress, Eltham, and H.M. Office of Works, Storey's Gate, London, S.W.

FALKIRK.—May 3.—For the mason, joiner, slater, plumber, and plaster works of new block to be erected at Camelon Hospital, Falkirk, for the Eastern District Committee of the County Council of Stirling. Messrs. A. & W. Black, architects, Falkirk.

GLASGOW.—May 4.—For the following works required in connection with the villas proposed to be erected at the corner of Dumbreck Road and Dalkeith Avenue, Dumbreck, viz., mason, brick, carpenter, joiner, slater, plumber, &c., plaster, and painter works. Deposit 1l. 1s. The Office of Public Works, City Chambers, 64 Cochrane Street, Glasgow.

GOOLE.—May 10.—For additions and alterations to the workhouse hospital and other buildings. Messrs. Thorp & Turner, architects, Carlisle Street, Goole.

HALIFAX.—May 1.—For the execution of the work required in erection of conveniences at Rockhollow Park, Ogden. Deposit 1l. Mr. J. Lord, M.I.C.E., borough engineer, Town Hall, Halifax.

HALIFAX.—May 5.—For the various works required in the conversion of lodge into detached villa, &c., at King Cross, Halifax. Messrs. Medley Hall & Son, architects, 1 Harrison Road, Halifax.

HEATHFIELD.—May 1.—For erection of a classroom and other work at the County Council public elementary school at Vine Cross, Heathfield. Send names and addresses to Mr. F. J. Wood, county surveyor, County Hall, Lewes.

HORWICH.—May 10.—For erection of an infants' school to accommodate 400 children, at Horwich, near Bolton. Deposit 2l. Mr. H. Littler, county architect, 16 Ribblesdale Place, Preston.

JERSEY.—May 31.—For the construction of a parish hall in the parish of St. John. Mr. C. G. Bowles, M.S.A., architect, Halkett Place, St. John.

KENT.—May 3.—For the erection of Eltham new Post Office, for the Commissioners of H.M. Works and Public Buildings. Deposit 1l. 1s. The Postmistress, Eltham, and H.M. Office of Works Storey's Gate, London, S.W.

KING'S LYNN.—May 17.—For proposed additions to the West Norfolk and King's Lynn High School for Girls. Send names and 2l. 2s. deposit by April 29 to Mr. H. J. Green, architect, Paradise Parade, King's Lynn.

LONDON.—May 2.—For additions and alterations at the receiving Workhouse and Casual Wards, Sheffield Street, Lincoln's Inn Fields, W.C., for the Guardians of the Strand Union. Deposit 3l. 3s. Mr. A. A. Kekwick, M.S.A., architect, 12 Norfolk Street, Strand.

LONDON.—May 4.—For the erection of a committee-room at the Workhouse, Swaffield Road, Wandsworth, S.W. Deposit 1l. Mr. F. W. Piper, clerk, Guardians' Office, St. John's Hill, Wandsworth, S.W.

LONDON, N.—May 10.—For certain building work at the Nurses' Home, Edmonton Workhouse, Upper Edmonton, in the erection of an escape stairs and alterations to an existing staircase, for the Guardians of Edmonton Union. Mr. J. C. S. Mummery, architect, 13 Fitzroy Square, W.

MAIDSTONE.—May 15.—For the erection of County offices and making certain alterations to the Sessions House adjoining, for the Kent County Council. Deposit 5l. 5s. The County Architect, 86 Week Street, Maidstone.

MARYPORT.—May 1.—For the whole or any of the several trades required in the erection and completion of new picture

palace in Senhouse Street, for Messrs. Graves Bros. Send names to Messrs. Oliver & Dodgshun, F.F.R.I.B.A., architects, Carlisle.

MEDOMSLEY EDGE (DURHAM).—May 4.—For the several works required in erection and completion of two houses at Medomsley Edge. Mr. T. H. Murray, architect and surveyor, Consett.

MILNSBRIDGE (YORKS.).—May 2.—For the various works required in additions and alterations to showrooms at Milnsbridge, for the Longwood Gas Co. Messrs. Lunn & Kaye, architects and surveyors, Milnsbridge and Huddersfield.

MORLEY.—May 8.—For the whole or any portion of the following works: Mason, joiner, plumber, plasterer, slater, tiler, and painter, required in erection of villa residence in Victoria Road. Mr. T. A. Buttery, Lic. R.I.B.A., architect, Queen Street, Morley, and 1 Basinghall Square, Leeds.

NEWBURN-ON-TYNE.—For the erection of an electric theatre at Newburn. Send names to Mr. T. R. Eltringham, architect, Throckley, Newburn-on-Tyne.

NUNEATON.—May 3.—For alterations to cottage adjoining the Council offices. Mr. F. C. Cook, borough surveyor.

PUDSEY.—May 30.—For the whole or any part of the works required in erection of three pairs of semi-detached houses on the Radcliffe Estate. Messrs. Jowett Kendall & Sons, architects, Pudsey, Yorks.

RHYMNEY (MON.).—May 3.—For repairing, papering, and painting, &c., the following hotels for Messrs. A. Buchan & Co., The Brewery, Rhymney, viz.:—(1) Old Mill Hotel, Bargoed; (2) Royal Hotel, Rhymney; (3) Railway Inn, Pontlottyn. Mr. T. Roderick, architect, Ashbrook House, Aberdare.

SALTASH.—May 4.—For building a farmhouse and farm buildings at Stoketon, near Saltash, Cornwall. Mr. J. Sansom, F.R.I.B.A., Liskeard, and at Stoketon.

SCOTLAND.—May 1.—For the brick, joiner, slater, plumber, plaster, heating and painter works of new building proposed to be erected at Winchburgh Public School, for the Kirkliston School Board. Mr. W. M. Scott, architect, Linlithgow.

SCOTLAND.—May 11.—For the several works required in altering, enlarging, and fitting-up two bathrooms and lavatories, &c., and erecting a new boiler-house, for the Annan Combination Infectious Diseases Hospital. Mr. D. A. Knox, clerk, Annan.

SEAFORD.—May 1.—For erection of a refuse destructor house and chimney at the Sewage Pumping Station, Brooklyn Road, together with the inclusion in the contract of the supply and erection by Messrs. Meldrum Bros., Ltd., of a two-cell refuse destructor and boiler, and works incidental thereto. Messrs. Pollard & Tingle, engineers, 31 Old Queen Street, Westminster, or Mr. W. H. Pawson, clerk, 3 Clinton Place, Seaford.

SELBY.—May 3.—For the various works in erection and completion of a post office and shop. Messrs. Thorp & Turner, architects and surveyors, Goole.

SHEFFIELD.—May 11.—For the work required in connection with alterations, &c., to the sanitary conveniences at the Children's Homes Headquarters, Smilter Lane. Mr. G. D. Baxter, clerk of works, Fir Vale Workhouse, Sheffield.

SILLOTH.—May 6.—For builders', slaters', plasterer, plumbing, painters' and ironwork of five houses proposed to be built at Silloth. Mr. J. R. Thompson, 13 Esk Street, Silloth, Cumberland.

SLOUGH.—May 2.—For erection of a bakery at the rear of the central premises, High Street, for the Slough and District Co-operative Society, Ltd. The Society's Office, High Street. Mr. W. T. Whalley, managing secretary.

SOUTHAMPTON.—May 8.—For erection of a new outpatient department, for the Committee of the Royal South Hants and Southampton Hospital, Southampton. Deposit 2l. 2s. Applications must be made by letter by May 8 addressed to Mr. T. A. Fisher Hall, secretary.

STAINCROSS.—May 1.—For the various trades in the building of a parsonage house at Staincross, Barnsley. Send names and addresses to Messrs. R. & W. Dixon, architects, 5 Eastgate, Barnsley.

STOCKTON-ON-TEES.—May 2.—For small alterations and additions at the workhouse for the accommodation of vagrants. Mr. J. Rodham, 16 Finkle Street, Stockton-on-Tees.

STOKETON.—May 4.—For building a farmhouse and farm buildings at Stoketon, near Saltash. Mr. J. Sansom, F.R.I.B.A., Liskeard.

STRATTON ST. MARGARET.—May 9.—For ventilation, &c., of old and young men's day rooms at the workhouse, Stratton St. Margaret, Wilts. Mr. J. P. Kirby, clerk, Union Offices, Swindon.

TOLLESHUNT D'ARCY.—May 2.—For erection of six cottages in the parish of Tolleshunt D'Arcy, Essex, for the Maldon Rural District Council. Mr. W. Almond, surveyor, Market Hill, Maldon.

WALES.—May 1.—For erection of 16 houses at Brecon Road, Merthyr Tydfil, for the Brecon Road Building Club. Mr. O. P. Bevan, architect and surveyor, "Express" Chambers, Merthyr Tydfil.

WALES.—May 1.—For erection of from 16 to 28 semi-detached villas at Ebbw Vale, Mon., for the Badminton Grove Building Club. Mr. W. Harris, architect and surveyor, Bank Chambers, Bargoed.

WALES.—May 2.—For erection of a Great Western Railway station at Llancaiach, Glam. The office of the engineer, Newport Station, Newport.

WALES.—May 2.—For the erection of a goods shed, stable, offices, &c., at Cremlin (Mon.). The office of the engineer, Newport Station, Newport.

WALES.—May 2.—For erection of new institute premises, close to Victoria station, Ebbw Vale, for the Committee of the Waunlywd and Victoria Institute. Deposit 2l. 2s. Mr. F. J. Veall, architect, 6 Arcade Chambers, High Street, Cardiff.

WALES.—May 5.—For the erection of a school at Craigygreos (Penygraig), to accommodate 400 boys, 400 girls, and 400 infant scholars, for the Rhondda Urban District Council. Send 2l. 2s. to the accountant. Mr. J. Rees, architect, Hillside Cottage, Pentre.

WALES.—May 5.—For erection of a lodge at Treallaw Cemetery, for the Rhondda Urban District Council. Deposit 1l. 1s. Mr. W. J. Jones, engineer and surveyor, Council Offices, Pentre.

WALES.—May 6.—For erection of stables at Quarry Row, Merthyr Tydfil. Mr. O. P. Bevan, architect and surveyor, Express Chambers, Merthyr Tydfil.

WALES.—May 6.—For erection of 29 or more workmen's dwellings at the Old Gantre, Ebbw Vale, Mon., for the Beaufort Building Club. Mr. W. Harris, architect and surveyor, Bank Chambers, Bargoed.

WALES.—May 8.—For alterations and renovation of the Caersalem Congregational Chapel, Pontyberem. Mr. W. B. Rees, architect, 3 Dumfries Place, Cardiff.

WALES.—May 9.—For erection of 48 or more houses near Nantybwch for the Ashgrove Building Club, Tredegar. Mr. W. Harris, architect and surveyor, Bank Chambers, Bargoed.

WALES.—May 10.—For the rebuilding of the Pandy Inn, Tonypandy, for Messrs. The Rhondda Valley Breweries Co., Ltd. Deposit 2l. 2s. Mr. R. S. Griffiths, M.S.A., architect and surveyor, Tonypandy.

WALES.—May 16.—For erection of the Monmouthshire County Training College, principal's residence and lodge at Caerleon, near Newport, Mon. Deposit 3l. 3s. Messrs. Alfred Swash & Son, F.R.I.B.A., Midland Bank Chambers, Newport.

WALES.—May 18.—For erection of a drill hall at Towyn for the Merionethshire Territorial Force Association. Deposit 1l. 1s. Mr. R. W. Davies, M.S.A., architect and surveyor, Carno, Mont.

WALSALL.—May 3.—For erection of bathroom, &c., to the Forrester Ward, also other alterations to the premises of the Walsall and District Hospital. Deposit 1l. 1s. Messrs. Bailey & McConnal, F.F.R.I.B.A., architects, Kingscourt, Bridge Street, Walsall.

WENFORD BRIDGE.—May 15.—For building a further china clay kiln and tanks at their works, Wenford Bridge, on the L. and S.W. Railway, for the North Cornwall China Clay Co. (1908), Ltd. Deposit 2l. Mr. W. H. Patchell, M.I.C.E., Caxton House, Westminster, S.W.

WEST BROMWICH.—May 12.—For the erection of new classrooms and cloak room at Lyng School, and for manual instruction rooms at Spon Lane School. Deposit 1l. 1s. each. Mr. A. Long, architect, West Bromwich.

WIMBLEDON.—May 6.—For the following works, for the Corporation of Wimbledon, viz.:—(1) Conversion of entire block into a four-bed observation block; (2) erection of a boiler house and chimney shaft; and (3) construction of boiler seatings, and the supply and fixing of two Cornish boilers at the Isolation Hospital, Gap Road, Wimbledon. For contracts 1 and 2 deposit 10s. The Borough Engineer and Surveyor, Town Hall, Wimbledon.

TENDERS.**CROMPTON.**

For construction of sewerage works, for the Crompton Urban District Council. Messrs. J. P. WILKINSON & SON, M.M.I.C.E., 301 to 304, Cathedral Street, Manchester, engineers.

where it is realised that the best tap proves in the end cheapest. The essential economy arises from the fact that they do not get out of order and drip, or need re-washing, so that their first is their last cost, though they outlive two ordinary taps. The reason of this longevity is that the rubber or other seating never turns nor twists, for it gets the direct pressure of the piston, whereas in the average screw-down tap the spindle turns and the friction on the jumper drags it with a shearing effect on the washer every time the tap is used. The screw-thread remains unaffected by hard or even gritty water, as it works out of contact with it.

The *Acme Flooring and Paving Co. (1904), Ltd.*, Victoria Park, N.E., have again a large and attractive stand. It is up in the Gallery and occupies Bays 24 and 25. A good display is made of sample blocks and polished panels in various woods, of W. Duffy's "Immovable Acme" system of oiled wood block flooring, which is guaranteed for five years. Stress may be laid on the fact that the blocks are not imported, but are made at the firm's own works with the utmost attention to accuracy of cutting and quality of the blocks. The blocks are bonded into a homogeneous floor by wooden dowels. This system has been adopted with unflinching success for many years past. Samples of their paving-blocks and timbers, including the "Acme-Sectional" hardwood paving, are also exhibited. The "Acme-Sectional" blocks are made up of six separate pieces securely bonded together by two tongues driven in by machinery. They have great wearing powers and have achieved much popularity among road-construction authorities.

Martin Earle & Co., Ltd., 139 Queen Victoria Street, E.C., show in Bay 20 in the Gallery both their "Rhinoceros" and "Ferroduric" brands of Portland cement, as well as specimens of their various types of barrels, which are all made on the works at Wickham, Rochester. The "Rhinoceros" brand carries with it a guarantee of compliance with all modern specifications, including the British Standard Specification, as revised to August of last year. In recent tests for tensile strain, for instance, briquettes of neat cement averaged 522 lb. and 695 lb. per square inch, after seven and twenty-eight days from gauging respectively, as against the requirements of the British Standard Specification of 400 lb. and 500 lb. The expansion test by the Le Chatelier method on the sixteen samples dealt with above was only four millimetres as against the ten millimetres which are allowable. "Ferroduric" is a brand manufactured to meet the huge demand for a cement specially suited for ferro-concrete construction, and has been used on many important contracts.

Mr. John Tann, 11 Newgate Street, E.C., shows at Stand 37, Row E, a good assortment of safes and doors. Pride of place may be given to those "Anchor Reliance" improved safes, which are made out of one steel plate, bent by hydraulic power at each of the twelve corners so as to render them solid and jointless. This renders the body of very great strength and capable of withstanding thieves and fire. Mr. Tann also shows his Party Wall and Warehouse Doors, made to meet the requirements of the L.C.C. and of the Fire Office Committee, plate closet doors where a moderate amount of security is required, and strong-room doors.

It is pleasing to find such a domesticated exhibit as that of the "J. M." *Curtain Rod Co.*, Leicester (Stand 162, Row H), for it makes an instantaneous appeal to minds somewhat jaded by wonders of construction. The "J. M." curtain Rod consists of bendable metal rod with a raised and grooved ridge in the centre on which the runners travel. The rod is bent to the desired shape and screwed into the window head. The curtain is then hooked to the runners, which travel on wheels. A similar idea, sold at a very much lower price, is the company's "Flexoid" curtain rod. In both the curtains are drawn easily, they hang gracefully, and admirably fit the shape of the window. This patent will at once remove the trouble of rods falling out of their supports and the unsightly cornice poles.

A comprehensive display is that of *Messrs. Newton, Chambers, & Co., Ltd.*, Thorncliffe Ironworks, near Sheffield, Stand 180, Row H. These include a "Thorncliffe" patent open and open-fire cooking range; a hot closet with two serving dishes with covers; a potato and pudding steamer, with welded compartments, a steam-jacketed boiling pan, and a fountain. There are several patterns of radiators, including one for use in hospital wards; the six nickel-plated sections are widely-spaced so as to allow of thorough cleaning between each. A "Thorncliffe" cast-iron sectional boiler is on the stand. For this it is claimed that it gets an exceptional calorific value out of the fuel, being as high as 9000 T.U. in the case of coke. The soot doors are made exceptionally strong.

Richard Crittall & Co., Ltd., 197 Wardour Street, W., provide at Stand 37, Row C, one of the interesting features of this exhibition in the patent "Panels" system of heating by low-pressure hot-water. With the hot panels utilising the full effects of radiant heat a much lower temperature of warming surface can be maintained than in the ordinary radiation which heats by convection. Consequently the quality of the air is not impaired by undue drying, and the temperature of the room may stand as low as 55 degrees while the general feeling is one of comfort. Each panel consists of a coil of jointless wrought-iron pipe embedded in the floors and walls in a layer of special composition unaffected by the heat of the pipes and of which the rate of expansion is extremely low. This composition is, we may mention, made by the Durato Company. It sets to a hard surface which can be painted, and on which mouldings can be mounted if desired. The specially-constructed pipes are coupled to the main warming system, and each section valved to enable the temperature to be controlled. There are no ledges or crevices for the lodgment of dust, all outward signs are removed, and the black marks on walls and ceilings that occur where ordinary radiators are used, are obviated. The installations of the "Panel" system include the Royal Automobile Club, Pall Mall; Savoy Hotel, Adelphi Hotel, London; Hanover Lodge, Regent's Park, N.W.; and the new offices for Royal Liver Friendly Society, Liverpool.

The *Carron Co.* have prepared special Interiors and Mantel Registers and Mantel Pieces suitable for garden city property; these are both artistic and cheap. A good show is made of their Armour Bright goods which are made at the Sheffield works, and some of these eighteenth century grates are particularly fine. The stand (No. 223, Row K) includes enamelled porcelain baths, steaming closets, and a range.

"Painting done while you wait" might truthfully be hung over Stand 56, Row D, where *Messrs. Archibald Vickers, Ltd.*, Prestons Road, E., carry out continual demonstrations of what their paints are capable of doing. The boldness of this method cannot fail to appeal to all who are anxious to judge of the efficacy of a paint under conditions which they themselves are likely to require it for. It is really instructive to watch a paint's covering capacity and surface when applied direct with and without undercoatings, first in one coat and then in two on to a piece of raw wood. These are searching tests which none but the best material can survive. The firm have taken as their watchword "Vickers' paints protect and decorate," and the truthfulness of this will be admitted without demur. Their paints, varnishes, and enamels are all manufactured in this country, are economical, regular in quality, and easily applied. The finishing coats are manufactured in three distinct grades—viz., oil finish, Japan finish, and enamel finish. Anyone who feels that "seeing is believing" should pay a long visit to this stand.

Messrs. Norton & Gregory, Ltd., Buckingham Gate, S.W., again occupy Bay 1 in the Gallery, and their stand is one to win favour with all architects, engineers, and surveyors. One of the new things exhibited is an improved pattern-drawing table. The "Adjustable" can be fixed at any height and angle so as to allow of the draughtsman sitting or standing at his work. This pattern is improved by the simplifying of the working parts. Thus all levers are done away with, the movements being regulated by thumb-screws. It is complete with shelf, drawer, and patent T-square. Another convenient appliance is the "Arcas" sun-painting frame. The counter cases contain a choice selection of the drawing instruments and surveying instruments which have made the name of Norton & Gregory familiar throughout the world. Anyone who has not yet tried the "Verrine" eraser should ask for particulars. It has the unique property of erasing ink lines from tracing cloth without damaging the surface of the material in any way.

If publicity is the soul of business the Stand 57, Row D, of *The Brilliant Sign Co., Ltd.*, Gray's Inn Road, W.C., is one of the important ones at Olympia, for that firm are past-masters in the art. Their freehold factory (now being enlarged) covers nearly three acres, and they employ five hundred men for carrying out the largest as well as the smallest orders. The firm were the original manufacturers and patentees of the Brilliant Metal Letters which have since become so popular; these they are prepared to sell at prices 10 per cent. lower than the imitation, and with a guarantee for fifteen years. The letters are stamped in stout sheet copper from steel discs and finally gilt under a secret process. On the stand there are a number of aids to publicity, whether they be ingenious trade signs, gilt-wood letters, plate-glass, shop front metal work, or repoussé signs.

Walter C. Candy, Hall Green, Birmingham, shows glazed stoneware drain-pipes as supplied to the War Office, sand-faced "Wallace" roofing which weather well, glazed bricks, sanitary ware, and facing bricks. Assorted truck-loads of builders' goods are made up and dispatched to any part of the country. The Stand is Row G, No. 140.

Lewis Berger & Sons, Ltd., Homerton, N.E., show "Enamelac," "Matone," and "Artercraft Stains." On the stand is a door painted seven years with "Enamelac," the pure white enamel, and which still shows a splendid surface, after being constantly exposed and annually exhibited ever since though without being re-touched. This paint is made in three varieties—egg-shell gloss, flat, and high gloss. "Matone" is a high-class durable flat enamel in paste form which does not require stippling, but can be applied with a full-sized distemper brush. It may be freely washed with soap and water without endangering its finish. Five wall spaces show "Matone" in different shades. The outside walls of the exhibit are finished in different shades of "Maisone" washable distemper, and a number of doors show other paints.

Messrs. Fenlon & Son, 8 Tudor Street, E.C., have at Stand 19, Row 9, a good display of geysers, baths, radiators, and allied apparatus required in their business as heating specialists, geyser, bath, and boiler-makers. The "Tudor" geyser has two sealed chambers; patent locking gear-taps or automatic eccentric valve, which prevents accidents; and a flue socket. The "Fleet" geyser has been put on the market to meet the demand for something both cheap and efficient, and is constructed on the open system. Shrewsbury's "Calda" geyser has been in use for more than forty years for places where hot water is required with expedition. The self-contained "Unique" radiators are complete in themselves, having a special circulating boiler with flow and return pipes. It is said to be the only self-contained radiator with a patent safety-valve. Messrs. Fenlon & Son show other radiators, boilers, and hot-water apparatus.

The British Stone & Marbles Co., Craven House, Kingsway, W.C., have two claims on the visitors' attention at Stand 148, Row 8. First, there is Reconstructed Stone, and secondly, a new and notable system of glazing called "Ferro-stone" glazing. It will be remembered that Reconstructed Stone is the product of a patent process by which the debris of any suitable building stone is first reduced by mechanical disintegration to a granular state, and then built up again by a series of mechanical and chemical operations, into a material indistinguishable from the quarried product, and superior to it in some respects. This Reconstructed Stone is used for "Ferro-stone" glazing. By the introduction of steel-tension members a glazing is produced which is stronger, though by little, than the old metal bars, imperishable, fire-resisting, and so dense and compact as to be acid proof. While comparing favourably with metal bar glazing in first cost, "Ferro-stone" glazing requires no painting, lead covering, or other treatment, so that the cost of maintenance is reduced to a minimum. The glass is easily fixed. It is secured to its seatings by lead clips which are drawn up tight by brass screws that screw into the stone. This new system is deserving of careful attention from architects, contractors, and others interested.

Towers' "Adamantine Clinker," Fire and Roofing Tile Co., Little Bytham, Grantham, show "Adamantine Clinkers" (of which they are the original makers); paving bricks and channels; fire-bricks and fire-tiles; and roofing tiles. The clinkers have for a large number of years been unsurpassed as a solid sanitary paving suitable for stables, fire stations, kennels, cattle markets, &c. Amongst the list of places where the material has been used are the Royal Mews at Windsor and Sandringham. It is interesting to learn that these clinkers are finding a growing market in the United States. The tiles are made in buff, red, and grey.

The Bath Cabinet Makers' Co., Ltd., have taken full advantage of a prominent position in Row E, No. 100, to display their architectural wood-carving to advantage. This artistic stand represents an oak-panelled hall or dining-room in the Jacobean style. The outside is carried out in "None-such" panelling, which is sold and fixed in the metropolitan area at 1s. 6d. per square foot. The stand on the inside is panelled up to about 8 ft., and has a plaster frieze above. It is covered in by a half-timber ceiling.

The Smart Improvement Co., 46 Broadway, West Ealing, show at Stand 27, Row C, the "Aero Window Sash Adjuster," which is designed to allow of the top sliding-sash of a window being raised or lowered without any of the usual stretching, or other trouble. The sash is not altered in any way, all that is done is to add a series of pulleys. An addi-

tional cord is attached to the top sash and carried through the window frame pocket down to the sill and through a guide-block into the room. The sash is opened by lightly pulling the cords; it is raised by merely raising the cords to a horizontal position, the camb grip releases the cord and the window shuts automatically. The apparatus can be easily fixed to existing sashes by adding make-weights made for the purpose.

THE CONCRETE INSTITUTE.

By the courtesy of Mr. H. Greville Montgomery, the members of the Concrete Institute have been invited to visit the International Building Trades Exhibition at Olympia, West Kensington, W., on Monday afternoon, May 1. The members of the Institute will assemble in the vestibule of the Addison Road entrance at 3.15 for 3.30 p.m. sharp, at which time groups of the members will be conducted round the Exhibition, special attention being accorded to the numerous concrete exhibits which will be on view. At 5 o'clock the members will re-assemble at the Restaurant, where Mr. Montgomery has invited the party to tea.

At 5.45 p.m. it has been arranged to hold, in a hall in the Exhibition, the first of the course of six Educational Lectures on the subject of Reinforced Concrete, by Mr. R. W. Vawdrey, B.A., Assoc. M.Inst. C.E., M.C.I., which have been arranged under the auspices of the Institute, and to which the public will be admitted free by ticket, obtainable on application to the Secretary. The other five Lectures will be delivered on consecutive Wednesdays, May 3, 10, 17, 24, and 31, in the Lecture Hall of the Concrete Institute, at Denison House, 296 Vauxhall Bridge Road, Westminster S.W. The following is a syllabus of the course: General description of the material; its advantages and limitations; principles of the design of columns, piles, beams, cantilevers, slabs, and arches; the determination of the external forces acting on a reinforced concrete structure; effect of a monolithic structure; general arrangements of a building; different types of design for footings, columns, rafts, floors, retaining walls, water towers, reservoirs, bridges, bins, and domes; workmanship and supervision.

The second annual general meeting of the Concrete Institute will be held at Denison House, on Thursday, May 11, at 8 p.m., Sir Henry Tanner, I.S.O., F.R.I.B.A., presiding, for the following purposes: (1) To receive and consider the annual report of the Council, the annual statement of accounts and balance sheet, and the report of the auditor thereon; (2) to receive the report of the scrutineers on the annual election of members of Council; (3) to appoint (on the nomination of the Council) Mr. H. Denton Hardwicke as auditor.

It has been decided to hold a two days' summer meeting on Wednesday and Thursday, June 7 and 8, in connection with which there will be the first annual dinner. Further particulars of this will appear shortly.

MR. EDWARD LEONARD, Inspector of the Local Government Board, held an inquiry at Westminster Guildhall last week into an application by the Middlesex County Council for consent to borrow sums amounting to 85,128l. for the erection of a new Guildhall on the present site at Westminster.

The Chartered Surveyors' Golfing Society will hold a one day tournament at Northwood on the Northwood club's course on Tuesday, May 9. The fixture includes a bogey competition, stroke competition and foursome competition. Prizes will be presented by the captain, Mr. C. R. Lowe, and the Society. All members of the Surveyors' Institution are eligible to join the Society. The Honorary Secretary is Mr. Sidney A. Smith, 22 Chancery Lane, W.C.

UNDER the auspices of the National Housing and Town Planning Council and other organisations, a conference for Lancashire, Cheshire, and the North-western Counties, will be held at Manchester on May 13, to consider the powers and duties of local authorities under the Housing and Town Planning Act, 1909. It is hoped, as a result of the conference, to form district committees to work on non-party lines "for the wise and active administration of the Act." The following points will be considered in detail: 1, Closing of houses unfit for human habitation; 2, improvement of houses which are not in all respects reasonably fit for human habitation; 3, right of complaint to the Local Government Board of inaction on the part of the local authority; 4, housing of the poorest poor and provision of lodging-houses; 5, building of new cottages and development of garden suburbs; 6, town planning.

THE HYGIENIC ASPECTS OF ILLUMINATION AND RECENT PROGRESS IN ILLUMINATING ENGINEERING.

(Continued from last week.)

IN electric lighting the chief advance has been in the direction of metallic filament glow-lamps. In the year 1905 lamps of this kind were known, but were regarded as little more than experimental curiosities. Subsequently, when I exhibited a 200-volt lamp of this kind at the Institution of Electrical Engineers early in 1906, there were still many who doubted whether it would be possible to make such lamps for higher voltages than 100. Yet, as you know, such lamps are in common use to-day, and the difficulties of making durable lamps of small intensity have been largely got over. We have now lamps consuming only 1.1–1.2 watts per c.p., which will burn, under favourable conditions, for over 1,000 hours without sensible diminution of light, can be used in any position, and are far less liable to fracture than those in use only two years ago. Moreover, it is now possible to obtain 100-volt lamps consuming only 17 watts and 200-volt lamps consuming only 30. A recent important step has been the discovery that metallic tungsten can be produced as malleable wire and wound on a frame inside the bulb, thus leading to improved durability and strength.

At the same time progress in connection with arc lamps has also been very rapid. Lamps credited with a light of several thousand candle-power and a specific consumption of less than one-third of a watt per c.p. (quite three times as efficient as the older forms of lamps) are now available. This improvement has been secured mainly by the use of special chemically-prepared carbons, and there have also been advances in the design of enclosing globes, reducing the consumption of carbons and expense of maintenance.

The use of luminescent vapours in artificial lighting has also recently received special attention. Steady progress in mercury vapour lamps has been made. A special development has been the introduction of a new lamp using a quartz tube to contain the mercury vapour. These lamps are stated to yield as much as 3,000 c.p. and to consume less than 0.2 watts per c.p., and the life of the tube is put at over 1,000 hours. The lamp has also the special quality of emitting an exceptional amount of non-luminous ultra-violet energy; to this I shall again refer later. At this stage I should merely like to point out that the study of the effects on the human body of radiation of this kind affords a striking example of the desirability of co-operation between the medical expert and the lighting engineer.

Among other developments in vapour lighting I may mention the progress in the Moore system, in which a ramifying tube, often 60 or more feet long and containing rarified gases, is subjected to a high tension discharge at 2,000 volts. The quality of the light depends largely on the nature of the gas used; with nitrogen a pinkish colour is said to be obtained, with carbon dioxide an almost white colour, closely approaching daylight. Quite recently a very distinct red tint is reported to have been secured by the use of the rare gas, Neon.

It need hardly be said that there have also been great improvements in gas lighting. Modern inverted high-pressure gas lamps, run at a pressure of 50 inches of water or more, are claimed to yield as much as 50 to 60 c.p. per cubic foot of gas, which is three times as high an efficiency as was considered possible with the best low-pressure burners a few years ago. The spread of high-pressure gas lighting has attracted much attention. But the steady improvement in low-pressure burners, especially by the aid of the inverted mantle, has been equally remarkable. The latest pattern of low-pressure street lamp is stated to give as much as 30 c.p. per cubic foot of gas per hour.

Equally important have been the developments in methods of controlling gas supply, the introduction of automatic means of lighting and extinguishing street lamps, etc., on which, however, I cannot dilate at present. The durability in mantles, like that of electric lamp filaments, has been much improved, and this has been the means of enabling gas-lighting to be applied to many purposes for which it might not have been considered suitable only a few years ago.

Next we must not forget the rapid advance of methods of artificial lighting, such as acetylene, petrol air-gas, and incandescent paraffin, which are suitable mainly for remote districts where a gas or electric supply is not available. The progress in methods of illumination in country districts has been, in its way, quite as remarkable as that in gas and electricity.

Moreover, attention should be drawn to the extraordinary development in new uses for light which this improvement in lamps has brought about. It is possible that the use of light for special decorative and advertising purposes is only in its infancy, and it is unquestionable that a great deal more care is now being taken to apply light in a wise and careful manner for ordinary every-day purposes. One indication of this change of view has been the attention now devoted to the scientific design of globes and reflectors intended to throw the light where it is needed for specific purposes. It is now realised that the mere production of light in large quantities does not constitute "illuminating engineering," and that it is necessary to make good use of the light we have now learned to produce in such abundance. Epigrammatically expressed, "Light is the cause, illumination the effect."

The Eye Developed to Use of Daylight.

Turning, therefore, to the practical utilisation of light, we find at once that the whole basis of successful illumination is physiological. For it is only through the eye that any impression of the nature of our surroundings is obtained. It is to our knowledge of the eye, therefore, that we must turn in considering which methods of lighting are useful and beneficial and which are harmful and injudicious.

The first thing that strikes us in considering the effect of light upon the eye is that it is only within a comparative short period of history that there has been any artificial illumination worth the name. In earlier days men tacitly assumed that when darkness fell their day's work was done. There was nothing left but to talk round the camp fire for a short time and then fall asleep until daylight returned. Consequently, through countless ages the eye has developed in such a way as to make the best use of daylight illumination; anything, therefore, unquestionably abnormal and distinct from daylight in artificial methods of illumination requires to be accepted with caution.

Indeed, within the last fifty years an entirely new condition of things has come about. As we have seen, new methods of lighting and new uses for light are daily making their appearance, and the phrase "the night when no man can work," has ceased to have any literal value. Step by step with the development of illumination in the last century has been the progress of education and the enormous spread of printed matter. The net result is that we use our eyes far more than our forefathers did. And this raises at once the questions: Are we wise in continuing to turn night into day? Is it not possible that the growing brilliancy of illumination by night may not have an unfavourable effect on physical development? That organs which require the occasional cessation of light are unduly stimulated and that nervous strain may follow? These are questions for the physiologists to study. Meantime, it is interesting to recall an experience in certain zoological gardens devoted to tropical birds, which seems to bear on this point. These birds, coming from tropical countries, were accustomed to practically equal periods of day and night. In our northern latitudes, even if the tropical conditions were most accurately reproduced as regards temperature, humidity, &c., they pined away and died. This was traced to the interruption of their sleep by the unusual conditions of light and darkness. When, by means of electric light, the periods of light and darkness during the day were equalised, the birds recovered their health and well-being. Is it not conceivable, therefore, that there may be a lesson to be drawn from their experience?

Features in Artificial Lighting to be Guarded Against.

However, industrial enterprise and the pursuit of knowledge and pleasure by night continue to demand an increasing use of artificial light. Our first duty, therefore, is obviously to secure that this light is wisely applied, and physiologists can confer a great boon by bringing their experience to bear on the matter. Now, artificial lighting we meet, as often practised, differs radically from daylight illumination in several important respects.

In the first place, it has been proved by photometric measurements that the intensity of illumination from the unobstructed sky is vastly greater than the order of illumination met with in most rooms lighted by artificial means—often as much as 100 times as great. The first danger we must guard against in artificial lighting, therefore, is that of providing too little light. People are constantly engaged in factories, in cotton mills, sewing, lace-making, or working at embroidery and many other processes which are known to be exceptionally trying to the eyes; others are constantly reading fine print, making intricate drawings, &c. How much illumination is required for these various processes?

Even more important is the case of children in schools who are at a critical stage in their development and specially liable to suffer as a result of working under imperfect illumination. This is again a question for the sanitary engineer, the factory inspector, the oculist, the school medical officer, and others concerned to study. We know, for example, that "eye-strain" among school children has been giving concern to the medical profession. How much of these defects of vision is to be traced to poor illumination? And is it not possible that many other nervous defects and symptoms of over-strain are due to the same cause? I may add that the Illuminating Engineering Society has recently been considering the question of the order of illumination required for schools and libraries, and at this discussion the tentative suggestion was made that for ordinary reading an illumination of not less than 2 to 3 foot-candles was desirable, while for special purposes a high value was felt to be necessary.

An equally important deviation from daylight conditions in most artificial illuminants is the concentration of the light. In the case of daylight our illumination is normally derived from a wide expanse of mildly luminous sky. Our artificial sources, on the other hand, consist of isolated, distributed bright points. Moreover, during the last few years the concentrated brilliancy (expressed in candle-power per square inch) has been steadily rising. I have here a table of data collected by Dr. K. Stockhausen, showing how great the change in this respect has been. Now, everyone is aware of the unpleasant effect of looking straight at such a bright source. The eye becomes fatigued and dazzled, so that, on looking away from the lamp, we are often conscious of a distinct "after image," and the greater the brilliancy of the source the more permanent such an impression of glare is apt to be. Professor Burch, of Oxford, who made experiments upon the effect of such bright images on the retina, has even experienced "spots" on the retina which persisted for years. You are also doubtless aware of the special inflammatory conditions which often follow even a short period of gazing at reflection off the sea, or at naked unscreened arc-lights, &c. In ordinary conditions we probably do not meet such extreme cases as this. But the eye is being constantly fatigued by irritations of this character, and at the end of the day bear witness, by a tired feeling, to their exposure to these glaring bright specks of light.

This weakness in artificial illuminants has been well recognised by many engineers. But public opinion still requires to be educated as to the wise use of light and the avoidance of glare of this description. Meantime, we require more definite data. What is the minimum brilliancy which the eye can bear without discomfort? How far is the impression of glare due to contrast of bright objects with relatively subdued surroundings? How can artificial lights be best distributed in interiors so as to avoid these defects? These are questions which are already confronting the lighting engineer to-day. He requires the expert advice of the physiologist and the sanitary engineer in framing recommendations on this point and in driving them home to the general public. Meantime it has been suggested that it would be wise to tone down, by suitable shades, the brightness of sources of light until the intrinsic brilliancy is not greater than that of the average sky, i.e., about $2\frac{1}{2}$ c.p. per square inch, and it is also admitted that we should do all that is possible to keep these bright sources out of the normal range of vision.

Indirect Lighting and Local Illumination.

I may add that there have been other suggestions for avoiding "glare." One method of lighting, the so-called "indirect system," has been much praised for its qualities in this respect. The method consists in screening the source from the eye and allowing its rays to play upon a white ceiling, so that its large and extended white surface becomes the source of light. The use of the ceiling in this manner has been likened to the diffused white sky, and it has a similar effect in producing shadowless illumination.

On the other hand, there are several respects in which this system, in an extreme form, does not exactly resemble daylight, and the impression of "flatness," "something wanting," that it produces is displeasing to people in many instances. Some physiologists in the United States have also contended that it is not physiologically satisfactory, because of the dead level of brightness in the surroundings produced; the eye, they assert, is not satisfied with this uniformity, and desires to rest itself sometimes by occasionally transferring its direction of gaze to some darker object. Again, it is urged that local illumination, in addition to inverted lighting, helps to concentrate the attention on some special spot; for ex-

ample, in a lecture theatre the table at which the lecturer stands and exhibits his apparatus should receive special illumination so that the attention of the audience is involuntarily concentrated upon him. The tendency, therefore, is to advocate a combination of the two systems.

Yet the other extreme, a very strongly-lighted desk, with very sombre surroundings, is also open to objection. Every time the eye strays from the desk the pupil aperture of the eye and the retina have to adapt themselves to the new conditions, and the continual repetition of this process is very fatiguing. Professor L. Weber, of Kiel, has suggested that the contrast between one's book and the surroundings ought not to exceed 100 to 1.

The tendency now is, therefore, to advocate a middle course between these extremes, i.e., moderate general illumination and stronger local lighting from well-shaded lamps in addition. This method frequently recommends itself in libraries. It is used, for example, in the British Museum, in the Patent Office library, and in other cases.

The Effects of Light of Different Colours.

So far we have considered the effect of varying intensities of light. But there is another matter which must not be lost sight of, namely, that artificial illuminants differ considerably from daylight, and from each other, in colour.

I fear I cannot allow myself time to dwell upon some interesting suggestions that have been made from time to time regarding the effects of light of different colours on the human body. These have been studied to some extent by the medical profession, and I may say in passing that the whole question is now becoming very interesting to lighting engineers. For whereas in the past we had to deal with only a few illuminants, such as the oil lamp, the gas flame, &c., which did not differ from each other very considerably in colour, we have now incandescent mantles, flame arcs, mercury vapour lamps, &c., all of which yield light of strikingly different tint.

I may add, too, that we have now at our disposal means of producing light of one colour only in much more powerful quantities than a few years ago, and these facilities might profitably be taken advantage of by medical experts interested in the subject. The matter is essentially one on which the lighting engineer and the medical physiological expert should combine. While leaving this subject for the present, I feel that it is necessary to say something on another question of equal moment, namely, the effects of invisible ultra-violet radiation.

(To be continued.)

TRADE NOTES.

MR. CHARLES R. H. PICKARD, architectural photographer, of Leeds, has requested us to announce his removal to larger and more commodious offices and studios at Brig-gate Chambers, Kirkgate, Leeds; his telephone number will be 4123 Central.

THE Ratner Safe Co., Ltd., have recently secured the following important Government business:—A repeat order for the large cash safes for the Admiralty, for use on H.M. battleships, making 85 in all; 75 improved bent steel safes for the Egyptian Government; and 12 safes for the use of their Majesties the King and Queen, the Viceroy, and their suite at the forthcoming grand Durbar, to be held at Delhi.

THE Registrar of Imports and Exports at Singapore (Mr. A. Stuart) reports that the Singapore Municipal Commissioners have decided to erect an isolation hospital at an estimated cost of about 18,250l. The camp will be divided into sections for cases of small-pox, cholera, and plague.

THE Mansfield Accident Hospital Board of Management have adopted a scheme prepared by the Building Committee, to add to the accommodation at the institution. The scheme includes the erection of a new block, to be known as the King Edward VII. block, three storeys high, and the building of an observation block, which will bring the accommodation up to 110 beds. There will be various internal alterations and additions to the nurses' quarters, and the cost is estimated at 10,000l.

THE British Vice-Consul at Leipzig (Mr. R. Turner) reports that an International Building Exhibition is to be held there in 1913. The exhibition will include sections for building construction, furnishing, the laying-out of gardens and parks, road making, the water supply, drainage, and lighting of towns &c. A copy of the programme (in German) may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

THE
Architect and Contract Reporter.

FRIDAY, MAY 5, 1911.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus, London, England.

Telephone No. 4725 Holborn.

Branch Offices at 43 OLD QUEEN STREET, S.W., Messrs. W. HAY FIELDING & CO. being the representatives for all business purposes.

The Birmingham Offices are at 102 COLMOORE ROW.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a *bona-fide* design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BURSTOW.—May 26.—The Trustees of Archbishop Abbott's School, Guildford, invite designs and estimates for erection of a pair of semi-detached labourers' cottages on the Rookery Farm, Burstow, Surrey, to contain a living room, a scullery, and three bed-rooms, and to be provided with a water supply and the usual offices and outbuildings. Mr. H. P. Smallpeice, clerk, 138 High Street, Guildford.

Works: FALKIRK.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000l. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3l. 3s. Apply to Mr. G. C. Copstick, L.R.I.B.A., County Offices, Derby.

DEVIZES.—May 10.—The Committee of the Devizes Cottage Hospital invite competitive designs for providing a new six-bed ward at, and making a general re-arrangement of, their existing hospital (16 beds) at a maximum cost of from 1,200l. to 1,500l. Deposit 10s. 6d. Conditions of competition and particulars of the buildings required will be supplied to intending competitors by Mr. E. Thorp, honorary secretary, Devizes.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

WHITLEY BAY.—June 7.—The Whitley and Monk-seaton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed cemetery buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and the conditions can be obtained on a written application being made, accompanied by a deposit of 1l. 1s., which will be returned to every competitor submitting a bona-fide design. The designs, addressed to the Surveyor, are to be delivered at the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Saville Street, North Shields.

CONTRACTS OPEN.

ALTHORPE.—May 20.—For alterations and additions to White House, Althorpe, near Doncaster. Mr. J. W. Ross, Belton, Doncaster.

FIRST FLOOR PLAN.

THE BUILDING TRADES EXHIBITION.

THE visitor who conscientiously follows the order of the catalogue finds himself first opposite the stand of *William Mallinson & Son*, London, No. 1, Row A, where there is a good collection of seasoned hardwoods specially selected for high-class joinery, for interior decoration, and for shop fitting. Particularly noticeable is the carved and polished panel, 13 ft. by 3 ft. 8 in., in African mahogany; this is a very exceptional length. Inside the stand there is a most elaborate piece of Grinling Gibbons carving, executed by Messrs. H. H. Martyn & Co., of Cheltenham.

Next comes the stand of *J. Sagar & Co., Ltd.*, London, with various joiners' machines in operation. Amongst them is a patent combined chain cutter and hollow chisel mortising and boring machine for hard and soft woods, also sawing machines, a vertical spindle moulding and shaping machine, &c.

The *Hempstead Patent Brick Company* have utilised the "Hempstead" hollow terra cotta partition blocks for enclosing their stand by the Addison Road entrance. The sample blocks range from 1 1/4 inches to 4 1/2 inches. Besides partitions the company make tubes and blocks for fireproof floors, fixing bricks and ceiling tiles. The partition openings are equipped with the "Hempstead" patent fireproof doors,

which have been most successfully tested up to 2020° Fahr. The doors consist of wrought-iron or steel frames filled in with hollow porous blocks, coated with Keene's cement and sand.

Knowltons, Ltd., Southampton, have sent, to this exhibition several pieces of their old stone house and garden furniture, which is guaranteed to be absolutely frost and weather-proof, and to be everlasting. It has a handsome appearance when moulded into vases and sundials. There are a number of glazed and faience fireplaces and art tiles.

The *Interoven Stove Co., Ltd.*, show their highly ingenious combined sitting-room interior and cooking range. This is guaranteed to be an entirely efficient range, which when desired can be converted into a slow combustion grate identical in appearance with an ordinary interior. The oven is hidden behind the sham canopy; the hot plate when not in use takes the place of the sloping brick at the back; the high pressure circulating boiler (if included) can be heated when either the oven or the open fire is in use. The "Interoven" is fitted into a 14 in. deep opening if without the boiler, and is ideal for flats, bungalows, and other places where a full-size kitchen range is undesirable. It is little wonder that it has been extensively adopted by the Co-partnership Tenants.

TOWN PLANNING-MODERN HOUSE & COTTAGE EXHIBITION
 PROPOSED COTTAGE BY H. DRYANT-NEWBOLD ARCHITECT
 DRAWN BY O. NEWBOLD

The speciality of the *Bromyard Tileries, Ltd.*, is the "Semincostic" paving. This has been designed to meet the demand for a tessellated tile paving possessing the finished appearance of encaustic and competing in price with the common quarry. It is made in squares, octagons, strips, &c., of half an inch thick, and weighs 45 yards to the ton. Any colour of dots or border may be ordered. The stand is covered with the firm's Linton red roofing tiles, which are guaranteed not to laminate or flake.

The "Watkin" switch is effectively demonstrated on Stand 133, Row F, by the *Adams Watkin Co., Ltd.*, 36 Victoria Street, S.W. This patent is, of course, a device by which electric current for lighting, heating, or power purposes can be regulated in very much the same way as a gas flame is controlled by the tap. A certificate of Faraday House is technical assurance as to the real diminution of current. The gain in enjoyment of a controllable light from dim to full-on would alone have justified the invention. Not the least rewiring is necessary, for the "Watkin" simply replaces the ordinary switch. The invention has been very extensively adopted.

Although the *Præd Patent Safety Gas Light Co., Ltd.*, have a position in Row B against an outer wall they have to take their generating plant outside the building in accordance with the regulations enforced at Olympia. But the brilliancy of the stall is due to the air gas which is conveyed to it. The gas is produced by passing air through a chamber in which it is associated with petrol vapour, the product being a gas with an intensely hot blue flame which when burning closely resembles the Bunsen flame. It is called "safety gas" because it has no explosive qualities, thanks to the small percentage of petrol vapour. The fact that it is composed almost wholly of air renders it free from deleterious impurities. The gas is used for heating and cooking as well as lighting. The plant is compact and very easily managed.

Bell's United Asbestos Co., Ltd., show "Poilite" as made into weather-resisting asbestos roofing tiles, fireproof asbestos sheets, veneered sheets and compressed sheets. "Poilite" tiles are made 3-16 in. thick for fixing at 13½ centre for large roofs and are guaranteed for twenty years. The asbestos cement sheets are made in any size up to 12 ft. by 4 ft., and from 5-32 in. to 1 in. in thickness.

They can be cut with carpenter's tools, and are fixed with nails or brads. "Poilite" compressed sheets are supplied 4 ft. square for electrical purposes.

The Manu-Marble Co., Ltd., Gloucester, again show their reconstructed marble as made for floorings, wall linings, shop fronts, &c. This material will stand weather, water, and heat, and is polished, cut, and tooled in the same way as natural marble. The manufacturers say that it can be obtained at very little above the cost of glazed tiles, while giving all the effects of the most expensive marbles, granites, and mosaics, but without their defects. Manu-marble is made in practically every class of natural stone, so that a beautiful range of colours and designs is available. The standard size of the slabs is sixteen inches square, or they may be obtained in oblong form fourteen inches by twenty inches.

What might have been an accident fraught with serious results occurred last week on the stand of the *British Ceresit Waterproofing Co., Ltd.*, in the balcony at Olympia. A feature of the exhibit was four large glass columns some five feet high and ten inches in diameter imbedded in pedestals made of cement mixed with "Ceresit" and containing water to show the imperviousness of the preparation to moisture. On Wednesday the sun was shining fiercely on one of these, and the glass not being able to expand broke, letting out the water, which flowed over the stand and down from the balcony on to the exhibit beneath. Fortunately, the glass column, although badly fractured, remained in position until removed by a member of the "Ceresit" staff. Had it fallen over the balcony rail—to which it was close—the results might have been disastrous.

An important display is made by the *Ransome-verMehrs Machinery Co.*, Caxton House, Westminster. Four of their patent concrete mixers have been brought to the show, viz. No. 4 size having a 40 cubic feet batch, No. 1 10 cubic feet batch, No. 0 6 cubic feet, and the hand-mixer with a 2 cubic feet batch. All are made by Messrs. Ransomes & Rapier, Ltd., of Ipswich. The No. 1 and No. 0 mixers are in use by several large contractors, who give most satisfactory testimonials as to their efficiency; the firms include Geo. Trollope & Sons and Colls & Sons, Ltd., Perry & Co. (Bow), Ltd., Morrison & Mason, Higgs & Hill, Ltd., Empire Stone Co., Ltd., Geo. Bell & Sons, Ltd., and Geo. Wimpey & Co. The "RvM" mixer, No. 0 size, is a new type specially designed for contractors engaged in works of short duration. In addition to the mixers there are three types of corrugated steel sheet piling, a crane skip, a new cement testing machine, a concrete vibrator, and a Ransome jiggling screen for gravel or other material where fine particles have to be separated from larger ones. Machines are shown in the Gallery, Stand 26, as well as in Row K, Stand 212.

The Aerograph Co., Ltd., can always be sure at any exhibition of attracting an audience when they give demonstrations with their spray painting apparatus for plain and ornamental work in oil, varnish, or water-colour. The speed and efficacy of this machine, which converts a plain surface into a decorated one in a second or two, exerts a perennial fascination. The outfit is most compact, consisting of the hand-piece or "aerograph" proper, an air-compressor, paint-pot and tubes. On the stand are also "Aerograph" machines for whitewashing, lime-washing, and spraying disinfectants, which are especially useful on very rough surfaces and for crevices.

Henry Hope & Sons, Ltd., Birmingham, are specialists in metal casements. Their stand in Row E, No. 93, shows domestic casements and frames with leaded lights in mullioned windows and examples of casement windows of large size suitable for offices and public buildings (similar to the nine thousand supplied to the Royal Liver Buildings, Liverpool, and the Calico Printers' Offices, Manchester). Hope's casements are all fitted with their patent two-point handle, which holds the casement open at 1 inch or ¼ inch as required without allowing any rattle. The stand also shows kupronised steel doors glazed with fireproof glass; cast-lead rain-water heads and pipes; patent glass roofing, and bronze door furniture.

The Guildcor Hinge Co., Ltd., demonstrate the advantages of double-action and single-action doors fitted with the patent "Guildcor" sight-proof and draught-proof hinge, which entirely seals the aperture between the frame and door whether the latter be opened or closed. A great feature of the hinge is that the customary floor plate is dispensed with as the necessary springs are contained in the steel barrel extending from the top to the bottom. If desired the Guildcor hinge check may be used in conjunction with it. For ordinary purposes a Guildcor hinge without a spring is suitable. This new hinge is easily fixed.

The Maximum Light Window Glass Co. (E. J. Dobbins, prop.), 28 Victoria Street, London, S.W., are exhibiting a very interesting form of rolled window glass—"Maximum Daylight Glass." This is a scientific combination of lenses and prisms in sheet form; it may be cut to ordinary window squares, fixed directly in wood or iron sashes. It is easily fixed and has the effect of deflecting and diffusing the daylight to parts of a room or building distant from the windows. The actual increase of light in many cases is from 5 to 20 times. The use of daylight-increasing glasses is becoming more popular with architects and builders, and the collective and dispersive power which the "Maxim" has makes it useful for all classes of buildings such as mills, warehouses, shops, offices, schools, flats, residences, &c. By glazing ordinary windows with the glass a considerable saving is effected in the cost of artificial lighting and perfect daylight is substituted for semi-

gloom. More than 60,000 windows have been glazed in London alone, and some of the very largest property owners have adopted this system as the most practical and permanently effective means of gaining additional daylight. The "Maximum Daylight Glass" is distinguished by the lense-prism combination as shown above. The latest product of the Maximum Light Window Glass Co. is a new form of figured rolled Max Silk Glass. This product has a moiré or silk effect, and is most suitable for partitions and door glazing. The lines are practically parallel, making any window glazed with same easily cleaned. This glass is made in various tints and is stocked now by the principal glass merchants throughout the country.

The Nautilus Fire Co., Ltd., have brought together many excellently designed "Bush" fire interiors on Stand 230, Row L. These were first exhibited in 1909 at Olympia, and the Company report that its success has been so phenomenal as to lead them to specialise in design. This patent slow combustion fire has a loose front and ashpan fitted with a grid ventilator for controlling draught. The fire rests on a pyramidal brick surrounded by a cast-iron grid sloping towards the back. The "Nautilus" fire has been on the market for a longer period. It was first brought out as a dog grate and then adapted to an interior. The name is derived from the nautilus shell shape of the stove. The products of combustion rise from the fire, and after revolving within the hood pass off through two exit nozzles into the small flues leading to the chimney. The heat is radiated directly from the open fire and indirectly from the superheated canopy and the hot-air chambers on each side. A damper controls the chimney draught with exactitude. The Nautilus grate has proved most effective when introduced in the place of fires which suffered from smoky chimneys.

Messrs. Messenger & Co., Ltd., Loughborough, are exhibiting on Stand 230, Row L, a few of their specialities. This well-known firm after an experience of over half a century are making a new departure in taking up hot-water supply independently of heating. Unqualified success has at once met the "Meseta" boiler, for it has gained the full approval of architects and the trade alike. Very little attention is required by the "Meseta," for the fire burns 12 or 15 hours on a charge of 30 lb. of coke and cinders, and gives a hot-water supply of from 25 to 30 gallons per hour at about 180 degs. during that time at a cost of 2d. The boiler has a water-way bottom and large mud-holes for cleaning. The "Quorn" sectional boilers are so familiar as scarcely to need comment. It is claimed for them that they consume from 25 per cent. to 33½ per cent. less fuel than any other sectional boiler on the market. Amongst the radiators on the stand is Pattern R 16, designed for use in churches and other buildings where height is not such a matter of importance as a large area of heating surface. The Loughborough boiler as applied to heating motor-houses is also shown.

The Eagle Range and Gas Stove Co., Ltd., show in operation their latest type of the Premier Gold Medal Eagle Range, which has several improvements over the Premier range of 1907, and this was in its turn an advance on the Company's preceding efforts to secure a faultless range. Also in operation is the Eagle "Imperial" grate exhibited

for the first time. In this the adjustable front bars are raised to the ordinary height, lowered to make a semi-bar fire, or pushed out of sight by means of the poker. The combustion is regulated by hinged draught doors before the ashpit. Other Eagle patents shown are a "New Portable" range, a "Governor" and "Premier" grates, a chimney-cowl, and an independent hot-water boiler and closet.

Mr. William Boby, Thornton Heath, has placed on his stand two types of water-softeners, one the "Simplex" for general purposes and the other "Type K" for domestic supply up to 200 gallons a day. This latter is quite automatic in its operations, requiring no chemical solution with its inevitable weighing and measuring. It can be connected to an existing cistern and is usually placed at the top of the house or water-tower.

Messrs. Allen & Norris exhibit the "Eureka" sash balance (Neren's patent), which replaces the old-fashioned clumsy weights, pulleys, and cords by a neat spring-balance, which silently lifts the sash to any height and counterbalances it. Sliding sashes can therefore be used in solid frames.

The Sussex Brick and Estates Co., Ltd., show their "Southwater" pressed facings and engineering bricks, "S.B.E.C." purple and mottled kiln stocks, and broken coloured reds, Warnham common pressed bricks, &c. These goods have a good reputation in Sussex, Surrey, and Hampshire.

Messrs. J. & R. Corker, Ltd., Ferham Works, Rotherham, have sent a selection of "Drawwell" fire grates to the stand of the *Albion Iron Co. (London), Ltd.* This grate, it may be remembered, was placed in the final tests of the Coal-Smoke Abatement Society in 1906 to ascertain (1) the amount of smoke given off, (2) the heating power, (3) the economy of fuel and the suitability of the various stoves for the office and household purposes. The Drawwell grate is fitted with an adjustable canopy, semi-circular and solid brick back in front sloping inwards, the bottom forming a dish or basin with loose grate to lift out. There is a ventilating fret with ash-pan attached. When the fire is out the bottom grate can be removed if necessary, and the dust and ashes carried away in the pan without causing them to fly about the room. On the stand the grate is seen in different finishes and set in a number of attractive fireplace suites.

Kitchen equipment may not at first sight seem very constructional, but it undoubtedly has as much, if not considerably more, to do with the selling or letting of house property than subtle refinements in planning or elevation. Consequently Stand 84, Row E, is important to the architect, the builder, and the housewife alike. Here *Messrs. Frank Staines & Co., Ltd.*, 38 Buckingham Palace Road, S.W., show their patent greaseproof sinks and "Easy" racks, which after acquiring a big reputation in Australia were brought into this country just over a year ago. Short as the interval has been, the inventions are already in use at the depots of the Aerated Bread Co. and *J. Lyons & Co., Ltd.*, the Savoy and Charing Cross Hotels, Selfridge's and many other places. The wooden sinks consist of three divisions. The first is the rinsing pocket, the hot water from which overflows first into the second division, where all the washing is done, and then into the third or slop division, which is fitted with pierced and removable iron receptacles to receive all solid matter from the overflow or the slops. Each division is drained from one another by lifting a patent gateway plug; a standing waste to outlet is in the slop division. When the crockery has been thus quickly and effectively washed in the Staines sink it is put away into no less ingenious trays and racks, with an immense saving in labour and breakages in consequence. There are absolutely no mechanical devices to get out of order, and there is no expensive plumbing work in these greaseproof sinks. The invention would seem to be about to enjoy a huge success in this country, where the cry of "No more wiping up" will be a welcome sound.

The Gypsum Mines, Ltd., Robertsbridge, show their Sirapite plaster rendered and finished in various ways. Something like three hundred thousand tons of this material have been sold for work both great and small. The advantages claimed for it are (1) great strength and adhesiveness, (2) freedom from glue or other organic compounds, (3) rapidity of application, and (4) only two coats are required. On the stand there are also panels and other work rendered in Sirapite and finished in the Company's Keene's and Parian cements, &c.

Candy & Co., Ltd., make a good display of their "Devon" fires in glazed briquettes, tiles, and faience work. These fires are supplied in a large variety of artistic designs to suit any style of room. They give out great heat with very little coal consumption, and they require a minimum of attention.

With their well-designed mantels they make an ornamental feature. The "Devon" fires were, it will be remembered, placed first in the recent official tests of domestic fires carried out jointly by H.M. Office of Works and the Smoke Abatement Society. The consumption of fuel and the production of smoke were each one-quarter less than the average of the 36 competing grates.

One of the most recent window improvement patents is to be seen at the stand of the *Bramble Joinery Co.*, Coventry, and it is called the "Gamble" beadless window. This window dispenses altogether with sash weights and cords, parting beads and stop beads. The sashes can be taken out of their frames and cleaned or painted by anyone standing within the room.

The *British Stone and Marble Co., Ltd.*, Craven House, Kingsway, W.C., are showing an interesting novelty at Stand 148, Row G, in addition to their well-known reconstructed stone and their glazing bar, to which we referred last week. This is the application of a stone-face to a hollow concrete block made in the ordinary way—we believe the Company themselves use the (U.K.) Winget Machine. The blocks, however, can be obtained either ready stone-faced from their works at Ponders End, Middlesex, or the firm will supply the stone-face only with its prepared inner surface to block manufacturers. To all intents and purposes a building formed of this construction is the same as regards appearance as a stone building, with the advantage of a hollow wall and its consequent reduction in weight and other advantages. The blocks are sold at a price which will ensure the total cost of the structure comparing very favourably with brick walling, and at a considerably less cost than a stone building.

Ripolin, Ltd., 35 Minories, E.C., present two novelties at Stand 149, Row G. The first is "Fletto" undercoating sold ready for use in white and eight colours for interior work. The great characteristic which will appeal at once to the decorator is its quality of "flowing out." It dries in a few hours to a hard non-porous surface and forms an ideal ground for Ripolin gloss, flat or semi-gloss finish. The second novelty is "Ripolin Stopsap." As its name indicates, this material is primarily for preventing sap and knots staining through white or light finished work. It can be used direct upon the wood or upon old or new paint surfaces at any stage previous to the application of the finishing coat. For new work it is preferably applied on priming. It may be used advantageously on distemper filling in place of oiling-in. Both these materials should receive early attention from painters and decorators, who will find in them remedies for too familiar troubles.

The *Granite Silicon Plaster Co., Ltd.*, show at Stand 58, Row D, their Special Cromoleth Plaster, Granite Plaster, Tilephast Plaster, and a 2-in. Granite Plaster Solid Partition. Granite Plaster is applied in the usual way, but produces such a hard, smooth and germ-proof surface as to earn the name of granite. The Tilephast Plaster is especially adapted for soffits of concrete or ferro-concrete, fire-resisting floors, &c. The partition has a core of expanded metal lathing held in position by vertical rods, and then plaster is put on each side to a thickness of one inch. The 2-inch partition is as sound-proof as a 4½-in. brick wall, as well as being strong, rigid, and fire-resisting.

The *Rawdon Foundry Co., Ltd.*, Moira, Leicestershire, have in motion a sanitary pipe machine, screw type, for the manufacture of socketted pipes, chimney-pots, ridge tiles, conduits, &c.; also a clay pug-mill and mixer for converting clay from the dry state to the plastic. The sanitary pipe-testing machine should not be overlooked.

The *Comet Telescopic Mast Co.*, of 20 Bucklersbury, E.C., exhibit at Stand 85, Row E, their telescopic mast, which consists of a series of welded steel tubes of gradually decreasing thickness, and so adapted as to slide telescopically. Three collars are affixed to each section, one top and two at the bottom; the top and bottom collars are for the purpose of strength, and the intermediate one, which is situated near the foot of the section, acts as a stop with the top collar of the preceding section, thus obviating the possibility of drawing the sections out too far. A drum driven by gearing and a chain and sprocket wheel is mounted inside the pedestal of the mast, with a crank handle shaft. A perforated, untempered steel band is coiled round the drum; the thickness of this band varies according to the size of the mast, and the band is to be hoisted. Leaving the drum this band passes up between two rollers, one of which is provided with teeth to fit the perforations of the band. Locking devices and other safeguards are introduced, but the mechanism is throughout so strong and simple that the probability of failure is prac-

tically an impossibility. The uses of the mast are obviously numerous, and builders and contractors will recognise how convenient a substitute this invention will be for scaffolding and invaluable in the erection of tall chimney construction. The main points are stability, strength and absolute simplicity.

The *Checkfire Door Co.*, of Silvertown, show on Stand No. 18, Row B, fireproof doors, which have passed the Fire Office Committee and meet the L.C.C. requirements. The thickness of the doors has been reduced to a minimum, but leaving a maximum of strength; by the reduction in thickness they certainly gain in appearance. Attached to one of the doors is their latest introduction of a patent panic bolt, which is so constructed as to be most simple and effective in action.

India rubber tiling was introduced by *The India Rubber, Gutta Percha and Telegraph Works Co., Ltd.*, over twenty years ago. Their stand in Row H, No. 163, reveals the handsome effects which can now be obtained. The large floor space includes sections of the new Silvertown Patent Mosaic, as well as various patterns of their ordinary rubber tiling, the whole being very imposing. Besides this flooring there are general rubber goods necessary in the building trade.

There is something very attractive about the arrangement of the stand occupied by *The Coalbrookdale Co., Ltd.*, in Row L, No. 240, for it suggests a commodious kitchen, with a smaller room on each side. The "K. B." range is shown in action with complete fittings, also the No. 4 "Thrift" range which, in a space of 3 feet to 3 feet 6 inches and a depth of 1 foot 6 inches, can give two ovens, and a high-pressure boiler amply sufficient for a small household.

The *Medway Safety Lift Co.* have installed an electric passenger lift under actual working conditions. It is operated by means of pushes in the car and on the landings, or alternatively by a switch fixed in the car for the attendant. The "S. M." patent controllers have several desirable features, not the least of which is that they are claimed to be absolutely fool-proof. A hand-power, self-sustaining dinner or service lift is also shown.

The stand of *The Patent Rapid Scaffold Tie Co., Ltd.*, in Row J, No. 203, should not be overlooked by any builder or contractor, for it shows something that would seem to have a big future. The steel tie is compact, easy of application, and has a minimum number of working parts. Messrs. Leslie & Co., the contractors, reported after exclusively using Scaffixer ties for the scaffolding at the Savoy Hotel extension, that they were so satisfied with their saving of time that they intended using them in other contracts. The same contractors employed them for the gigantic scaffolding at the new Money Order Office, Holloway, which has a frontage of 400 feet, and a height of 100 feet. The Scaffixer Tie may be obtained on hire if desired.

The *Sieewart Fireproof Floor Co.*, Thanet House, Strand, W.C., show their hollow concrete beams on Stand 21, Row B, in the Gallery. The Sieewart beams are made of a uniform width of 10 inches; in depth they range from 4 inches to 8½ inches, and they are made to span up to 20 feet without intermediate support. The size and reinforcement vary, of course, with the span and the load. The beams are sent to the job all ready, they are then placed on their supports close together, the narrow space in between each being grouted with cement, after which the floor is at once ready for use. The girders are generally provided with concrete haunchings upon which the beams are placed, and hooked stirrups are laid over the top flange to ensure continuity. This system obviously lends itself to great rapidity of construction and consequent saving in time and money. The advantages of hollow fire-resisting floors are generally admitted to be most substantial. The company are prepared to supply complete schemes and tenders on application.

At Stand 121, Row F, *Mr. F. H. Brook*, 11 Queen Victoria Street, E.C., the London agent of the Bursledon Brick Co., shows a variety of Bursledon bricks. These include their hard red wire-cut common bricks, which have been used for big contracts like Bordon Camp Barracks (3 millions), Southampton Dock extensions (1½ millions), Meon Valley Railway (11½ millions), and Amesbury Military Light Railway (2½ millions); also sand-faced hand-pressed red facings and Bursledon facings. Another feature of the stand is the wire-cut engineering and sewer bricks made by the Blishworth Brick and Tile Co., of which many millions have been used for the L.C.C. new main drainage works on account of their great strength and non-absorption. In addition to acting as agent for the above, Mr. F. H. Brook is agent for the Permanent Decorative Glass Co., Ltd., of Lancaster, and he shows their "Florite" opal tiling and "Stocal" patent

tiling. The latter consists of steel plates in brick or tile sizes having a dove-tail turned-in edge on all four sides, which gives a perfect grip, so that it cannot become detached from the wall. At the same time it does not take up more than $\frac{3}{8}$ -inch thickness. The surface can be enamelled to any colour from dull eggshell to bright majolica. It is especially recommended for reinforced concrete walls.

R. Gay & Co., Ltd., arouse a good deal of interest through their model roller mill and mixer as used for the manufacture of "Impenetrable" Paint. This latter is an odourless varnish paint which dries with a high gloss in from six to eight hours and renders the surface damp-proof. A cheaper brand than "Impenetrable" is their "Etruscan" paint. The "Tegoline" is a more expensive paint than these, and it is intended for high-class interior work.

Messrs. J. F. Phillips & Son, heating engineers, Westminster, show Barker's patent hydro-radiant heating system intended for small houses, which combines an open fire, closed stove and a hot-water boiler. The radiator is shaped in the manner of a dog-grate, and it is lined in the ordinary way with fire-bricks. The boiler is fixed at the back out of sight, and it can be connected to a hot-water supply apparatus or with radiators in any part of the house, thus making full use of the waste heat. The generator is closed when extra slow combustion is desired. The stove is made by the Falkirk Iron Co., which is of itself a guarantee of excellence. Another apparatus is Barker's patent low-pressure boiler feeder.

The Barnstone Blue Lias Lime Co., Ltd., show in the Gallery Vianex for binding macadam, Barnstone Portland cement, Barnstone blue lias ground and lump lime, and Murite for plastering. The Vianex can be used in any kind of weather, and is known to road surveyors as one of the simplest, cheapest and most expeditious in working of the many new binders at present being tried to produce a perfect road surface. By virtue of its ease of preparation, great covering capacity, strength and durability, it is claimed there is no better or cheaper material than Murite for plastering walls, ceilings and partitions of all kinds. For plastering on walls five parts of sand to one of Murite are used for the first coat and two parts of sand to one of Murite for the second or finishing coat.

Several interesting machines represent the *First Cottbus Cement Goods and Machine Works*. These include a brick machine with a guaranteed daily output of three thousand perfect bricks, a machine for making interlocking concrete roofing tiles, a concrete block machine, a hollow or plain partition slab maker, and a hand concrete mosaic tile press.

Of the many brick structures erected by exhibitors this year the stand of *D. & C. Rutter, Ltd.*, is conspicuous from the fact that hand-made yellow stocks are principally employed. This firm were established eighty years ago and claim to be the oldest stock brick makers in the trade. A guarantee is given that all brick earth used by them is washed and made to pass through an eighth of an inch mesh, and is weathered and tempered by exposing it for six months before it is made up. Yellow stocks are by no means the only kind of brick produced, for considerable variation in colour (including red facings) is to be found in the eight qualities. They also make partition blocks, flooring tiles, chimney-pots, ridge tiles, and flower-pots.

If there were many more stands like that of *Godfrey Giles & Co.*, Olympia would indeed be a sight to attract all the town. The exhibit consists of a circular Georgian pavilion in fibrous plaster and compo with the interior charmingly arranged as a dining-room or lounge. The firm are specialists in this kind of interior decorative work and they have here utilised their space to most excellent purpose.

Vulcanite, Ltd., have erected a wooden stand roofed with patent Vulcanite roofing. This consists of several layers of sheet asphalt combined with liquid Vulcanite composition applied in a hot state so as to render the whole surface into a waterproof and fire-resisting jointless sheet. It is chiefly employed for covering flat roofs and for roof tanks. The latter use is illustrated by a small tank on the stand. The Company also show others of their specialities, including Vulcanite sheet asphaltes, Leatherite Felts, Rexitite (pure bitumen) roofing and dampcourse, and Bituna dampcourse.

Unluckily *John Davidge & Co.*, 6 Holborn Viaduct, E.C., were too late in their application to be included in the catalogue. At Stand 6, Row B, they are showing their new Georgian "Nosmoke" down-draught preventing chimney-pot and ventilator. The section we here give of it will help to explain the principle of the patent. The head of the pot consists of two cones placed one above the other surrounded by a wind-guard at a distance of about two inches. The

theory is that a descending current striking down on the cover is deflected outwards and downwards between the pipe and the wind-guard past the outlet, thereby inducing an upward current in the pipe. An upward current passes

between the pipe and the wind-guard inducing a similar up-draught, while a horizontal current draws the smoke out of the pipe on the lee-side. The pot may be obtained in galvanised iron and fitted to any existing pot by means of clips, or it may be had in stoneware. The nominal height is twenty-four inches for any of the various patterns. There are no moving parts to get out of order and it is easily swept. It is claimed for them that they will work anywhere and in any position.

Mander Bros., Wolverhampton, hold a royal warrant of appointment as manufacturers to King George V., which comes as a worthy climax to a century of existence. The firm are makers of varnish, paints, and enamels. On the stand are examples of their many kinds of varnishes, of Flexolin white enamel, of the ten shades of Suffield green, of Olsina water paints (made in 100 shades), of Matsine permanent stain for woodwork, and of other specialities.

Japanol Enamel Co., Culford Works, N., sell a material equally suited for both inside and outside work whether on buildings, yachts, or for general painting where a brilliant, non-fading, washable surface is desired on wood, metal, stone, plaster, &c. Japanol resists the weather even under most searching conditions. It is conspicuous for its spreading and covering properties, one gallon covering between 70 and 80 square yards on properly prepared work. The best ground-work is said to be hard-flattening, or ordinary lead or zinc paint may be used so long as they contain very little oil. The enamel is in 36 stock tints. Other products of the Company are Japanol Flat and Japanol bath enamel.

"*Solita*" *Cement Waterproofing Co.*, Swansea, show, of course, their dry powder for waterproofing cement named "Solita" and "Muranda" water-paint. Their waterproofing compound is sprinkled over the cement in the requisite proportion, and then the whole is turned over repeatedly with a shovel until no trace of the Solita is visible. The sand and water are then added. The War Office, India Office, and Office of Works have all tried and approved of the compound as a damp-resister. "Muranda" can be used for new walls; it can be painted on or varnished, and is both lime-resisting and washable.

The (U.K.) Winget Concrete Machine Co., Ltd., Newcastle-on-Tyne, show at Stand 187, Row J, a Winget concrete block-making machine, a partition slab-making machine, and an "Express" concrete mixer. One feature of the "Winget" block-making machine is its versatility, for it will make blocks of all lengths, from 4 inches to 32 inches, all widths between $2\frac{3}{8}$ inches and 16 inches, and all heights from 2 inches to 9 inches. The same machine will make three partition slabs at one operation, curved blocks, solid or hollow blocks, four blocks at one operation, pier blocks, and other shapes; all of these may have any desired pattern of finish, either chiselled or carved face. Nowadays speed is of such importance that it is important to know that Messrs. Macalpine, the contractors, have turned out over 500 of the 32 x 16 x 9 blocks on one machine in ten hours. This number is, of course, phenomenal, but the company guarantee an output of from two to three hundred a day. "The Express" batch concrete mixer is also put into operation on the stand. This machine consists of a pan 6 feet 6 inches in diameter and 1 foot 3 inches deep. To the central capstan are attached revolving arms, fitted with adjustable plough-shaped beaters and iron rakes. After the cement and aggregate have been mixed dry in the pan for about fifteen seconds, water is supplied from a circular overhead spray-pipe. The mixing is continued for a further 25 seconds, and then the thoroughly-mixed concrete is drawn off by a sliding door.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BURSTOW.—May 26.—The Trustees of Archbishop Abbott's School, Guildford, invite designs and estimates for erection of a pair of semi-detached labourers' cottages on the Rookery Farm, Burstow, Surrey, to contain a living room, a scullery, and three bed-rooms, and to be provided with a water supply and the usual offices and outbuildings. Mr. H. P. Smallpeice, clerk, 138 High Street, Guildford.

CHESTERFIELD.—May 15.—The Standing Joint Committee for Derbyshire invite architects practising in the county to submit designs for a Court-house and lock-up to cost 8,000l. Mr. F. Baggallay, F.R.I.B.A., will act as assessor. Deposit 3l. 3s. Apply to Mr. G. C. Copstick, F.R.I.B.A., County Offices, Derby.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

NORWICH.—June 2.—The Royal Agricultural Society offer prizes for plans of house and buildings containing accommodation suitable for a mixed farm not exceeding 50 acres in extent: First prize, 25l.; second prize, 15l.; third prize, 10l.; fourth prize, 5l., for the Royal Agricultural Society of England Show at Norwich, June 26 to 30. Entries close June 2. Mr. T. McRow, Secretary, 16 Bedford Square, London, W.C.

WHITLEY BAY.—June 7.—The Whitley and Monk-eaton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed cemetery buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and the conditions can be obtained on a written application being made, accompanied by a deposit of 1l. 1s., which will be returned to every competitor submitting a bona-fide design. The designs, addressed to the Surveyor, are to be delivered at the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Laville Street, North Shields.

WALES.—June 16.—The Cymmer Co-operative Society, Ltd., invite competitive designs for rebuilding business premises at Cymmer, Port Talbot. Deposit 5s. Premiums of 5l. and 5l. will be awarded to plans first and second in order of merit respectively. The Secretary, Co-operative Society, Cymmer, Port Talbot, Glamorgan.

THE BUILDING TRADES EXHIBITION.

THE Building Exhibition of 1911 was remarkable for the costly manner in which many of the exhibitors fitted up their stands, which is evidence that experience has shown the value of these exhibitions to those engaged in supplying building material. This wise expenditure naturally acted as an attraction to visitors, and the number of these on the latter two Saturdays was almost too great for comfort, though undoubtedly good for business. From the visitor's point of view the show was admirable, and we may say the best that has been given. There was plenty to see and pleasure in the seeing, which was enhanced by an absence of objectionable touting and a readiness on the part of exhibitors to give courteous attention to all inquirers. In these respects the exhibition of 1911 was far in advance of some in the more distant past. The general tone of the exhibition was, in fact, of a very high order, and we believe that many of the exhibitors are very well satisfied with the results of their enterprise. There is no doubt that the man who wishes to see good results from advertising must do it well and thoroughly. He who spends niggardly wastes his money; 100l. brings a return, 1,000l. a handsome return, whilst the bold enterprise of an expenditure of 10,000l. makes a fortune. This principle has evidently been recognised by the exhibitors at the Building Exhibition just closed.

Messrs. S. E. Collier, Ltd., Reading, were one of the firms who made a special show of reproductions of the old English brick. It is unnecessary to mention that English brickwork is considered of peculiar charm with its refinement, mellow colour, wide jointing, and general high workmanship. Messrs. Collier exhibited an assortment of their bricks, several kinds of roofing tiles, ridges, chimney-pots, terra-cotta and art pottery.

Messrs. Robert W. Blackwell & Co., Ltd., exemplified the uses of "Genasco" Trinidad Lake asphalt for roofing, dampcourse, and underslating, and the "Genasco" waterproof paints, which they specially manufacture in five colours for painting their roofing, and which is also used on iron roofs, &c. One square of "Genasco Ready Roofing" will cover 100 square feet net, as each roll contains an allowance for the necessary 2-inch laps. There were also on the stand samples of Blackwell's white-glazed bricks.

Messrs. Hubert Todd & Co. suggested up in the gallery the architectural possibilities of granite concrete by exhibiting a simple Renaissance doorway and a sun-dial made in that material from the designs of Mr. J. Cash, F.R.I.B.A. A more obvious and more general use for granite concrete was exemplified in the paving in red, buff, and grey. When occasion demands, the concrete can be strengthened by reinforcement, and in this class of work Hubert Todd & Co., 53 Victoria Street, S.W., have specialised.

Newland's "Double-flush" water-waste preventer was put on the market less than a year ago and has met with a most favourable reception. It was shown in the gallery by the Double Flush Cisterns, Ltd., 6 Lloyd's Avenue, E.C. The cistern is divided into two compartments; the second compartment being filled by the overflow from the first, enables a second flush to be obtained, when required, immediately after the first. The refill is both rapid and silent, and by the improved syphoning plungers the flush is delivered at full bore and at once.

The Havana Exploration Co., Ltd., as proprietors of the British Cork Asphalt, Ltd., exhibited in the gallery the familiar "Cork Asphalt," "Corkadamant," "Corkite," and "Cormastik." The first is a durable, noiseless paving for the heaviest traffic; "Corkite" is for heavy pedestrian traffic, and was recently selected for laying inside and outside the L.B.S.C.R. station at London Bridge; "Corkadamant" is a fire-resisting, noiseless, and jointless flooring laid in situ, and "Cormastik" is a compound which may be spread on old macadam roads, on stone setts or wooden blocks to resurface them, or it may be made into paving bricks.

The "Shark Grip" Tiling Co., Ltd., are not content with giving the patent shark's tooth backing to their tiles, which gives them such a firm attachment, but they have a special close joint and a pliable bitumen backing which ensures them against cracking and facial crazing and renders them immune from any effects of vibration. The tiles are fixed on a five-year guarantee. The firm also showed tiled flooring, terrazzo and mosaic, parquet flooring, &c.

Messrs. Tuke & Bell, Ltd., 69 Leadenhall Street, E.C., as sewage specialists, showed a semi-septic sewage installation suitable for a house in the country, a model of an institute or village installation for sewage purification, "Grip" road covers and frames, and other highly useful accessories. Their

SHOP FOR MR. A. G. WHITTENHAM, FERNDOWN, DORSET.

GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

Auto-flush" revolving sprinklers are guaranteed for eighteen months. In these the distributing pipes and orifices are automatically kept clear by frequent flushes of liquid from cistern having 10 feet head over the revolving arms.

Messrs. Stephens & Carter, Paddington Green, W., have a comprehensive exhibition of ladders, barrows, trestles, steps, and other plant for building purposes and for local authorities, which they keep both for sale and for letting on hire. The three patent specialities were wire scaffold cords, wire-rope rubbish basket with an iron rod through the handles and bottom, and a "Kruse-cradle" for use on a ladder.

A large assortment of sewer ironwork and appliances were on the stand of Messrs. George Waller & Son, Stroud, including some of "E.F.B." patents. The firm also are sole makers of the "Pinkney" gas engines and "Bexley" cesspool pumps, and other engineering apparatus.

Messrs. Homan & Rodgers, 17 Gracechurch Street, E.C., exhibited their widely-known hollow brick fire-resisting floor and ferro-concrete fire-resisting floor and partitions. The former is constructed of steel joists 1 foot 6 inches apart with triangular fireclay hollow bricks between and a filling of concrete. The floor is light and inexpensive. The patent reinforced floor is of steel rods used in conjunction with the bricks.

Arthur Sanderson & Sons, Ltd., arranged their stand in the form of a single room, the interior walls of which were decorated panelwise with a new grey paper and border giving pilaster effect which was very effective. There were besides fine array of sample wallpapers. The outside showed "Wal a Mur" water paint, "Paripan" lacquer enamel, and "Gilmour" doors. For the latter patent they are the sole agents in this country.

To many county and borough surveyors the stand of Messrs. Llewellyns & James, Ltd., Bristol, showed a valued rival in the shape of the "W. & B." patent tar-spraying machines. These are in use by a large number of local bodies, and have given very great satisfaction. Proof of this is found in the catalogue of the machine, which almost entirely consists of laudatory testimonials received last autumn from English and Welsh officials.

There are so many grates, ranges, and boilers now on the

market that the Bell Range & Foundry Co., Ltd., Northampton, and 70 Mortimer Street, W., were very well advised in relying mainly on Delft faience to attract attention to their stand. They are the agents for a Delft firm who have been making this splendid faience for, we believe, more than two centuries. On the stand there were many striking examples of Dutch work, as well as "Bell" grates and boilers and French tiles.

The specialities of G. Tucker & Son, Ltd., Loughborough, are hand-made facing bricks and roofing tiles. Several varieties of the former were shown in the gallery, as, for instance, the "T.S.L.," "Rustic T.S.L.," and "Old Style T.S.L." Arches constructed of "T.S.L." hand-made sandstock facing bricks illustrated how semi or flat arches are sent out lettered and numbered for erection. Their "Loughborough" roofing tiles are guaranteed against damage by frost. Special bricks are made by this firm for purposes like bakers' ovens and engineering bricks.

The "Martlett" casement is strikingly different from most of the many other casement windows. It must, for instance, be hung in double leaf—i.e., hinged in centre. In order to open the window it is pushed outwards so that the two sides leave their frame and the double window assumes the shape of a triangle. The two wings may be securely locked in any position, and they may be brought so close together as to practically form but a single leaf at right angles to the frame and at any point along it. The casement is watertight, as there is a water-bar along the bottom of the frame, and the two sashes fit into a groove on each side. When open the weight is carried by ball bearings instead of by the hinges, though most of the strain is taken by the balance of the two sides of the triangle. In a range of four casement windows the centre pair may be arranged as a "Martlett," so as to allow of the two others being accessible for cleaning from the inside, though of the ordinary type. This window was exhibited by the Martlett Casement Co., Eastbourne.

"Filocol" distemper is made by the Gelatinous White Co., Ltd., Southall, W., as either a paste in casks or a powder in seven-pound packets. Two kinds of the former are made, one for inside and the other for outside use, and two kinds

of the powder, one for hot and the other for cold water. "Filocol" is specially made for whitening walls and ceilings, but it may be had in tints. It is claimed that it effects a great saving of time over the old-fashioned methods of distempering and that it is absolutely pure.

H. S. Goodwin & Son, 16 Charles Street, E.C., exhibited a varied collection of builders' joinery, including compoboard (made by a new dry-core process with damp-proof cement and waterproof paper), staircases, and beaver boards.

Messrs. Barford & Perkins, Peterborough, showed a patent water-ballast motor roller (petrol or paraffin) specially adapted for tar-macadam road repairs and for patching. When the tank is filled with its 180 gallons of sprinkling water the stone box, with its 15 cwt. of stone and the cylinder, the total weight is about eight tons. The roller is worked by one man, and dispenses with the customary water and coal carts.

The Teale Fireplace Co. enjoy the not inconsiderable satisfaction of being by special appointment fireplace makers to H.M. the King. They also claim that they are the original patentees and manufacturers of the barless or well type of fireplace, their original patent being some years prior to that of any other. They have since patented further improvements, notably the carpet protector, which enables them to use a hearth 4 inches high instead of 6 inches. All their fireplaces are provided with a controllable air supply. In the "Front Hob" sunk fireplace the ashes drop into pans and can be removed without letting the fire out, which is an important point in a sick room. The firm make a speciality of the manufacture of ward stoves and of wood mantels.

Messrs. Hammond & Champness, Ltd., show a variety of lifts, including an electric-service lift containing the winding gear, controller, &c., in the cage, so that no casing is required overhead. The cage rises through a floor opening which automatically closes as the cage descends. The same ingenious principle is applied to their type "E" hand-service lift. A safety invalid lift, which can be worked from either the floor or by the occupant of the cabin with perfect ease, was also on the stand. The exhibit included various models.

Messrs. Lips, Ltd., who recently opened a showroom at Kingsway House, Kingsway, W.C., made an interesting display of safes, caskets, safety bolts, locks, and other goods of a like nature. The firm have enjoyed a large experience in the design and construction of steel strong rooms and safe deposits, as well as in making the smaller guards against thieves and fire. Five of their safes were in use by the Belgian Union of Jewellers, Goldsmiths, Diamond Merchants, and Watchmakers at the Brussels Exhibition of last year. When the disastrous fire occurred their contents were valued at over a million pounds sterling. The assessor representing the English insurers who was present when the safes were opened after the fire reported "these safes were very efficient, and I regard them as of A1 standard."

The British Vacuum Cleaner Co., Ltd., brought to the exhibition six types of their machines, and a series of demonstrations were given. The types ranged from a 2 h.p. electric motor vacuum cleaner for fixed-installation work to an "A.L." type $\frac{1}{4}$ h.p. portable cleaner, and also included several kinds of hand cleaners and "Excelsior Ideal" sweepers with electric motor.

Messrs. Sharp, Jones & Co., Dorset, showed rock-concrete sewer manholes, the "Aquatite" patent self-contained manhole bottom for waterlogged ground, and rock-concrete applied to sewer tubes, tanks, interlocking roofing tiles, &c. Concrete tubes were introduced into this country by Sharp, Jones & Co. over thirty-five years ago, and they are now specialists in the application of rock-concrete to sewerage purposes, by virtue of their very wide experience. The tubes are made of a very dense and heavy concrete composed of granite from the Channel Islands and a special Portland cement.

The Aerogen Gas Co. and Strode & Co. were exhibiting on the same stand some of their various lighting specialities. The "Aerogen" petrol gas generator is primarily one of the weight-driven class, though it has been adapted to a hot-air motor and to water-power. *Messrs. Strode & Co.* have many departments to their business, and of these only a few were touched on at Olympia. These included an art metal work display, especially as applied to fittings for electric light, air gas, &c.

One of the newcomers to Olympia was the firm of *William Morris & Co., Ltd.*, Ruskin House, S.W. As exemplifying the decorative side of the building trade they are welcome. On their stand were examples of their stained and leaded glass work, metal work, and door and window furniture. A special feature was made of the patent metal casements

fitted with an automatic reversible hinge. To reverse the window it is opened at right angles and then lifted from its normal hinge and reversed upon the projecting pivot. In the "Victoria" reversible casement the hinged side may be moved to both the right and left by releasing a bolt in the frame.

Messrs. James Stott & Co. showed their patent warming and ventilating apparatus for all classes of building. Their ventilators included such forms as the ridge, flue outlet, quadrant inlet, concealed roof, and the louvre. Amongst the other exhibits were their mercurial gas governor, of which 250,000 are in use; an instantaneous water heater and an automatic gas boiler, and gas pendants.

F. Johnson & Co. (Hull), Ltd., exhibited a "Paragon" concrete block-making machine which works by either hand or power, and also the latest type of "Paragon" mixer. The standard size of the blocks is 18 by 9 by $6\frac{1}{2}$ inches, and their weight is about 50 lb. They are made automatically under hydraulic pressure and without tamping.

John Jones (Chelsea), Ltd., so arranged their stand that one side showed high-class sanitary fittings, such as bathroom suites and water closets, while the other was devoted to a very large collection of general sanitary fittings of a more strictly utilitarian character.

W. T. Lamb & Sons, 21 Essex Street, W.C., put up a pavilion to display the bricks and tiles of the different firms for whom they act as agent. One conspicuous feature was the primrose facings made by the Northam Brick Co., of Eye Green; another exhibit was the mottled tiles from the G. W. Lewis' Tileries, Ltd., Nuneaton, who keep thirty-six shades of the "Rosemary" tiles in stock.

It was not surprising to find that before the close of the exhibition the charming lych gate in English oak with cleft oak shingle roofing exhibited by *Mr. George Blay*, New Malden, was marked "Sold." The work was of very pleasing design and was well carried out. On the stand were also a number of wooden gates and patterns of fencing, and in one corner a general show of roofing tiles.

Colliers, Ltd., brick and tile manufacturers, have works in different parts of Essex. Their gravel pits at Stanway, near Colchester, are drawn upon for purposes of filtration, cement paving, and stone-dashing. Their stand showed the many kinds of bricks and tiles turned out.

La Brea Asphalte Co., Ltd., are the sole importers of "Breala" natural rock asphalte of Limmer quality, which is obtained from mines in Brunswick. The purposes for which it is used are innumerable, and include acid-proof asphalte, mastic dampcourse, bitumen cavity cement, pure bitumen sheeting, and bituminous solution. The firm are contractors and paviors in all kinds of foreign rock and British asphaltes.

Messrs. Wilkinson, Heywood & Clark, Ltd., 7 Caledonian Road, N. (established 1796), are veterans at winning honours at exhibitions, for as far back as 1862 they were awarded a prize medal for varnishes, colours, and oxidised oils at the International Exhibition in London. They introduced non-poisonous colours over thirty years ago. Their stand at Olympia was arranged to make an attractive display of their many manufactures. Several attractive colour schemes suitable for high-class decorative work were to be seen.

H. J. & C. Major, Ltd., Bridgwater, were represented principally by their patent weatherproof interlocking roofing tiles in different patterns, which may be used with confidence on a roof with pitch as low as 30°. They can be securely fixed without nails, they do not require mortar or cement, or counter-lathing. Bricks, ridges, and other clay goods were also on the stand.

Messrs. Carter & Co., Kingston-on-Thames, gave continual demonstrations with their patent reversible sash window in which both the upper and lower sashes may be lowered out of their frames to a horizontal position inside the room for the purpose of cleaning, re-glazing, or painting.

Percy Heffer & Co., Ltd., 64 Berners Street, W., made a good show of wallpapers of the latest designs and colours. Particularly curious were those representing the willow pattern on a ground of black, and another against a rich red. In the matter of wallpapers there seems to be the widest scope for individualism, but anybody would be hard to please who did not find attraction in something or other that *Messrs. Heffer & Co.* stock. One side of the stand was framed up to form panels treated with "Decorine," a water-paint made from a non-poisonous base. All its colours are fast to lime, light, and air.

The pyramidal form adopted by *Stanley Bros., Ltd.*, Nuneaton, for their stand enabled a good idea to be obtained of

their glazed bricks and glazed terra-cotta. The structure was surmounted by large glazed vases.

Amongst the exhibits of *Messrs. Smith & Wellstood* perhaps the most interesting was their new patent "Sidelight Wellstood" range with "Wellstood" independent boiler combined. Standing out from the wall without side jambs, good side-light is obtained, and the oven doors being lined with white enamel reflect light into the interior. There are two ovens, one for baking, the other for roasting, both fitted with heat indicators and pedal openers. Plate-rack and hot closet, with glass sliding doors, indicating dampers, open or close fire with lifting bottom, nine round covers to hot plate, and other refinements, including non-conducting doors and ends, make this a model kitchener of very high class for easy and efficient cooking, but perhaps the best of the many good features is the independent boiler, which abolishes one of the greatest drawbacks of most kitcheners, the waste of fuel in keeping up hot-water supply when cooking is not in progress. The range as shown in our illustration is made in two

roofing by sticking the metal strips with "Stucatine" over the joint; "Calorine" paint for radiators, hot-water pipes and other heating apparatus, and, lastly, artistic fabrics.

C. J. Thursfield & Co. are widely known as specialists in the design and manufacture of electric-light fittings. Of these many very interesting and artistic examples were shown. They have brought out an excellent device for so fixing the small glass shades bought for carbon filament metal lamps as to make them long enough to shade the large metal filament lamp now in use.

The Banner Sanitation Co., 24 Craven Street, W.C., showed a large number of their specialities, including several drain-testing appliances and drainage and sanitary fittings. The firm are prepared to undertake the sanitary examination of public and private buildings and to draw up schemes for water-supply or sewage-purification and disposal.

John Freeman, Sons & Co., Ltd., of Penryn, Cornwall, had an interesting exhibit of Cornish granite, which included

sizes, 77 inches and 83 inches wide, and although even the smaller may seem too costly at 60*l.* for a small house, the saving of fuel would pay a handsome return on the cost, to say nothing of the comfort and efficiency.

John Line & Sons, Ltd., were represented by their colour department. The exhibits covered a wide field, and included enamels, varnishes, and japans, wood finishes, damp-resisting preparations, protective paints for iron and steel, as well as mechanical novelties for painters and decorators.

Messrs. Benham & Sons, Ltd., 66 Wigmore Street, W., were represented by (1) a "Wigmore" independent hot-water supply system consisting of a special boiler and a cylinder or hot-water tank; (2) a "Wigmore" kitchener; (3) a wrought-steel central hot plate; and (4) by other kitchen accessories.

F. McNeill & Co., Ltd., had a representative display of dampcourses, roofing felts, waterproofing materials, and other specialities which have become necessities to the building trade.

Mr. G. Collantier, Caxton House, S.W., showed "Stucatine," a new patent stone-coating paint for inside or outside work which gives a very hard surface to any material; "Lino-metal," a new process for making watertight glass

a section of the parapet in that material which is being supplied for the embankment wall at the L.C.C. County Hall. The granite was shown both carved and in the form of setts and street curbs.

The "Sanitas" Co., Ltd., Limehouse, E., included among their highly efficient sanitary specialities a "Kingzett" patent drain-tester. This is in the form of a spring bi-valve which, when a length of twine is unwound, opens and drops a quantity of chemical. The chemical is so packed that it gives off a quantity of gas, enabling the user to detect leaky drains by its strong odour.

Justifiable pride is felt by *Mr. Sam Deards*, Harlow, in the fact that he secured with his patent "Superior" roof-glazing the largest contract given out by the Admiralty for work of the kind. The area covered was 102,000 feet super in the new steam factory in Portsmouth Dockyard. The "Superior" system dispenses with screws, putty, paint, or springs; the steel bar is entirely covered by hand with sheet lead. On the same stand was *Smale's* concrete block-making machine.

Wm. Harland & Son, Merton, S.W., had two stands side by side for the display of their materials. One was a green

structure and the other was a white one. The latter was finished with "Snowite" enamel as used on the Royal yachts "Victoria and Albert" and the "Alexandra."

The *Ivoril Plaster Co.*, Middlesbrough, showed "Stonament" as well as "Ivoril" plaster on their stand. The former is a new patent system for treating the outsides of new or old buildings so as to give them a stone face of the desired appearance. "Ivoril" is a plaster for interior work which gives a particularly hard and smooth surface capable of being washed or cleaned.

The "*Young Firm, Ltd.*, Bethnal Green, E., made their customary display of American hardwoods, pine, teak, and mahogany; turnery and mouldings; newels, balusters, &c.; plywood and oak flooring. Orders can be executed equal to the samples shown.

Messrs. *Gross, Sherwood & Heald, Ltd.*, Barking, erected a handsome and lofty structure for the advantageous display of Sherwood's "Rystolite" enamel, which numbers amongst its many users the Office of Works. It is sold in white, cream, ivory, and ninety-six colours and tints, giving either a gloss or flat surface.

Rubber flooring in an uncommon form was exhibited by *Charles L. Cuthbe & Co.*, 37 Great Eastern Street, E.C., under the name of "Rubberled." As its name suggests, this consists of rubber tiles interlaced with lead strips. Experience has shown a tendency in some cases for the ordinary rubber tile to become loose. This failing is here counteracted by the pieces of lead into which they fit. The possibility of slipperiness is also overcome in the same way. It is recommended that the flooring should be laid by the skilled workmen of the manufacturers. The company have prepared some good designs. This material puts a full palette of colour at the service of architects and lends itself to many pleasing patterns.

Two novelties were put forward by *Mr. E. G. Wright*, Guildford. One was his patent down-blow preventor for geysers and gas stoves in place of the baffle. It may also be used for ventilating soil pipes, or any other purpose in which it is desired to allow fumes to escape into the open air without permitting a back-draught. The same principle is used for his self-acting room ventilator. This is fixed on the outside of a room a little below ceiling level, and as the wind passes through the metal box it draws out the vitiated air from the inside. These patents have been adopted by the Office of Works, the London County Council, the London, Brighton and South Coast Railway, &c. *Mr. Wright* also exhibited the "20th Century King Chimney Cowl" and "Excelsior" stoneware pot.

London Warming and Ventilating Co. Ltd., W., had in action their patent "Florence" Boiler Grate which burns any sort of fuel; also the "Record" Range; the "Leon" anthracite continuous burning stove; the "La Française" boiler stove for heating one to four radiators; and various continuous burning stoves.

The *Anglo-American Oil Co., Ltd.*, exhibited for the first time their new preparations for dressing and binding macadam roads which they are selling under the name of "Roadoleum." These are fluxed and pure asphalt obtained in several consistencies.

The *Northern Quarries Co., Ltd.*, showed specimen sections of Quarrite paving after use on streets having a heavy traffic; specimens of Bitulithic paving, and samples of the stone from which the Quarrite paving is manufactured.

The *Limmer Asphalt Paving Co., Ltd.*, always can be counted on for a good display of their various materials which have been used as horizontal and vertical damp courses, flooring, roofing, &c., on many of the most important buildings throughout the Kingdom. Their Lithofalt paving blocks and Lithomac asphalt paving blocks are also well known.

Vincent Brooks, Day & Son, Ltd., 48 Parker Street, W.C., showed specimens of their "True-Scale" photo-litho, for making from six copies to ten thousand; their "Vinbede" True-Scale System is intended for turning out under six copies; specimens were also shown of their general lithographic work like specifications, estate plans and posters. The firm make toned blocks and the ordinary photo-litho reductions and enlargements.

Messrs. *William E. Farrer, Ltd.*, Birmingham, again exhibited their patent sewage distributors. Farrer's facile rotary distributor dispenses with dosing syphons and intermitting valves. The improved distributor for rectangular beds is intended for small schemes. Both are to be commended for their efficiency.

B. J. Hall & Co., Ltd., Victoria Street, S.W., included in their stand some most up-to-date things in the way of drawing office equipment. These included a vertical electric copier, the "Catena" adjustable drawing table, a Standard

double elephant drawing cabinet, and a patent drum continuous copier, printing two classes of paper at one time and dealing with copies of any length.

A. C. W. Hobman & Co., South Bermondsey, S.E., have acted as contractors to the Government and the London Board Schools for thirty years. They specialise in tar paving, tar macadam, asphalt, artificial stone, "Cliftonite" paving, and "Emerite" non-slippery stair treads.

The *Abdon Clee Stone Quarry Co., Ltd.*, Bridgnorth, and the *St. Keverne Stone Co.*, Cornwall, were among the exhibitors up in the gallery whose stands were particularly calculated to appeal to surveyors.

Messrs. *Burn Brothers*, 3 Blackfriars Road, S.E., made a brave show with their sanitary and sewage disposal specialties of many kinds. They included cast iron drain pipes, flushing tanks, sluice valves, drain plugs, and drain cleaners.

The "Kulm" hollow brick system of construction as applied to floors, roofs, and staircases was shown by Messrs. *Horace W. Cullum & Co.*, Craven House, W.C. The "Kulm" partition slabs of pumice and Portland stone were also exhibited.

One of the imposing displays in the gallery was that made by *Millars' Karri & Jarrah Co. (1902), Ltd.*, of their West Australian hardwood, which lends itself so admirably to paving. But the wood is also used for window sills, chairs, tables, and other purposes.

Messrs. *Mellows & Co., Ltd.*, showed two model bathrooms, several water closets, and lavatories. Special attention was drawn to their recently patented "Pneumonic" silent action waste water preventer cistern and to the "Eclipse" Glazing.

The *Tella Camera Co.*, who make a speciality of photography for architects, contractors, and builders, were appointed to act as official photographers to the exhibition, and in that capacity had no little work to do.

Structures in brickwork were put up by *James Brown (London), Ltd.*, and the *Benfield Brick & Tile Co.*, to display their different kinds of bricks.

Moule's Patent Earth Closet Co., Ltd., were represented by their specialities.

The *Hoo Brick Co., Ltd.*, Rochester, installed a Brice's automatic brickmaking machine, as well as exhibiting their red and sand stock and moulded bricks, washed sand, and graded shingles. The machine consists of two presses, and is capable of turning out up to ten thousand bricks a day of ten hours, all of first-class quality and perfectly symmetrical. It can be driven from the pug mill shafting.

The latest improved type of the "Hornsby-Stockport" gas engine was shown by *Richard Hornsby & Sons, Ltd.* Some thirteen thousand of these engines are in daily use. Another machine is the "Hornsby-Stockport" suction-producer gas plant, which consists of—(1) A generator lined with fire-brick in which the gas is made; (2) a vaporiser for producing the steam or vapour from the heat of the gas; (3) a scrubber for cooling and cleaning the gas; and (4) a reservoir box from which the gas engine draws its supply. The general arrangement of these parts can be planned to suit the place at disposal.

TRADE NOTES.

MESSRS. W. M. POTTS & SONS, LTD., clock manufacturers, Guildford Street, Leeds, and Newcastle, have received instructions to make and erect a large turret clock at Messrs. Pease, Sons & Partners, Ltd., Old Mill, Darlington. The company have also to make and fix a new Cambridge quarter-chime clock and illuminated dial at the Parish Church, Birtley, Co. Durham, from the designs and plans of the late Lord Grimthorpe. The Coronation Committee, Anlaby, Hull, have ordered a first-rate clock for the Parish Church, from the late Lord Grimthorpe's plans, from Messrs. W. Potts & Sons, Ltd. The firm are also making a new clock and bell for Colonel Harding, J.P., Madingley Hall, Cambridge.

MESSRS. E. H. SHORLAND & BROTHER, LTD., of Fails-worth, Manchester, have just supplied their patent Manchester Stoves for the Guards' Coffee Bar, Pirbright Camp; the Cottage Hospital, Runcorn, has also recently been supplied with Shorland's double-fronted patent Manchester Stoves, with descending smoke flues and patent exhaust roof ventilators. The Crook of Devon Public Institute, near Kinross, is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet ventilators, and the Hospital for Incurables, Newcastle-on-Tyne, is being supplied with double-fronted patent Manchester Stoves with descending smoke flues by Messrs. E. H. Shorland & Brother, Ltd.

VARIETIES.

MR. EDWIN L. LUTYENS has been appointed by the Johannesburg Municipal Council to prepare designs for a new art gallery which is to cost 20,000*l*.

MR. J. H. BECKETT, A.R.I.B.A., architect, Longton, has been instructed to proceed with the quantities and to invite tenders for the proposed extensions of the Town Hall at Longton, Staffs.

MR. PETER E. ROBERTS, J.P., chairman of the Mold Urban District Council, has undertaken to erect and present to the town as a permanent Coronation memorial municipal buildings, which will include council chamber, committee rooms, officials' offices, and accommodation for local literary society and free library.

MR. A. REEVE, architect, London, has prepared the plans for repairing the hammer beam roof at Cawston Church. The decayed portions will be replaced with English oak. The mouldings and carved work (of which a good deal is missing) will be restored, and the lead covering will be recast. The cost is estimated at 1,450*l*. Messrs. Cornish & Gaymer, North Walsham, will carry out the work.

GOVAN Dean of Guild Court granted linings last week for the following works: Extensions at engine-house at the electricity station in Helen Street, to cost over 2,000*l*; extensions of a boiler shop in Baird Street, belonging to Messrs. Dunsmuir & Jackson, engineers, by 313 feet in length and 50 feet in breadth; and alterations and additions to Lambhill Street School, in order to provide a suite of retiring rooms for teachers and increased accommodation for scholars. The School Board intend to spend 6,000*l*. on the improvement of this school.

THE Northumberland Education Committee have approved the plans prepared by their architect for the proposed secondary school and technical institute for 140 boys and 140 girls at Wallsend. The cost is put down at 10,800*l*., exclusive of furnishings and equipment.

THE Corporation Electricity Works at Alloa, N.B., are to be extended at a cost of 3,400*l*. The additions, for which plans have been passed by the Dean of Guild Court, include new buildings for the generating plant and a gas-producer plant house.

MR. H. A. JOHNSON, C.E., Bradford, has submitted a report to the local Council on the subject of proposed sewerage improvements at Otley, and he recommends the construction of new sewers, manholes, &c., 2,200*l*; alterations at sewage disposal works, 5,200*l*; and a refuse destructor, 2,550*l*; a total of 9,950*l*.

THE fund for the enlargement of the ancient parish church at Hendon now stands at about 4,500*l*., and as the cost of the work will not be more than 6,000*l*., it is hoped that the increased accommodation will be provided at an early date. The sittings will be increased from 457 to 807. Mr. Temple Moore has prepared the plans.

THE North Eastern Railway Company are about to enter after long consideration upon an extensive improvement scheme at Bridlington railway station. It is proposed to lay two additional lines, making the existing up platform an island platform of 60 or 70 feet in width, and to erect new station buildings and booking hall near the existing excursion station. The scheme will cost 30,000*l*.

H.M. CONSUL at Bucharest (Mr. E. MacDonell) reports that the Roumanian Chamber has voted a special credit of 2,240,000*l*., to be devoted for the greater part to public buildings in the capital and provinces; 120,000*l*. for the continuation of the Constanza harbour works; 120,000*l*. for the completion and fitting of two frontier slaughterhouses; 36,000*l*. for the construction and installation of cold storage buildings for the fishing industry of Galatz and Tulcea (State owned).

THE Local Government Board have approved of the scheme prepared by Mr. Harry W. Taylor, A.M.I.C.E. (Messrs. Taylor, Wallin & Taylor), of Newcastle, for the augmentation of the waterworks of Petersfield town. The works consist of tapping springs in the chalk measures, construction of intake works, laying several miles of cast-iron pipes from the springs to the town, ferro-concrete works at the reservoirs, &c.

THE last meeting of the executive of the Scottish Building Trades Federation was held in the premises of Edinburgh, Leith, and District Building Association, at 61 Lothian Road, Edinburgh. Representatives were present from Aberdeen, Inverness, Kilmarnock, Edinburgh, and other centres. Reports on the state of trade throughout the country showed that, generally speaking, there was a slight improvement. In Edinburgh and district particularly there were indications of a revival.

THERE is some demand for portable houses in the Congo State, and, according to the Board of Trade Journal, several inquiries for catalogues of these have been received by the Governor-General at Boma. Catalogues should give particulars of the materials of which the houses are made and of the dimensions, as well as the conditions of sale.

THE "Golden Lion" in Deritend, an Elizabethan building of considerable archaeological interest to the citizens of Birmingham, which was purchased by public subscription and presented to the city, has been taken down and re-erected in Cannon Hill Park, Birmingham.

THE Rochdale Corporation are undertaking a scheme of sewage works extension, involving an expenditure of 31,500*l*. Part of the work they will do themselves, but the chief contract has been let to Mr. J. E. Bentley, of Bradford. The tenders ranged from 25,000*l*. to 28,000*l*., and that of Mr. Bentley was about 25,600*l*.

THE Glasgow Parish Council have resolved upon the erection of a colony for epileptics in the lands of East Muckcroft, at Woodilee, and at a recent meeting the Woodilee Asylum Committee agreed that the 46½ acres required for the purpose should be rented to the Council at 70*l*. per annum. The Local Government Board have approved of the site. It has been further resolved to erect a large hall for recreative purposes.

A BIRMINGHAM and District branch of the National Association of Master Heating and Domestic Engineers has been formed. Mr. W. L. White (Birmingham) was elected president of the association, and Mr. W. Nelson Haden (Birmingham and Trowbridge) vice-president. The association will embrace in its operations the counties of Warwickshire, Worcestershire, and Staffordshire, and has as objects the raising of the standard of the trade, the standardisation of fittings, and the promotion of technical education.

THE Newcastle Corporation have granted to Messrs. Dickinson, Miller & Turnbull, solicitors, Newcastle, a perpetual lease of 300 square yards of the Cross House site in Westgate Road, which the Corporation purchased some years ago for street widening and which has since been vacant. It is the purpose of the lessors to erect a large building to be used as offices. The structure, several storeys high, will be approximately triangular, and will have two main doors towards Grainger Street and Westgate Road. The architects are Messrs. Cackett & Burns Dick, Pilgrim Street, Newcastle.

A REPORT by His Majesty's Consul at Venice (Mr. E. de Zuccato) on the trade of that district in 1909-10 says:—There is nothing new to report as regards British trade in general in the province of Venetia during 1910. The Germans continue to hold all the trade formerly in British hands which they have captured, chiefly in machinery, electrical appliances, iron goods, crockery, &c. For instance, iron gas pipes, which until a short time ago were supplied by the United Kingdom, now come from Germany, although there are also factories in Italy; but the produce of the latter is considered inferior by local merchants. Presumably it is only the question of price which induces Italian traders to give preference to Germany, as the superior quality of British goods is universally acknowledged. No efforts appear to be made by British manufacturers to recapture the trade by sending out practical persons to inquire about German prices and to study the means of adapting themselves, if possible, to the ways and customs of the country.

AT Greenock Dean of Guild Court last week an application was submitted on behalf of Scotts' Shipbuilding and Engineering Company, Ltd., for permission to erect, in Cartburn Street and Springkell Street, an extensive addition to their works. The plans were for a building 422 feet in length, 126 feet in average width, and 42 feet in height all over, the frontage to the street to be of brick at a height of 30 feet, and the remainder of corrugated iron. The building is to be a steel-frame structure, built in spans of 50 feet, and equipped with overhead travelling cranes, the whole to be entirely roofed with glass. It was pointed out by the master of works that under the new Greenock Corporation Act, 1909, no building could be erected at a height greater than the width of the street. The proposed height of those buildings was 10 feet greater than the breadth of Cartburn Street. On behalf of the petitioners, it was contended that under another section of the same statute the Corporation had powers, in exceptional circumstances, to grant a relaxation from this rule. The plans were passed on the understanding that the condition regarding the height of the building was complied with, and intimation was made by Scotts' Company's agent that application would be made to the Corporation to exercise their statutory power in the matter. The principal purpose for which the buildings are to be erected is the manufacture of ventilating shafts.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

. As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

BURSTOW.—May 26.—The Trustees of Archbishop Abbott's School, Guildford, invite designs and estimates for erection of a pair of semi-detached labourers' cottages on the Rookery Farm, Burstow, Surrey, to contain a living room, a scullery, and three bed-rooms, and to be provided with a water supply and the usual offices and outbuildings. Mr. H. P. Smallpeice, clerk, 138 High Street, Guildford.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a primary school for girls, to be erected in St. George's Lane. A plan of the site and a copy of the instructions defining the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Committee, 4 St. Giles's Street, Northampton.

NORWICH.—June 2.—The Royal Agricultural Society prizes for plans of house and buildings containing accommodation suitable for a mixed farm not exceeding 50 acres in extent: First prize, 25*l.*; second prize, 15*l.*; third prize, 10*l.*; fourth prize, 5*l.*, for the Royal Agricultural Society of England Show at Norwich, June 26 to 30. Entries close June 2. Mr. T. McRow, Secretary, 16 Bedford Square, London, W.C.

SWANSEA.—June 16.—The Cymmer Co-operative Society, Limited, invite competitive designs for rebuilding business premises at Cymmer, Port Talbot. Deposit 5*s.* Premiums of 5*l.* and 2*l.* will be awarded to plans first and second in order of merit respectively. The Secretary, Co-operative Society, Cymmer, Port Talbot, Glamorgan.

SWANSEA.—July 1.—Competitive designs are invited for a school, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

WHITLEY BAY.—June 7.—The Whitley and Monkton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed factory buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and conditions can be obtained on a written application being made, accompanied by a deposit of 1*l.* 1*s.*, which will be returned to every competitor submitting a bona-fide design. Designs, addressed to the Surveyor, are to be delivered to the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Mill Street, North Shields.

YEovil.—The Corporation of Yeovil invite competitive designs as follows:—(1) For laying out a site of about 10 acres of land for the purpose of erecting houses for the working class, and (2) for houses to be erected thereon. In respect of each class of design premiums of 20*l.* and 10*l.* will be awarded. Particulars and conditions of site may be obtained upon deposit of 10*s.* 6*d.* from the Town Clerk, Yeovil.

CONTRACTS OPEN.

THE BUILDING TRADES EXHIBITION.

THIS week we conclude our references to the recent Building Trades Exhibition, Olympia, with descriptions of some of the stands which owing to pressure on space have had to be omitted in previous issues.

The Douglas Granite Co. were showing at the Art Pavements Co.'s stand some very fine Scotch granites, known as "Glencoe Grey," "Glencoe Red," and "Douglas Grey." The quarries from which the "Glencoe Grey" is obtained are on islands close to the shipping quay. One block recently quarried measured 14 feet by 8 feet by 6 feet, and weighed over fifty tons. In colour the material is regular and clean, free from stripes, clouds, and spots, and practically every stone is of the same tint. "Glencoe Red" is another granite being introduced on to the market which possesses very high qualities. It appears to be a very sound rock, rather larger in grain than Balmoral, but just as rich in colour. "Douglas Grey" is a stone of a bright blue-grey without veins or patchy markings. It takes an excellent polish and axes white. Some of the blocks are split with faces almost as clean as if they had been worked over with a tool.

Messrs. Coup, Phillips & Co., 5 Featherstone Buildings, High Holborn, W.C., showed two very ingenious devices in builders' ironmongery. One was the "Uneeda" self-adjusting casement stay, and the other the "Uneeda" self-locking bolt. The brass casement stay is worked on the principle of a piston or telescopic action; it is fastened at one end to the window-sill and at the other to the casement. To open the window the casement is pushed outwards to the desired position, and the stay is held firmly in that position without further fastening, even under a wind pressure of 25 lb. to the square foot. The casement may, however, be opened or

THE "UNEEDA" SELF-ADJUSTING CASEMENT STAY.

closed with very slight pressure. Demonstrations were given with such frequency as to prove that the mechanism will not get out of order by constant use. In their patent self-locking bolt, by lifting up the knob, a pin is drawn out of a hole in the back plate, and the shoot may be pushed home, when the pin again falls into a hole provided, and becomes locked. The locking action is ensured by the use of a small phosphor-bronze spring, which drives the pin into position directly the knob is released. The whole bolt is so constructed that there is no pressure between the shoot and the outer casing. The shoot has a tapered end, so that the bolt may be driven sufficiently far to be secured by the middle lock should the door have dropped.

"Metacon" adjustable steel shelving for libraries was displayed by the patentees, the Adjustable Shelving and Metal Construction Co., Ltd., who have their works at Willesden. It works on a ratchet principle, and is automatically adjustable. The shelves are interchangeable, and may be of varied depths and heights, so that there need be no waste of space between one row of books and the shelf immediately above. Continuous stacks may be formed by placing a series of the all-metal frames side by side as the necessity arises. The company have carried out many important installations, among these being the Royal Library, Berlin, London University, and the Library of the Royal Society, Burlington House, W. "Metacon" is also used for steel cupboards, lockers, drawers, &c.

Although with true artistic modesty it was content to let others jostle for the conspicuous positions, the exhibit of the Albany Forge, Ltd., 45 Goldhawk Road, W., at the far end of the hall was one calculated to excite in some visitors, at any rate, more enthusiasm than many miles of roofing felts, stoneware pipes, or even of high-class paints. It was a small general display of most pleasing wrought bronze and

wrought-ironwork executed recently at the forge, and included details from staircases, gates, &c.

Fireproof Doors, Ltd., 40 King William Street, E.C., showed several types of their "Dreadnought" doors. These have enjoyed a most successful career, and may be found in such important buildings as the Admiralty, Law Courts, Foreign Office, National Gallery, Victoria and Albert Museum, Imperial Institute, and Royal Naval Hospital. The "Dreadnought" doors passed through a searching test of the British Fire Prevention Committee with conspicuous success.

The Farringdon Works (H. Pontifex & Sons, Ltd.), Shoe Lane, E.C., had a very large assortment of porcelain enamelled baths, lavatories, sinks, closets, urinals, and general sanitary brass work.

The Counties Industries for Dorset and Hants, Burley, Hants, was founded by Lady A. Baker about three years ago in order to bring into prominence the unique and many-coloured clays of those two counties, which, on baking in a muffled kiln, produce some delightful effects in terra-cotta. The enterprise was at first quite experimental, but has now become established on a commercial basis. It is proposed to set aside 75 per cent. of the profits to enlarge the business and to divide 25 per cent. among the workers. On the stand was a striking Dorset hearth fireplace, another in "Dorset marble," made from veins of naturally-tinted clay, and an assortment of tiles and of other forms of terra-cotta.

Messrs. Campbell & Christmas, St. Oswald's Studios, S.W., touch on an architect's requirements at many points. On their stand they showed stained and leaded glass of delightfully fresh design, stained plate glass for roofs, a number of original coloured drawings for lunettes and frieze decoration, "Glasmure," opus sectile, and mosaic work, &c.

The Patent Waterproof Materials Co., Croydon, showed their rotproof and waterproof lining paper for underlining coverings on damp or new walls. Made in three colours (green, brown, and black), it is pasted and hung in the same way as ordinary wallpapers, and having a perfectly smooth surface, it may be painted or distempered if desired.

The Art Pavements and Decorations, Ltd., 7 Emerald Street, W.C., made a handsome display of British and foreign marble, mosaic, tiles, and parquetry. Marble work of every description is manufactured at their London works. Particularly striking were the four towering marble columns which form part of the work now being erected at the English and Scottish Law Life Offices. Another conspicuous specimen was a large polished slab in four pieces.

THE HUDSON BAY COMPANY are proposing to erect a large store at Winnipeg at a cost of about 410,000*l.*

PROVISIONAL plans have been drawn up for a new station on the L. and N.W. Railway at Ellesmere Port, to be erected on the site of the present shunting sidings on the west side of the old station. Extra sidings are contemplated for the convenience of the local ironworks. Increased railway facilities are called for chiefly through the developments of the Mersey Ironworks trade. A sum of 200,000*l.* is being spent in extensions and equipment with modern machinery. Several acres of land have been acquired in anticipation of further developments.

THE COURT of Common Council, at their last meeting, received a petition asking for a contribution to the fund for the completion of the Wellington Monument in St. Paul's Cathedral. The petition stated that a number of citizens had privately raised a fund to provide for the casting and erection of the equestrian figure of the Duke according to the original design, which had never been completed. The greater part of the money required had, it appeared, been collected, but a sum of 500*l.* was still needed. The subject was referred to the Coal and Corn and Finance Committee.

A TWO-LIGHT stained-glass window has recently been erected in the Lady chapel at St. Mary's Church, Albert Bridge Road, Battersea. The subjects are "The Presentation in the Temple" and "Christ among the Doctors." The window was designed and executed by Mr. H. G. Murray, of Britannia Studio, Caroline Street, S.W.

IN the Sculpture Gallery of the Royal Academy is a clever bust of the late King Edward VII. by Mr. Bruce Joy. This bust is intended for presentation to the British Chamber of Commerce, Paris, by its President, Mr. R. Walton, and will, as well as being a present to the British colony at Paris, serve to commemorate the reception in 1903 of the Directors of the Chamber by His late Majesty. The bust will be placed in the board room on a suitable pedestal being prepared by Mr. A. Vye Parminter, architect to H.M. Embassy, Paris.

THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Institution of Civil Engineers have made the following awards for Papers read and discussed during the Session 1910-1911:—Telford Gold Medals to Mr. W. J. Wilgus (New York) and Mr. J. Walker Smith (Edinburgh); a George Stephenson Gold Medal to Mr. Philip Dawson (London); Telford Premiums to Messrs. G. W. Humphreys (London), H. K. G. Bamber (Greenhithe), A. E. Carey (London), William Dawson (Crewe) and C. S. R. Palmer (London); and the Trevithick Premium to Mr. A. T. Blackall (Reading).

The awards for Papers published in the Proceedings without discussion and for Students' Papers will be announced later.

At the annual general meeting of the Institution, held on April 25, the result of the ballot for the election of officers was declared as follows: President:—Dr. William Cawthorne Unwin (London); Vice-Presidents:—Mr. R. Elliott-Cooper (London), Mr. Anthony G. Lyster (Liverpool), Mr. B. Hall-Blyth (Edinburgh), and Mr. John Strain (Glasgow); other Members of Council:—Mr. John A. F. Aspinall (Liverpool), Mr. John A. Brodie (Liverpool), Mr. William B. Bryan (London), Col. R. E. B. Crompton, C.B. (London), Mr. Wm. Davidson (Australasia), Mr. James M. Dobson (London), Mr. H. F. Donaldson, C.B. (London), Mr. E. B. Ellington (London), Mr. Maurice Fitzmaurice, C.M.G. (London), Mr. J. P. Griffith (Ireland), Dr. Charles A. Harrison (Newcastle-on-Tyne), Mr. Walter Hunter (London), Mr. G. R. Jebb (Birmingham), Mr. Harry E. Jones (London), Mr. E. H. Keating (Canada), Sir Wm. Thos. Lewis, Bart., K.C.V.O. (Aberdare), Sir Thomas Matthews (London), Mr. Wm. Henry Maw (London), Hon. C. A. Parsons, C.B. (Wylam-on-Tyne), Mr. F. E. Robertson, C.I.E. (London), Mr. Alexander Ross (London), Mr. J. W. Shores, C.M.G. (South Africa), Hon. F. J. E. Spring, C.I.E. (India), Sir Philip Watts, K.C.B. (London), Mr. W. B. Worthington (Derby), and Mr. A. F. Yarrow (Glasgow). This Council will take office on the first Tuesday in November, 1911.

THE Chester Town Council give notice of their intention to provide a school for about 150 children at Neston.

THE Chertsey Rural District Council have decided to provide houses for the working classes, as ordered by the Local Government Board, in the parish of Thorpe.

THE Drapers' Company have voted 6,000*l.* to the Battersea Polytechnic for the erection and equipment of a department of hygiene and physiology.

A NEW church hall for which plans have been passed will shortly be erected in connection with the parish church at Kilwinning, N.B., at a cost of about 2,000*l.*

AN appeal has been made for contributions towards the 12,000*l.* required for erecting new buildings at Ruskin College, Oxford.

MR. C. F. GETTINGS, surveyor to the Teignmouth Urban District Council, has been selected out of 118 applicants for the post of county road surveyor for Worcestershire. The salary is 450*l.* per annum.

THE Reading Borough Surveyor has prepared plans and sections of an open-air bathing place proposed to be erected at Coley at an estimated cost of 1,800*l.*

MESSRS. HOMER & LUCAS, architects, 35 Bucklersbury, E.C., have prepared the necessary plans for the offices and club (Playgoers') now in course of erection over Leicester Square (Tube) Station. The contract was let to Mr. F. W. Dunkley, builder, Barnes.

MESSRS. R. MACDONALD & Co., contractors, of Bombay and Calcutta, have been awarded the contract for rebuilding the Grand Oriental Hotel in Colombo in three sections. The firm has taken offices in the Victoria Arcade, Colombo.

AN extensive enlargement scheme is to be carried out shortly at the Caledonian house of Messrs. Copland & Lye, Sauchiehall Street, Glasgow. The plans, which have been passed by the Dean of Guild Court, show a new building of six storeys in Bath Street, representing together an addition of 11,000 square feet to the existing floorage.

THE Newcastle Education Committee have decided to obtain in a local competition plans for the proposed school at Walker Gate. The school is to consist of two departments (350 senior mixed and 300 juniors, with an infants' class attached), and the accommodation of the various class-rooms is to be for 55 in the senior and junior departments, and 50 in the infants' department.

THE PROTECTION OF WATER SUPPLIES.

At a meeting on Monday, May 1, of the Society of Engineers (Incorporated), a paper entitled "The Protection of Water Supplies" was read by Mr. H. C. H. Shenton, vice-president.

The paper dealt with the difficulties of deciding on standards of purity for water and of danger from pollution. Dr. Somerville's and Dr. Thresh's warnings as to the harmfulness of certain organisms other than those usually taken into account were quoted, and Dr. Russell McLean's warnings against the harmfulness of coli, Dr. Sims Woodhead's statement as to the impurity of chalk waters, Dr. McWeeney's coli standard, Dr. Ridell's comments on the coli standard, Dr. Houston's object in the purification of London water supplies, and Mr. Dibdin's statements with regard to coli were discussed.

The author stated that animal pollution was sometimes considered harmless, without any apparent justification, and Mr. Downs's conclusions as to the harmlessness of farmyard pollution were given as an instance. Mr. Revell's opinion as to the relative unimportance of chemical and bacteriological tests for water was discussed, and the possible harmfulness of an absolutely sterile water was illustrated by Sir John Moore's statement at Dublin as to the nutritive value of certain bacteria in water, and by an instance of illness supposed to have been caused by the consumption of distilled water.

The pollution of supplies had been demonstrated recently by a great many authorities, including Mr. Baldwin Latham, who had drawn attention once again to the fact that typhoid germs could exist in the ground, a fact which had been proved by Dr. Robinson's experiments, which were confirmed by Dr. Sidney Martin, of the L.G.B. The author stated that Dr. J. W. Miller's paper on the Dangerous Pollution of Rivers was confirmed by the serious warning of the Joint Committee of both Houses of Parliament on the Water Supplies Protection Bill.

Statistics published by the New York State Department of Health proved that cities which had improved their water supplies during a period of ten years showed a typhoid death-rate considerably diminished, while those which had not improved their water supplies during the same period showed no change in the typhoid death-rate.

In the author's opinion, standards could not be adopted that would ensure safety from all possible dangers, *including unknown causes*, but standards could be adopted that would exclude such germs as were known to be harmful. For the rest, a risk must be accepted or ignored till the existence of anything harmful in the water was proved or disproved by the scientist. Such standards should be rigidly enforced. If the scientist would fix such a standard, the engineer could make water conform to it. The author also stated that the fact that waters could be purified did not afford any excuse for permitting pollution to occur. All possible sources of pollution should be excluded, or purified so as to be harmless where exclusion was impossible. Engineers could do away with all sources of danger as required by constructing new and better works of various kinds, but these must be of a character superior to what was now generally accepted. To do away with the sources of pollution would prove less expensive in the end than the present acquiescence in the construction or use of leaking sewers, house connections, drains, cesspits, and the like in places where pollution of the underground water supply was possible.

JACKSON SELF-FEEDING WATER BOILER PATENT.

In the Chancery Division, before Mr. Justice Joyce on Wednesday, May 10, the action of Jackson Boilers, Ltd., Queen's Square, Leeds, *v.* Fourness Lamp Co. was heard. Mr. A. J. Walter, K.C., and Mr. Hunter Gray appeared for the plaintiffs. Mr. Hunter Gray stated that the action was one for infringement of the plaintiffs' patent for water boilers. He explained that by the plaintiffs' invention boiling water could be obtained in the shortest possible time by reason of the ingenious arrangement of the interior parts of the boiler, and that a further advantage of the patent was that the apparatus could be readily cleaned out without any disturbance of the parts, and thus it was very suitable for use with hard water where it was likely that there would be any deposit. The Judge remarked that that was a very material advantage in any hot-water apparatus.

The defendants had shortly before the hearing intimated that they were not going to contest the case and had agreed

to pay damages and costs, but the plaintiffs contended that they were entitled to an order of the Court that the validity of the patent having been in question in the action the Court should grant a certificate of validity.

Mr. Atkinson Adam, C.E., explained the operation of the boiler. In his opinion it was a good invention and that there was no anticipation whatever in the cases set up upon the defendants' pleadings. In his opinion it was a valid and good patent. He explained at length to the Judge the working of the boiler, and his Lordship carefully examined the plaintiffs' patent with the infringement of the defendants.

Mr. Jackson, the patentee, was called, and at the close of the evidence Mr. Hunter Gray submitted that he was entitled to a certificate of validity of the patent as well as to an injunction.

His Lordship made the order granting an injunction against the defendants and also a certificate of the validity of the patent.

THE SOCIETY OF ENGINEERS (INCORPORATED).

By permission of the Council of the Festival of Empire, a party of members of the Society of Engineers (Incorporated) and their friends, numbering nearly 100, visited the Crystal Palace on Saturday, May 6, to inspect the building works in progress. Mr. Burnard Geen, A.M.I.C.E., M.S.E., consulting engineer to the Council, explained the chief points of interest. The visitors were first shown the two new reinforced concrete staircases leading from the main floor level of the centre transepts to the first terrace. The surface of all steps and landings is finished with 1 in. granolithic, put on at the same time as the main body of concrete. The hand-mixed concrete was composed of washed shingle varying in size from $\frac{3}{4}$ inch to $\frac{1}{2}$ inch, washed sand of a sharp nature, varying in size from $\frac{1}{8}$ inch downward, and Portland cement, in the proportions of 27 cubic feet of shingle to $13\frac{1}{2}$ cubic feet of sand to $6\frac{1}{2}$ cwt. of cement. The whole of the work, consisting of some 325 cubic yards of concrete, was completed in about 11 weeks.

The next work of interest was the strengthening to the existing roof of the Indian Section, a polygonal-shaped building of sixteen sides. The existing iron domed roof, with a fixed span of 123 feet 6 inches and a rise of 27 feet, built thirty years ago, was found to be in bad repair, and in order to carry the new false dome of fibrous plaster, supported on timber framework, which it was decided to add, it was necessary to truss the existing ribs. Scaffolding was erected from below, and the closing members of the new steel trusses were put in with initial tension, so as to relieve the existing ribs of dome action and convert them into compression members of the new trusses.

At the main entrance to this building there is a drop of no less than 10 feet, which has been got over by a flight of thirteen steps leading down to a raised platform 3 feet 6 inches high above the main floor of the building, 12 feet wide and 60 feet long, with a further seven steps at each side, thus converting a serious difficulty into a feature of the building.

Passing out into the grounds again the party had a good view of the various features of the exhibition, and inspected the buildings for housing the exhibits from South Africa, New Zealand, and Australia. These latter buildings are models to three-quarter full size of the parliament houses of the respective Colonies, and have an area collectively of about 6,500 super yards. They are constructed of timber covered with fibrous plaster, painted so as to take the appearance as far as possible of the stonework of which the originals are constructed.

After seeing the various other attractions of the Exhibition, tea was served in the Palace, and ended a very enjoyable and instructive visit.

The South Shields Town Council are going to apply to the Local Government Board for power to make the water-carriage system compulsory in all new buildings from January 1 next.

Mr. EDWARD MANSELL, of Temple Row, and Mr. Gerald Fowler, of Waterloo Street, have been re-elected diocesan surveyors of dilapidations for a period of three years for Birmingham.

An understanding has been arrived at between the brick manufacturers of Kent and Peterborough under which the output will in future be so regulated as to approximate more nearly to the actual demand for bricks by the building trade, so avoiding the financial losses occasioned by over-production.

THE HYGIENIC ASPECTS OF ILLUMINATION AND RECENT PROGRESS IN ILLUMINATING ENGINEERING.

(Continued from April 28.)

Invisible Radiation—Ultra-Violet Light.

WE know that artificial illuminants emit rays which are not visible but have, nevertheless, a profound effect upon us. We are conscious of the heat rays of the sun-rays of too low a frequency to appeal to the eye as visible light. We now know also that there are rays at the other end of the spectrum, beyond the violet, which affect the photographic plate, and are not without influence upon the human body; it is these rays that are now regarded as responsible for sun-burn. It is also these rays which are believed to cause the marking in smallpox and fading away of colours. In connection with their effect in imprinting the scars of smallpox on the skin, it is very interesting to learn that right back in the middle ages red curtains were popularly supposed to make the marking less. But it was only the researches of Finsen that enabled us to appreciate the reason, namely, that such curtains absorb the ultra-violet rays.

These rays are also believed to have a powerful action on the eyes when present in excess. The severe inflammation following incautious exposure to the naked arc light, the snow-blindness which occurs in mountainous districts where the light received is rich in ultra-violet rays, even the formation of cataract in the eyes of glass-workers constantly exposed to the radiation of molten material have been ascribed to their action.

A considerable amount of work on this subject has been done by the joint efforts of Dr. K. Stockhausen, an engineer, and Dr. F. Schanz, an oculist in Dresden. These observations have drawn attention to the fact that our artificial illuminants of the present day contain an increased amount of ultra-violet energy, and have, as a result of their researches, formed the opinion that, in excess, it is undoubtedly prejudicial to vision, and that certain fatiguing effects of artificial light are to be ascribed to this cause. They point out also that the rays can be divided into several distinct classes, and that ordinary glass does not absorb some of them. They have, therefore, devised a special variety of glass which they term "Euphos," which is specially adapted to absorb these rays. Spectacles of this glass are made for special use in snowy districts, or for the use of those engaged in work with intensely bright sources.

While, however, the pressure of an excessive amount of ultra-violet light is believed to have these prejudicial effects, it is also known that these very rays are serviceable in destroying bacteria. It would, therefore, presumably be rash to recommend their total exclusion from the spectrum of illuminants. But we require the physiologist to tell us how much or how little of this kind of energy is desirable for ordinary purposes. On the other hand, for special applications, such as the treatment of skin diseases, the sterilisation of material, &c., they are said to have already proved their utility. It may be suggested that there is still much to be learned regarding the effects of such invisible radiation in daily life. It is believed, for example, that the access of daylight into interiors is very beneficial in preventing the accumulation of microbes and the development of unhealthy conditions. How far is this effect to be ascribed to the influence of ultra-violet radiation, and how far to the natural effect of visible rays? Again, we know that the habit of constantly keeping windows shut is unhygienic because it leads to the gradual accumulation of impurities in the confined air. But it has been suggested that there is another and quite distinct reason why open windows should be encouraged. Ordinary window glass, while allowing visible radiation to pass almost unaffected, absorbs a considerable amount of ultra-violet energy; indeed, is said to suppress the rays of shortest wave-length altogether. May we not, therefore, regard this as another possible argument in favour of open windows? but no draughts! Here, again, we find an instance of the close connection between the need for abundant supplies of fresh air and the necessity for providing adequate illumination. In general, access of daylight and admittance of fresh air are closely connected.

Ventilation and Artificial Lights, &c.

This leads me to make passing reference to another line of work that has recently received a considerable amount of attention, namely, the connection between ventilation and the effect of the products of combustion of open flames, gas burners and stoves, &c., on the ventilation. Experiments on these points have been made, but the views expressed by

different authorities seem inconsistent in some respects, and further confirmation would be desirable.

It may be observed, for example, that a very complete and interesting series of researches was carried out by Dr. S. Rideal, and published in the Journal of the Royal Sanitary Institute in 1908, on the effect of products of combustion of various kinds on frequency of pulse and respiration, richness of blood in coloured corpuscles, body temperature, mental fatigue, &c., and has provided a most interesting and suggestive record of the possible lines of research in this direction. The questions he studied may be said to have never, apparently, been thoroughly threshed out, and one would like to see confirmatory tests carried out, especially in view of the well-recognised need for repetition of result in physiological study.

The effect of the heat and infra red rays of illuminants has also been the subject of study, but here, again, one feels that in order to be able to speak with certainty, more complete confirmatory investigations would be desirable.

Quite recently some tests on the effects of products of combustion have also been carried out by Dr. Toogood, at the Lewisham Infirmary, and it is interesting to observe that in 1908 a special grant was made to Dr. W. Wade for the purpose of carrying out researches on the same point.

Such experiments have certainly added to our knowledge of the subject. At the same time, it may be suggested that in the case of physiological researches of this kind experiments on a large number of individuals are desirable, and that the repetition of experiments by various observers is also very necessary. It is to be noted, also, that in order to carry the necessary weight such tests should be conducted under circumstances that leave no doubt as to their impartiality. The matter is mentioned merely as an instance of another line of work in which co-operation between the lighting engineer and the physiologist would be very beneficial, and on which reliable and impartial tests would still be welcome. There are also many other questions connected with the hygiene of illumination which might profitably be made the subject of similar investigations.

It might be added that one point which has not always received as much attention as one would desire in such experiments has been the measurement of the actual illumination in the case of the illuminants studied. This leads me to my next section on the value of measurements of illumination.

In illuminating engineering, as in other branches of work, it is most essential to have at one's command simple and reliable methods of measurement, the more so as many different experts are interested in the matter and desire to make tests, but cannot be bothered with cumbrous or complicated apparatus.

(To be concluded.)

TRADE NOTES.

WE are asked to notify that Messrs. Cockayne & Co., Ltd., of 185 Walworth Road, S.E., are now issuing a second edition of Oxborrow's Combined Order, Prime Cost, Charges to Customers, and Summary Book. To obtain for this practical account book a wide circulation, and to enable every trader carrying out repairs and jobbing work the opportunity of testing its merits at a trivial outlay, the publishers will supply at a charge of 1s. (post free 1s. 3d.), a specimen copy containing 50 pages of rulings, printed instructions, and a worked-out example. Builders, decorators, plumbers, engineers, manufacturers and others can profitably utilise this simple, economical and perfect method for accurately ascertaining their outlay, and also for fixing equitable charges in connection with their customers' orders.

WENGERS, LTD., Etruria, Stoke-on-Trent, have issued a well-printed wall calendar. As manufacturers of colours, chemicals, and all requisites for potters, glassmakers, and enamellers on metal, they have pinned on to the cord above it a series of colour cards, with names and numbers to assist customers when posting their orders.

THE annual dinner of the Society of Engineers (Incorporated) is to be held at the Criterion Restaurant on Saturday, May 27. Mr. F. G. Bloyd, the President, will be in the chair, and the guests will include Mr. Alexander Siemens, President Institution of Civil Engineers, Mr. E. B. Ellington, President Institution of Mechanical Engineers, Prof. C. Vernon Boys, F.R.S., Sir David Gill, and others. After the dinner there will be a conversazione and concert, the musical programme having been arranged by Mr. Chas. Capper, who will contribute some of his whistling solos.

LAND UNION JOURNAL.

Two years have passed since the Chancellor of the Exchequer, in his Budget speech of April 29, 1909, foreshadowed the principles involved in the Finance Act of 1910. It is probably safe to say that no more intricate and difficult piece of legislation has ever had to be dealt with by the people of the United Kingdom. The valuation of the whole of the land of the country would, in its simplest form, be a herculean task, but the magnitude of the enterprise has been augmented by the intricate rules and definitions and the absolute unreality of the whole conception of "site-value," which is the basis of the system.

The Land Union, on the 1st of May, published the first number of its Journal, one of the principal objects of which is to give assistance and advice to owners and their agents in connection with the valuation.

The Journal will be conducted on non-party lines. The subject being in its very essence political, it will be impossible to avoid politics in the broad sense of the word, but the distinction between political and party treatment will be carefully maintained.

The Journal will also deal with other important questions connected with the ownership of land and house property. The relations between local and Imperial finance and the reform of the present system of rating are matters which will inevitably demand considerable public attention in the near future. The principles involved and the legislation proposed will be discussed.

The May number contains articles by Mr. E. G. Pretymann and Mr. Harold Cox. Debates in the House of Commons will be dealt with by Mr. Crofton Black.

The Supplement to the May number reprints the Land Clauses of the new Revenue Act, 1911, with notes, and also the Statutory Rules and Orders which have been issued by the Reference Committee dealing with appeals to referees.

The Journal will be the official organ of the Land Union, but it is certain that it will prove of interest and utility to a larger circle than the members of that association and that all those who are interested in land and land legislation, whether in a private or official capacity, will be numbered amongst its subscribers.

VARIETIES.

A COMPLETE scheme is to be prepared for the extension of the eastern end of the esplanade at Penzance, at a probable cost of 14,000*l*.

THE Local Government Board have sanctioned the borrowing of 6,400*l*. by the South Bank (near Middlesbrough) Council for the erection of a Town Hall.

THE Star Theatre, Liverpool, has been acquired for the purpose of converting it into a permanent repertory theatre. Very considerable reconstruction will be necessary, and the necessary plans have been prepared by Professor S. D. Adshead, Liverpool.

A COMMITTEE was appointed on Monday to promote the completion of St. Mary's Episcopal Cathedral, Edinburgh, by the erection of the two western spires as a memorial to the two Misses Walker. These ladies practically built and endowed the cathedral in 1871. It is believed that a sum of 15,000*l*. will be required.

THE Leith School Board have resolved to request Mr. Geo. Craig, architect, Leith, to submit a plan showing how an elementary school could be erected on the topmost portion of the ground recently acquired by the Board from the Parish Council at North Junction Street, extending to about 1½ acres.

THE Governors of the Royal Caledonian Asylum propose to complete the new building by adding a dormitory at each end, and providing accommodation for at least 200 children; and to erect workshops for the teaching of trades. The scheme is to be as a Coronation memorial.

THE Dundee Town Council propose to give a sum not exceeding 4,000*l*., together with a site, for the erection of a new church in the west end for St. John's Cross congregation. The cost of the church and church halls is estimated at 10,000*l*.

At the annual meeting of the Visitors of the Bracebridge County Asylum, the Building and Sanitary Committee reported that the continuous increase in patients pointed to the necessity of providing more accommodation by additional wings. Plans had been submitted for the accommodation of sixty male and 100 female patients.

Two new large theatres are to be erected in Manchester very shortly. One will be the "New Queen's" Theatre, and an island site has been secured in Great Bridgewater Street

within a few yards of Oxford Street. The other is to be built in Quay Street, a few yards away from Deansgate. The site available has an area of about 1,800 square yards. The estimated cost of the theatre, exclusive of the site, is a little under 30,000*l*.

THE Worshipful Company of Makers of Playing Cards offers the Company's prize of 15*l*. 15*s*. for the best design for the backs of playing cards, illustrating the subject of "India, the Imperial diadem." The "H. D. Phillips" prize of 10*l*. 10*s*. is also offered by the Company for the best design on any other subject than that mentioned above, or of any pattern at the choice of the competitor. Designs must be sent in by June 30.

THE Dudley Education Committee last month invited architects practising within eight miles of Dudley (including the area of the city of Birmingham) to send in their names as competing architects for a school to be erected at a cost of about 5,000*l*., at Netherton. Thirty-five applications were received. It has been decided that twelve of these will be invited to submit competitive plans. Mr. C. Smith, F.R.I.B.A., Reading, will act as assessor.

HIS MAJESTY'S Acting Consul-General at Leipzig reports that a Portland cement factory, with an annual capacity of 1,000,000 barrels of cement, is to be erected at Sättelstad. An assurance has been issued that the new concern will immediately join the Central German Cement Association, but, says the Acting Consul-General, it is almost certain that the establishment of this new factory will make the already unsatisfactory price and market conditions in the German cement trade even worse.

DURING the past three years the imports of cement into San Francisco have rapidly declined, and according to his Majesty's Consul-General at San Francisco, it is thought to be only a question of a few years when they will cease entirely. The number of barrels imported last year was 23,448, as compared with 151,097 barrels in 1908. The decline in the importations from the United Kingdom is very marked, none being registered last year, as against 2,255 barrels in 1909 and 13,785 barrels in 1908. The local manufacturers are now more than able to meet all requirements.

THE Edinburgh Dean of Guild Court have granted warrant to erect a new school at M'Leod Street, Tynecastle. The main building will accommodate 960 pupils, and have twenty-four class-rooms. The building is L-shaped, and is so planned that only a class-room and a corridor comprise the width of the building. On the ground floor there is a central hall 80 feet by 40 feet. In addition, spray baths will be provided for both sexes. The grounds extend to 3½ acres. The total cost of the building will be about 17,000*l*. The architect is Mr. J. A. Carfrae, 3 Queen Street, Edinburgh.

At a meeting of the Northern and Yorkshire divisions of the Institution of Municipal Engineers on the 6th inst., it was decided to appoint a special sub-committee to consider the question of the alleged unsatisfactory attitude of the Local Government Board towards the engineer. Mr. Davison (Chairman of the Northern Division), of Morpeth, who presided, said the tendency of the Local Government Board for some time past had been to ignore the surveyors very largely. The present President of the Local Government Board seemed to favour the health officers against the surveyors, and they had some glaring examples of this.

On the 3rd inst. a meeting of workers in the building trades of Leeds was held in the Kingston Unity Hall, with a view to trying to incorporate the whole of the various branches of the many building trade unions into one federation. Mr. J. Smith, District Chairman of the Amalgamated Carpenters and Joiners, presided, and the meeting was addressed by Mr. P. Flanagan, of Hull, Mr. H. A. Stone, Mr. W. Hirst, and Mr. Bradshaw. A resolution was passed pledging those present to use every endeavour to strengthen each society by securing the admission of every eligible candidate in their respective trades, and to bring about the industrial federation of all branches of the building trade.

THE Durham County Council held their annual meeting last week. The seal of the Council was affixed to contracts for new schools at Benfieldside (cost, 3,562*l*.), Deaf Hill (5,869*l*.), Horden Temporary (1,352*l*.), and for alterations at Crook (2,040*l*.), Eldon (1,646*l*.), and other schools. The purchase of six acres of land at Houghton-le-Spring for 3,500*l*. for a secondary school and higher standard school was agreed to. Amongst other places at which new schools, or extensive alterations, were proposed were Black Boy (estimated cost, 4,930*l*.), Byers Green (1,450*l*.), Dunston Hill (4,000*l*.) East Hetton (2,396*l*.), Fatfield (5,625*l*.), Helmington Row (2,650*l*.), Newbottle (3,484*l*.), Newton Cap (3,772*l*.), Peases West (3,217*l*.), Sacriston (975*l*.), Stanley, near Crook (2,250*l*.), and Tursdale (2,395*l*.).

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

BRADFORD.—June 1.—The Board of Management of the Bradford Infirmary invite plans with estimates for a new infirmary in Duckworth Lane. Mr. Keith D. Young, F.R.I.B.A., will act as assessor. Deposit 3l. 3s., which will be refunded on receipt of a bona-fide design or if block plan, instructions, &c., are returned within a month after receipt of replies to competitors' questions. The Secretary Superintendent of the Royal Infirmary, Bradford. (For further particulars see advertisement, January 13.)

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

NORWICH.—June 2.—The Royal Agricultural Society offer prizes for plans of house and buildings containing accommodation suitable for a mixed farm not exceeding 50 acres in extent: First prize, 25*l.*; second prize, 15*l.*; third prize, 10*l.*; fourth prize, 5*l.*, for the Royal Agricultural Society of England Show at Norwich, June 26 to 30. Entries close June 2. Mr. T. McRow, Secretary, 16 Bedford Square, London, W.C.

WALES.—June 16.—The Cymmer Co-operative Society, Ltd., invite competitive designs for rebuilding business premises at Cymmer, Port Talbot. Deposit 5*s.* Premiums of 15*l.* and 5*l.* will be awarded to plans first and second in order of merit respectively. The Secretary, Co-operative Society, Cymmer, Port Talbot, Glamorgan.

WALES.—July 1.—Competitive designs are invited for chapel, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

WHITLEY BAY.—June 7.—The Whitley and Monk-seaton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed cemetery buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and the conditions can be obtained on a written application being made, accompanied by a deposit of 1*l.* 1*s.*, which will be returned to every competitor submitting a bona-fide design. The designs, addressed to the Surveyor, are to be delivered at the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Saville Street, North Shields.

YEovil.—The Corporation of Yeovil invite competitive designs as follows:—(1) For laying out a site of about 10 acres of land for the purpose of erecting houses for the working class, and (2) for houses to be erected thereon. In respect of each class of design premiums of 20*l.* and 10*l.* will be awarded. Particulars and conditions of site may be obtained upon deposit of 10*s.* 6*d.* from the Town Clerk, Yeovil.

CONTRACTS OPEN.

AISKEW.—June 16.—For erection of a cottage at Aiskew, near Bedale. Apply by June 3 to Mr. T. Linscott, Wycar, Bedale.

AYLESBURY.—June 7.—For alterations to the infirmary at the Union House. Deposit 5*l.* Bank of England note. Mr. F. Taylor, A.R.I.B.A., 7 Bourbon Street, Aylesbury.

BARNARD CASTLE.—June 5.—For the following work at the Auction Mart, viz.: Contract No. 1, cementing and draining; (2) iron pens and stalls; (3) iron roof. Mr. E. C. Surtees, architect, 4 Park Terrace, Barnard Castle, Durham.

BASINGSTOKE.—June 12.—For erection of a new secondary school for 160 girls. Deposit 5*l.* 5*s.* Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BELFAST.—For erection and completion of offices, Board-room, and stores, York Road, for the Belfast Mineral Water Co., Ltd. Messrs. Moore & Flanagan, architects, 35 Royal Avenue, Belfast.

BEVERLEY.—For pulling down and reconstruction of shop premises in Market Place, for Messrs. A. Altham, Ltd. Send names to Mr. F. Mason, architect, 20 Park Road, Leeds.

BIGGLESWADE.—June 6.—For alterations and additions to the infirmary at the workhouse. Deposit 1*l.* 1*s.* Mr. W. Jackson, architect, Market Square, Biggleswade.

BOLTON.—June 2.—For the separate trades in erection of the Hardcastle Memorial Hall, St. Augustine's, Tonge Moor. Mr. Ernest W. Dyson, architect, 17 Lee Lane, Horwich.

BURY.—May 29.—For erection and completion of a new entrance lodge at the Bury Infirmary. Messrs. Nuttall & Cooper, architects and surveyors, Market Street, Bury, Lancs.

CALLINGTON.—June 10.—For erecting a Council school at Callington. The Council School, Callington, or Mr. B. C. Andrew, architect, St. Austell.

CRANBROOK.—May 30.—For alterations at the workhouse infirmary. Mr. C. Payne, surveyor, Cranbrook, Kent.

CUMBERLAND.—May 30.—For the erection of a dwelling-house at Hayton, Cumberland, for Mr. W. E. Dover. Mr. J. Henney, architect and surveyor, 39 Senhouse Street, Maryport.

DORCHESTER.—May 31.—The Guardians invite separate tenders for—(1) alterations to the porter's quarters at the workhouse, and (2) for repairs to porter's lodge, near the entrance gates. Mr. H. Wilton Reed, clerk, 24 High West Street, Dorchester.

DRUMBURGH.—June 10.—For the whole of the work required in alterations and additions to Drumburgh Council school, Cumberland. Mr. J. Forster, M.S.A., 13 Earl Street, Carlisle.

EDINBURGH.—May 29.—For the carrying out of the following works in connection with the erection of Tollcross School, Fountainbridge, for the School Board, viz.:—(1) Mason and brick works; (2) carpenter and joiner works; (3) steel and iron works; (4) slater work; (5) plaster work; (6) glazier work; (7) plumber work; (8) painter work. Mr. J. A. Carfrae, architect, 3 Queen Street, Edinburgh.

EDINBURGH.—June 3.—For the various trades in connection with erection of a training college for teachers at Moray House. Deposit 3*l.* 3*s.* Mr. A. K. Robertson, architect, 29 Hanover Street, Edinburgh.

EDINBURGH.—June 12.—For carrying out the following works in connection with the erection of Boroughmuir (New) school, Viewforth, for the School Board, viz.: (1) Mason and brick works; (2) carpenter and joiner works; (3) smith and ironfounder works; (4) slater works; (5) plaster work; (6) glazier work; (7) tile work; (8) plumber work; (9) painter work. Mr. J. A. Carfrae, architect, 3 Queen Street, Edinburgh.

FAENWORTH.—June 3.—For erection of an elementary school for 878 children, in Queen Street. Deposit 3*l.* 3*s.* Mr. Frank Freeman, architect, 13 Bowker's Row, Bolton.

GLASGOW.—May 30.—For erection and completion of houses. Mr. J. Earnshaw, architect, Carlton House, Bridlington.

GLASGOW.—May 31.—Constructional schemes and tenders are invited for the erection of the reinforced concrete floors, roofs, beams, columns, staircases, &c., in connection with the extension of Glasgow head post office. Any system or systems of construction may be adopted for the whole or any part of the work. Deposit 3*l.* 3*s.* H.M. Office of Works, 3 Parliament Square, Edinburgh, or at H.M. Office of Works, G.P.O., Glasgow.

GLASGOW.—June 26.—For the construction of a granary at Meadowside, Partick, for the trustees of the Clyde Navigation. The granary to be 312 ft. long by 72 ft. wide, inside dimensions, and 14 storeys in height. The building to comprise two portions, viz., grain bins or silos to contain 20,000 tons of grain, and floor warehouse to store 11,000 tons of grain. Tenders are to be for the construction of the granary in the following methods, viz.: (a) Entire building of reinforced concrete; (b) entire building of reinforced concrete, but with brickwork facing the external walls; (c) silos of reinforced concrete with external walls faced with brickwork; floor warehouse having external walls of brickwork, internal columns of cast-iron, and floors of rolled steel beams and concrete. Tenderers may offer for one or more of the alternative systems of construction. Send 5*l.* deposit to the Trustees' Engineer, Mr. T. R. Mackenzie, general manager and secretary, 16 Robertson Street, Glasgow.

GREAT YARMOUTH.—May 29.—For erection of stabling for fifty horses on the racecourse, South Denes. Mr. J. W. Cockrill, M.I.C.E., borough surveyor, Town Hall, Great Yarmouth.

HARRINGTON LOWCA.—June 3.—For the whole of the work required to be done in connection with proposed alterations and additions to Harrington Lowca Council School, for the Cumberland Education Committee. Mr. J. Forster, M.S.A., architect, 13 Earl Street, Carlisle, or Mr. Tolson, School Offices, Harrington.

HELLINGLY.—May 29.—For new Council elementary school at Hellingly, East Sussex. Send names and addresses by May 29 to Mr. F. J. Wood, county surveyor, County Hall, Lewes.

IRELAND.—June 9.—For erection of a dispensary residence and dispensary at Corbally, Downpatrick. Deposit 2*l.* 2*s.* The Boardroom, Workhouse, Downpatrick.

ISLE OF MAN.—June 1.—For the erection of a large concert-hall and other buildings, together with laying out grounds, &c., at the Villa Marina Estate. Send names and 2*l.* 2*s.* deposit by June 1 to Mr. A. Robertson, Town Clerk, Town Hall, Douglas, Isle of Man.

KING'S HEATH.—June 14.—For the erection of a superintendent's lodge in the King's Heath Park, Birmingham. Deposit 1*l.* 1*s.* Mr. A. W. Cross, engineer and surveyor, 23 Valentine Road, King's Heath, Birmingham.

LAUNCESTON.—June 10.—For erecting a Council school. The Council School, Launceston, or Mr. B. C. Andrew, architect to the Committee, Biddick's Court, St. Austell.

LEEDS.—May 29.—For the reinstatement of 53 Burman-tofts Street, recently damaged by fire, for the Corporation. Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

LONDON.—May 31.—For erection of a small hall for St. John's Parish Church, Croydon. Deposit 1*l.* Apply by May 31 to Mr. H. Carter Pegg, F.R.I.B.A., 452 London Road, Thornton Heath.

LONDON.—June 1.—For making alterations and re-decorating two wards at the Infirmary, Bancroft Road, Mile End, E. Mr. B. Catmur, Bancroft Road, Mile End, E.

LONDON.—June 6.—For the enlargement of Croydon Telephone Exchange. Deposit 1*l.* 1*s.* The Postmaster, Croydon, and at H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON.—June 12.—For erection of a refuse destructor for dealing with the refuse of the district, including the provision of the necessary buildings, chimney, boilers, machinery, &c., for the Barnes Urban District Council. Deposit 1*l.* 1*s.* Mr. G. B. Tomes, A.M.I.C.E., engineer and surveyor, Council House, High Street, Mortlake, S.W.

LONDON.—June 27.—Constructional schemes with tenders are invited for the erection in reinforced concrete of new buildings for His Majesty's Stationery Office and Office of Works Stores in Waterloo Road and Stamford Street, S.E. Any system of construction may be adopted for the whole or part of the work. Deposit 3*l.* 3*s.* Mr. R. J. Allison, A.R.I.B.A., H.M. Office of Works, &c., Storey's Gate, S.W. (See advertisement.)

MACCLESFIELD.—June 3.—For alterations at the General Infirmary. Mr. A. E. Hanrahan, secretary.

MACCLESFIELD.—June 14.—For erection and completion of a public elementary school building, playsheds, boundary fences, and other works in connection therewith, on land in Athey Street. Deposit 2*l.* 2*s.* Messrs. Whittaker & Bradburn, architects, 19 King Edward Street, Macclesfield.

MANCHESTER.—May 31.—For the erection of additional bath-rooms and a waiting-room for messengers at the workhouse at Crumpsall. Deposit 10*s.* 6*d.* Mr. A. J. Murgatroyd, architect, 23 Strutt Street, Manchester.

NEWCASTLE-UPON-TYNE.—June 12.—For supply and erection of a single-storey shed about 320 ft. long and 66 ft. wide, for the Trade and Commerce Committee of the Council. The contract will include steelwork, brickwork, corrugated iron roof covering, glazing, sliding doors, &c. Send deposit of 2*l.* 2*s.* to the City Treasurer, Town Hall. The City Engineer's Office, Town Hall, Newcastle-upon-Tyne.

NEWTON ABBOT.—May 30.—For erection of a new laundry at Brookhill, Highweek. Mr. S. Segar, F.I.A.S., Union Street, Newton Abbot.

TOTTINGTON (LANCS.).—May 31.—For the rebuilding of a retaining wall and contingent works at Brandlesholme Road, Greenmount. Mr. Lawrence Kenyon, surveyor, 33 Chapel Street, Tottington.

TROON.—May 29.—For erection of Wesleyan Methodist church at Plantation, near Troon, Cornwall. Mr. S. Hill, architect, Green Lane, Redruth.

TRURO.—May 31.—For erection of proposed additions to the Royal Cornwall Infirmary. Mr. A. J. Cornelius, M.S.A., architect, Truro.

WAKEFIELD.—June 8.—The West Riding Education Committee invite whole tenders for the following works: Adwick-le-Street, Woodlands new Council school, Kirkburton Council School, South Emsall Council school, asphaltting of playgrounds. Education Architect, County Hall, Wakefield. Send 1*l.* deposit in each case to the West Riding Treasurer, County Hall, Wakefield.

WALES.—For carrying out alterations and additions to No. 1 Railway Terrace, Penrhiwceiber. Apply to Messrs. Morgan & Elford, architects, 1 Jeffrey Street, Mountain Ash.

WALES.—For building a vicarage at Avon Vale, Port Talbot. Deposit 1*l.* 1*s.* Mr. Mansel H. Hunter, architect and surveyor, The Square, Neath.

WALES.—May 29.—For erection of eighteen or more houses at Abertridwr, for the Cwmceffyl Building Club. Mr. G. A. Treharne, engineer and architect, Station Street, Aberdare.

WALES.—May 29.—For new galleries, class-rooms, and decorating Bethel Chapel, Libanus Road, Ebbw Vale. Rev. E. Clements, Fernleigh, Ebbw Vale, Mon.

WALES.—May 29.—For the erection of 17 houses or more at Woodfield, Blackwood, Mon., for the Church View Building Club. Mr. D. J. Thomas, architect, High Street, Blackwood, Mon.

WALES.—May 30.—For additions and alterations to the Cwmffrwdor branch premises for the Abersychan, British, and Talywain Industrial Co-operative Society, Ltd. Mr. A. G. Babbidge, architect and surveyor, Clarence Chambers, Pontypool.

WALES.—May 30.—For erection of a public convenience in Sloper Road, Grangetown, Cardiff. The City Engineer's Office, City Hall, Cardiff.

WALES.—May 31.—For erection of Blackwood Police Station and Petty Sessional Court. Deposit 1*l.* 1*s.* Mr. W. Tanner, F.S.I., county surveyor, Blackwood, Mon.

WALES.—May 31.—For erection of additions to the National School, Bwlch-y-Cibau. Mr. R. W. Davies, M.S.A., architect, &c., Carno, Montgomery.

WALES.—May 31.—For the following works, for the Glamorgan County Council, viz.:—(1) Repairs to offices at Abergwynfi Council school; (2) alterations to offices at Seven Sisters Council school; (3) heating chamber at Tairgwaith Council school, near Gwauncaegurwen; (4) alterations to offices at Sketty Council school; (5) boundary walls and railings at Cwmlai Council school, near Tonyrefail; (6) levelling playground, fencing, &c., at Gilfach Goch Council school. The Glamorgan County Council Offices, Westgate Street, Cardiff.

WALES.—June 1.—For alterations at the White Horse Inn, Fochriw, for Messrs. David Williams & Co., Taff Vale Brewery, Merthyr. Mr. C. M. Davies, M.S.A., 112 High Street, Merthyr.

WALES.—June 3.—For erection of four houses at Penygarn. Mr. D. C. Udell, architect and surveyor, Commercial Street, Pontypool.

WALES.—June 7.—For the work required in making roads and footpaths, laying subsoil and surface-water drains, building retaining walls, erecting messroom and bier house, entrance gates, and railings, and any other work necessary in the construction of a burial ground at Cwm, for the Ebbw Vale Urban District Council. Deposit 2*l.* Mr. T. J. Thomas, town engineer and surveyor, Ebbw Vale, Mon.

WALES.—June 9.—For building a farm house at Cwmporthman, Blaenporth. Apply to Mr. W. H. Harris, Cwmporthman.

WALES.—June 10.—For the general builders' work in alterations and repairs of the Town Hall, Pembroke. Deposit 5*s.* Mr. H. R. Crabb, A.R.I.B.A., Bush Street, Pembroke Dock.

WREXHAM.—June 1.—For erection of extensions to the Imperial Hotel, Regent Street. Deposit 2*l.* 2*s.* Mr. F. A. Bevan, architect, 5 Queen Street, Wrexham.

WREXHAM.—June 3.—For pulling down and rebuilding a stone boundary wall and other works in front of the Roman Catholic Church grounds, Regent Street. Mr. J. England, borough engineer, Willow Road, Wrexham.

WREXHAM.—June 6.—For the following works, for the Corporation, viz.:—(1) Alterations to the market hall shop; (2) alterations and extensions to the conveniences, windows, &c., at the Victoria Council schools; (3) painting at the general market and shops in Henblas Street; (4) painting of offices at the Willow Depot; (5) cleaning down and painting cemetery superintendent's lodge. Mr. John England, borough engineer, Willow Road.

YORK.—May 29.—For extensions to electric-car sheds, Fulford Road. Deposit 1*l.* 1*s.* Mr. F. W. Spurr, City Engineer, Guildhall, York.

YORK.—May 31.—For supply of a proposed hospital for open-air treatment of consumption. Deposit 1*l.* 1*s.* Mr. F. W. Spurr, city engineer, Guildhall, York.

"In these days it pays better to work for other people than to employ men on one's own," said a master builder at Bow County Court last week.

THE Local Government Board has formally sanctioned the borrowing by the Rural District Council of Penrith of the sum of 21,800*l.* for the purpose of water supply. The source is from springs situated on the fell west of Mungrisdale at an altitude 1,250 feet above Ordnance datum. There will be two service reservoirs. The total length of main is over 52 miles. The Board of Agriculture and Fisheries has also sanctioned the scheme. The contracts will be let and the works commenced without delay. Mr. Joseph Graham, Castle Street, Carlisle, is engineer for the scheme.

THE FESTIVAL OF EMPIRE AND IMPERIAL EXHIBITION, CRYSTAL PALACE.

THE note of "Empire" is being sounded on every side just now in this country, and nowhere more triumphantly than at the Crystal Palace, where the much-talked-of exhibition was recently opened with much *eclat* by His Majesty the King. It was known that the dominant note of this year's mammoth Festival would be the Gospel of Empire. That promise has been amply fulfilled. "The Palace" has stirred itself like a giant after a long sleep. Its rejuvenation has confounded the critics who talked of it as a senile resort tottering to its doom of extinction, and justified those who saw in its future unlimited possibilities for popular entertainment, if only the traffic facilities could be brought up-to-date. The electrification of the railway system and the new fast services have been a most important advance in this respect.

To most visitors the outstanding feature of this 1911 exhibition will be found to the south of the terrace, where many of our Dominions Beyond the Seas are represented by exact replicas of their Parliament buildings, in which are exhibited examples of the productive and industrial wealth of the different Dependencies. These are approached through scenes realistically laid out to suggest the principal avocations of the various countries. An intrinsic part of this section is the "All Red" route, *i.e.* the specially-constructed full-size electric railway, which conveys enquiring visitors along its one and a half mile of track in a lightning tour of the different Colonies. By this means an astonishing amount of information can be assimilated in the twenty minutes or so journey which separates Newfoundland from South Africa, *via* Canada, Jamaica, Malay Peninsula, India, Australia, and New Zealand.

This Empire in Miniature is, of course, only one of the attractions to Sydenham. In the interior of the Palace itself there is an All-British exhibition of Arts and Industries. Here also a succession of concerts and other entertainments will take place. In the grounds there is an open-air amphitheatre designed by Sir Aston Webb, R.A., which will be used for a variety of purposes, including the Pageant of London. Individual mention cannot here be made of the many bungalows and pavilions which offer instruction or amusement. The Exhibition is amply sufficient to occupy the visitor on many successive days. It has received the official patronage of His Majesty's Government, and the entire profits will be devoted to the King Edward VII. Hospital Fund.

LONDON MASTER BUILDERS' ASSOCIATION.

THE monthly meeting of the Council of the above Association was held at Koh-i-Noor House, Kingsway, on the 18th inst., Mr. G. Bird Godson, President, in the chair, supported by a large number of members.

Reference was made to the Home Office Departmental Inquiry into Lead Poisoning and the evidence on the subject to be supplied.

It was reported that the House of Lords decided in favour of the builder in the final appeal case of Roberts *v.* Hickman. The financial assistance voted to Messrs. Roberts, in the event of their case not being successful will, therefore, not be claimed. Great interest has been aroused by this case greatly affecting the interests of architects and builders.

The effect of the National Insurance Bill upon the trade was fully discussed, and the Council was unanimously of opinion that if the additional burdens set forth in the Bill are to be imposed upon the trade employers would be glad to see the principle extended so that their present risks under the various Employers' Liability Acts should be included in one payment, and the Association's representatives on the Employers' Parliamentary Council were requested to do their best to attain this end.

A further election of new members followed.

MR. G. H. FELLOWES PRYNNE, architect, London, has prepared plans for the practical reconstruction of St. Nicholas Church, Taplow. It is proposed to build a new nave, aisles, vestries, and chapel, at an estimated cost of 7,350*l.*

It is proposed to enlarge Walton Parish Church, Liverpool, by the addition of a side chapel, vestries and ambulatory providing 120 additional seats. It will also be necessary to repair the roof and strengthen the walls of the existing building. The estimated cost is 2,415*l.* Mr. L. Nagington, Liverpool, is the architect.

THE L.C.C. SCHOOLS.

THE Education Committee of the London County Council have, in accordance with the practice obtaining in previous years when the annual estimates have been considered by the Council, submitted observations on the education account for the financial year 1911-12.

The total of the estimates amounts to 729,675*l.*, which is an increase by 179,095*l.* on the estimates for the year 1910-11.

The estimate in respect of new elementary Council schools is 58,665*l.* less than for 1910-11. This is due to the fact that a considerable part of the Council's present programme of provision of elementary school accommodation has been proposed as a result of the survey of the accommodation of the county made in connection with Article 14 of the code of regulations for public elementary schools, and to the fact that these proposals have been made too recently to render it probable that a large sum will be needed for actual building operations during the year. On the other hand, in the estimates for the year 1910-11 most of the new elementary schools provided for were in a more advanced stage. Although, however, the provision for new schools during the year 1911-12 is smaller, the provision in respect of additions and alterations to elementary Council schools shows an increase of 15,825*l.* over last year's estimate, and the amount estimated in respect of modernising and improving elementary Council schools shows an increase of 48,700*l.*

Whilst it has not been found necessary to make provision for as much expenditure on building elementary schools and enlargements as was made for the year 1910-11, it is pointed out that the provision for sites has been increased by 27,070*l.*

In respect of new elementary Council schools and additions and alterations to existing schools there is included a sum of 270,000*l.*

The Council's present programme of elementary school accommodation amounts to about 29,000 places. Of this number about 2,000 places (mostly being provided) represent the residue of the provision which had to be made in order to meet the loss of accommodation arising out of the survey of the non-provided schools; 13,000 places are required to meet the requirements of Article 14 of the code of regulations for public elementary schools; 3,000 places are to replace old and out-of-date schools; and 11,000 places are to meet increases of population in various parts of the county and for other purposes. In the present estimates provision is made for the expenditure which is likely to be incurred in the financial year 1911-12 as a result of the progress made in carrying out this programme.

The average cost of a new elementary school place is usually put approximately at 30*l.*, *i.e.*, 10*l.* for site and 20*l.* for building and equipment. The cost of sites varies very considerably according to the particular district in which they are situated, and the cost of building varies to some extent owing to the particular nature of different sites and other circumstances. The estimates are, however, framed on the estimated cost of each individual site or building provided for therein.

With respect to sites, for which the total estimate is 163,070*l.*, about half of the amount is in respect of sites over which compulsory powers of purchase are being sought in the current session of Parliament.

With regard to the buildings, it may be stated that the cost of building 8,650 places has been estimated at 23*l.* 3*s.* 7*d.* a place. In connection with this figure, however, 6 out of the 16 proposals involved are "central" schools, and in other cases the estimated cost includes the cost of domestic economy or other centres to be erected on the same site as the new school. The average cost a place of the 6 new schools (4,268 places) where none of these complications arise is 20*l.* 1*s.* 11*d.*

Modernising and Improving Elementary Council Schools Vote.—The total expenditure for the year in respect of buildings is estimated at 103,040*l.*, including 16,000*l.* provided in the maintenance estimates. This is an increase of 43,040*l.* over the amount provided for building work in previous years. The increase is due very largely to the policy of entirely reconstructing some of the older schools where it is found that remodelling cannot be satisfactorily carried out at a moderate figure or where the comparatively small difference between the cost of remodelling and of reconstruction is such as to justify the extra expenditure so as to obtain an entirely new school.

Accommodation in Respect of Special Schools.—The amount included in the estimates for new special schools and enlargements of existing special school is 50,000*l.* (3,500*l.* for sites, 46,640*l.* for buildings, and 710*l.* for equipment, the total

written down to 50,000*l.*). The proposed new special schools and enlargements, expenditure on which is provided for in the estimates, will provide accommodation in all for 1,965 children (blind 30, deaf 100, mentally defective 1,080, and physically defective 755).

Accommodation in Respect of Higher Education.—As regards secondary schools, practically no building operations were undertaken during the year 1910-11. The plans of several schools have, however, now reached a somewhat advanced stage, and it is expected that the work will be put in hand before or during the year 1911-12. This is the reason for the estimate of 50,000*l.* in respect of buildings, an increase by 41,000*l.* over the estimate for 1910-11.

As regards technical institutes and schools of art, the increased expenditure on capital account in respect of buildings from 14,200*l.*; the estimate for 1910-11, to 54,630*l.* is due to the provision of 10,150*l.* for the extension of the L.C.C. Camberwell school of arts and crafts, 13,500*l.* for the extensions of the trade schools for girls at Hammersmith and Bloomsbury, 15,800*l.* for the erection of new premises at the L.C.C. school of photo-engraving and lithography, and 6,000*l.* for the extension of the L.C.C. Hackney institute. These proposals, with the exception of the L.C.C. Hackney institute, have been approved by the Council. This increased expenditure was anticipated when the estimate for the year 1910-11 was prepared, and a sum of 33,800*l.* was included accordingly in the vote for the six months ending September 30, 1911.

VARIETIES.

MESSRS. JAMES KEITH & BLACKMAN, LTD., engineers, Arbroath, are negotiating for the purchase of ground adjoining their present works for the purpose of erecting important extensions.

THE Horsham Urban District Council are considering the desirability of erecting a refuse destructor in connection with their electricity works. The estimated cost of the apparatus is 1,130*l.*

FUNDS are being raised for the erection of a new church at Sunbury, Surrey, in place of the present temporary St. Saviour's Church. A site has been obtained and paid for. The total cost of building will be 8,000*l.*, and a commencement will be made shortly by erecting the chancel and two bays, at a cost of 3,500*l.*

THE Sewerage Committee of the Leeds Corporation on Monday accepted (subject to the approval of the Council) the tender of Messrs. E. Arnold & Sons, of Leeds and Doncaster, for sewage disposal works at Thorpe Stapleton. The tender amounted to over 40,000*l.*

MESSRS. HOARE & WHEELER, architects, London, have prepared the plans for the proposed church of St. Saviour, in the parish of Prittwell, Westcliff-on-Sea, to replace the present mission church. The first portion will consist of the five western bays of nave and aisles, providing accommodation for 474 persons, at an estimated cost of 7,052*l.* When completed the church will accommodate 1,100 and is estimated to cost 15,000*l.*

THE Cathedral Church of St. Giles, Edinburgh, after being closed for four weeks, was re-opened on Sunday for public worship. The walls and church generally have received a thorough cleaning, such as they have not received for the last twenty-eight years. The walls from top to bottom were thoroughly brushed, the regimental flags were taken down and dusted, and the windows cleaned. Electric light has been introduced under the direction of Mr. R. S. Lorimer, A.R.S.A., architect to the Cathedral Board.

THE Selby Urban District Council decided last week to buy four acres of land adjoining the park at Selby from Mr. William Bell, of Aysgarth, for 2,000*l.* It is intended to build 56 much-needed cottage houses with an area for a playground, and to use over an acre as an extension of the park. It is understood that when the necessary sanction has been obtained from the Local Government Board, the proposed blocks of houses will be provided with a playground in the centre, half-an-acre of land being devoted to this purpose.

THE Ayr Dean of Guild Court, at their fortnightly meeting on Friday, May 19, passed the following plans:—New gymnasium for the Ayr Industrial School. Architect, Mr. J. K. Hunter, F.R.I.B.A., Ayr. Alterations to Commercial Bank, Ayr. Architect, Office of Works, George Street, Edinburgh. Addition to house in Park Circus, Ayr. Architect, Mr. J. K. Hunter, F.R.I.B.A., Ayr. Addition to Temperance Hotel, Killoch Place, Ayr. Architect, Mr. Wm. Cowie, A.R.I.B.A., Alloway Chambers, Ayr.

"THE HOMESTEAD" is the title of a new quarterly illustrated residential gazette issued by the Great Central and the Metropolitan Railway Companies. Its purpose is to show the Londoner what attractive neighbourhoods await him in the area called the "Beautiful North-West." The information given includes a brief description of the locality, together with such useful data as are demanded by everyone who has to cut his coat according to his cloth. It is evident that the compiler has had before his mind first and foremost the class who at present live in the long, unlovely streets of typical Suburbia, but who may be expected to joyfully set up their roof tree in more salubrious surroundings when once they realise that it can be done with ease.

At the last meeting of the Edinburgh Dean of Guild Court warrant was granted for the extension of the buildings of Edinburgh Academy, Henderson Row, by the erection of a building comprising a new dining hall and additional classroom accommodation. The cost, it is understood, will amount to 5,000*l.* Plans were also passed for the extension of George Heriot's School, at a total cost of 13,000*l.*, by the erection of new laboratories to be erected according to plans prepared by Mr. John Anderson, superintendent of works. The petition by the Edinburgh Provincial College Committee for the Training of Teachers for the erection of a building at the corner of St. John Street and South Back Canongate was continued for a week. This work will involve the demolition of seven tenements, a church, a large educational institute, and some slum property, besides several modern dwellings.

STATISTICS of plans passed at Ayr Dean of Guild Court for the past year were submitted at the Court last week by the master of works. The total number of warrants granted was forty-three, and the estimated value of buildings was 52,993*l.*, as compared with 44,733*l.* in the previous year. These included 11 dwellings, 5,742*l.*; 17 business premises (including the following public works): County Hospital alterations, 1,000*l.*; Liberal Club, 4,000*l.*; Congregational Hall, 1,500*l.*; new Newton Academy Schools, 11,500*l.*; North Quay wall, 12,500*l.*; Ayr Gas Co.'s gasometer, 1,600*l.*; Cattle Market byres, 2,444*l.*; total, 34,544*l.*; grand total, 40,826*l.*; 22 alterations, 3,925*l.*

In the course of a report for the year 1910 on the trade of the Consular district of Baltimore issued recently as a Consular report, Mr. Consul G. Fraser states:—The chief engineer of the Sewage Commission proposes, as soon as the sewage disposal plant at Back River—the point of the final discharge of the sewage into the Chesapeake Bay—is completed, to use the fall of the water after it has passed through the various tanks, which will be 18 feet, to operate turbines for the generation of electricity. It is expected that the quantity of water passing from the outfall will produce about 455 horse-power. The intention is to light and operate the disposal works with the current produced, and the chief engineer believes that the surplus will be sufficient to light the City Hall and the Court-house in Baltimore.

WHITSUNTIDE HOLIDAYS.

WE have just seen a copy of the A.B.C. Programme issued by the Great Central Railway Company. There are over 300 seaside and inland health resorts in the Midlands and the North, including Liverpool, Isle of Man, and West Coast, Cleethorpes, Scarborough, and East Coast, which can be reached in quick time at very low fares, and the choice of destination stretches from the Midland Counties to the North of Scotland. To those not willing to go so far away, the Vale of Aylesbury, Chiltern Hills, and Stratford-on-Avon should particularly appeal. Those wishing to undertake a walking or cycling tour, visiting the beauty spots of Middlesex, Herts, and Beechy Bucks are given a wide range of tours at low fares. Express corridor trains with buffet car accommodation will leave Marylebone at suitable times on June 2, 3, 4, and 5, and full particulars are contained in this programme, which may be obtained free at Marylebone Station, any of the Company's town offices and agencies, or by post from Publicity Department, 216 Marylebone Road, N.W.

FOR spending Whitsuntide on the Continent the Great Eastern Railway Company's Hook of Holland route offers exceptional facilities. Passengers leaving London in the evening arrive at Amsterdam, The Hague, &c., the following morning. From the Hook of Holland through carriages and restaurant cars run in the North and South German express

trains to Hamburg, Berlin, Cologne, and Wiesbaden. Special tickets at reduced fares will be issued by the Antwerp-Harwich route for Brussels. For the convenience of passengers, tickets dated in advance can be obtained at the Liverpool Street Station Continental Inquiry or Booking Office. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg (West Coast of Denmark) on Wednesday, May 31, and Saturday, June 3. The Swedish Royal Mail steamers of the Thule Line of Gothenburg will leave Harwich for Gothenburg June 3. The General Steam Navigation Company's steamers will leave Harwich for Hamburg May 31 and June 3.

THE South-Eastern and Chatham Railway have made special Continental arrangements. Cheap tickets will be issued to Paris by express services, *via* Folkestone and Boulogne, leaving Charing Cross at 10 A.M. and 2.20 P.M. on June 1, 2, 3, 4, and 5, also on the same date by the right mail leaving Charing Cross at 9 P.M., returning from Paris at 8.25 A.M. or 2.30 P.M., *via* Boulogne, or at 9.15 P.M., *via* Calais, any day within fourteen days. Cheap tickets to Brussels will be issued from May 31 to June 5, *via* Dover-Calais, Folkestone-Boulogne, and Dover-Ostend by express, leaving Charing Cross at 9 A.M., 2.20 P.M., and 9 P.M., returning from Brussels within fourteen days, and by any service. A cheap excursion to Boulogne will leave Charing Cross at 2.20 P.M. on June 3 and June 4, returning at 11.45 A.M. or 6.30 P.M. on Whit-Monday. Cheap return tickets, available for eight days, will be issued from Charing Cross to Boulogne from May 31 to June 5 inclusive, available by the 10 A.M. and 2.20 P.M. services. Similar tickets will also be issued to Calais by the 9 A.M. and 9 P.M. services from Charing Cross. Cheap tickets to Le Touquet and Paris-Plage, *via* Folkestone and Boulogne, will also be issued. Special cheap eight-day return tickets to Amsterdam, The Hague, Scheveningen, and other Dutch towns, *via* Queenborough and Flushing, will be issued from May 31 to June 5 inclusive, leaving Victoria and Holborn at 9.55 A.M. Cheap eight-day return tickets to Ostend will be issued from May 31 to June 5 inclusive. Cheap tickets to the Belgian Ardennes will be issued. During the holidays the Continental services will run as usual. A special service to Switzerland (1st and 2nd class), *via* Dover, Calais, Laon, and Bâle, will leave Victoria at 8.20 P.M. and Charing Cross at 9 P.M. on June 2.

The home arrangements of the South-Eastern and Chatham Railway are extremely complete. Return tickets to Tunbridge Wells, St. Leonards, Hastings, Bexhill, Rye, Winchelsea, Canterbury, Whitstable, Herne Bay, Birchington, Westgate, Margate, Broadstairs, Ramsgate, Sandwich, Deal, Walmer, Dover, Folkestone, Shorncliffe, Hythe, Sandgate, and New Romney (Littlestone-on-Sea) will be issued from London by certain trains on June 2, 3, and 4, available to return on June 4, 5, 6, and 7, by any train (mail and boat expresses excepted). A large number of cheap day and half-day excursions have been arranged for Whit-Sunday and Monday. Cheap return tickets will be issued from London to the Crystal Palace (High Level) on Whit-Monday, 1*s.* 6*d.* third class, including admission. Full particulars of the Continental and home excursions, extension of time for certain return tickets, alterations in train services, &c., are given in the special holiday programme and bills.

A SCHEME is on foot for the formation of a garden suburb under the co-operative system by laying out a portion of the Curzon Park estate adjoining Glan Aber Park, Chester. The plans, prepared by Mr. Philip Lockwood, show houses, the rents of which vary from 6*s.* 6*d.* per week to 35*l.* per annum, each house having a fair-sized garden.

THE communal authorities of Constantza, Roumania, have now been authorised to contract a loan for 3,000,000 lei (120,000*l.*) to be utilised in connection with the erection of public buildings, barracks, schools, and slaughterhouses, the construction of baths, paving operations, canal extensions, &c.

ACCORDING to an article in the *Messenger de Sao Paulo*, the city of Sao Paulo, Brazil, will soon undergo a complete transformation. By the co-operation of the city authorities and the Government of the State of Sao Paulo, schemes are to be considered for the construction of new streets and avenues, and the erection of imposing buildings, which will necessitate the expenditure of a large sum of money. This, it is stated, will compel the authorities to levy house duties and to impose other taxes by way of providing the requisite guarantees for the loans which will have to be raised.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

** As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

WALES.—June 16.—The Cymmer Co-operative Society, Ltd., invite competitive designs for rebuilding business premises at Cymmer, Port Talbot. Deposit 5s. Premiums of 15l. and 5l. will be awarded to plans first and second in order of merit respectively. The Secretary, Co-operative Society, Cymmer, Port Talbot, Glamorgan.

WALES.—July 1.—Competitive designs are invited for chapel, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

The Principles of Architectural Design

By **PERCY L. MARKS, Architect,**

Author of "The Principles of Planning."

With 165 Full-plate and other Illustrations, Royal 8vo, 10s. 6d. net.

THIS work embodies not only a series of articles on Exterior Design, that appeared in the columns of THE ARCHITECT, but includes also a similarly detailed treatment on the principles affecting Interior Design.

There cannot be any dogmatism on the subject of Art; but there are certain underlying principles, and the object of this book is to propound these in an easy and argumentative manner on the lines so successfully pursued by the author in his now standard work on Planning.

The study of the principles referred to is aided by illustrations which are for the most part of a diagrammatic character; in which light they are to be regarded, and not as finished illustrations exemplifying the Perfect Design.

The book has been well received and sympathetically reviewed during the short period that it has been issued; and with a view to fostering the growing interest of the general public in the art of Design, it has been kept free from any undue use of technicalities. It should appeal, therefore, to the layman as well as to the architectural student and designer.

ORDER FORM.

Please send me copy of "The Principles of Architectural Design," at the price of 5s. 6d. per copy, including postage, for which I enclose

P. A. Gilbert Wood,
6-11 Imperial Buildings,
Ludgate Circus,
London, E.C.

Date

Name

Address

WHITLEY BAY.—June 7.—The Whitley and Monk-seaton Urban District Council invite architects practising in Northumberland and the city of Newcastle-upon-Tyne to submit designs for the proposed cemetery buildings. A professional assessor has been nominated by the President of the R.I.B.A. to assist in drawing up the conditions and to advise on the relative merits of the various designs. The site-plan and the conditions can be obtained on a written application being made, accompanied by a deposit of 1*l.* 1*s.*, which will be returned to every competitor submitting a bona-fide design. The designs, addressed to the Surveyor, are to be delivered at the Council Offices, Whitley Bay, on or before June 7. Apply to Mr. Augustus Whitehorn, Clerk to the Council, 60 Saville Street, North Shields.

YEOVIL.—The Corporation of Yeovil invite competitive designs as follows:—(1) For laying out a site of about 10 acres of land for the purpose of erecting houses for the working class, and (2) for houses to be erected thereon. In respect of each class of design premiums of 20*l.* and 10*l.* will be awarded. Particulars and conditions of site may be obtained upon deposit of 10*s.* 6*d.* from the Town Clerk, Yeovil.

CONTRACTS OPEN.

AYLESBURY.—June 7.—For alterations to the infirmary at the Union House. Deposit 5*l.* Bank of England note. Mr. F. Taylor, A.R.I.B.A., 7 Bourbon Street, Aylesbury.

BARNARD CASTLE.—June 5.—For the following work at the Auction Mart, viz.: Contract No. 1, cementing and draining; (2) iron pens and stalls; (3) iron roof. Mr. E. C. Surtees, architect, 4 Park Terrace, Barnard Castle, Durham.

BASINGSTOKE.—June 12.—For erection of a new secondary school for 160 girls. Deposit 5*l.* 5*s.* Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BIGGLESWADE.—June 6.—For alterations and additions to the infirmary at the workhouse. Deposit 1*l.* 1*s.* Mr. W. Jackson, architect, Market Square, Biggleswade.

BINGLEY.—June 22.—For the following works in connection with alterations and additions to Bingley (Mornington Road) Council school, for the West Riding Education Committee, viz.:—Builder, joiner, slater, plumber, plasterer, and painter. The Education Architect, County Hall, Wakefield. Send 1*l.* deposit to the West Riding Treasurer, County Hall, Wakefield.

BRADFORD.—June 20.—For the mason's, joiner's, plumber's, plasterer's, slater's and painter's work in connection with extensions and additions to the medical officer's residence at the Union Workhouse, Horton Lane. Deposit 10*s.* 6*d.* Mr. Fred Holland, architect to the Board, 22 Manor Row, Bradford.

BURY.—June 15.—For execution of certain repairs required at Nos. 50, 52, and 54 Stanley Street, and Nos. 2 to 16 inclusive, Barlow Street. The Borough Engineer and Surveyor, Bury, Lancs.

CALLINGTON.—June 10.—For erecting a Council school at Callington. The Council School, Callington, or Mr. B. C. Andrew, architect, St. Austell.

CLAYTON-LE-MOORS.—June 7.—For erection of bakery in Mercer Street, for the Clayton-le-Moors Co-operative Society. Send names by June 7 to Mr. J. W. Cooper, secretary.

CROFT (DARLINGTON).—June 5.—For erection of new tabling, coach houses, and grooms' accommodation at Hainaby Hall (sole tenders). Send names by June 5 to Messrs. Clark & Moscrop, F.F.R.I.B.A., architects, Feethams, Darlington.

DOVER.—June 21.—For the erection of No. 6 barrack blocks for non-commissioned officers and men at Fort Bur-royne, Dover, in the Eastern Command. Send names and 10*s.* deposit by June 12 to the Director of Barrack Construction, 80 Pall Mall, London, S.W. (See Advertisement.)

DRUMBURGH.—June 10.—For the whole of the work required in alterations and additions to Drumburgh Council school, Cumberland. Mr. J. Forster, M.S.A., 13 Earl Street, Carlisle.

EDINBURGH.—June 12.—For carrying out the following works in connection with the erection of Boroughmuir (New) school, Viewforth, for the School Board, viz.: (1) Mason and brick works; (2) carpenter and joiner works; (3) smith and ironfounder works; (4) slater works; (5) plaster work; (6) glazier work; (7) tile work; (8) plumber work; (9) painter work. Mr. J. A. Carfrae, architect, 3 Queen Street, Edinburgh.

EMBSAY.—For the several works required in erection of a new church. Forward names to Mr. G. D. W. Douglas, architect and surveyor, Halifax Commercial Bank Chambers, Bradford.

EXETER.—June 6.—For the construction of a swimming bath and dressing boxes at the Devon and Exeter Boys' Reformatory. Deposit 3*l.* Messrs. E. H. Harbottle & Sons, architects, County Chambers, Exeter.

EXMOUTH.—June 24.—For erection of a police station and petty sessions room. Deposit 3*l.* Mr. E. H. Harbottle, county architect, Queen Street, Exeter.

GLASGOW.—June 26.—For the construction of a granary at Meadowside, Partick, for the trustees of the Clyde Navigation. The granary to be 312 ft. long by 72 ft. wide, inside dimensions, and 14 storeys in height. The building to comprise two portions, viz., grain bins or silos to contain 20,000 tons of grain, and floor warehouse to store 11,000 tons of grain. Tenders are to be for the construction of the granary in the following methods, viz.: (a) Entire building of reinforced concrete; (b) entire building of reinforced concrete, but with brickwork facing the external walls; (c) silos of reinforced concrete with external walls faced with brickwork; floor warehouse having external walls of brickwork, internal columns of cast-iron, and floors of rolled steel beams and concrete. Tenderers may offer for one or more of the alternative systems of construction. Send 5*l.* deposit to the Trustees' Engineer, Mr. T. R. Mackenzie, general manager and secretary, 16 Robertson Street, Glasgow.

HALIFAX.—June 5.—For the work required in the erection of bandstands, stages, and fencing off for fireworks, &c., on Savile Park, for the Coronation festivities. Deposit 1*l.* Mr. J. Lord, M.I.C.E., borough engineer, Town Hall, Halifax.

HALIFAX.—June 7.—For the various works required in erection of new workshop, Water Lane. Send in names on or before June 7 to Messrs. Jackson & Fox, architects, Rawson Street, Halifax.

HORSFORTE.—For the several works required in erection of St. Margaret's Parish Hall and schools. Forward names to Messrs. Emmsall & Clarkson, architects and surveyors, 7 Exchange, Bradford.

IRELAND.—June 9.—For erection of a dispensary residence and dispensary at Corbally, Downpatrick. Deposit 2*l.* 2*s.* The Boardroom, Workhouse, Downpatrick.

IRELAND.—June 12.—For erection of two semi-detached villas at Newtownards. Mr. T. Houston, architect and civil engineer, Kings Court, Wellington Place, Belfast.

IRELAND.—June 17.—For erection of out offices and stables for the Rathmines Urban District Council. Deposit 1*l.* 1*s.* The Engineer's Office, Town Hall, Rathmines, Co. Dublin.

IRELAND.—June 17.—For erection of a galvanised iron hay and cart shed, for the Rathmines Urban District Council. Deposit 1*l.* 1*s.* Engineer's Office, Town Hall, Rathmines, Co. Dublin.

IRELAND.—July 3.—For the erection of 28 labourers' and artisans' dwellings, for the Birr Urban District Council. Mr. H. Browne, A.M.I.C.E.I., Town Surveyor, Town Hall, Birr.

KIMBERWORTH (ROTHERHAM).—June 9.—For erection of the Kimberworth upper standard school and infants' school. Send names and 2*l.* 2*s.* deposit by June 9 to Mr. Spurley Hey, director of education, Education Offices, Imperial Buildings, Rotherham.

KING'S HEATH.—June 14.—For the erection of a superintendent's lodge in the King's Heath Park, Birmingham. Deposit 1*l.* 1*s.* Mr. A. W. Cross, engineer and surveyor, 23 Valentine Road, King's Heath, Birmingham.

LAUNCESTON.—June 10.—For erecting a Council school. The Council School, Launceston, or Mr. B. C. Andrew, architect to the Committee, Biddick's Court, St. Austell.

LEEK (STAFFS.).—June 6.—For alterations to the Sea Lion Inn, and adjoining property, in Russell Street. Deposit 1*l.* 1*s.* Mr. W. E. Beacham, C.E., surveyor, Town Hall, Leek.

LEOMINSTER.—June 9.—For extension of the Secondary School. Deposit 2*l.* 2*s.* The County Surveyor, Shirehall, Hereford.

LONDON.—June 6.—For the enlargement of Croydon Telephone Exchange. Deposit 1*l.* 1*s.* The Postmaster, Croydon, and at H.M. Office of Works, &c., Storey's Gate, S.W.

LONDON.—June 8.—For providing new flooring, &c., at the infirmary day rooms of the Plashet schools, Upton Park, E., for the Guardians of St. George's-in-the-East. Mr. T. W. Aldwinckle, F.R.I.B.A., architect, 20 Denman Street, London Bridge, S.E.

LONDON.—June 12.—For erection of a refuse destructor for dealing with the refuse of the district, including the provision of the necessary buildings, chimney, boilers, machinery,

&c., for the Barnes Urban District Council. Deposit 1*l.* 1*s.* Mr. G. B. Tomes, A.M.I.C.E., engineer and surveyor, Council House, High Street, Mortlake, S.W.

THE SURVEYORS' INSTITUTION.

THE annual general meeting of the Surveyors' Institution was held on May 29 at 12 Great George Street, Westminster, S.W. According to the forty-third annual report the grand total of membership is now 4,500, which figure marks the highest number yet attained, and is an increase of 157 since May of last year. The balance-sheet shows receipts amounting to 14,633l., and current expenses of 9,979l.

During the year 905 candidates presented themselves for the Institution Examinations, being 152 more than in 1910, and 130 more than the previous record in 1907. This great increase must be looked upon as to some extent of a temporary nature, the closing of the doors of membership after October 1913, to all who have not passed both the Intermediate and Final Examinations having the effect doubtless of inducing candidates to come up before that date if possible. The percentage of passes was 67.15 in the Preliminary and 67.18 in the Professional Examinations.

The successful candidate for the Institution Scholarship of 80l. per annum tenable at Cambridge University was Mr. P. D. Sturge, a great-nephew of the late Mr. William Sturge, President of the Institution in 1878. No scholarship was awarded at Oxford University, but for those in connection with which the successful candidates had the choice of the University at which they would take their course the competition was encouraging.

The Council remind members that these Scholarships, which are of an annual value of 50l. or 60l. respectively, and are tenable for three years, two being offered yearly, may be held at any University selected by the successful candidates other than Oxford or Cambridge, which have their own Institution Scholarships. The course of study, too, is not restricted, candidates being allowed to choose the course they elect to follow, provided that it is one sanctioned by the Council as bearing on the training and practice of a surveyor.

After careful consideration the Council awarded the Gold Medal for the best Paper read at an Ordinary General Meeting during the Session 1909-10 to Mr. W. R. Davidge in respect of his Paper on "Town Planning," which both in the interest of its matter and the ability of its compilation compares not unfavourably with those which have proved successful in the past.

The possibility of an extension of the Institution premises over Princes Mews to the new street at the back, referred to in the last Annual Report, has now practically been settled. Mr. Paul Waterhouse, F.R.I.B.A., has prepared plans extending the Lecture Hall and the Council Chamber, and making use of the ground floor thereunder for the staff offices, which are at present much scattered. This will not only allow the ordinary work of the Institution to be more conveniently carried on, but will also provide both a ground-floor lavatory and improved accommodation for writing and arbitrations. The elevation to the new street proposed by Mr. Waterhouse is a dignified one, in accord with the existing building, and the Council feel that when the extension is complete with the additional frontages the Institution will be housed in a manner befitting the position which it has attained.

Some years ago the Council thought it desirable to issue a Memorandum to all public bodies, drawing their attention to the serious objections to the practice of inviting quantity surveyors to tender for employment. While there is reason to hope that this practice is certainly not extending, a case was recently brought to the notice of the Council in which

surveyors were asked to compete against each other in respect of the time within which the work was to be completed, a method almost equally to be deprecated as subversive to accurate work. The original Memorandum was therefore extended to cover this case, and has again been widely issued throughout the United Kingdom, a course which it is hoped may be followed by similar good results to those which were associated with the issue of the ordinal Memorandum.

WESTERN CANADA NOTES.

[By A CORRESPONDENT.]

WORK on the new union station for the Canadian Pacific and Canadian Northern at Regina will be started soon. Regina is experiencing a building boom which exceeds anything of former years. Saskatoon is living up to its reputation as one of the liveliest among many lively cities. Building permits for April went to 1,188,000 dollars. The city will spend 1,000,000 dollars this year on local improvements, 90,000 dollars for concrete walks alone. The City Council approved an agreement which will supply Saskatoon with natural gas for industrial purposes. A twenty-year franchise will be granted, and the agreement will be void if gas in sufficient quantity is not supplied within eighteen months. Among many improvements to the business facilities of Saskatoon Mr. J. F. Cairns is to build a big department store, the best in Saskatchewan.

Prince Albert building permits for April show another remarkable increase over last year, which was the record to date. Figures are: April 1910, 17,550 dollars; April 1911, 162,355 dollars; first four months, 1910, 37,525 dollars; corresponding period, 1911, 319,635 dollars.

The burgesses of Edmonton, Alberta, have approved of twenty-three money by-laws placed before them by the City Council, authorising aggregate expenditures exceeding 700,000 dollars for improvements and betterments to various city services. The most important by-law was one covering an expenditure of 250,000 dollars for increased equipment at the power-house and pumping station.

The City Council has decided to accept the terms offered by the Dominion Government in regard to the privilege of developing hydroelectric power at Pelican Rapids, some 200 miles north of here on the Athabasca River. The city is to commence actual construction in 1912, and must be in a position to actually deliver 10,000 horse-power in Edmonton in 1916. The city has the right to ultimately develop 60,000 horse-power.

An important industrial enterprise was successfully promoted at Edmonton during the past few days. This is the Edmonton Portland Cement Co., Ltd., owning extensive marl deposits at Entwistle, on the Pembina River, to the west of Edmonton. A strong directorate has been formed, including a number of the most successful business men, with Lieutenant-Governor Bulyea as chairman. Construction is to be commenced at once, and the plant is to be in operation early in the season of 1912.

The Canadian Pacific Railway is to have a new irrigation and colonisation building at Calgary. The structure will be large, commodious, and thoroughly in keeping with the dignity of the Corporation and the magnitude of the enterprise it is to serve.

THE RUSSIAN TIMBER INDUSTRY.

THE Russian Empire occupies the first place among the nations of the world in the extent of its timber resources, the value and quality of two-thirds of which are practically unknown. The total area of the Russian Empire is 8,647,657 square miles, or about one-seventh of the entire land area of the globe, and 39 per cent. of the surface of the Empire is under forests. Those in European Russia cover an area of 474,000,000 acres; Finland, 50,500,000; Poland, 6,700,000; Caucasus, 18,600,000; total, 549,800,000. In the Ural provinces forests cover 70 per cent. of the area; in the northern provinces 68 per cent., and in the four lake provinces 57 per cent. The Government owns 65 per cent. of these forests, possessing in European Russia, 285,598,941 acres, Caucasus, 12,826,387; Asiatic Russia, 360,519,435; Amur region, 288,742,000; total, 947,686,763. Twenty-three per cent. of the forests belong to the landed proprietors, and 9 per cent. to the peasantry. It is estimated that in Western Siberia alone there are 465,000,000 acres in virgin forest, and Eastern Siberia, although not quite so rich in timber, has sufficient forests for the world's supply of timber for years to come. According to the American Consul at Moscow, the largest

timber districts in European Russia are in the north. The four Governments of Olonetz, Archangel, Vologda, and Viatka, comprising a total area of 650,000 square miles, are almost entirely covered with timber, but the greater part has never been explored by civilised man, though expeditions are now being formed for the purpose of investigating the immense resources of the country. The State forests during a recent year yielded 1,286,560,000 cubic feet of lumber, the Department of Forestry realising in round numbers for the sale of timber, rent of lands, &c., 6,500,000*l.* The expenditure, including 160,000*l.* for cutting trees and sawing logs, amounted to 1,400,000*l.*, thus leaving a profit to the State of 5,100,000*l.* It is stated officially that the reafforestation of State lands provides for more than the amount cut from the forests each year. The above figures do not include the timber lands owned by private parties in European Russia. They are divided as follows:—Imperial appanages, 14,274,500 acres; private landowners, 151,072,000; peasants, 29,210,000; joint-stock companies, factories, works, churches, &c., 6,853,500 acres. The Russian timber industry comprises 1,428 factories, saw-mills, planing establishments, wooden-box factories, piano factories, &c., the number of hands employed being 80,000, and the value of the annual output 16,000,000*l.* This industry is one of the greatest in the Empire, and offers many possibilities, which should not be neglected by manufacturers of requisite machinery. In a recent year Russia imported saw-mill machinery and wood-working machinery to the value of 17,500*l.* and 56,000*l.* respectively. Timber ranks second in the exports of Russia, preceded only by grain.

LONDON SMOKE NUISANCES.

ACCORDING to the report of Dr. Wm. Collingridge (Medical Officer of Health for the City of London) nine cases of smoke nuisance were reported during 1910. The number of observations recorded amounted to 360, as against 237 noted at fourteen premises in 1909. The service of notices upon offenders resulted in the abatement of the nuisances in all cases, and therefore there was no occasion to take further action in the matter.

In the reports for previous years attention has frequently been invited to the necessity for amendment in the law with a view to strengthening the City's powers and those of the Metropolitan Borough Councils for more completely abating smoke nuisances. In the annual report for 1909 reference was made to certain sections of the London County Council (General Powers) Bill. This Bill has resulted in the passing of the London County Council (General Powers) Act, 1910; but this, as far as smoke nuisances are concerned, does not appear to effect much improvement.

As frequently reiterated, the pall of darkness so often hanging over London is undoubtedly largely due to the smoke from the chimneys of private dwelling-houses, the factory chimney as a rule contributing but a small portion of the whole, and while the Acts of Parliament under which we are governed permit private dwelling-houses to send forth black smoke in unlimited quantity, and any premises other than private dwelling-houses to send forth unlimited smoke of any sort provided it be not black, any drastic mitigation of the evil is improbable.

The most useful alteration of the law proposed by the Bill mentioned, viz. that any chimney (not being the chimney of a private dwelling-house) sending forth smoke in such quantity as to be a nuisance shall be a nuisance liable to be dealt with summarily (thus omitting the word "black," which still obtains), has not been retained in the Act as passed, thus continuing the existing difficulty of local authorities in taking offenders into Court, and necessitating the proof that the smoke causing the nuisance was black.

Annoyances are still reported by occupiers of lofty buildings from chimneys at a lower level. Proprietors of restaurants and grills occasionally give trouble to their neighbours when lighting or forcing their fires and by improperly burning refuse, but it is to be noted that the atmosphere is now much less dense than in former years, and in the summer season it is noticeable that on many afternoons, while clouds of smoke overhang adjoining districts, but little smoke is seen in the clear air of the City.

THE contract for the reconstruction of the Caledonian Railway Goods Station at Aberdeen, amounting to about 60,000*l.*, has been placed with Messrs. Hugh Symington & Sons, Glasgow. The work does not include the alterations of the permanent way. The work should be completed by about the end of next year.

VARIETIES.

THE Board of Management of Dudley Hospital have decided to erect a new Eye Infirmary at a cost of 10,000*l.*

THE principal linings granted at Glasgow Dean of Guild Court last week were:—Cowlaire Co-operative Society, Ltd., 19 Angus Street, Springburn, to add to creamery in Kemp Street; J. & D. Hamilton, Ltd., 118 Queen Street, to erect a building to be used as offices at their works in Stirling Street and Port-Dundas Road; Western Shops Company, Hyndland, to erect shops and offices at the corner of Hyndland Road and York Drive.

At the quarterly meeting of the Abingdon Town Council a report was received from the Estates Committee recommending the expenditure of 1,100*l.* in altering and renovating the Municipal Buildings. The scheme comprises stripping and renewing the roof of the Council Chamber, renovating the interior of the room, adapting the old Grammar School room so as to make it suitable for a second dining-room, and repairing a cottage adjoining.

A LARGE scheme for the extension of the Rochdale Infirmary is under consideration. The proposal is to provide a two-storeyed ward to contain 24 beds, a new operating theatre, a steam laundry, an enlargement of the out-patients' department, a remodelling of the ophthalmic and x-rays departments, and the construction of an electric hoist. The extension is expected to cost about 16,000*l.* The local King Edward Memorial Fund for the extension of the Infirmary now amounts to 18,500*l.*

At the last meeting of the Broughty Ferry Dean of Guild Court plans, involving an expenditure of 5,900*l.*, were passed. The plans for alterations at St. Mary's Episcopal Church, at a cost of 1,600*l.*, were, with slight alterations, approved. The plans for a Masonic Hall in Brook Street, for the Broughty Castle Lodge, shows sitting accommodation for 240, with kitchen and other adjuncts for Masonic purposes. Work is shortly to be commenced on the erection of a new school at a cost of 10,000*l.*

THE Streets Committee of the Bolton Council have approved the following plans:—Mr. A. Maginnis, amended plan for six houses, Deane Church Lane; Messrs. James & Joseph Bolton, new streets and levels off Willows Lane; Mr. W. Parker, six houses, Anglia Grove; Messrs. J. Marsden & Sons, new boiler-house, Coe Street. A plan submitted by the Education Committee for a school in Wolfenden Street was disapproved, with a recommendation that such plans be reconsidered by the Education Committee, having regard to the fact that part of the site of the proposed school is tipped up land, also that in the opinion of this committee it would be advisable to set back the proposed building in order that a greater portion of the playground may be on the southerly side of the school. At a subsequent meeting the plans were approved, subject to the Borough Engineer being satisfied that the material of the ground proposed to be utilised for such school has become consolidated sufficiently for the purpose of building thereon.

TRADE NOTES.

OZONAIR, LTD., 96 Victoria Street, Westminster, S.W., have received an order to instal the Ozonair system of ventilation in the whole of the stations and tunnels of the Central London Railway. This must certainly be one of the most difficult and interesting ventilation schemes yet attempted, and it is a very high testimonial to this Company's system that it should have been selected. The method which will be adopted in the case of the Central London Railway will be to fix in each of the thirteen stations a complete plant. The total capacity of the thirteen plants will be about ninety million (90,000,000) cubic feet of pure clean air per day. There will be over two miles of ducts, and every point in the whole system has been carefully thought out to provide a perfect system of ventilation to add to the comfort of the public.

As in former years, the fire protection arrangements at the Bath and West and Southern Counties Agricultural Show, which opened at Cardiff on May 31, are in the hands of Messrs. Merryweather & Sons. Motor and horse-drawn engines are in readiness at their fire station on the ground, whilst hydrants, hose and fittings, as well as small portable appliances, are placed about the yard. A detachment of the Merryweather Brigade is on duty day and night. There is also on view a large exhibit of fire appliances and water supply apparatus for country houses, farms and estates, as well as a selection of the firm's patent spraying apparatus.

THE HYGIENIC ASPECTS OF ILLUMINATION AND RECENT PROGRESS IN ILLUMINATING ENGINEERING.

(Concluded from May 19.)

The Value of Measurements of Illumination.

BEFORE passing on to my concluding remarks, I should like to lay special stress on the value of actual measurements of illumination. Considerable progress has recently been made in the direction of producing simple and reliable instruments for this work, and I have here an apparatus which was recently used in a series of investigations of lighting conditions in schools and libraries in London recently undertaken by myself in conjunction with Mr. J. S. Dow, and presented before the Illuminating Engineering Society. I mention this merely to show that such measurements can now be made with comparative ease and security, and that they may be of considerable service in preserving a record of daylight and artificial conditions. One of the points brought out by these investigations, for example, was the great difference in the distribution of daylight and artificial light in the average interior. In some cases the daylight illumination at different parts of a room varies to a far greater extent than does artificial illumination; in some cases examined the range was as high as 30 to 1.

Reference has already been made to the enormous variations in daylight that may occur from day to day, or even from minute to minute. But until we have adequate actual records of measurement of such conditions, the scientific treatment of daylight illumination of interiors is very difficult. It is only when such records are prepared that we gain an indication of the right course to be pursued. The discussion on school lighting which I have just mentioned, for example, led some of the surveyors and medical officers of health present to lay stress on the importance of designing narrow class-rooms in which the distance from windows to the back of the room is not too great.

If this depth exceeds a certain value, the old rule that the window area should not be less than one-fifth of the floor area does not lead to satisfactory results; on this account Engelbracht, in Hanover, has suggested as preferable the formula

$$f = \frac{F}{5} \cdot \frac{t^2}{36}, \text{ where } f = \text{window area in square metres.}$$

$F = \text{floor;}$
 $t = \text{depth of classroom in metres.}$

However, even at present, it is probable that, with a proper study of the record of daylight conditions available, one could foretell the average intensity of illumination at different parts of the year, given plans of an interior and the knowledge where it is to be erected. If more trouble were taken in this respect beforehand it is possible that the number of failures, as regards daylight illumination in interiors, might be considerably reduced.

One particular matter, special instance of the value of precise tests of illumination, is afforded by ancient light cases. At present the difficulty of deciding whether an applicant has a *bona fide* claim that his illumination is materially affected is very considerable; it is safe to say that in many such cases the photometric measurement of illumination would be a very valuable weapon, and I understand that Mr. P. J. Waldram has recently found his modification of the Trotter photometer very serviceable in this connection.

As regards artificial illumination, it is equally clear that in order to prescribe what is the proper amount of illumination for different purposes, one must have available some means of measuring the illumination provided. For example, in suggesting the desirability of having at least 3 foot-candles as a reading illumination in schools and libraries, the Illuminating Engineering Society was assisted by having at their command a record of measurements in such interiors showing that this standard could actually be attained. In the same way, were it attempted to put forward tentative suggestions regarding the amount of illumination required for different trades and industries, actual measurements would be essential as a means of checking the results obtained.

In passing, one may trace an interesting analogy between the study of ventilation and conditions of air in rooms and illumination. In the case of ventilation and air-supply it was only when precise and simple methods of testing were devised that the importance of the matter could be brought home to the general public; in the same way when one can demonstrate that illumination is a measurable quantity, one has gone far towards impressing the public with the desirability of scientific treatment.

Hygienic Aspects of Factory Lighting.

Something has already been said regarding the importance of illumination in schools and colleges, and libraries. These two subjects recently formed the subject of special discussion at meetings of the Illuminating Engineering Society. In conclusion, a few words may be said about factory lighting and illumination for industrial purposes. This has also been a matter which has recently been brought prominently forward. It formed the subject of special comment in the Report of H.M. Inspector of Factories for 1909, from which a quotation has already been made. The report just issued by the Departmental Committee on Accidents has again made special reference to the subject, inadequate lighting being designated as "a very frequent cause of accident and of grave danger," and a general opinion, on the part of inspectors, employers, and employees being expressed that some further tentative recommendations on the subject were needed.

Public opinion is therefore rapidly becoming educated to the need for greater care in this respect, just as in the case of ventilation and pure air. Moreover, just as in the matter cited above, it may be expected that the statement of a precise standard of illumination for different purposes will be greatly facilitated in the future by better means of measuring illumination. While noting the need for consideration in this matter, the report proceeded: "Even before such a standard can be arrived at, it is recommended that inspectors should be given general statutory powers to require adequate lighting in all places where work is done, and in all places which are a source of danger by reason of artificial insufficient lighting."

A very similar expression of opinion was made at the important Congrès International des Maladies Professionnelles, held in Brussels last year, at which I was present as one of the delegates of the Illuminating Engineering Society. It was again recognised that good illumination is essential in all industrial operations, if only by reason of the strain thrown on operators by attempting to do their work in a poor light. But it was felt to be possibly even more important that dangerous machinery should be illuminated with sufficient intensity, and with properly placed lamps, so as to reduce the danger of accidents to a minimum.

I should like to make it clear that in laying stress on this matter I, for one, do not advocate any immediate stringent regulations at the moment, nor does anything of the kind appear to be foreshadowed in the reports referred to. It is necessary to proceed cautiously in the matter, and all that is desired at the present moment is for an interest to be taken by the authorities and due measures taken to collect the necessary data. It may be anticipated, therefore, that a moderate course, taken in accordance with this spirit, will be welcomed both by the workpeople and the employer. The impression appears to be very general and well-grounded that good illumination is desirable from the standpoint of both parties; employers will only be too glad to receive guidance on these matters, recognising that poor illumination, besides involving risk of accident to employees, leads to spoiled work and prejudicially affects quality and output of work.

Another aspect of the matter which is not without its appeal to employers is the close connection which may be presumed to exist, and which is already becoming recognised by insurance companies, between the number of accidents that occur and the conditions of illumination. Accidents are doubly inconvenient to employers, both on account of the stoppage of work and interference of routine, and because of the heavy compensation to the injured; they are, therefore, the more willing, when this is pointed out, to bear the relatively small expense needed in order to put the lighting in a thoroughly satisfactory condition.

THE British Minister at Panama has forwarded to the Board of Trade a translation of a law passed by the Panama National Assembly providing for public works to be carried out during 1911-12. The total cost is put at about 232,000L., and the works include the construction of public buildings, bridges, roads, wharves, and port improvements, sewer improvements, &c. The works will be given to local contractors in preference to others. Most of the bridges will be of concrete. His Majesty's Minister adds that catalogues and other information sent to him by British manufacturers in regard to the supply of material for any of the improvements will be handed to the contractor who undertakes that special work. The particulars of the works may be seen at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

THE
Architect and Contract Reporter.

FRIDAY, JUNE 9, 1911.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

** As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

WALES.—June 16.—The Cymmer Co-operative Society, Ltd., invite competitive designs for rebuilding business premises at Cymmer, Port Talbot. Deposit 5s. Premiums of 15l. and 5l. will be awarded to plans first and second in order of merit respectively. The Secretary, Co-operative Society, Cymmer, Port Talbot, Glamorgan.

WALES.—July 1.—Competitive designs are invited for chapel, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

YEovil.—The Corporation of Yeovil invite competitive designs as follows:—(1) For laying out a site of about 10 acres of land for the purpose of erecting houses for the working class, and (2) for houses to be erected thereon. In respect of each class of design premiums of 20*l.* and 10*l.* will be awarded. Particulars and conditions of site may be obtained upon deposit of 10*s.* 6*d.* from the Town Clerk, Yeovil.

CONTRACTS OPEN.

BARMOOR.—June 19.—For the whole work of erecting a residence at Barmoor, near Morpeth. Send names by June 19 to Mr. L. A. Loades, A.R.I.B.A., architect, Market Place, Morpeth.

BASINGSTOKE.—June 12.—For erection of a new secondary school for 160 girls. Deposit 5*l.* 5*s.* Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BEXHILL.—July 10.—For the erection of an infants' school. Send names and 2*l.* 2*s.* deposit by June 19 to Mr. B. Lawson, Secretary, Education Offices, Bexhill. (See advertisement.)

BINGLEY.—June 22.—For the following works in connection with alterations and additions to Bingley (Mornington Road) Council school, for the West Riding Education Committee, viz.:—Builder, joiner, slater, plumber, plasterer, and painter. The Education Architect, County Hall, Wakefield. Send 1*l.* deposit to the West Riding Treasurer, County Hall, Wakefield.

BRADFORD.—June 20.—For the mason's, joiner's, lumber's, plasterer's, slater's and painter's work in connection with extensions and additions to the medical officer's residence at the Union Workhouse, Horton Lane. Deposit 1*l.* 6*d.* Mr. Fred Holland, architect to the Board, 22 Manor Row, Bradford.

BURNLEY.—June 10.—For the work of various trades required in the conversion into shops of property in Garden Street. Send names to Mr. G. H. Pickles, M.I.C.E., borough engineer.

BURY.—June 15.—For execution of certain repairs required at Nos. 50, 52, and 54 Stanley Street, and Nos. 2 and 16 inclusive, Barlow Street. The Borough Engineer and Surveyor, Bury, Lancs.

CHELMSFORD.—June 10.—For erection of showrooms and offices, Duke Street, for the Gas Company. Send names and 1*l.* 2*s.* deposit by June 10 to Mr. F. Whitmore, architect and surveyor, 73 Duke Street, Chelmsford.

CHELTENHAM.—June 15.—For erection of a small block for annual instruction purposes at the Naunton Park Council schools. Messrs. Chatters & Smithson, architects, Cheltenham.

CHESTER.—June 19.—For alterations and additions to St. Thomas's Schools, Walpole Street. Rev. H. E. Burder, St. Oswald's Vicarage, Chester.

CHURWELL.—June 14.—For the joiners', plasterers', slaters', and plumbers' work required in the erection of warehouse and rolling rooms at Millshaw Leather Works, Churwell, Yorks. Mr. T. A. Buttery, L.R.I.B.A., architect, Queen Street, Morley, and 1 Basinghall Square, Leeds.

CLECKHEATON.—June 12.—For erection of boundary wall at Norwood Green Mission Church. Messrs. Howorth & Howorth, architects, &c., Old Bank Chambers, Cleckheaton.

COCKERMOUTH.—June 15.—For erection of barn and other buildings and for repairs at Ullock Mains Farm. Ullock Mains Farm (Mr. W. Jackson), and at Cockermonth Castle.

DENHOLME.—June 24.—The West Riding Education Committee invite whole or separate tenders for alterations, &c., Denholme District Council School, viz.: Builder, joiner, lumber, plasterer, and painter. The Education Architect, County Hall, Wakefield. Send 1*l.* deposit to the West Riding Treasurer, County Hall, Wakefield.

DORCHESTER.—June 22.—For building, in brickwork, a bridge over the River Hooke at Lower Kingcombe. Mr. F. T. Galtby, A.M.I.C.E., South Street, Dorchester.

DOVER.—June 21.—For the erection of No. 6 barrack blocks for non-commissioned officers and men at Fort Burghy, Dover, in the Eastern Command. Send names and 1*l.* deposit by June 12 to the Director of Barrack Construction, 80 Pall Mall, London, S.W. (See advertisement.)

ANDERSON, Poplar (accepted)	1,400	6	0

THE CRYSTAL PALACE.

LORD TENTERDEN's scheme for the purchase has been before the public for some months, and the interesting details are known to most of our readers, as from time to time we have urged its claims in the columns of this Journal. Under these circumstances the report just issued by the Alexandra Palace Trustees for the past twelve months will be of interest. A profit of nearly 2,000l. made on the year's working, with about 1,600l. spent out of revenue on improvement and furniture is not a bad record, and if this can be done in connection with the Alexandra Palace, much more could be done with the larger and more important undertaking at Sydenham. The life membership should appeal to intending subscribers.

THE Wortley (Sheffield) Rural District Council have decided to build a small-pox hospital costing over 2,000l., at Hallwood, near Grenoside. The building is also designed to serve as a sanatorium for consumptives when there are no cases of small-pox. The site has been leased from the Duke of Norfolk for 200 years.

A CHIMNEY FROM AN EARLY SIXTEENTH CENTURY HOUSE AT MASHAM, YORKSHIRE.

THE illustration shows a particularly fine example of a stone chimney from an old farm-house near the station at Masham, Yorkshire.

It is simple and good in outline, and gives indication of a cosy hearth inside. Directly following the Perpendicular period, its details are of quite a late Gothic tendency. The coping is distinctly Perpendicular in treatment, and is similar to one on the chimney-stack at Bolton Castle, a few miles further up the dale (Wensleydale). The weatherings and tumbling courses are nicely treated with good overhanging throatings.

The chimney is built in rather large courses of local limestone, with wide joints, and the whole is of a delightful grey-brown colour. The slates on the roofs are moor flags.

THE Incorporated Institute of British Decorators are offering a Travelling Studentship of 50l. for the encouragement of decorative painting. A silver medal and 3l. is also offered for the best essay on "The decorative use of colour."

THE new Opera House, at Blackpool, is approaching completion, and Messrs. Waring & Gillow, London, who are furnishing the interior, have done a considerable amount of work. The general contract was carried out from the designs of Messrs. Magnall & Littlewood, of Manchester, by Messrs. J. Parkinson & Sons.

AMONG the inventories of the estates lodged with the Sheriff-Clerk of Lanarkshire at Glasgow is that of Alexander Cullen, F.R.I.B.A., F.R.S.E., J.P., architect in Hamilton, Motherwell, and Glasgow, who resided at Millburn, Dalserf, and 3 Blythswood Square, Glasgow, 16,276l. 2s. 10d.

THE fourth congress of the International Musical Society, held at the University of London, terminated on Saturday last. Sir Alexander C. Mackenzie presided at the general meeting, and mentioned that the membership had grown from 756 in October, 1902, to 1,028 in May, 1911. A resolution was adopted recommending that certain rules be laid down for the use of architects planning church buildings, in order that the space required for the apparatus of church music might always be secured.

MR. F. W. P. RUTTER has purchased the fine example of Mr. Norman Shaw's domestic work known as "Dawpool," Cheshire, with thirty acres of ground. The residence was designed for the late Mr. T. H. Ismay, of the White Star Line.

A COMPETITION has been organised for schemes for improving the present appearance of the Central Pier at Blackpool. An essential feature of the project is the erection of a large pavilion on the centre portion. Premiums of 35l. and 15l. are offered, and designs must be sent in by the end of the month.

Two memorial wall-paintings, executed under the direction of Mr. A. O. Collard, F.R.I.B.A., were dedicated last week by the Bishop of London in the church of St. Peter, Hammersmith. The panels are by Mr. H. G. Murray, of Britannia Studio, Sloane Square, W. The one on the north shows "Our Lord's Charge to St. Peter," that on the south "Our Lord's Appearance to St. Mary Magdalene in the Garden."

WARRANT was granted to Moss' Empires, Ltd., at Edinburgh Dean of Guild Court last week for the work of reconstruction of the stage of the Edinburgh Empire Palace Theatre. The general structure of the stage will be similar to that of the old one, though light iron work will to some extent replace woodwork. There will be a new fireproof curtain of asbestos, with a water spray attachment instead of a sheet-iron screen as before. The dressing-rooms are to be re-arranged with the necessary exits. Over the stage will be fixed a special contrivance which would act as an exit for smoke in case of fire. Operations will be commenced immediately, and it is hoped to have the work completed by the end of July.

THE Managing Committee of the Heritors of the Parish of Dunfermline had under consideration last week a report from Sir R. Rowand Anderson, L.L.D., on the condition of the external stonework of the walls of the Abbey Church, which in several places are showing signs of decay. In his report the architect stated that the decay of the stone is only superficial, and that the structure is not in any way endangered, and, after detailing the measures that should be taken to arrest the process of decay, he recommended that a portion of the decayed work on the north-east and south sides of the church should be dealt with this summer. The committee adopted his recommendation, and gave the necessary instructions for having same carried out.

PERSPECTIVE SKETCH

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.
FROM A DRAWING BY "LE QUAYT."

NEW CATALOGUES.

THE British Thomson-Houston Co., Ltd., have prepared an illustrated 8-page leaflet giving some effective electric illumination devices for the Coronation. Most of them are made to look effective by day no less than by night through the use of flags and drapery. Letters and monograms serve, of course, their loyal purpose equally well whether seen by day or by artificial light. The firm have also issued through their Lamp and Wiring Supplies Department a list of surplus lamps offered at cheap prices.

Messrs. Thomas Skidmore & Son, Wolverhampton, recently sent us a leaflet illustrating a few of the twelve-corner-bent steel safes. Two types of their book safes are shown which are especially adapted to meet the demand for an inexpensive and thoroughly reliable fire-resisting office book safe, and which have never failed to preserve their contents from the ravages of the fiercest flames. The third type shown are the Quality 101 B. safes, which, as well as being guaranteed fire-resisting, are reliable thief-resisting safes for ordinary risk, and are warranted free from damp or any moisture, so that deeds or papers enclosed will not be in any way discoloured or defaced.

It has frequently been remarked that whereas a building owner (and sometimes his architect) is very often almost reckless in his efforts to render the carcase of his property fire-resisting he fails to take any steps at all to protect the windows, forgetting that fire may come from without no less than from within. This short-sighted policy is only equalled by the economy of the shipowner who imperils his vessels to save a bucketful of tar. One means of window protection is the provision of metal shutters. But better still, because it is never caught unprepared, is the use of wired glass. Messrs. Pilkington Bros., Ltd., St. Helens, recall in two leaflets a couple of instances of its effectiveness. Four years back a violent explosion occurred at Woolwich Arsenal, doing severe damage for miles around. Although the Plumstead electricity generating station is less than half a mile away the wired glass held together, and no damage was done to the valuable plant below. A more recent proof of the qualities of Messrs. Pilkington's glass was afforded a few weeks back at their own works when a large straw shed was burnt out, but a warehouse connected with it was unaffected, though the wired glass windows became red hot. This is consistent with the British Fire Prevention Committee's test, which reached 1,660 degrees Fahr. The glass is made in three varieties, wired cast, wired rolled, and wired polished. It is recommended by Messrs. Pilkington for roofs, windows and doors in workshops, mills, factories, car sheds, electric power stations, lift doors, sides of lifts, skylights, verandahs, motor garages, covered ways, &c.

Certainly one of the most interesting possibilities of present-day architecture lies around the use of surface materials like glazed terra-cotta for façades of town buildings. Many examples may already be seen in the streets both of London and the provinces; some of these are very good, some are indifferent, and some decidedly bad. The profession are not yet quite educated in the use of colour, and as a consequence some regrettable mistakes have been committed in the employment of the material. It is, however, obvious that they arise from lack of experience and over boldness in æsthetic experiment. The surest protection against their recurrence is for architects to learn by a careful scrutiny of what has been already carried out, what to do, and what not to do. In view of this (rather obvious) fact, special value attaches to an album issued by the Leeds Fireclay Co., Ltd., illustrating a number of buildings erected with their "Burmantofts Marmo" and "Vitreous" Terra Cotta. "Burmantofts Marmo" is a material having a "matt" surface. It is produced in a variety of colours in addition to white, and an examination of the photographs shows to what diverse buildings it has been successfully applied. It is unaffected by atmospheric conditions, and of great durability. The great advantages of hard fired terra cotta are well known to all architects; it does not disintegrate like many stones, and it has excellent fire-resisting qualities. The album furnishes excellent examples also of the Burmantofts "Vitreous" Terra Cotta, which has a washable surface, is made in many shades, and, like "Marmo," has great weather-resisting qualities. Among the excellent photographs of buildings in which Burmantofts "Marmo" was employed are Atlas Chambers and the Scottish Union Offices, Leeds (Messrs. Perkin & Bulmer, archi-

itects); Post Office House, Leeds (Messrs. G. D. Martin & Sydney D. Kitson, M.A., architects); new premises for the Michelin Tyre Co., Ltd., Chelsea (Mons. F. Espinasse, architect); Messrs. Wright's premises, Middlesbrough (Messrs. Moore & Archibald, architects); Messrs. Thornton & Co.'s premises, Leeds (Mr. Sydney D. Kitson, M.A., architect); and Messrs. Simpson's premises, Doncaster (Mr. F. Norman D. Masters, M.A., architect). The examples of "Vitreous Terra Cotta" include Lancaster House, Princess Street, Manchester (Mr. Harry S. Fairhurst, architect); the Manchester Central Fire Station (Messrs. Woodhouse, Willoughby & Langham, architects); Messrs. Hepworth's premises, Leeds (Mr. Percy Robinson, architect); the new Y.M.C.A. building in Manchester (Messrs. Woodhouse, Corbett & Dean, architects); and business premises in Dale Street, Manchester (Mr. A. Argile, Manchester). In addition to the buildings illustrated, "Burmantofts Marmo" has been used for the construction of the *Daily Telegraph* building at Brighton, Messrs. Joseph & Smithem being the architects; and the new premises for Messrs J. Lyons & Co. in Fleet Street (Messrs. Brown & Barrow, architects). Mention must be made of the building for the Armourers' Company in Copthall Court and Drapers' Gardens (Mr. Alexander Graham, architect), the elevations being entirely carried out in "Burmantofts Marmo," and the booking hall at Cannon Street District Railway Station. The elevations of all the tube stations for the Underground Electric Railway are executed in Burmantofts "Sang de Bœuf" glazed terra cotta.

An unusually compact catalogue has been issued by Messrs. John Gibbs & Son, Duke Street, Liverpool, illustrating a selection of their many mechanical ventilation specialities. They are approved makers of patent air-propelling and ventilating fans, of "Peerless" mechanical heaters, dust collecting and separating plant; blowers and exhaust fans for gas-producing plant, and other contrivances for human comfort and safety. The fans have been designed for use in drying rooms, cotton factories, dye works, printing works, ships, hotels, theatres, assembly rooms, and all places where it is difficult to carry off vitiated air by natural ventilation. Messrs Gibbs & Son are so confident of the all-round superiority of their patent fans that they are willing to send one of the stock size for a fortnight's comparison with those by any other maker. Their patent safety interlocking double pole quick-break regulating switch provides at a low cost a means of controlling the fans with perfect safety, it being impossible to turn on the power without all the resistance being in circuit. Included in the catalogue are numerous illustrations of installations of different kinds carried out by the firm; tables and reports giving cold facts as to their efficiency; and other data interesting to all connected with this great subject.

Mr. Alexander G. Lee, 14 John Street, Bedford Row, W.C., has forwarded to us a small pamphlet dealing with his "All Time" Asphalted Sheet Lead, together with a sample of it. This damp course consists of a continuous single sheet of lead (not a series of foils laid together) between two layers of specially prepared fibrous asphalted sheeting. It is nearly twenty years since Mr. Lee commenced to advocate the damp-resisting qualities of lead as a damp-course; and in the interval the profession generally have become so thoroughly converted that there is no need to go into them here. Four qualities are made by Mr. Lee, viz. A, B, C, and D. All are similar in appearance, the exception being a thicker quality of lead foil in the B, C, and D qualities, and the insertion of oiled paper bands along the edges, facilitating their being pulled apart to form a water-tight lap-joint, when used on large, flat surfaces or for vertical work. "A" quality is stocked ready for delivery in all wall widths, viz. 4½, 9, 14, 18, 22½, 27, 31½, 36, and 39 inches, in rolls 66 feet long without a joint. The other qualities are stocked 39 inches wide by 49 feet long without a joint, but can be had in all widths to special order. "A" quality 4½ in. wide works out at 1¼d. per foot run; "D" quality at 7d. per foot super.

Messrs. Richard Johnson, Clapham & Morris, Manchester, have issued a well got up new catalogue relating to some of the various kinds of wire guards and woven wire which they manufacture. This catalogue is specially got out for the use of works, as it shows the best methods of guarding machinery, &c. A portion of it is also devoted to wirework suitable for lift and window guards, such as might be used by architects. The firm are prepared to submit special designs with quotations upon receipt of a rough sketch giving

measurements of the parts for which the guards are required; and, if desired, send skilled workmen to erect and fix. The range covered in the catalogue is a very wide one, for it includes letter boxes and revolving screens, grilles, and drying-racks.

Messrs. Robert Jenkins & Co., Rotherham, have issued a new list of the "Ivanhoe" patent welded steel sectional boiler. At a recent test with a No. 3 size boiler the number of B.T.U.'s per hour was 702,250 with the damper full open, and the B.T.U.'s per square foot heating surface for the same time was 9,438. These figures are proof of high efficiency. Messrs. Jenkins & Co. vigorously advocate the use of steel boilers as against those of cast iron.

THE STREET OF TO-DAY AND TO-MORROW.*

The Street of Yesterday.

IN considering the street of to-day and to-morrow it might not be amiss to first consider the street of yesterday. Roads there have always been since prehistoric times, for man as a nomadic animal always desired to reach from one point to another as readily as possible. First, the beating of a track through the primeval forest, or over the moor, was possibly the first suggestion of what is now the modern street. Continuous traffic, the carrying of heavy loads, &c., incited the idea of a permanent highway, first composed of rough logs or stone, and then developing into a thought-out formation. The old civilisations of India, Egypt, Greece and Italy had their fine main-roads over vast stretches of country, and the Romans have left a legacy behind them as the greatest of road-makers of the ancient world. To carry their roads the most direct route, they not only overcame great engineering difficulties by piercing mountains and throwing bold arches over rivers, but on a scientific basis they laid the foundation of the art of road-making. Roads came before cities, and not until the few congregated houses had developed into the city, by long stages and through many eras, did the street as we know it arise. In the cities of ancient and mediæval times the street plan was rarely treated with artistic regard, large outlook, or firm grasp, except perhaps in the instance of Piræus, which, as the seaport of Athens, was laid out by Athenian engineers. Blind, tortuous, and narrow streets were the rule in them, relieved now and then by splendid temple or palace and noble squares. It has remained for modern times with great traffic and building considerations to grapple with, to insist on street reforms. A sense of the civic responsibility has been aroused by the unseemly conditions prevailing, and out of this the passing of the Town Planning Act of 1909 in our own country may be considered as the forerunner of further legislation to secure to the municipality and the State the right of control in matters which have previously either been left to chance or else allowed to fall into the hands of those whose sole interest is land and property exploitation.

The streets of our already-built towns and cities exist, and any quarrel with their widths, beginnings, terminations, or general lay-out can at present only be remedied by expensive and cumbersome methods. In the suburbs and parts yet unbuilt, it is to be hoped that the scientific principles of modern town-planning will prevail. In both cases, the street must be viewed, first, from the point of traffic consideration; secondly, building considerations; and thirdly, aesthetic considerations.

Traffic Considerations.

Paving.—The first consideration—viz., traffic—precipitates us into questions of paving as primary factors. Good and suitable paving is essential to the ideal street. The standard type of old, the cobble-stone, has happily passed away, or, at any rate, where it does exist it may be generally taken that its retention is mainly affected. From that we have passed on to many developments in road making, varying widely according to districts, traffic, &c. Economic and hygienic considerations come most into play, and however largely traffic may develop in the future—possibly entirely of the nature of motors and self-propelled vehicles—these must remain as essentials.

A committee of the borough councils of London, reporting this last March, showed that the streets of London are paved with thirteen different kinds of material. Most of these are laid on a foundation of concrete, and include: (1) Jarrah and karri wood from Australia; (2) deal and fir from Norway; (3) beech, larch, and red gum from California; (4)

rock asphalt from Eastern France and Northern Italy; (5) basalt lava from Germany; (6) tarred slag-macadam from British ironworks; (7) lithophalt blocks and flints, &c.

London has over 2,000 miles of streets, and all manner of varieties of stone, wood, asphalt, &c.—even indiarubber—have been and are used. We have travelled very far since the days of the old macadam paving, and the only portions of that now left in the City are a small portion of the Victoria Embankment and the Guildhall yard. It has been stated that London streets have cost over 3,000,000*l.* to make them as they are to-day, and every year over 400,000*l.* is spent in keeping them in repair. There is therefore some degree of truth in the legend that the streets of London are "paved with gold."

The general consensus of opinion is that the motor traffic is injurious to macadamised roads, but that it does not materially affect the surface of asphalted streets. And this leads one to the opinion that asphalt is the road material of the future. It is general in the great capitals of the Continent, and in America, since first being laid in Washington, in 1878, it has never looked back in the States. It is not to be asserted that asphalt is always preferable. Not only may a better pavement be yet discovered, but there are places where wood, granite, brick, or macadam may be chosen over asphalt without a moment's hesitation. The point is that good paving is a *sine qua non* of the ideal street, and it is foolish to talk of good planning, vistas, street adornments, &c., if the street itself is badly or poorly paved.

Repairs and Cleansing.—Next to the paving surface the great essential of the good street is its repair and cleanliness. All the considerations of traffic hinge upon these three fundamentals. The constant dislocations of traffic in our English streets consequent upon the constant sewerage, gas, water, electric light, &c., operations, as well as the repair necessary from use, are one of the great problems which beset the municipal engineer. Beyond the contemporary carrying out, as far as possible, of this work, little can be done except by the construction of special subways for all pipes and cables in main thoroughfares, which is now done in very many instances. The immense benefits of a regular subway system in our cities are evident when one thinks that by this means it would be possible to introduce into buildings installations for vacuum cleaning, pneumatic letter-delivery, and very many various electrical and mechanical contrivances.

The expeditious and economical cleansing of our thoroughfares is one to which much thought has been given in recent years. Originally each resident swept his portion of the street, that portion which lay in front of his premises, and up to 1853 this was actually the custom in Paris—the *beau-ideal* of all cities. This system has now been superseded except in the case of snow-clearing on footpaths, and the uniform municipal service has been found more popular and efficient, quite apart from the impracticability of the old primitive method in our present-day civilisation. As a man is so often judged by the condition of his linen, a city may be equally judged by the cleanliness of its streets.

Traffic Problems.—These two brief references to paving and street cleansing lead up to the primary considerations of the street as a traffic artery. This is a subject which has come to the front enormously in recent years, owing largely to the great increase of self-propelled vehicles. At the end of 1910 there were no less than 218,680 vehicles of this description registered for use in the United Kingdom. Their introduction has been revolutionary, and, besides the effect they produce on the road surface, their effect on traffic conditions is one warranting deep inquiry. The chaos in the streets caused by fast motor-traffic and slow horse-traffic is only likely to remedy itself by the elimination of horse vehicles altogether. At first it might be done by insisting upon the transmission through main thoroughfares of the horse vehicles at the least busy hours of the day. The movement towards the better regulation of goods traffic is a step in the right direction, and should lead to the abolition of such a state of affairs as now exists on the south-east side of Piccadilly Circus. Too much praise cannot be given to the admirable supervision of the traffic by the police, but it is evident that two classes of vehicles, one driven fast and the other slow, and permission being allowed for the former to overtake the latter, will be sufficient to block—as it does—any crowded thoroughfare. Coupled with this we find all kinds of vans and carts being loaded and unloaded even at times of the maximum flow of traffic. This is a condition of affairs which also prevents the traffic from cross-streets either being allowed to cross over a main thoroughfare or to join the main stream, and incidentally blocks the pedestrian traffic on the footpath. This is a time of transition in the method of locomotion, and with greater organisation the problem will

* A paper read before the Institution of Municipal Engineers, London, May 31, by Mr. Guy Wilfrid Hayler, M.Inst.Mun.E., M.R.San.I.

likely be solved. A system of recognised stopping-places for omnibuses, together with the abolition of all obstacles in the street area likely to impede traffic, would be welcome reforms.

(To be continued.)

VARIETIES.

THE Gillingham Town Council have adopted a plan submitted by Mr. J. J. Robson for a new pier at Commodore Hard 800 feet in length, and estimated to cost 8,645*l*.

THE Guildford Town Council have decided to erect twenty workmen's cottages in place of the fifty recommended by the Housing Committee.

THE tender, amounting to 44,334*l*., of Messrs. G. E. Wallis & Sons, Ltd., Maidstone, for the erection of County Offices at Maidstone, has been accepted by the County Council in place of the lowest tender which was at first accepted.

THE Wolverhampton Borough Education Committee are going to apply for a loan of 915*l*., the cost of the site of a proposed school in Whitmore Reans, for 400 mixed scholars and 300 infants.

MR. W. H. MOON, in consequence of the dissolution of partnership between Mr. John Abbot and himself, has opened an office at 4 Parliament Street, Hull, where he will continue to practice as an architect and surveyor.

MR. TEMPLE MOORE, architect, has been instructed to prepare plans of a new pulpit and reading desk for the Abbey Church at Hexham, and also the filling with painted panels of two bays in the choir triforia. The woodwork throughout will be by Messrs. Holloway Bros., London.

TRADE NOTES.

A LARGE clock has just been erected in the parish church of Elland, Yorkshire, which shows time on four 7 feet illuminated dials, strikes the hours and chimes the Westminster quarters. It has been erected by Messrs. John Smith & Sons, of Derby, generally to the designs of the late Lord Grimthorpe, and the makers guarantee it to maintain perfectly accurate time. They made a similar clock for Huddersfield parish church a little time since, also one for Sowerby Church in the same neighbourhood.

AMONG the recent contracts of Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester, are the following:—The new Secondary Schools, Peterborough, are being ventilated by means of Shorland's patent Exhaust Roof and Special Inlet Ventilators; the New Infirmary, Cardiff, is being supplied with Shorland's double-fronted patent Manchester Stoves with descending smoke flues and patent Manchester Grates; the Plashet Schools, Upton Park, London, and the Teviothead Schools, N.B., have been supplied with their patent Warm-Air Manchester Stoves.

An exhibition has just been held at Winchester House, Old Broad Street, under the title of "The City of London Business Exhibition." The principal exhibitors were Roneo, Ltd., of 26 Holborn Viaduct, E.C., who were showing a wide range of office requirements, which included samples of their steel cabinets; the drawers are also made of steel, and the rollers are on ball bearings. The result is perfectly satisfactory, the drawers opening and shutting with absolute ease. They are clean, and are, of course, proof against rats and mice. An important point is that, being constructed of steel, there is no shrinkage, and they are almost dust-proof in consequence. Several novelties were shown by other firms, a machine for punching a cheque for the prevention of forgery, several adding machines, and a stamp-affixing and checking machine.

An extraordinary general meeting of Joseph Robinson & Co., Carlisle, has been called for June 9 to consider the expediency of effecting an amalgamation between that company and John Howe & Co. and the Long Meg Plaster Company, the new company to be called the Carlisle Plaster and Cement Company, and to take over the various concerns as from January 1 last. The capital of the new company, including Debentures, will be 127,320*l*., consisting of 60,000 Ordinary and 10,000 Five per Cent. Preference shares of 1*l*. each, 50,000 Four and a-Half per Cent. First Debenture stock, 3,000*l*. Five per Cent. First Second Debentures, and 4,320*l*. Five per Cent. Second Debentures. The whole of the assets of the three firms, with the exception of stocks in hand, book debts, and cash balances, will be taken over on the following terms:—Joseph Robinson & Co., Ltd., will receive 60,500*l*.; John Howe & Co., Ltd., will receive 40,000*l*.; and the Long Meg Plaster Company will receive 8,532*l*. Nominees of the three undertakings will subscribe for the remaining shares and Debentures in cash.

PICTUREDROME, KENSINGTON, LIVERPOOL.
Messrs. CAMPBELL & FAIRHURST, architects, Southport. Messrs. J. B. JOHNSON & Co., contractors, Liverpool.

PICTUREDROME, SANKEY STREET, WARRINGTON.
Messrs. CAMPBELL & FAIRHURST, architects, Southport. Messrs. J. B. JOHNSON & Co., contractors, Liverpool.

WE illustrate herewith the front elevations of two recently-opened picturedromes as examples of a surface treatment which has proved particularly suitable for this class of work. In both cases the exterior was coated with "Zingessol"—the perfected water paint—as soon as the plasterers had left the job. "Zingessol" was also used with success for the interiors. This paint is, of course, manufactured by Orr's Zinc White, Ltd., at Widnes, Lancs. The work was carried out by Messrs. J. B. Johnson & Co., slaters, plasterers, and concretors, 108 Crown Street, Liverpool.

THE Plymouth Corporation Works Committee have approved plans and estimates submitted by the borough surveyor for the reconstruction of subsidiary sewers and repaving of streets in district No. 11, and comprising an area of 42 acres. The estimated cost of the work was 11,552*l*.

THE Ayr Dean of Guild Court have passed plans for the reconstruction of the Academy School at an estimated cost of 12,500*l*. at their fortnightly meeting on June 2. The architect is Mr. Jas. A. Morris, F.R.I.B.A., Wellington Chambers, Ayr.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

TENDERS, ETC.

** As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000l. A first prize of 800l., and a second prize of 320l. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

LOWESTOFT.—July 31.—The education committee invite designs for an elementary school at Roman Hill for 500 boys. Premiums of 20, 10, and 5 guineas. Send application for particulars and 10s. 6d. deposit by June 24 to Mr. R. Beattie Nicholson, Town Clerk, Town Hall, Lowestoft.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

WALES.—July 1.—Competitive designs are invited for chapel, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

YORK.—June 20.—For the restoration of the nave roof of St. Cuthbert's Church. Mr. John Howard, F.A.I., 3 New Street, York.

TRADE NOTES.

THE Brilliant Sign Co. (1907), Ltd., inform us that they have executed nearly the whole of the day and night signs for the Festival of Empire, Crystal Palace. They have one in hand for the National Gas Engine Co. measuring 50 feet long by 3 feet 6 inches deep—one of the largest day and night signs in existence. It will be fixed on the top of the power house, so as to be readable all over the grounds. The Brilliant Sign Co. have also large contracts in hand for illuminated signs for the Great Northern Railway, the Great Western Railway, the Great Central Railway, the Metropolitan and District Railways. In fact, their illuminated sign department has grown to such an extent that in the extension of the factory now in progress they are arranging for this department to be increased for another thirty hands.

THE British Improved Construction Co., 47 Victoria Street, W., have acquired a site on the south side of Inverkeithing Bay, N.B., for extensive works for the manufacture of concrete piping and reinforced concrete. The company, who will employ at least 300 men, intend to make Inverkeithing their headquarters for Scotland.

INTERIOR FROM HOUSE AT GIDEA PARK.—Messrs. FORBES & TATE, Architects.

AN ARTISTIC CORONATION GIFT.

THE authorities of the School of Art Woodcarving, South Kensington, were happily inspired when they decided to present to Their Majesties a cabinet or Armoire on the occasion of their Coronation.

The Armoire (which was sent this week to Buckingham Palace) was designed by the headmaster and carved by the students of the school.

The wood used is French walnut, and the design is carried out on the lines of the Transitional Gothic of the "Francois Premier" period. The details are modern, but treated somewhat severely in accordance with the style.

The cabinet stands 4 feet 6 inches high and is 2 feet 9 inches wide, the upper portion forming a cupboard with an opening of 2 feet by 1 foot 4½ inches by 1 foot 7½ inches high.

Beneath the centre of the cupboard is a drawer 8 inches by 5 inches by 15 inches deep. The Royal monogram is introduced in the carved panel on the front.

The door, which forms the centre panel, is richly carved with the Royal Arms, the rose, the thistle, and the shamrock. On either side and at the sides of the cupboard are six panels ornamented with the linenfold pattern, with a very delicate line of carving down the centre of each.

The three front panels are separated by small columns richly tooled and finished off with finials and pendants.

The cupboard rests on three arches and bands of pierced tracery. These arches are supported by small shafts with caps and bases. They are octagonal in section and covered with delicately-tooled ornament.

The whole is surmounted by a cornice consisting of a convex moulding pierced and carved with roses and foliage and a frieze on which is carved an inscribed garter. At the two angles are winged cherubs' heads carved out of the angle posts.

THE LIVERPOOL STREET EXTENSION OF THE CENTRAL LONDON RAILWAY.

THE Society of Engineers held their second vacation visit of the present session on June 8, when the works in progress in connection with the extension of the Central London Railway from the Bank Station to Liverpool Street were inspected. The work of driving the tunnels is being carried out from a shaft in Bishopsgate, near Acorn Street, and will be continued up to the junction with the Company's existing sidings at the Bank.

The small running tunnels are 12 feet 5 inches internal diameter, each ring being 20 inches wide with 4-inch flanges, and are made up of four radial-jointed cast-iron segments, two top segments, and a key whose sides taper slightly in the reverse direction to the keystone of an arch; this admits of ease in erection. The joints between the flanges of adjacent rings and segments are formed of creosoted wood

packings, and are bolted together in such a way that the horizontal joints of one ring break joint with its neighbours. The weight of each ring is 33.4 cwt. Under ordinary conditions nine rings or five lineal yards of tunnel are built every twenty-four hours. The shield by which these tunnels are driven consists of a cast-iron or steel cutting edge, followed by a skin of ¾-inch steel plates, butt jointed, which are kept to the cylindrical form by means of suitable strengthened segments and girders, well bolted and riveted together. Forward movement is obtained by means of 7-inch diameter hydraulic rams, eight in number, disposed round the inside of the skin and arranged so that the tongues press against the iron lining already built. These rams are controlled individually or collectively by a set of valves, so that by a suitable combination the direction of the shield may be guided. The maximum pressure available is 2,000 lb. per square inch, which gives a total maximum push of 275 tons.

In the case of the 21 feet 2½ inch internal diameter station tunnel, the shield is on the same principle as that just described, the method of procedure in construction being the same. There are twenty-two rams of 7½ inch diameter, each capable of exerting a total force of forty tons as a maximum, and in place of hand erection of the cast-iron segments hydraulic erectors are used. The rings of this tunnel are 18 inches wide, with 6½ inch flanges, and consist of ten radial segments, two top segments, and a key. The horizontal joints are machined true to radius, but the vertical joints are made with creosoted wood packings. The weight of each ring is 4½ tons, and the anticipated progress is about five rings or 2½ lineal yards per day of twenty-four hours.

The plant at the site of the working shaft consists of two three-ton cranes for dealing with materials to and from the tunnels, and the following compressors for supplying compressed air to the tunnels and for operating the pneumatic-hydraulic pumps and grouting pans:—One vertical compressor with one cylinder 19 inch diameter, 8-inch stroke, and three Reavels compressors each having eight cylinders, 12 inch diameter and 6-inch stroke. One of these latter works against a pressure of 15 lb. per square inch, the other two are two-stage machines, and work against a pressure of 60 lb. per square inch. There is also a compressor by Ingersoll, measuring 18 inches by 18½ inches, and an hydraulic intensifier converting a pressure of 750 lb. per square inch to one of one ton per square inch.

The contractors for the work are Messrs. John Mowlem & Co., and the engineers to the Central London Railway Co. are Messrs. Mott & Hay, of Westminster, for whom Mr. H. J. Deane acts as resident engineer.

MR. CHARLES WILLIAM JUDSON, of Ripon, left 2,500l. to his trustees for the purchase of a site and for the erection of almshouses.

THE STREET OF TO-DAY AND TO-MORROW.

(Continued from last week.)

ONE of the most important developments in considering the street of to-day seems to have sprung up within comparatively recent years. This is the idea that the street is a fitting place for the erection of all the various useful accessories of our modern life. Of course, it is mainly due to the difficulty of finding any other handy place. But it is not easy to see how we can expect good traffic facilities in our streets when we continue to allow them to be the dumping-ground of all sorts of posts, poles, pillars, kiosks, refuges, boxes, &c.. For instance, in narrow thoroughfares it would surely be better to dispense with massive electric-light standards and connect the cables by suspension wires to rosettes on the houses. This is frequently done with success in the case of electric tramways in narrow streets, an example being Dale Street, Liverpool. Local authorities have not power to regulate the erection of telegraph and telephone poles by the authority of the Postmaster-General, and this leads to their being put up very often in main roads, when subsidiary streets would have done equally as well. Poles of all descriptions, fire-alarms, ambulance sheds, ladders, fire-escapes, &c., should be grouped together, either in a wide, open space, or else provision should be made for them in special buildings. Hydrants, street-orderly boxes, and sand boxes might easily be sunk below the roadway, inside the street area. The elimination of these various obstacles to traffic from the main thoroughfares of London would greatly assist in solving traffic difficulties.

At the present time we find it absolutely necessary to have refuges for foot-passengers in the centre of the streets. It is argued that they separate the two streams of traffic. This is probably true, but they do not facilitate easy locomotion. If underground difficulties in the shape of pipes and sewers render a subway under the road impracticable, they must, of course, be tolerated, but it would surely be better to dispense with them wherever possible, because to be of much service they are obliged to be of a good size. Where they are unavoidable, they are better if designed as islands, rather than as a long strip, thus allowing of cross-traffic to and from streets on the opposite side of the roads. If they have a good high kerb above the street, and are guarded by iron posts, they will be perfect places of safety, but some, in London, are raised scarcely any height above the road surface, others not at all, many being also unguarded by posts. The filth of the streets in wet weather, the danger of vehicles mounting the kerb, &c., render them more like places of danger than safety. The creation of underground conveniences entered from the centre of busy streets also seems indefensible. They are necessarily costly constructions, and to use them one has to run the unnecessary risk of being knocked down by a vehicle, and on emerging into the busy street again the danger is still greater. The convenience in Fleet Street at the Law Courts is an instance. No country has taken up the construction of the underground convenience so widely as England; others have worked upon different lines. Germany has gone in for a system of chalets, often very picturesquely designed, a remarkably good one being in the Ludwigskirche Platz in Charlottenburg. These provide conveniences for both sexes, and might be usefully copied in London. A still further development would be to a wider municipal service, giving facilities for baths, &c., and answering the requirements of an inquiry office, &c. This is, of course, by the way, but the question of the underground convenience and the curtailment of the street area which it causes is certainly a factor in the traffic problem. The street of the future will undoubtedly be one which offers throughout its traffic area—both vehicular and pedestrian—the least obstacle to those using it.

Lighting.—The question of street lighting cannot be ignored here. From the individual lantern to the public and permanent illumination by oil, gas, then electricity and incandescent gas-burners, the record is one of progress throughout. There is still, however, scope for much more to be done. The traffic of our streets by night makes good lighting imperative. In driving motor vehicles, every nerve is strained, and the optic nerve is probably at the highest tension. The streets of London show all kinds and methods of lighting. Many streets are in semi-darkness, others have glaring lamps and the intervening space seems abnormally dark. A common basis of lighting the streets will undoubtedly be the keynote of the future. The improvement in Westminster lighting is commendable, but we still have the spectacle of Edgware Road lighted on the Paddington side by gas and on

the Marylebone side by electricity. There is no doubt London streets could be much better and more economically lighted by more co-operation among the authorities concerned; and as good lighting is profitable to tradesmen, the value of property in the present dingy streets would appreciate enormously, with a general benefit all round. It might be recalled that when the question of better lighting the Unter den Linden in Berlin arose some years ago the choice lay between improved gas and expensive electricity. The authorities decided on electricity because the street was a popular promenade. It is this view, that the street is not merely an avenue of communication, but, in leading thoroughfares at least, something of a "Rotten Row" to the great masses of the population, that should lead one to regard all that concerns it as having an æsthetic side as well as a purely utilitarian one.

Building Considerations.

Architecture.—The next consideration, street building, is perhaps wider in scope than the first, and has all the vexed questions of architecture, by-laws, and building legislation encompassing it. First of all might be mentioned uniformity of design in the architecture of our streets. However much we may be entranced by the glorious medley of our picturesque old English towns, it would be idle to imagine that they can be taken as a model for present-day civic conditions. We are not laying out new cities, like the Americans, and in our building works we must make the transition from the old to the new weave as happily as we can.

In the aspect of any city its architecture is always its dominating feature, and gives the character of its citizens by the houses they live in and the buildings they erect for either their work or their pleasure. In our modern cities we see the vast commercial spirit of the times reflected in its buildings—huge manufactories on the one hand and great areas of mean streets on the other. The solution of many great problems lies with them. The municipality can give the impetus by the erection of noble civic buildings, and repeat history as in Florence, when the Duomo, the Palace of the Signoria, and the great churches of Santa Croce and Santa Maria Novella sprung into being almost in the same year, and that proud and ambitious city awakened its citizens to new life and aspirations.

The tendency of the time towards garden suburbs is decidedly good, but the progress towards making the business quarters of the city mere "canyons" of high buildings is not very inviting. The tall building may be the symbol of commercial daring, as one writer put it, but considerations of air, light, fire, &c., give them more than an individual importance. In America, there being no restrictions to ancient lights, skyscrapers have attained extraordinary dimensions, but it is interesting to know that even there the governing authorities have set limits of upward expansion, varying in different parts of the city, according to the widths of the streets and the nature of the district. This has already been done in Washington, Boston, and recently in Chicago.

It seems absolutely illogical to allow great business houses, factories, workshops, &c., to crowd together on narrow streets, because, not being dwelling-places, they are not required to have the air-space the by-laws stipulate in these cases. While continuity in the frontage line of the thoroughfare should be allowed, there should be provision made for air-space in the front and rear of such premises in proportion to the height.

Professor Beresford Pite, speaking on street architecture, summed up the situation very pointedly by saying: "A whole-hearted acceptance of the doctrine of a frank modernism of design and construction in business premises by architects is sufficient requirement to make of them for the establishment and growth in our midst of healthy street-architecture, expressing the movement of the age in its requirements, and reflecting the intellectual attitude of trained and artistic minds applied to a commercial problem in building. The profitless and stupid antipathy that is supposed to exist between commercial requirements and artistic character should thus, at all events in architecture, cease to be professed, and, having reformed the attitude of art to business life, we can the more sincerely and successfully hope and attempt the resuscitation—for it once existed in pure and noble beauty—of living art in the commercial world."

Frontage Lines.—Coming more into detail with the building considerations of the street, one of the most important points is the question of frontage lines, which in so many of our streets have been permitted to entirely spoil its aspect. There is much to be said for the rigid restrictions which are enforced in this regard on the Continent. There may be individual hardship in some cases, but it has ensured the creation and maintenance of great and noble thoroughfares.

As we have passed the stage when four plain walls and a roof passed for a building, let us hope we are on the way to an era when the erection or alteration of a building will be impossible without strict harmony with its neighbours and its general surroundings. A particularly objectionable proceeding which is frequently observed is the setting back of buildings in the centre of a block and the bringing forward of the two end-buildings. Even if gardens are provided, the street line is spoiled, and is later on still further "uglified" by shops brought forward to the boundary line. Granting the very great importance of light and air in our streets, it should be possible to insist on greater regard being paid to the frontage line of the street without sacrificing these.

Building Legislation.—Very many of the problems of street building have been created by by-laws of an insufficient character and allowing buildings to be judged too much on their merits. There are, of course, local conditions existing everywhere, but they can be too local, and they have led to much abuse and general detriment of the locality in many cases. At the same time, by-laws should be so compiled that the unfairness of enforcing restrictions which might properly apply for crowded property would be avoided in the case of estates laid out on modern lines with houses erected at four to twelve in the acre. The monotony of the streets of our great industrial towns has been to a great extent due to the by-laws being interpreted in this way in the past. It is the crowded property which produces the slum, and if relaxed by-laws are allowed in garden suburbs a rigid insistence on the maintenance of open space should be upheld, as it is so soon found that all sorts of erections make their appearance on this class of property. A great deal has been said for a consolidating Public Health Act, and it would undoubtedly be a great gain to have building by-laws, regulations, and Acts put upon a similar footing, and revised periodically, especially in view of the rapid progress made by the modern methods of construction since they have come into vogue. This would at once set up a civic standard of building and make the street of to-morrow a much better place than the street of to-day. For building legislation is different from much other legislation, inasmuch as it can prevent violation as well as punish the offender.

Aesthetic Considerations.

Art in the Street.—The last consideration of the street from an æsthetic standpoint is one which deserves more attention than it usually obtains. We are proud to consider ourselves a practical people, and, unfortunately, ideas of beauty are not bound up with this. Anglo-Saxons are too prone to consider Art as a luxury, but it can be shown that "to clothe in an artistic form that which civilisation has made useful in the public life" is in the end financially profitable.

But, apart from that, as the ideal street requires to be well planned and well constructed, it is the last human touch, that of harmony and beauty, which will give it character—as essential in the material make-up as in the individual. The example of the beautiful Continental cities is continually alluded to, and, while their main principles may be possible of adaptation, it must not be overlooked that we can only evolve on our own lines. Other countries with other customs mean other ideas. The Latin peoples view the street as their larger home. Climate makes this possible with them, but for only a small fraction of the year would it be possible with us. A writer has said of the Parisian: "He comes downstairs to the street; he descends to his thoroughfare as the millionaire expects to descend to his breakfast-room or his study. Whatever the gloom of the house, his street, catering to his need of colour, variety, beauty and movement, helps him to feel good." If we view the city as Aristotle viewed it—a place "where men live a common life for a noble end"—we cannot but agree that the city can well afford to yield to so innocent and joyous a need.

Trees.—In any consideration of the æsthetic needs of the street, the natural beauty of trees, flowers, and grass must come first. The place of the tree in the street is only slowly being conceded in England. At present it is carried out in a most haphazard fashion, seemingly on the principle that any vacant space calls for a tree. This is surely a wrong way to proceed, as the fine air of spaciousness is constantly marred by uncalled-for clusters of trees, and while wide open space may be spoiled in this way, the planting of trees in thoroughfares of a less width than 80 ft. is, again, likely to be unsuccessful. But much depends on a regular system in street tree-planting, and due consideration being given to the main points which arise, consideration of individual merits of the case. Paris has over 100,000 street trees, and spends

over 12,000*l.* annually on their care and cultivation. But Paris has wide streets and boulevards, whereas our English towns have generally narrow streets, where if the light was obscured by trees it would be extremely prejudicial. But we have very many thoroughfares which would well admit of tree planting, even business thoroughfares, and in London we may well look forward to realising in the not distant future the "green girdle," at least round the Metropolis, so eloquently advocated by Mr. D. B. Niven. The trees planted in Paris are principally plane trees, sycamores, and chestnuts, while acacia has been introduced and thrives splendidly. The choice of trees is a matter of serious consideration, as so many of the existing specimens in our streets, struggling bravely on amidst countless disadvantages, lead the man in the street to regard the subject as a costly fad. Plane and poplar trees planted in the North of England have been failures, while successful in London, but it needs the advice of an expert in these matters.

(To be concluded.)

VARIETIES.

THE Walthamstow District Council are considering the desirability of purchasing a site for the proposed new Town Hall.

THE Llangollen County Schools are to be enlarged by the addition of a new technical school at a cost of 4,000*l.* The plans have been prepared by the county architect.

THE Middlesbrough Education Committee have accepted the tender of Messrs. R. Blackett & Son, of Darlington, for the erection of the Archibald Schools, at a cost of 14,275*l.*

THE Plymouth Borough Council this week adopted a scheme for the reconstruction of subsidiary sewers and the repaving of streets in the Hoe district at an estimated cost of 11,552*l.*

THE Chesterfield Town Council are in negotiation with the Home Brewery Company with a view to the purchase by the latter of 1,000 square yards of Corporation land near the Cattle Market as the site for an hotel.

THE York Education Committee have resolved to invite competitive plans for the proposed elementary school for the Bishopthorpe Road district. The selected site in Campleshon Lane has received the approval of the Board of Education.

MR. J. C. BOYD, engineer, Carlisle, has been appointed engineer to carry out the extensions required to Silloth sea wall required by the Holme Cultram Urban District Council. Plans are to be prepared immediately.

THE Brighton Board of Guardians on the 13th inst. adopted a scheme for the erection of four receiving homes at a cost of 5,100*l.*, and a separate hospital at a cost of 1,500*l.*, on a site at Warren Farm Schools.

THE Bishop of Guildford recently consecrated the new nave and chancel of Aldershot Parish Church. The church now consists of a new chancel, nave, and north aisle, designed by Mr. T. G. Jackson, R.A., the old nave and chancel forming the south aisle and side-chapel.

THE foundation-stone of a new church at Whorlton, near Newcastle, was laid on the 15th inst. The first portion of the work will consist of a chancel, vestries, organ chamber, and heating chamber. Mr. A. B. Plummer, F.R.I.B.A., diocesan architect, has prepared the design.

H.M. CONSUL at Christiania reports that, according to the local press, plans have been prepared by the Christiania Harbour Board for the erection at that place of a corn silo with a capacity of 8,000 tons, at a cost of between 22,000*l.* and 28,000*l.* The Board contemplate letting it on a twenty-five years concession to a private company.

AT Edinburgh Dean of Guild Court last week warrants were granted to the proprietors of Edinburgh Academy to erect a new pavilion at Inverleith Place, and to the Edinburgh Provincial Committee for the erection of new buildings in St. John Street and South Back Canongate.

THE Bexley Heath Urban Council and a committee of ratepayers have decided to mark the Coronation by erecting a clock-tower in the market place. The design submitted by Mr. Walter Epps, A.R.I.B.A., architect, of Bexley Heath, has been selected.

THE Edinburgh School Board have decided to purchase from the Governors of George Heriot's Trust ground at Bellevue, which is let on lease at the present time to the Corporation of Edinburgh as a public park. The area extends to about 4½ acres, and the price to be paid for it is 8,280*l.*

THE Guardians of the Godstone Union invite schemes by the 19th inst. to equip the laundry at the workhouse, Bletchingley, near Redhill, for mechanical working on a basis of 4,000 pieces per week. The scheme must include the

adaptation of all existing machinery to steam power as far as practicable.

THE Board of Education have approved the plans submitted by the Monmouthshire Education Authority for a training college for 100 men teachers at Caerleon. The tender of Mr. F. Bond, Cardiff, amounting to 28,248*l.*, has been accepted for the work. The plans were prepared by Messrs. Alfred Swash, F.R.I.B.A., & Son, Newport.

As a memorial to Lord Clive, who was born in the parish in 1725, a church house and institute have been erected at Moreton Saye, near Market Drayton, and was opened on Tuesday. The building, which contains a large concert room, billiard room, reading rooms, &c., has been designed by Mr. Craig, A.R.I.B.A.

THE Erdington Urban District Council have approved plans and estimates for the Bromford area scheme at the following estimated costs:—Sewering from Erdington Hall to Ashold Farm, 12,500*l.*; surface water drainage, 6,300*l.*; widening and improving Wheelwright Road, &c., 5,600*l.*; total cost, 24,400*l.* Application to the Local Government Board will be made for the necessary loans, together with a further 9,000*l.* for wood-block paving in Slade Road.

THE nave of All Souls Church, Ascot, has recently been dedicated. The chancel, side-chapel, and transepts were built by Lord Stanmore some few years ago in memory of his late wife. Afterwards he contributed 2,000*l.* of the 3,000*l.* required to complete the nave, and also built a baptistery. A spire and north porch remain now to be added. The church was designed by the late Mr. J. L. Pearson, R.A., and has been completed by his son, Mr. F. L. Pearson.

THE Cheltenham Town Council at their last meeting decided (1) that the land at the south-west end of the Winter Garden building be selected as a site for the erection of Municipal Offices, and (2) that architects be invited to send in designs and plans for the building in competition, and that premiums of 100*l.* and 50*l.* be offered for the first and second award, the premium to merge in the commission in the event of the plans being adopted and the architect employed in carrying out the building.

LORD HASTINGS has decided to turn Hartley, on the Northumberland coast, into a high-class resort. Recently he signed an agreement by which the North-Eastern Railway Company would construct a railway between Monkseaton and Seaton Sluice, Lord Hastings to pay two-thirds of the interest on the capital expended by the company, that interest to be reduced 2*l.* annually for each house built in Hartley. Lord Hastings is also prepared to hand over the sea front for an esplanade, provided the new Urban Council maintain it for the benefit of the general public.

At the last sitting of Paisley Dean of Guild Court the following linings were granted:—Messrs. Brown & Polson, starch manufacturers, to erect a new floor and roof in the engine-room of their works at Carriagehill; A. F. Craig & Co., engineers, to put up an erecting shop in their works in MacDowall Street; Richard Stutt, to make alterations and additions to his property at 201 Neilston Road; Peter F. Ross, draper, 14 Wellmeadow, to erect saloons, stores, and other additions to his property there; and Wm. M'Ghee, builder, to erect two tenements of two storeys each at 5 and 6 Well Street.

A conference will be held at Toynbee Hall, in White-chapel, on Monday evening next, at 8.15, in order to discuss Unemployment Insurance proposals. This portion of the National Insurance Bill at present chiefly concerns every employer and workman in the building and engineering trades, and it is hoped that all organisations in East London in these trades, whether employers or workmen, will send representatives. The object of this conference, which will follow the lines of the very successful conference on the scheme, is to elucidate and discuss in a frank and friendly manner the proposals of the Bill, and consequently no resolutions will be proposed.

THE Liverpool City Council last week referred back a recommendation that the scheme submitted by the Corporation Surveyor for the erection of baths at George's Dock site should be approved. A resolution was also withdrawn by the Finance Committee "that competitive designs for the elevations only of the proposed baths, to be accompanied by estimates of the cost of carrying out such designs, be invited by advertisement from architects, and that premiums of 100, 50, and 25 guineas respectively be awarded to the architects whose designs this Committee shall consider to be respectively first, second, and third in order of merit."

THE York City Council recently made an application to the Local Government Board for sanction to the borrowing

of the sum of 57,637*l.* for sewage purposes. The Board intimated that the scheme as submitted to them was generally satisfactory, but they required certain amendments to be made, and the plans amending and amplifying accordingly, and re-submitting for approval. The City Surveyor has now amended the plans accordingly and revised his estimate of the cost, which will be increased by 5,141*l.*

THE Glasgow Parish Council last week approved generally of plans for a colony for epileptics, proposed to be erected on ground at Muckcroft, rented by the Council from the Glasgow District Lunacy Board. These plans provide for the erection of four villa blocks to accommodate a total of about 200 patients, with provision for the erection at a later stage, if necessary, of two additional villa blocks. The total cost is given as 43,520*l.*, equal to a cost of 176*l.* per bed on the building of four villa blocks, with administrative buildings for six villa blocks, and a cost per bed of 145*l.* should the whole six villa blocks be proceeded with. But the question of cost is to be reconsidered.

THE Finance Committee of the Birmingham City Council have just been authorised to borrow 17,615*l.* for the erection of a Council school in St. Benedict's Road, Small Heath. The Finance Committee were also authorised to borrow 3,233*l.* for providing accommodation for cookery, laundry, manual, and housewifery instruction at Dudley Road, Camden Street, and Tilton Road Council Schools. At the same meeting the Council authorised the Education Committee to purchase a site, having an area of about 7,000 square yards, in Willow Avenue, at 5*s.* per yard, and to erect thereon a school for about 600 children.

THE Kensington Borough Council recently adopted resolutions urging the London County Council (1) to claim in aid of the rates the profits of the Middlesex Deed Registry, estimated at 15,000*l.* a year, following the example of the Yorkshire County Councils, who receive the profits of the Yorkshire registries; and (2) to take action in accordance with the recommendation of the Royal Commission on Land Transfer to obtain the extension of the Middlesex Deed Registry to the whole County of London, which, it is estimated, would increase the profits to 27,000*l.* per annum. The movement has already obtained the support of the following Metropolitan Borough Councils:—Battersea, Bermondsey, Chelsea, Fulham, Hammersmith, Poplar, Stoke Newington, Wandsworth, and Woolwich. The Local Government Committee of the London County Council have the proposals under consideration.

THE United Kingdom Granite and Whinstone Quarrymasters' Association, at their annual meeting, had under consideration the National Insurance Bill, and, after discussion, adopted a resolution to the effect that, while approving of any principle whereby provision through the State should be made compulsory for the insurance of employees against sickness, invalidity, and unemployment, the Association are of opinion that the provisions of the National Insurance Bill impose upon employers of labour a burden the incidence of which it is unjust they should be called upon to bear; that the contribution proposed to be exacted from employers, being made a first charge, is a tax which it is inequitable should be imposed upon an industry already overburdened through workmen's compensation liability and others; and it is calculated seriously to cripple its development, thereby being prejudicial to the employees themselves by tending to decrease employment.

MR. P. MORRIS, county architect, has submitted to the Devon Education Committee a memorandum with reference to the report of the Departmental Committee appointed to consider the cost of school buildings. He said a school building with suitable hall accommodation, but without rooms for special subjects, should cost from 33*s.* 4*d.* to 37*s.* 6*d.* per head for every penny per cubic foot. These figures assumed that there was nothing in the site or locality which would entail extraordinary expenditure. The corresponding figures for the Devon County Council schools were 32*s.* 8*d.* (minimum 25*s.*, maximum 38*s.*). The cost of very small schools was said to present a much wider range of difference, although under favourable circumstances they had been built for 7*l.* per head. One of the Devon County Council schools of this type had been built at a cost of 6*l.* 18*s.* 10*d.* per head, whilst the average cost had been 10*l.* 4*s.* 11*d.* per head. Questions of drainage, water supply, and accessibility must obviously render unreliable any definite statement as to what should be the average cost of such buildings. Mr. Morris pointed out that the cost of building in Devon is largely increased in many cases by the levels of the site and other causes.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

Special Position Spaces.—Unless ordered for weekly insertions the Proprietors cannot guarantee particular dates.

EDITORIAL NOTICES.

The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

ATHENS.—Sept. 25.—An international competition of plans is invited by the Greek Ministry of the Interior (Public Works) for the erection of a Court of Justice at Athens. The cost of the building must not exceed 160,000*l*. A first prize of 800*l*., and a second prize of 320*l*. will be awarded. The Greek Official Gazette, containing particulars (in Greek and in French) may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

LOWESTOFT.—July 31.—The education committee invite designs for an elementary school at Roman Hill for 500 boys. Premiums of 20, 10, and 5 guineas. Send application for particulars and 10*s*. 6*d*. deposit by June 24 to Mr. R. Beattie Nicholson, Town Clerk, Town Hall, Lowestoft.

NORTHAMPTON.—July 7.—The Borough Education Committee invite architects practising in the borough or county of Northampton to submit on the 7th July plans for a secondary school for girls, to be erected in St. George's Avenue. A plan of the site and a copy of the instructions containing the terms and conditions of the competition may be obtained from Mr. Stewart Beattie, Secretary, Education Offices, 4 St. Giles's Street, Northampton.

SCOTLAND.—Aug. 1.—The Committee of the Battle of Largs Memorial Fund invite sketches of a suitable memorial to commemorate the battle of Largs, 1263. The site of the memorial will be on the foreshores of Largs, but the exact position has not yet been determined. The committee have at their disposal the sum of 300*l*., which is the maximum sum to be expended on the erection. A premium of 5*l*. will be paid for the successful sketch. The sketches will be judged by the subscribers. Mr. Peter Morris, Town Clerk, Largs.

WALES.—July 1.—Competitive designs are invited for chapel, schoolroom, and classrooms to be erected at the junction of St. Alban's Road and Finsbury Terrace, Swansea. Particulars and conditions may be obtained from the Secretary, Mr. D. Walters, 19 Brooklands Terrace, Swansea.

YORK.

For extension of workhouse, Huntington Road, for the Guardians. Mr. J. H. MORTON, F.R.I.B.A., architect, South Shields.

BELLERBY, York (accepted) £13,387 15 0

THERE has been placed before the Dominion Government a project for the development of electrical energy at Cedar Rapids, on the St. Lawrence River, at a cost of between 3,083,000*l.* and 4,111,000*l.* It is estimated that 500,000 h.p. can be developed.

At the last meeting of the Cheshire County Plans and Buildings Sub-committee, plans prepared by Messrs. John Davies & Sons, Chester, of a proposed Council school at Hoole were approved and forwarded to the Board of Education. The committee took the same course with plans for a Roman Catholic school proposed to be erected in Ellesmere Port. Mr. H. Beswick, county architect, in his report, stated: The new building is designed so that it can be built in portions, the first part to consist of a school for 150 children in three classrooms of 50 each, capable of extension by the addition of two classrooms for 55 each, which will make a one-storey building for 200 scholars with all the necessary cloakrooms, &c., complete. A further extension to be made afterwards by the addition of a first floor of four classrooms for 50 each. The site for the new school is situated at the corner of Enfield and Whitby roads. A portion of the site along the Whitby road frontage is reserved for a new church and presbytery, while the existing temporary chapel is to remain.

THE Incorporated Church Building Society held its usual monthly meeting on the 15th inst. at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W. Grants of money were made in aid of the following objects, viz.: Building new churches at Abercrave, St. David, Brecons, 100*l.*; Golders Green, St. Michael, Middlesex, 100*l.*; Six Mile Bottom, St. George, near Cambridge, 50*l.*; and West Shore, Llandudno, North Wales, 40*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Leytonstone, St. Margaret, Essex, 20*l.*; Llandrindod Wells (old church), South Wales, 20*l.*; Medbourne, St. Giles, Leics., 20*l.*; and Millbrook, St. Nicholas, Hants, 15*l.* A grant of 25*l.* was also made from the Special Mission Buildings Fund towards building a mission church at Bearwood, St. Dunstan, near Birmingham. The following grants were also paid for works completed:—Great Saughall, All Saints, near Chester, 45*l.*; Dalton-in-Furness, St. Margaret, 100*l.*; Hope Bagot, St. John, Salop, 15*l.*; Coldred, St. Pancras, near Dover, 15*l.*; Grainthorpe, St. Clement, Lincs., 25*l.*; and Pontycymmer, Glam., 30*l.* In addition to this the sum of 60*l.* was paid towards the repairs of nine churches from trust funds held by the Society. The Society likewise accepted a sum of money as a trust fund for the parish church of Dunton, Norfolk. The grants voted at this meeting have entirely exhausted the funds at the disposal of the committee. It should not be forgotten that the Society is entirely dependent upon voluntary contributions.

VENTILATION AND HEATING OF SCHOOLS.

DR. H. B. MAPLETON, M.A., Medical Officer of Health to the Newton Abbot Rural and Urban Council, in his annual report, has the following interesting remarks on the above:—

Among the many conditions affecting school life, which have of late years received attention, the question of ventilation is, from the sanitary point of view, of the first importance. Medical inspection of the children is now an established routine procedure, and the logical consequence—treatment of abnormal conditions—is on the threshold; these constitute curative measures, which are generally placed first in public estimation. But in many cases disease will be avoided, and in others the treatment of it greatly facilitated, if the preventive side of the question—the environment of the children—is also thoroughly attended to. Five hours, or nearly half the day, are spent in the school-room, and, therefore, the condition of the air breathed should have at least as careful consideration as food, clothing, or any other necessity of life. Now, in practically all schools except those of the most modern construction, the arrangements for ventilation are suitable for warm weather only—that is to say, that a tolerable condition can only be obtained by the free opening of windows—and if the external temperature is low, this means that either warmth or air purity must be sacrificed, a Hobson's choice of evils, in which the former, being more immediately appreciated, has usually the first attention. The danger is most insidious, because the air in a room, if fairly pure to start with, becomes deteriorated so gradually that nothing is noticed by the occupants till an extreme condition is reached.

The effects of such a daily dose are indeterminate, and it would be hardly possible to define them exactly in any given case, or even group, of children, but, speaking generally, several may be mentioned:—(1) The vitality of the growing child, which depends to a large extent on a freely oxygenated and pure blood supply to the tissues, is adversely influenced. (2) This loss of vital power produces in its turn susceptibility to the invasion of any infective germs—such as those of phthisis, diphtheria, scarlatina, &c., which may be present, and with all the care possible such cannot be altogether excluded when children are collected together in the school-room. (3) The infection itself is more concentrated and a larger dose received. (4) The central nervous system, equally needing pure blood for its proper operation and development, suffers; the children are less receptive in regard to their lessons, and public money is thus wasted. (5) Education should comprise sanitary instruction, and to teach children that the closed window is necessary, or even desirable, contravenes one of the first principles of health.

In this county, where winters are for the most part mild, the problem is perhaps easier and less costly in solution than a more rigorous climate would entail, but even here, if anything like ideal conditions are to be obtained, certain structural alterations in most of the older schools, and not a few of comparatively modern ones, would seem necessary. Ventilation is, as a rule, obtained by casements below and swing sashes above, combined with a few Tobins' tubes or Sheringham valve inlets—mostly of such limited area as to be of very little use; in many of the former the air before entering passes through long pipes, which contain the dust of years, and are inaccessible for cleansing purposes. Ceiling outlets, on the other hand, are, if of any size, of real value, and these in most cases have been provided. It is, however, difficult to discriminate between inlets and outlets, and, as far as my experience goes, they act at different times in both capacities, according to external air movements. The casements and swing sashes when opened, especially if cross ventilation—the most important object—is attempted, are liable to create draughts, which in anything but calm and warm weather become unpleasantly noticeable; and even under favourable conditions a good deal depends on the susceptibility of the individual teacher. The position of the school also constitutes another factor; a building on apparently a most healthy and desirable site is, *ipso facto*, more exposed to air movements, and thus an external benefit become an internal disadvantage, because it encourages at certain times the closed window.

Heating is inseparably connected with ventilation; in all but the most modern schools this is effected by stoves—either open or closed—and these, however effective in a comparatively small living room, cease to be so in any large building. The area near the fires may be—and often is—over warm, while more distant parts are not warm enough.

Sepulchral Slab designed by Mr. A. BORROWDALE and executed in Hopton Wood limestone by Messrs. BORROWDALE BROS., Sunderland.

Children feel a low temperature more than the teacher, inasmuch as the former—some of whom are, perhaps, insufficiently clothed—are sitting still most of the time, while the latter is continually on the move; moreover, children, especially the younger ones, endure in silence.

It may be said that stoves and open fires assist ventilation by drawing away vitiated air; this, however, only operates to a height of 4 feet or 5 feet, and, moreover, tends to create draughts, which affect the lower extremities of those exposed to them.

With a view to ascertain local conditions in these matters, I made during the latter part of the year some tests of the air and temperature in the Newton schools, under various climatic influences. Each school was visited, and a test of the air made in every class-room; the external and internal temperature was taken, and the floor space, cubic area, and ventilation accommodation per head at the time

of visit worked out. The apparatus used for the air test had of necessity to be simple, and one giving a quick result, both because of the number of tests involved, and also to avoid disturbing the lesson. Lunge and Zeckendorff's was the method employed. In this process a measured quantity of standard solution of carbonate of soda tinted pink with phenolphthalien, is put in a bottle, and the air to be tested pumped through by means of a syringe of known capacity. When the soda is neutralised by the carbonic acid, the colour is discharged, and the amount of air necessary to effect this calculated. The change is soon apparent if the air is impure, and, on the other hand, under anything like normal conditions, the colour is difficult to discharge. Thus the actual percentage of carbonic acid is determined; the results are very fairly reliable, and any errors arising from slight deterioration of the solution are favourable to the schools. A test was made on each occasion in the open air as a control.

It is generally estimated that the normal atmosphere contains .4 parts per 1,000 of carbonic acid, but that the "permissible" amount may range up to .6 without harm; indeed, a slight increase, where many persons are congregated indoors, is unavoidable. On the other hand, anything approaching .8, where the excess is due to respiration, is perceptible to the senses of anyone entering from fresh air, and begins to be actively deleterious.

It is not that this small quantity is in itself poisonous, but where it results from respiration, waste organic matters from the lungs and bodies are also present. These constitute the real danger, and they are most readily estimated by the carbonic acid, to which they bear a constant proportion.

It will be seen that the conditions varied widely in the different schools, and even in the different class-rooms. Floor space, for instance, ranged from 6.5 to 21.5 sq. ft. per head, while it was under 10 in nine class-rooms; cubic area in the former case was only 93, and in the latter 300, but it was under 100 in two rooms only. Available area of ventilation, including all inlets and outlets (so-called) and open window space, reached 170 square inches per head in one class-room, while in another the figure was only 19; three show 22—very little more. It is generally estimated that each person should have 48 inches (24 inlet and 24 outlet), but in seventeen rooms this was not attained at the time of my visit.

The results of the carbonic acid test, without being wholly unfavourable, were sufficient to show that attention is needed in the matter, especially when it is considered that they were made under climatic conditions which could have made no severe demands on effective ventilation and heating systems.

The estimated quantity of carbonic acid was below the permissible amount of .6 in eleven rooms, while .8 per 1,000 was reached in nine more, excluding two in which the gas had been alight for a considerable time previously, which discounts the figures to some extent in their case; the remainder were between the two. Owing to the delicacy of the standard solution, it is probable that the figures are all slightly under-estimated, but they represented the apparent freshness (or otherwise) of the air as perceptible on entering, most accurately; all rooms in which .8 was approached were distinctly stuffy and unpleasant. I found that the chief factor of influence was the presence or absence of cross window ventilation, rather than cubic space or floor area per head, though, of course—other things being equal—these had their due effect.

Heating arrangements mainly consisted of open fires, though in five rooms closed stoves were in use, and the Highweek Boys' School has a hot-water radiator system throughout. During the time the experiments were proceeding there was no really cold weather, and external temperature ranged from 41 deg. to 53 deg. Fahr.—no great extreme. The internal figure was as low as 48 deg. in one class-room, and in no case exceeded 60 deg., while it was below 55 deg. in nine out of twenty-nine, or nearly one-third. In this respect the Marsh and British Schools showed the lowest figures on the whole; it is possible the site they occupy, being on the low level alluvial soil of the valley, has some influence. In one or two instances I was told that the gas was lighted at times for the sake of warmth; this is not a desirable proceeding, because it helps to exhaust the oxygen, and still further deteriorate the air supply of a crowded room. If the temperature cannot be maintained without this auxiliary, especially under comparatively mild conditions, it is evident that heating arrangements are in need of improvement.

THE STREET OF TO-DAY AND TO-MORROW.

(Concluded from last week.)

Parks.—The tree-lined street leads one to realise the position which parks, gardens, and squares must occupy in the street planning of a well-ordered city. The first merit is, of course, the fact that parks are more and more essential as the lungs of a city, offering physical exercise, recreation, and amusement to the thousands who perforce are compelled by the exigencies of modern civilisation to spend the major portion of their lives in its midst. But beyond the physical merits, colour in the street softens architectural outlines, and so adds to city beauty, and the clumps of park foliage, colour and brightness of flowers, refreshing lakes, bring æsthetic charm into town life. Happily there is no need of argument for parks, but it would be well if the various parks of a city were made into a system by means of tree-lined streets or boulevards connecting them with the city proper. At the same time, as parks are so often on the outskirts, it would be well if they were connected as far as possible in a circle of boulevards round the city. This would achieve to some extent the same result as Continental cities have already achieved by the great boulevards encircling their cities on the lines of the old fortifications. Continental cities in the matter of their parks and gardens view them as public property in a way quite foreign to England, and they are rarely walled in or railed, but free access is allowed at all times. This privilege is rarely, if ever, abused, and one thinks if only the public in England were allowed a similar concession it would add much more to the enjoyment of city life and the vandalism of which complaints are now made would gradually disappear. There should be no reason why the exclusiveness of the Britisher should come in when public property is concerned, and an unrailed park or garden would bring the spirit of Nature more into the street and the city than anything else could possibly do. How much more delightful the squares of London would be if they were, at the most, guarded only by low rails, and likely enough a move in this direction in the case of parks owned by local authorities would lead to the opening out of the privately owned squares.

Advertisements.—Next to the part which natural surroundings play in the ideal street is the matter of advertisements. No more vexed question affects city life, and while there is a general consensus of opinion that the regulation of advertisements is urgently required very little is really done. The architect and artist have every reason to grumble because the advertiser who disregards the dignity and propriety of the streets degrades the best elements of their arts. Paris, Brussels, Berlin, and Rome have restricted the advertiser in many ways, but the restrictions in England have not so far been strong enough to effect more than slight reforms. It is possible that the Housing and Town Planning Act may be used to regulate, restrain, and prevent public hoardings, and in London the County Council seems disposed to put some check on the advertising displays on house-fronts. All this, together with the gradual adoption of the permissive by-laws of the Advertisements Regulation Act of 1907, may, it is hoped, lead in time to a better view being taken of the street in an æsthetic sense.

Statuary, Fountains, &c.—When offensive public advertising is abolished, it will naturally follow that the street embellishments will be better cared for and cultivated. The function and placing of statuary in the streets, which is almost non-existent in England—that is, in comparison with the Continent—will be better understood. Public statuary has an educative and cultural mission. As the Column of July in Paris, the Column of Victory in Berlin, the Statue of Liberty at New York have all served to keep alive national traditions in these various places, let us hope that the beauty of the new Victorian Memorial in the Mall and the proposed King Edward Memorial will awaken a new consciousness in our midst. One of the greatest signs of progress is the fact that the new Victorian Memorial has been erected in a wide public thoroughfare, and not in a park. English cities unfortunately have few open spaces capable of accommodating such a memorial, but with the better development of the street in the future the function of sculpture and the fountain is bound to be recognised. The Fountain of St. Michel in Paris is a striking example of how a city might grace the junction of two great boulevards.

Smoke and Noise.—The two last æsthetic considerations of the street are smoke and noise. The former is solving itself mainly by the aid of improved scientific combustion, but the latter is, unfortunately, increasing owing largely to scientific progress in locomotion. A writer in the press

recently analysed the traffic chorus in the Strand, and showed how the very nature of the street, the presence of innumerable side streets, narrowing of the thoroughfare, &c., was largely responsible for an increase in the noise of warning of vehicles. Indeed, all the various traffic considerations which govern the street help to create the nuisance of noise. The presence of two kinds of traffic—fast and slow—in our streets, and the condition of the road surface cause as much noise as the vehicles do by being imperfectly built. By the better development of the street as a traffic artery, the improvement of the road surface, and regulation and restriction of speed, alone will come an abatement of noise. Until then traffic noise must be tolerated on grounds of public safety.

The Street of To-morrow.

Progress towards the better street, in which the whole profession of the municipal engineer is so intimately bound up, must be on lines both logical and harmonious, and the demands for comfort and well-being must appeal to all as reasonable. The wish for a better street will always be visionary until the want of it is felt. The Civic Renaissance which broke over Italy in the fifteenth and sixteenth centuries was preceded by just such a rational movement. In the middle of the thirteenth century stone bridges began to span the rivers, and city streets and squares were paved with flags. In the fourteenth century the cities were a "spectacle of solid and substantial comfort," and the way, so prepared, heralded the Renaissance. The requirements of progress remain the same to-day, and with municipalities taking the first steps, perhaps unconsciously, in the making of the better street of to-morrow, they are helping in laying the surest foundations of the ideal city, and to give effect to the words of Ruskin, who, speaking of the blocks of London houses, intersected by railways, said: "It is not possible to have any right morality, happiness or art in any country where the cities are thus built, or thus, let me rather say, clotted and coagulated into form; limited in size, and not casting out the scum and scurf of them into an encircling eruption of shame, but girdled each with its sacred pomarium and with garlands of gardens, full of blossoming trees and softly guided streams."

At the conclusion of the paper a long and animated discussion took place, in the course of which

Mr. HENRY C. ADAMS said he disagreed entirely with the suggestion that street refuges should be removed. They not only helped to regulate the traffic, but were a great protection to the public, who would not take the trouble to use subways which necessitated going down and up steps, but preferred to take their chances in crossing on the level. He deprecated uniformity of design in buildings, but agreed it was necessary that controlling power should be given to local authorities so as to prevent the erection of the monstrosities which are occasionally seen. Tall buildings were the natural corollary of the increase in the value of land, and were an economic necessity of the age. With reference to the suggested multiplication of street statuary, he was only in agreement so far as memorials, such as the Victoria Memorial, but the ordinary street statue depicting public men could not, as a rule, be considered a thing of beauty, and as an educational asset it was practically valueless, the average "man in the street" probably not even being aware of the identity of those statues he passed every day of his life. The affixing of rosettes to houses in lieu of using poles for the suspension of overhead wires would result in clearing the streets of obstructions, but there was no power to utilise the property in such a way, and he had found, in connection with tramway work, considerable opposition from the owners, who claimed compensation and from the tenants who felt, or thought they felt, the vibration of passing cars, notwithstanding the use of efficient anti-vibrators.

Mr. FAYERS (Watford) said that a few years ago the ideas contained in the paper might have been considered Utopian, but they were certainly now within the range of practical politics. He wished to know what the author meant by uniformity in design of the buildings. Long rows of houses all the same pattern were terribly depressing.

Mr. C. CHAMBERS SMITH (Sutton) did not think the height of the kerb should exceed 4½ in. to 5 in. He was a great advocate of tree planting, and had planted thousands in Sutton, at an average cost of 4s. each. If trees were carefully lopped their appearance would not be spoilt, and in any event if the work were done in February the trees were covered with leaves soon after the pruning.

Mr. BERNARD PARTRIDGE (Walthamstow) said that a large number of flowering trees had been planted in his district, which were most effective. No appreciable damage

nd been done by children or irresponsible persons. He pointed out that while the author proposed to clear all existing obstructions off the streets, he suggested adding an equal number in the shape of trees.

Mr. THOS. MUNDY (Woolwich) said that trees were wanted in all new roads at Woolwich. They were mostly plane trees, the lime not being used because of the tendency of the roots to rise near the surface to the detriment and destruction of the footpaths.

THE BUILDING TRADE AND THE INSURANCE BILL.

QUARTERLY meeting of the Northern Counties Federation of Building Trade employers was held at Seaton on the 14th inst. The chief business was the discussion of the National Insurance Bill and the consideration of report of their Executive Council on the matter.

The observations of the Council included the following:— In the first place your Council feel that no substantial reason has yet been advanced for imposing upon the employers the burden of financing the insurance of the health of their workpeople. The benefit of this insurance will be reaped directly by the workpeople themselves and indirectly by the State. The employers will gain nothing personally by making them a party to the measure, and their trade is not able to bear the constant imposition of burden upon burden in the way of legislation and taxation. The present Bill entails greater hardships upon them than those sought to be levied.

"Your committee feel that health insurance and accident insurance should have been dealt with as a whole, as they are inter-dependent; a perusal of the provisions of the last part of the Bill and the reference to the benefits under the Workmen's Compensation Acts therein will prove this. They feel that such a procedure would have been more desirable than linking up with health insurance the question of unemployment. They feel that scant justice has been done in the very important matter of unemployment, and the latter part of the measure is just the skeleton of a Bill which leaves much to the imagination of the Legislature, the inactivity of the Board of Trade, and the resources of the Treasury.

"Your committee recommend that the National Federation and the Employers' Parliamentary Council be urged to watch very carefully the progress of the measure, and take the necessary steps to have such amendments as are considered advisable introduced into the Bill through its different stages."

Mr. F. Ranken (Sunderland), the Chairman, said the Executive Council were of opinion that the Bill had been hastily considered, and was not in the interests of employers. There were grave matters in it affecting the trade, and they must enter their protest against the Bill as soon as possible.

Clause 51, which provides against distraint for twelve months during sickness, was referred to by Mr. Robertson (South Shields), who remarked that it was a very serious matter for a builder who was also a large property owner, and they should protest strongly against that clause alone.

The Secretary mentioned in this connection that if the sickness was due to the fault of the employers' works the employers had to make up to the sickness fund the extra cost which the actuary certified had been incurred. This would not apply in the case of one man, but only in the event of the sickness of several men being traceable to the works where they were employed.

Mr. Heslop (Newcastle) questioned whether the Chancellor of the Exchequer dared push the scheme forward. It could be the beginning of the end of the voluntary friendly societies as they understood them. This was a malicious and vindictive attack upon the thrifty and the property owners of the country.

Mr. J. Proud (West Hartlepool) commented on the fact that the only criticism of the Bill up to the present time in the House of Commons had come from the Liberal side.

The report was adopted.

The representatives of the Scottish Building Trades' Federation, whilst approving of the general principle of the Bill in relation to part one, says a memorandum prepared by the Executive Committee, take serious exception to several of the clauses. The Bill is of a far-reaching character, requiring much elucidation, and it is strongly urged that no attempt should be made to rush the Bill through Parliament. In its present form it will adversely reflect upon the building trades." The Government have in the Bill admitted the

principle of contributing payments by State, employers, and workmen, in regard to the liability for sickness, and it is vital in the interests of the building trade that that principle should be extended to liability for accident. At present the employer is liable to his workmen for accident at Common Law, and under the Employers' Liability and Workmen's Compensation Acts. This obligation is an extremely heavy one, and in the already depressed condition of trade it is felt to be most unjust that by the scheme of the Bill there should be a further heavy obligation imposed upon him. Relief to the extent of contribution in the direction of accident insurance is accordingly of urgent necessity. At a recent meeting held in Edinburgh the clauses of the Bill were considered in detail, and it was agreed to co-operate with the National Federation of Building Trades Employers of Great Britain and other Associations in taking united action to secure amendments in regard to the administration of benefits and the constitution of the local Health Committees. Objection *in toto* was urged to the clause dealing with excessive sickness, and to the clause proposing to make a distress or execution illegal in certain cases. Unanimous opposition was expressed against part two of the Bill, dealing with insurance against unemployment. It being solely for the benefit of the unemployed, the contribution should, they contend, be entirely paid by the State, and no penalty should attach to an employer on account of his being unable to find work for his workmen.

VICTORIA AND ALBERT MUSEUM.

THE following recent acquisitions have now been placed on exhibition in the Department of Engraving, Illustration, and Design:—

A series of working proofs of aquatint engravings, "Sunrise o'er Whitby Scaur," "Bosham," "The Curfew, Rye," and "Sea-piece, after J. M. W. Turner, R.A.," given by the artist, Mr. Frank Short, R.A., P.R.E., to illustrate the technique of the process. (Room 70.)

A series of six working proofs of a colour aquatint, "Kensington Gardens," by Mr. E. L. Laurensen, given by the artist; and three proofs of the new book-plates etched by Mr. G. W. Eve, for the Royal Library at Windsor; given (with the King's permission) by the artist. (Room 70.)

Working proof of the mezzotint after "The Huguenots," by Sir J. E. Millais, Bart, R.A.; and etched state of the mezzotint portrait of Sir William Sterndale Bennett, after the same painter; both by the late T. O. Barlow, R.A., and given by the Misses Barlow. (Room 70.)

Eight lithographs by Mr. Joseph Pennell, of buildings, factories, &c., in New York and Niagara; and six colour-lithographs by Professor Carlos Grethe (of which three were given by him). (Room 70.)

Two tinted pen-drawings by Constantin Guys; a drawing, "Summer," by James Ward, R.A., being a study for a subject afterwards engraved by William Ward, given by Mr. A. E. Anderson; and four sheets of studies of cats, hands, &c., by the late E. J. Gregory, R.A., given by Mr. Harold Hartley. (Room 70.)

On the staircase leading to Room 65 has been placed a very fine Chinese painting of quite unusual size and decorative quality, representing birds of Paradise and storks in a grove of bamboo, roses, and other plants. This has the signature Tei-ki, and is dated 10th month, 1st year of Che Shun, Horse Year (A.D. 1330). It was presented to the Museum by a donor who wishes to remain anonymous.

In Room 65 a good Japanese painting of a pheasant (early nineteenth century), one of a willow-wren on a pine branch by the living artist, Watanabe Seitei, and two original drawings by Kyosai have also been placed.

Additions have been made to the exhibition of illustrations of British stained glass, in Room 71, of drawings and tracings of glass at York by Mr. Laurence B. Saint; and to that of designs for textiles, in Room 72, of a series of original designs for Lyons silks of the Louis XVIII. epoch.

THE Italian *Gazzetta Ufficiale* of June 8 contains a notice, issued by the Ministry of Public Works, to the effect that tenders will be opened on July 6 for the construction of a new Post Office Savings Bank in Rome. The upset price is put at 127,200*l*. Although this contract will doubtless be awarded to an Italian firm, nevertheless the carrying out of the work may involve the purchase of some materials out of Italy.

VARIETIES.

THE Liverpool Cathedral Building Committee have received 2,000*l.* for a window in the south transept from an anonymous donor.

THE Visiting Committee of the Chichester City Guardians recommend provision of an outside staircase to the women's dormitory.

NEW buildings are to be erected for the Dumfries County Council at Dumfries at an approximate cost of 20,000*l.* Mr. J. M. Dick Peddie, Edinburgh, is the architect.

THE Chester County Council have given formal notice of their intention to enlarge the Neston Council school by providing additional accommodation for about 150 children.

THE executors of the late Rev. Canon Webb have paid over to the Vicar of St. Paul's, Crewe, 3,000*l.* towards the erection of a new church in the parish, to be called St. Peter's.

THE Leatherhead Urban District Council at their last meeting approved plans of the new schools to be erected on the Hilly Fields estate, and of additions to the girls' school, Poplar Road.

PLANS have been prepared for large new repair shops for the Canadian Pacific Railway at Coquitlam, British Columbia. It is stated that the shops will extend for nearly two miles.

THE Hull Corporation Property Committee on Friday adopted a recommendation that the front portion of the Town Hall be pulled down and re-built to harmonise with the new portion at an estimated cost of 27,521*l.*

THE Cardiff Corporation have finally approved the scheme, prepared in 1909, for the erection of a central fire brigade station in Westgate Street. The estimate for the building is 17,000*l.*

MR. C. F. C. CHURCHWARD, surveyor to the Dawlish Urban Council, has been appointed surveyor and water engineer to the Teignmouth Urban District Council at a commencing salary of 180*l.* a year, rising to 230*l.*

THE Ludlow Rural District Council have resolved to ask the Earl of Plymouth's permission to build a collecting reservoir at Craven Arms capable of holding about 3,000,000 gallons of water for an auxiliary supply.

THE Committee of the Royal South Hants and Southampton Hospital have accepted the tender of Messrs. H. Stevens & Co., builders, Southampton, for the erection of a new out-patients' department. The total cost, inclusive of fittings, architects' fees, &c., will be 10,609*l.*

MR. F. E. P. EDWARDES, F.R.I.B.A., city architect, Sheffield, was formerly with the Bradford Corporation, and after leaving Bradford for Sheffield continued to act as consulting architect with regard to the extensions of the Town Hall. At the last meeting of the Bradford City Council Mr. Edwardes was voted an honorarium of 100 guineas in appreciation of his services.

THE foundation-stones of a new English Congregational Chapel were laid at Rhymney last week. The new building will provide accommodation for about 400 worshippers, and will cost 1,400*l.* The contractors are Messrs. Williams & Sons, New Tredegar, and the architects Messrs. Habershon, Fawcner & Co., F.R.I.B.A., Cardiff.

THE Woking Sanitary Committee have had under consideration plans submitted by Messrs. Clemence & Moon for the development of a building estate near Triggs Lock; but the Sanitary Committee reported to the Council that they could not recommend the approval of the plans, as they showed the laying-out of a new street less than 40 feet wide.

THE Portsmouth Town Council last week adopted a recommendation to purchase for 8,000*l.* seven acres of the Goldsmith estate for the erection of a hostel and recreation ground for the Day Technical School. It is estimated that the maximum inclusive cost of the site and buildings to accommodate 120 students will be 29,600*l.*

THE Edinburgh Provincial Committee for the Training of Teachers last week considered tenders for the erection of the new Training College in the neighbourhood of Moray House. The contract was given to Messrs. G. & R. Cousin, Edinburgh, whose tender for the whole work amounted to 38,225*l.*

At Glasgow Dean of Guild Court, last week, linings were granted to the Corporation of Glasgow to erect a double villa and a villa at the corner of Dalkeith Avenue and Dumbreck Road, to the School Board of Glasgow to erect a school in Netherfield Street, and to Sir Donald MacAlister and others, Committee of Management of the Glasgow University Officers' Training Corps, to erect buildings within the grounds of the University.

THE Dean and Chapter of Winchester Cathedral, after consideration of various designs of buttresses and schemes for dealing with the south side of the nave, have approved a design by Mr. T. G. Jackson, R.A., for a double flying buttress. The buttress, which will terminate in a pinnacle in the Perpendicular style on the lines of Wykeham's pinnacles on the north side of the nave, will be placed at a distance of 6 feet 6 inches from the main wall. At half its height there will be a four-centred arch from buttress to wall, and from near its apex a flying arch in alignment with the arches in the nave aisle which support the thrust of the central vaulting of the nave. The front of the buttress will be richly panelled and traceried.

THE Local Government Board, having considered the application of the Tottenham District Council for sanction to borrow 2,432*l.*, for the purpose of erecting a central cooking depôt, from which meals for necessitous school children can be supplied, has replied stating that while some improvement in the present arrangements was desirable, sufficient grounds had not been shown to justify a large permanent depôt of the kind proposed. The scheme should be on a much less ambitious scale, and in the first instance should be of a temporary character.

THE Local Government Board have approved of a scheme of main sewerage and sewage disposal for the parish of Owston and Skellow in the district of the Doncaster Rural Council. There are several miles of main sewers to be constructed with cast-iron pipes, which will gravitate to an underground storage tank from which the sewage will be electrically pumped to the disposal works, where it will be treated in open tanks, followed by filtration through percolating filters before being discharged into the adjacent watercourse. The engineers for the work are Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne.

IN the York Consistory Court, last week, faculties were granted to the vicar and churchwardens of St. Paul's, Middlesbrough, to build a choir and clergy vestry, to change the position of the organ and to convert the south choir aisle into a chapel for daily prayer; to the vicar and churchwardens of Eastwood, Rotherham, to extend the chancel; to the vicar and churchwardens of Bentley, Doncaster, to make alterations in the churchyard; to the vicar and churchwardens of Westerdale, Grosmont, to make alterations in the interior of the church.

At a meeting of the Court of Governors of Sheffield University on Friday last, the main business was the confirmation of some proposed alterations in existing ordinances and the establishment of a diploma in architecture. The Pro-Chancellor said the resolutions before the Court all denoted progress. As new subjects came up they had to incorporate them in their ordinances from time to time. The diploma in architecture is to be awarded only to candidates who have had practical training in the office of an architect, and who can present certificates showing that they have attended approved courses of study and passed the prescribed examinations. Mr. J. A. Wigfull, as representing the Architects and Surveyors Society in Sheffield, expressed appreciation of the new departure.

TRADE NOTES.

UNDER the direction of Mr. Thomas Owen, architect, Tydweiliog, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Calvinistic Chapel, Tydweiliog.

THE name of the Patent Indented Steel Bar Co., Ltd., has been altered to the Indented Bar and Concrete Engineering Co., Ltd. The business of the firm will not be altered, but will be carried on under the new name at the same address, Queen Anne's Chambers, Westminster.

WE are informed that the Portland stone used in the Anglo-American Oil Company's offices and the Radium Institute, illustrated by us last week, was supplied from the quarries of Mr. F. J. Barnes, and the stone for the latter building was quarry-worked.

THE rebuilding of Cartago, Costa Rica, which was practically destroyed by earthquake in May of last year, has been commenced. The damage to property exceeded 500,000*l.* In consequence of the rebuilding a considerable impetus has been given to the building trade in the capital. A demand has sprung up for metal lathing, light structural iron, roof iron, and Portland cement.

LIME

Powerfully hydraulic. Prepared from the well-known beds of the Lower Lias, obtained from the renowned Warwickshire Lias Limestone Quarries.

A Bath with Hot Water
for every cottage.

The
"CONQUEROR"
No. 5907.

A Patent Combination by which the Washing Copper becomes the Bath Water Heater. Smith's Patent No. 13053/10.

REFERENCES.	
A Ashpan.	G Plug.
B Grid.	H Chimney.
C Fire.	J Hot water to sink.
D Firebrick.	K Hot water to bath.
E Cold supply pipe.	L Bath.
F Copper.	M Cold water to bath.

1. This patent Combination yields an abundant supply of hot and cold water to sink and upstairs bath, thereby greatly increasing the value of small property and the comfort of tenants.
2. The "CONQUEROR" Combination is a system whereby Hot Water is forced from the household boiler or copper into the bath or sink by an influx of cold water.
3. This boon to tenants is secured at a minimum of cost and labour, and there is nothing likely, afterwards, to get out of order.
4. The "CONQUEROR" set complete can be purchased and fixed at a lower price than an efficient geyser, and it is much safer and more effective.
5. By installing the "CONQUEROR" the Builder or Property Owner vastly enhances the attractiveness and value of his property at very trifling outlay.

6. The "CONQUEROR" pan or boiler holds 14 gallons and is made of galvanised iron or stout copper. It is fitted with a galvanised iron lid easily sealed down, which is necessary when a hot bath is required. A wood lid is provided for use when copper is required for washing purposes.
7. The Combination is so devised that practically the whole of the 14 gallons of boiling water is available.
8. The cost of fuel is trifling and a succession of baths can be had without delay.
9. The "CONQUEROR" can be supplied for building into brickwork, if preferred, but the set fitted with a cast iron portable copper, as shown, is more economical and takes up less room.
10. It is not necessary for the bath to be placed in a room directly over that in which the copper is erected.

Write for full particulars, also Catalogues of our Patent "BURKONE" FIRES and MUNICIPAL RANGES, both awarded the BRONZE MEDAL of the Royal Sanitary Institute at their last two Exhibitions.

DENNETT'S FIREPROOF CONSTRUCTION.

As Patented in Great Britain, Canada, and the United States.

SECTION OF FLOORS.

THIS method of construction has been found to be most **ECONOMICAL, EASY OF ADAPTATION**, and possessing great **STRENGTH, RIGIDITY**, and highly **FIRE-PROOF** character. It has been subjected at various times to severe tests, and is now generally adopted by the first Architects of the day.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material; and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure."—GEO. GILBERT SCOTT, 20 Spring Gardens.

DENNETT & INGLE,

24 QUEEN ANNE'S GATE (late 5 WHITEHALL), LONDON, S.W.; STATION ST., NOTTINGHAM.

Drawing, Estimates, and full particulars will be furnished without charge by the Patentees on application to either of the above Addresses. Rough Sketches or Tracings or Plans should accompany the application.

Scagliola Marble

An old Italian process, revived in the early part of the Sixteenth Century by Guido Sassi; is not a surface decoration, but a thoroughly artistic material. It was largely used by the Florentines in some of their most elaborate works, and was introduced into this country by Mr. J. Wyatt about 1750. It has been manufactured by this firm for the last 85 years, and fixed in many of the most important buildings in the Kingdom.

6-11 Imperial Buildings, Ludgate Circus,
London, E.C.

THE PRINCIPLES OF
ARCHITECTURAL DESIGN.

By Percy L. Marks,

ARCHITECT,
Author of "The Principles of Planning."

With 165 Full-plate and other Illustrations,
Royal 8vo, 10s. 6d. net.

This work embodies not only a series of articles on
Exterior Design, that appeared in the columns of
THE ARCHITECT, but includes also a similarly de-
tailed treatment on the principles affecting Interior
Design.

There cannot be any dogmatism on the subject of
Art; but there are certain underlying principles,
and the object of this book is to propound these in
an easy and argumentative manner on the lines so
successfully pursued by the author in his now
standard work on Planning.

The study of the principles referred to is aided by
illustrations which are for the most part of a dia-
grammatic character; in which light they are to be
regarded, and not as finished illustrations exemplifying
the Perfect Design.

The book has been well received and sympatheti-
cally reviewed during the short period that it
has been issued; and with a view to fostering the
growing interest of the general public in the art of
Design, it has been kept free from any undue use of
technicalities. It should appeal, therefore, to the
layman as well as to the architectural student and
designer.

ORDER FORM.

Please send me *cop* of "The Prin-
ciples of Architectural Design," at the price
of 5s. 6d. per copy, including postage, for
which I enclose

MIDDLESEX.
One mile from Feltham Station on the London and South
Western Railway, three miles from Hampton Court and
Hounslow, four from Richmond, and only twelve from
London. The exceedingly valuable and remarkably choice
FREEHOLD RESIDENTIAL ESTATE, known as
"HANWORTH PARK," of Great Historic Interest, being
formerly part of a Royal Domain (see printed particulars).
It extends to some 207 ACRES, lies most compact, and includes
an IMPOSING MANSION, occupying a beautiful and secluded
position, enjoying charming views, approached by long
avenue carriage drives, and containing some 22 bed
and dressing rooms, two bathrooms, a very noble suite of enter-
taining rooms, together with complete and well equipped
domestic offices; all in first-class structural and decorative
order, with Company's water, gas and electric light installa-
tion. Extensive Stabling, with Coachman's residence, an
excellent range of Farm Buildings, Lodge, Gardener's and
Bailiff's Cottages, &c. Exceptionally BEAUTIFUL
PLEASURE GROUNDS, with spacious lawns, shady Wood-
land Walks, charming Dutch garden, Arboretum, &c. Walled
Kitchen garden, with Glasshouses and Vegetable garden.
The remainder of the Estate is practically all HEAVILY
TIMBERED PARKLAND, ornamented by a HANDSOME
STREAM OF WATER affording capital Fishing, and whilst
the property in every way forms a Perfect and Retired
Country House, within easy reach of London by rail or motor,
at the same time, owing to its situation and very extensive
road frontages, it offers every facility for immediate and
profitable development.

MESSRS. TROLLOPE are instructed to SELL
the above by AUCTION, at the Mart, Tokenhouse Yard,
E.C., in JULY NEXT (unless an acceptable offer be previously
made privately). Possession of the whole on completion of the
purchase. Particulars, with Plan, Views, and Conditions of
Sale, of Messrs. DOWSON, AINSLIE & CO., Solicitors, 19 Surrey
Street, Strand, W.C.; and with Orders to View of the
Auctioneers, Messrs. TROLLOPE, 14 Mount Street, Grosvenor
Square, London, W., and at their other offices.

SUSSEX.
In one of the most healthy and charming parts of this county,
a mile and a half from Barnham Junction Station, five miles
from Bognor, four and a half from Goodwood, and five from
the favourite Cathedral and Market town of Chichester.
THE REMAINING PORTIONS OF THE WESTERGADE
ESTATE, comprising EXCEEDINGLY CHOICE FREEHOLD
BUILDING SITES from about 1 to 10 acres, all having a
Southern slope, enjoying delightful views, approached by
excellent roads, and in every way suitable for the erection
of good class Residences, in a district affording capital
Hunting and within an easy drive of the Coast. The whole
Estate extends to some 52 ACRES, has been well planted with
ornamental timber, and includes a beautiful wood, a pair of
Cottages, and range of modern Farm Buildings, Company's
water.

MESSRS. TROLLOPE, in conjunction with
Messrs. STRIDE & SONS, will SELL the above by
AUCTION, at the STATION HOTEL, Barnham, on MONDAY,
JULY 17 NEXT, in some 17 lots (unless previously disposed
of privately).
Particulars, with Plan and Conditions of Sale, of Messrs.
SAXTON & MORGAN, Solicitors, 29 Somerset Street, Portman
Square, W.; Messrs. STRIDE & SONS, Land Agents, Chichester;
and with Orders to View of the Auctioneers, Messrs. TROLLOPE,
14 Mount Street, Grosvenor Square, London, W., and at their
other offices.

EDUCATIONAL.

TUITION FOR ARCHITECTS AND THEIR ASSISTANTS.

MANY hundreds of professional men and
students who have taken the I.C.S. tuition in Archi-
tecture have expressed their entire approval and keen satis-
faction.

Tuition is offered in all subjects coming within the sphere of
an Architect's professional practice. The courses are arranged
to suit the beginner or the Architect who requires advanced
subjects only.

The Complete Architectural Course embraces all
subjects coming within the range of an Architect's practice.

The Advanced Architectural Course deals with such
subjects as steel-construction, reinforced concrete work,
drainage, heating and ventilation, history and design, and
other cognate subjects. A knowledge of these is essential in
practice both to the principal and to his assistants.

The I.C.S. offers its Building Contractor's Course,
which appeals to builders and clerks of works, and to foremen
and others desiring to improve their positions.

The Quantity Surveyor's Course and Archi-
tectural Drawing and Designing Course deal with
all points of the subjects with exactitude.

Architects' assistants, and those about to sit for profes-
sional examinations will find the complete Architectural Course
of instruction most valuable.

The tuition is practical and effective. No attempt is made
to cram, but the system of teaching is conscientious and
thorough.

Write for full particulars, sent free of charge, to
INTERNATIONAL CORRESPONDENCE SCHOOLS, Ltd.,
Dept. 4/C2, International Buildings, Kingsway, London, W.C.

A PEOPLE'S MEMORIAL OF THEIR LATE KING

WITHIN SIX MILES OF THE
CRYSTAL PALACE

THERE ARE MORE THAN TWO MILLIONS OF PEOPLE.
If ONE-THIRD of these people will subscribe only

ONE GUINEA EACH
(which may be paid in instalments spread over a whole year)

THE CRYSTAL PALACE, NOW BEING SOLD,
by order of the Judge, and thus in grave danger of passing
into the Speculating Builder's hands, will be purchased as

The King Edward National Memorial

AND WILL BE AT THE SERVICE
OF THE NATION FOR EVER,
and when the purchase is completed each person who
has subscribed One Guinea or more will be given a

LIFE ADMISSION TICKET.

London has now its opportunity. Subscriptions are
being received. Those desiring to pay by instalments may
do so at leisure any time within One Year of the date of
first instalment. Parents are advised that they may
purchase tickets for their children. Not less than Sixpence
per time can be received in instalments. Subscriptions
should be addressed to the Hon. Treasurer, the RIGHT HON.
THE EARL OF KINNOULL, D.L., The King Edward National
Memorial Office, 26 Shaftesbury Avenue, London, W., from
which address all particulars may be obtained.—For and
on behalf of the Council, TENTERDEN, Chairman.

BOOKS.

Now Ready. Price 2/6 Net; by Post 2/10.

MERTON COLLEGE, OXFORD,
with HISTORICAL and DESCRIPTIVE ESSAY
by BERNARD W. HENDERSON, M.A., containing 14 illus-
trations on art paper, neatly bound in Oxford blue cover. The
first of "The Architect" series.

"Contains much useful information, enriched by 14
admirable plates reproduced from singularly excellent
photographs; letterpress worthy of the pictures, full of
knowledge pleasantly expounded, history and criticism
combined; plates excellently chosen and rich in detail in
this artistic souvenir."—THE DAILY TELEGRAPH.

"A good piece of work, welcomed by all lovers of
Architecture."—THE GUARDIAN.

"Better illustrations could not be desired. The printer
has done them justice."—NORTHAMPTON MERCURY.

"The work is of permanent value."—THE IRIS.

"Remarkable for clearness of detail." THE BIRMINGHAM POST.

"An attractive publication."—THE GLASGOW HERALD

The demand has been such that the issue will, it is
expected, soon be exhausted.
